NOTICE TO BE READ BY ALL USERS OF THIS PUBLICATION

Great care has been taken in the preparation of this work and, to the best knowledge of the Publisher and the Editors, the information contained herein is factual and accurate and the opinions expressed are those of qualified experts. The data are not to be taken as a warranty or representation for which the Publisher or Editors assumes legal responsibility. Furthermore, the Publisher does not assume any responsibility or liability for the accuracy or completeness of, or consequences from, such information. Data are offered in this work are solely for your consideration, investigation, and verification. Mention of trade names or commercial products in the work does not constitute endorsement or recommendation for use by the Publisher or Editors.

This reference work is intended to provide information about chemical hazards and guidelines for those trained in the use and storage of hazardous materials, as well as those trained to respond to spills, leaks, and accidents involving those materials. The work is not intended as a primary source of research information. As with any reference, it cannot include all information or discuss all situations that might occur. It cannot be assumed that all necessary warnings and precautionary measures are contained in this work; other, or additional, information or assessments may be required. Most of all, it cannot replace the expertise, and experience of trained professionals or qualified responders.

As information may not be available for some chemicals, an absence of data does not necessarily mean that a substance is not hazardous. For major incidents, it will be necessary to obtain additional detailed information from other resources as well as more expertise from those with extensive training. Neither the Publisher nor the Editors assume any liability or responsibility for completeness or accuracy of the information presented or any damages of any kind alleged to result in connection with, or arising from, the use of this work.

Final determination of the suitability of any information for use contemplated by any user of this work, and the manner of that use, is the sole responsibility of the user. Any use of these data and information must be determined by the user to be in accordance with applicable federal, state, territory, and local laws, and regulations. The Publisher and Editors recommend that anyone intending to use any toxic, hazardous chemical, and/or carcinogenic material mentioned in this work, should satisfy themselves as to such suitability, and that the user can meet all applicable safety and health standards. The Publisher and the Editors strongly encourage all readers, and users of chemicals, to adhere to and follow the manufacturers' or suppliers' current instructions, technical bulletins, and material safety data sheets for specific use, handling, protection (including the use of personal protective equipment and eye protection), and storage of all chemical materials. The Publisher and Editors also strongly recommend that users obtain expert advice before implementing procedures involving any hazardous chemicals, materials, or carcinogens.

Contents

Preface

For more than 35 years *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* has continued to serve an ever-widening audience of users. It has been proven to be among the most easy-to-use and essential reference works on hazardous materials. The 7th edition has been updated and expanded, once again, to keep pace with world events and to respond to the ever-expanding need for reliable information on chemicals used in the workplace and the tool shed.

Most users of this work understand the potential dangers of chemicals. Hazardous and toxic substances pose a wide range of health hazards, including irritation, sensitization, and carcinogenicity. Chemicals can possess physical properties of flammability, explosion and corrosion. Many chemicals can harm the environment by poisoning aquatic and plant life.

The chemical industry and its many component businesses are forced to strike a delicate balance because the same properties that make a chemical substance highly useful can also make it extremely harmful. We are told by some industrialists that toxic chemicals are present in nature and that industrial contributions are just the price we have to pay for progress. There is little argument about the chemical industry's critical place in the nation's economy. The United States is the number one chemical producer in the world, generating more than $550 billion a year and employing more than 5 million people. So, somewhere in between lies the truth—or at least an area in which we can function. Information is vital in a world where virtually every aspect of our lives is touched by chemical hazards.

Each year, in the United States, over 2 billion tons of hazardous and toxic chemicals are manufactured. Including imports, more than 3 billion tons are transported employing 800,000 shipments each day. It is estimated that 1.3 billion tons are moved by truck and hundreds of billions of pounds of these hazardous materials are transported through populated areas. The average American household generates approximately 15 pounds of hazardous waste per year. Nearly five million poisonings occur in the United States annually, resulting in thousands of deaths. Based on 2004 TRI data (publically released April 2006), over 4 billion pounds of toxic chemicals are released into the nation's environment each year, including 72 million pounds of recognized carcinogens from nearly 24,000 industrial facilities.

Chemical accidents and spills can range from small to large and can occur anywhere chemicals are manufactured, transported, stored or used. Today's media headlines constantly point out both the information gaps and the need for constantly updated information. On January 9, 2014, for example, an estimated 10,000 gallons[CDC,NTP] of chemicals used to process coal spilled from a damaged 45,000 gallon storage tank into the Elk River in the US state of West Virginia. As the news of the spill developed, it became clear to the public (and many experts) that federal and state officials had sparse data about the health risks of the two potentially toxic organic solvents involved in the spill: primarily crude 4-methylcyclohexanemethanol and a minor component of mixed glycol ethers consisting of glycol phenyl ether and dipropylene glycol phenyl ether. The latter mixture of chemicals was not reported by the manufacturer to the public until 12 days after the initial spill. The unfortunate truth is that the Elk River is a municipal water source that serves approximately 300,000 people in and around Charleston, the state capitol. For weeks following the spill, residents were instructed not to drink or bathe with local tap water.

The problem of toxic chemicals in the United States; and, indeed, in all the world frightens many people. Over the years, these fears are heightened by news stories such as the huge accidental plant fire in Saudi Arabia that killed at least 12 people and injured another dozen (April 2016); the huge explosion at a vinyl chloride plant in Coatzacoalcos, Mexico—A few days later (also April 2016) that killed 24 workers and injured 136; the worst environmental disaster in Vietnam history caused by a chemical spill of cyanide, phenols and iron hydroxide which poisoned tons of marine life and killed people along 120 miles of coastline and stretching some 20 nautical miles out to sea (June 2016); the chemical plant explosion and subsequent spill of highly flammable liquids in Guizhou Province, China (February 2012) that killed more than 20 people and forced the evacuation of almost 30,000. Whether the chemical involves an aluminum dust explosion (Huntington, IN, 2003), a fertilizer explosion in West Texas (April 2013) leads in the water supply (Flint, MI, 2016), the massive Deepwater Horizon oil spill (Gulf of Mexico, 2010), or older problems—Bhopal, India, Love Canal, New York, the disastrous Valley of the (100,000) Drums (Kentucky), the Valley of Death in Brazil, and the like−these incidents generate emotional responses, often from people uninformed about science or technology and confirm the charge of critics that chemicals are "accidents waiting to happen."

In 2001, the 4th Edition of *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* was published shortly before the tragic events of the morning of September 11. The decade that followed brought many changes to life in the civilized world. The United States government, for example, established the Department of Homeland Security and enacted laws such as the *Chemical Facilities Security Act of 2003.* These actions were prompted by concerns involving infrastructure protection and the anticipation of another attack, possibly on the nation's chemical and energy facilities or by using trucks

or tank cars that transport highly dangerous and possibly lethal chemicals. "These facilities are found around the country in industrial parks, in seaports, and near the major population centers. Dangerous chemicals routinely travel along our highways, inland waterways, and on railcars that pass through the heart of major cities including Washington, D.C., just a short distance from Capitol Hill. Terrorist attacks on the US chemical industry have the potential to kill tens of thousands of Americans and seriously injure many more. In many instances, these attacks hold the potential for having a cascading effect across other infrastructures, particularly in the energy and transportation sectors. This is both because of the damage that can be caused by the attack, and the enormous expense and effort associated with the clean-up to an affected area in its aftermath."[83] To put it more simply, using the same low tech/high concept approach that turned passenger planes into missiles, terrorists do not need to produce or amass chemical weapons or smuggle them into the United States in order to produce great damage.

"Commercial chemical incidents occur tens of thousands of times each year, often with devastating and exorbitantly expensive consequences. They are indiscriminate in their effects. Workers, companies, the public, emergency response organizations, and all levels of government pay the figurative and literal price. Yet, until now and with few exceptions, chemical incidents have been invisible. Perhaps it is due to their pervasiveness, or to the common tendency to overlook what is taken for granted."[84] This quote is from the highly publicized *600K Report* prepared by the Chemical Safety and Hazard Investigation Board (CSB), an independent, nonpartisan, quasi-legislative US government agency. The CSB described our nation's lack of definitive knowledge of the "big picture" surrounding chemical incidents as "… the industrial equivalent of two 737 airplanes "crashing" year after year, killing all passengers (256 people) without anyone seeming to notice."[84]

Almost 40 years ago, the United States Government Accounting Office (GAO) estimated that 62,000 chemicals were in commercial use. Today, that number has grown to beyond 82,000.

Given the reality of problems inherent to chemical hazards, including accidents and spills, the advent of new threats to our way of life, and the challenges of communicating complex data, it is the goal of this work to provide data so that responsible decisions can be made by all who may have contact with chemicals covered in this reference work. With this in mind the work can be used by those in the following chemical fields and related professions:

Applied research and product development
Attorneys
Campus safety and health
Certified chemical hygiene officer (CCHO)
Chemical engineering
Chemical health and safety
Chemical informatics and information management
Chemicals manufacturers and distributors
Chemical technology
Certified hazardous materials manager (CHMM)
Certified health physicist (CHP)
Certified industrial hygienist (CIH)
Certified safety professional (CSP)
Dyes, pigments and inks
Emergency response personnel
Environmental protection and management
Forensic chemistry
Formulation chemistry
Hazardous waste management
Industrial management
Laboratory management
Loss control management
Pesticide distributors
Process chemistry
Process safety
Project management
Public information and outreach
Public health
Quality control and assurance
Regulatory affairs
Researchers
Science policy
Technical communications
Technical support
Toxicology
Water chemistry

The chemicals chosen for inclusion are officially recognized substances, many identified as carcinogens, as belonging to some designated category of hazardous or toxic materials; with numerically defined safe limits in air in the workplace, ambient air, water; in waste effluents. For the most part these are materials of commerce that can be heavily used and may be transported in bulk.

The 7th edition contains more chemicals and data for each material. In keeping with the broad changes initiated with the fourth edition, contents of the 7th edition are focused on the concept of "regulated chemicals." The carcinogen potential of each chemical was compared to listings and reports from eminent authorities as the International Agency for Research on Cancer (IARC), the US National Toxicology Program (NTP) and the US Environmental Protection Agency.

The "Regulatory Authority and Advisory Bodies" section contains new items including, where available, EPA Gene-Tox Program findings, and many of the individual listings now contain useful advice sought after by the regulated community. As a result, the new volume should be even

more practical for those users of specific chemicals, and to those concerned with both adherence to, and enforcement of, regulations.

Data is furnished, to the extent currently available, in a uniform multisection uniform format to make it easy for users who must find information quickly and/or compare the data contained within records, in any or all of these important categories:

Chemical Name and Record Number
Chemical Formula
Synonyms (including trade names)
Code Numbers (including CAS Registry, HSDB, RTECS, UN/NA & ERG, EC)
Regulatory Authority and Advisory Information (summary)
Description (including physical properties, explosion and fire data and water reaction and solubility)
Potential Exposure
Incompatibilities
Permissible Exposure Limits in Air
Determination in Air
Permissible Concentration in Water
Determination in Water
Routes of Entry
Short-Term Exposure
Long-Term Exposure
Points of Attack
Medical Surveillance
First Aid
Decontamination (selected records)
Personal Protective Methods
Respirator Selection
Storage
Shipping
Spill Handling
Fire Extinguishing
Disposal Method Suggested
References

A Brief history of this work

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens was first published more than 35 years ago. This work continues to provide first responders and occupational and environmental health and safety professionals with an accessible and portable reference source. Based on a count of CAS numbers, the seventh edition of this handbook contains data on almost 2600 toxic and hazardous chemicals (up from nearly 600 in the first edition, nearly 800 in the second edition, nearly 1300 in the third edition, and nearly 1500 in the fourth edition, and 2200 in the sixth edition).

According to the United State Library of Congress, the history of the project is as follows: 1st edition published in 1981; 2nd edition published in 1985; 3rd edition published in 1991; 4th edition published in 2001; 5th edition November 2007; 6th edition 2012, 7th edition: 2017.

Acknowledgments

The compilation of this 7th edition could not have been realized without the contributions of many of the researchers, scientists, contract employees and institutions that developed the excellent documents and databases that provided so much of the essential data that appear in this work. A full list of these contributors is impossible to compile. Nevertheless, In no particular order, I wish to acknowledge the those associated with US Environmental Protection Agency (EPA); United States Department of Labor; Occupational Safety and Health Administration (OSHA); Department of Health and Human Services; National Institute for Occupational Safety and Health (NIOSH); US Department of Energy (DOE); Agency for Toxic Substances and Disease Registry (ATSDR); American Conference of Governmental Industrial Hygienists (ACGIH); Deutsche Forschungsgemeinschaft (DFG); Centers for Disease Control and Prevention (CDC); NOAA; United States National Library of Medicine (NLM) National Institutes of Health (NIH); Hazardous Substance Data Bank (HSDB) and (TOXNET); US Department of Health and Human Services, Public Health Service, National Toxicology Program (NTP); Federal Emergency Management Agency (FEMA); US Department of Transportation (DOT); US Coast Guard (USCG); National Fire Protection Association (NFPA); International Agency for Research on Cancer; (IARC); New Jersey Department of Health and Senior Services; Chemical Safety and Hazard Investigation Board (CSB); United Nations Environment Programme; the states of New York and New Jersey, and many other government organizations, organizations and companies. It is nearly impossible to express the extent of my gratitude to all of them for their contributions to my research.

Although every effort has been made to produce an accurate and highly useful handbook, the editors and Publisher appreciates the need-for constant improvement. Any comments, corrections, or advice from users of this book are welcomed by the author who asks that all correspondence be submitted in writing and mailed directly to the publisher who will maintain a file for reprints and future editions.

How to Use This Book

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens focuses on critical data for more than 2600 commercially important, regulated and hazardous, to one degree or another, substances. A large number of these chemicals are known or suspected potentially dangerous carcinogens. Many are found in the workplace and fewer are found in the medical and research fields. Some are found in home basements and worksheds. For the most part, importance is defined by inclusion in official, regulatory, and advisory listings. Much of this information, found in US government sources, has been supplemented by a careful search of many publications and databases.

This handbook is becoming more encyclopedic in nature. When one looks at many, if not most published works in this field, the user simply expects to find numerical data. Here, we have tried, wherever possible, to provide useful descriptive material and references which hopefully opens the door to additional of published materials.

Nevertheless, this is not a seminal research work and it is recommended that this book be used as a guide. This work is not meant to be a substitute for workplace hazard communication programs required by regulatory bodies such as OSHA, and/or any other United States or international government agencies. If data are required for legal purposes, the original source documents [such as Code of Federal Regulations (CFR)], appropriate Federal and State agencies, which are often referenced, should be consulted.

In the pages which follow, the following categories of information will be presented, for each chemical record, discussed with reference to scope, sources, nomenclature employed, and the like. Omission of a category generally indicates a lack of available information.

Chemical name: Each record is arranged alphabetically by a chemical name. These are names used by regulatory and advisory bodies. In very few cases the name may be a popularly-used product name or trade name. The chemical name section of each chemical record is backed-up with the "Synonyms" section and Appendix 5, "Synonym and Trade Name-Cross Index."

Formula: Generally, this has been limited to a commonly used one-line empirical or atomic formula. In the *Molecular Formula* field, the Hill system has been used showing number of carbons (if present), number of hydrogens (if present), followed by alphabetically listed element (s). Multiple carbon−carbon (double and triple) bonds have been displayed where appropriate.

Synonyms: This section contains scientific, product, trade, and other synonym names that are commonly used for each hazardous substance. Some of these names are registered trade names. Some are provided in other major languages other than English, including Spanish, French, and German. In some cases, "trivial" and nicknames (such as MEK for methyl ethyl ketone) have been included because they are commonly used in general communications, especially in the workplace. This section is important because the various "regulatory" lists published by federal, state, international agencies and advisory bodies do not always use the same name for a given hazardous substance. Every attempt has been made to ensure the accuracy of the synonyms and trade names found in this work, but errors of highly complex names are inevitable in compilations of this magnitude. Please note that this work may not include the names of all products currently found in commerce, particularly mixtures that may contain ingredients that are regulated chemicals.

The synonym index contains all synonym names listed in alphabetical order. It should be noted that organic chemical prefixes and interpolations such as (α-) alpha-, (β-) beta-, (γ-) gamma-, (δ-) delta-, (o-) ortho-, (m-) meta-; (p-) para-; sec- (secondary-), trans-, cis-, (n-) normal-, and numbers (1-; 1,2-), etc. are not used when searching for a chemical name. In other words, these prefixes are not treated as part of the chemical name for the purposes of alphabetization. Users should use the substance name without the prefix. For example, to locate *n*-butane, search for butane; to locate 3,3′-dichlorobenzidine; search for dichlorobenzidine; and to locate α-cyanotoluene or *alpha*-cyanotoluene, search for cyanotoluene. *Note*: All product names, company names, trademarks, and brands are the registered property of their respective owners. All company, product and service names used in this work are for identification purposes only. Use of these names, logos, and brands does not imply endorsement by the Author, Editors or the Publisher.

CAS Registry Number: The Chemical Abstracts Service (CAS) number is a unique identifier assigned to each chemical registered with the CAS of the American Chemical Society. This number is used to identify chemicals on the basis of their molecular structure. CAS numbers, in the format "nnn-nn-n" [two or more numeric characters (dash) two numeric characters (dash) followed by a single numeric check digit]. CAS numbers should always be used in conjunction with substance names to insure positive identification and to avoid confusion with like-sounding names, i.e., benzene (71-43-2) and benzine (8032-32-4). This 7th edition contains some alternate CAS numbers that may now be considered related, retired, obsolete and/or widely and incorrectly used in the literature. In this section, the first CAS number(s), before the abbreviation "alt." for the word "alternate," is considered (based on several sources) to be the correct CAS number(s). Ultimately, it is the responsibility of the user to find and use the correct number. *Note*: CAS Registry Number is a Registered Trademark of the American Chemical Society.

HSDB Number: HSDB is a toxicology data file on the National Library of Medicine's (NLM's) Toxicology Data Network (TOXNET). HSDB is organized into individual chemical records, and contains over 5000 such records. HSDB is a database focused primarily on the toxicology of potentially hazardous chemicals. The information in HSDB has been assessed by a Scientific Review Panel. Using your computer browser and entering a search such as "HSDB (followed by the Number)" should take you to the exact record you are seeking.

RTECS Number: RTECS (Registry of Toxic Effects of Chemical Substances) is a compendium of data extracted from the open scientific literature. The data are recorded in the format developed by the RTECS staff at NIOSH and arranged in alphabetical order by prime chemical name.[NIOSH] The RTECS numbers are unique identifiers assigned NIOSH. The RTECS number in the format "AAnnnnnnn" (two alphabetic characters followed by seven numeric characters) may be useful for online searching for additional toxicologic information on specific substances. It can, for example, be used to provide access to the MEDLARS computerized literature retrieval services of the NLM in Washington, DC. The RTECS number and the CAS number can serve to narrow down online searches. The RTECS Database is currently available from a growing list of "value-added" vendors that are listed on the Internet from NIOSH or CDC. In the US 1-800-232-4636; Outside the US 1-513-533-8328 or by Email: cdcinfo@cdc.gov.

UN/NA & ERG Number: United Nations-North America numbers are four-digit numbers that identify an individual chemical or group of hazardous substances, chemicals or articles (such as explosives, corrosive substances, pesticides, grenades, etc.) with similar characteristics. These four-digit numbers are normally preceded by UN or NA (e.g., UN1759-NA1759). UN/NA numbers are required to appear on shipping documents, and are often displayed on warning labels, the exterior of packages, and on specified containers such as truck or railway placards. These ID (identification) numbers may also be called NA (North American) numbers or DOT (Department of Transportation) numbers.[cameo] UN numbers are assigned by the United Nations Committee of Experts on the Transport of Dangerous Goods. Identification numbers containing a UN prefix (United Nations numbers) are authorized for use with all international shipments of hazardous materials. NA numbers are assigned by the United States DOT and usually correspond closely, but not always precisely, to the UN listing. The "NA" prefix is used for shipments between Canada and the United States *only*, and may *not* be used for other international shipments. Some chemicals without an assigned UN number may have an NA number. These latter NA numbers are usually in the format and range of NA8000−NA9999. Use of these ID numbers for hazardous materials will (1) serve to verify descriptions of chemicals; (2) provide for rapid identification of materials when it might be inappropriate or confusing to require the display of lengthy chemical names on vehicles; (3) aid in speeding communication of information on materials from accident scenes and in the receipt of more accurate emergency response information; and (4) provide a means for quick access to immediate emergency response information in the *North American Emergency Response Guidebook* (ERG) and also in the international publication, *Recommendations on the Transport of Dangerous Goods*, also known as the *Orange Book*.

EC Number: The European Commission number is a seven digit identification code used in countries of the European Union (EU) for commercially available chemical substances within the EU. This number is an identification number (ID) from *European Inventory of Existing Commercial Chemical Substances*, published by the European Environment Agency, Copenhagen, Denmark. The EC number supercedes the outmoded EINECS, ELINCS and NLP numbers. This section also includes "Annex I, Index Number" for the Export and Import of Dangerous Chemicals found in Annex I of Regulation (EC) No. 689/2008.

Regulatory Authority and Advisory Bodies:

This section contains a listing of major regulatory and advisories for the chemical of concern, including, but not limited to, Homeland Security, OSHA, US EPA, DFG (Germany), US DOT, ACGIH, IARC, NTP, WHMIS (Canada) and the EC, etc. Many law or regulatory references in this work have been abbreviated. For example, Title 40 of the CFR, Part 261, subpart 32 has been abbreviated as 40CFR261.32. The symbol "§" may be used as well to designate a "section" or "part."

- United States Department of Homeland Security. Includes "chemicals of interest" from The Chemical Facility Anti-Terrorism Standards (CFATS Act of 2014) program and the *Federal Register*, Appendix A, including all provisions of 6 CFR Part 27, including § 27.210(a)(1)(i). In developing the list, the DHS looked to existing expert sources of information including other federal regulations related to chemicals, including the following: chemicals covered under the United States Environmental Protection Agency's Risk Management Program. Chemicals included in the Chemical Weapons Convention. Hazardous materials, such as gases that are poisonous by inhalation. Explosives regulated by the DOT. The Department of Homeland Security has identified three security issues related to chemicals: *Release*—Toxic, flammable, or explosive chemicals or materials that, if released from a facility, have the potential for significant adverse consequences for human life or health. *Theft or Diversion*—Chemicals or materials that, if stolen or diverted, have the potential to be misused as weapons or easily converted into weapons using chemical

manipulation and techniques and related equipment with the intent of creating significant adverse consequences for human life or health. *Sabotage or Contamination*—Chemicals or materials that, if mixed with other and possibly readily available materials, have the potential to create significant adverse consequences for human life or health. Also considered were these security issues as well as to determine their potential future inclusion in the final version of Appendix A, and/or coverage under *Chemical Facility Anti-Terrorism Standards: Critical to Government Mission*—Chemicals or facilities the loss of which could create significant adverse consequences for national security or the ability of the government to deliver essential services, and *Critical to National Economy*—Chemicals or facilities the loss of which could create significant adverse consequences for the national or regional economy.

- Carcinogenicity: lists known and suspected human carcinogens, the agency making such a determination, the nature of the carcinogenicity. The following lists and agencies were consulted: *US Department of Health and Human Services 13th Report on Carcinogens (10/2/2014)*. United States Environmental Protection Agency: US EPA's general categories recognized by the 2005 guidelines are as follows: *Group A*: Carcinogenic to Humans: Agents with adequate human data to demonstrate the causal association of the agent with human cancer (typically epidemiologic data). *Group B*: Probably Carcinogenic to Humans: Agents with sufficient evidence (i.e., indicative of a causal relationship) from animal bioassay data, but either limited human evidence (i.e., indicative of a possible causal relationship, but not exclusive of alternative explanations; Group B1), or with little or no human data (Group B2). *Group C*: Possibly Carcinogenic to Humans: Agents with limited animal evidence and little or no human data. *Group D*: Not Classifiable as to Human Carcinogenicity: Agents without adequate data either to support or refute human carcinogenicity. *Group E*: Evidence of Noncarcinogenicity for Humans: Agents that show no evidence for carcinogenicity in at least two adequate animal tests in different species or in both adequate epidemiologic and animal studies.[USEPA] US Department of Health and Human Services *13th Report on Carcinogens (RoC)*, (2014), a science-based document prepared by the National Toxicology Program (NTP) that identifies chemical, biological, and physical agents that are considered cancer hazards for people living in the United States. IARC (International Agency for Research on Cancer),[12] are classified as to their carcinogenic risk to humans by IARC as follows: Group 1: Human Carcinogen; Group 2A: Probable Human Carcinogen; Group 2B: Possible Human Carcinogen.
- Chemicals on California's Proposition 65 List, revised as of September 30, 2016. Officially known as the Safe Drinking Water and Toxic Enforcement Act of 1986. The proposition requires that the Governor protect the state's drinking water sources from being contaminated with chemicals known to cause cancer, birth defects or other reproductive harm, and to revise and republish at least once per year a list of such chemicals. It also requires businesses to inform Californians about exposures to chemicals on the revised list[OEHHA].
- This 7th edition contains a brief summary labeled "Hazard Alert". The purpose of this section is to quickly notify users of specific dangers related to each chemicals of interest. Following is a *sample* of warnings appearing in this section: Asphyxiation hazard • Combustible liquid • Contains gas under pressure • may explode if heated • Endocrine disruptors (high/medium/low, where available) • Dangerous nerve agent • Extremely flammable gas • Flammable liquid • Frostbite/Cryogenic burn hazard • Poison inhalation hazard: exposure can be lethal • Polymerization hazard (high) • Polymerization hazard $>$ 30°C • Possible risk of forming tumors • Primary irritant (w/o allergic reaction) • Sensitization hazard (skin, respiratory) • Suspected of causing genetic defects • Suspected reprotoxic hazard • Environmental hazard, etc. *Warning*: This section is merely a guide and does not purport to be complete for every chemical covered in this work.
- A banned or severely restricted product as designated by the United Nations[13] or by the US EPA Office of Pesticide Programs under FIFRA (Federal Insecticide, Fungicide and Rodenticide Act).[14]
- A substance with an air pollutant standard set or recommended by OSHA and/or NIOSH,[58] ACGIH,[1] DFG.[3] The OSHA limits are the enforceable pre-1989 PELs. The transitional limits that were vacated by court order have not been included. However, the vacated limits are used and enforced by some states. Some airborne limits, for example, such as those from NIOSH and ACGIH are recommendations that do not carry the force of law.
- A substance whose allowable concentrations in workplace air are adopted or proposed by the American Conference of Government Industrial Hygienists

(ACGIH),[1] DFG [Deutsche Forschungsgemeinschaft (German Research Society)].[3] Substances whose allowable concentrations in air and other safety considerations have been considered by OSHA and NIOSH.[2] Substances which have limits set in workplace air, in residential air, in water for domestic purposes or in water for fishery purposes as set forth by the former USSRUNEP/IRPTC Project.[43]

- Substances that are specifically regulated by OSHA under 29CFR1910.1001 to 29CFR1910.1050
- Highly hazardous chemicals, toxics, and reactives regulated by OSHA's "*Process Safety Management of Highly Hazardous Chemicals*" under 29CFR1910.119, Appendix A. Substances that are Hazardous Air Pollutants (Title I, Part A, § 112) as amended under 42USC7412. This list provided for regulating at least 189 specific substances using technology-based standards that employ Maximum Achievable Control Technology (MACT) standards; and, possibly health-based standards if required at a later time. § 112 of the Clean Air Act (CAA) requires emission control by the EPA on a source-by-source basis. Therefore, the emission of substances on this list does not necessarily mean that a firm is subject to regulation.
- Regulated Toxic Substances and Threshold Quantities for Accidental Release Prevention. These appear as Accidental Release Prevention/Flammable Substances, Clean Air Act (CAA) §112(r), Table 3, TQ (threshold quantity) in pounds and kilograms under 40 CFR68.130. The accidental release prevention regulations applies to stationary sources that have present more than a threshold quantity of a CAA § 112(r) regulated substance.
- Clean Air Act (CAA) Public Law 101−549, Title VI, *Protection of Stratospheric Ozone*, Subpart A, Appendix A, class I and Appendix B, Class II, Controlled Substances, (CFCs) Ozone depleting substances under 40CFR82.
- Clean Water Act (CWA) Priority toxic water pollutants defined by the US Environmental Protection Agency for 65 pollutants and classes of pollutants which yielded 129 specific substances.[6]
- Chemicals designated by EPA as "Hazardous Substances"[4] under the Clean Water Act (CWA) 40CFR116.4, Table 116.4A.
- Clean Water Act (CWA) § 311 Hazardous Materials Discharge Reportable Quantities (RQs). This regulation establishes reportable quantities for substances designated as hazardous (see §116.4, above) and sets forth requirements for notification in the event of discharges into navigable waters. Source: 40 CFR117.3, amended at 60FR30937.
- Clean Water Act (CWA) § 307 List of Toxic Pollutants. Source: 40CFR401.15.
- Clean Water Act (CWA) § 307 Priority Pollutant List. This list was developed from the List of Toxic Pollutants classes discussed above and includes substances with known toxic effects on human and aquatic life, and those known to be, or suspected of being, carcinogens, mutagens, or teratogens. Source: 40CFR423, Appendix A.
- Clean Water Act, § 313 Water Priority Chemicals. Source: 57FR41331.
- RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic with Regulatory levels in mg/L. Source: 40CFR261.24.
- RCRA Hazardous Constituents. Source: 40CFR261, Appendix VIII. Substances listed have been shown, in scientific studies, to have carcinogenic, mutagenic, teratogenic or toxic effects on humans and other life forms. This list also contains RCRA waste codes. The words, "waste number not listed" appears when a RCRA number is NOT provided in Appendix VIII.

Characteristic Hazardous Wastes

Ignitability	A nonaqueous solution containing less than 24% alcohol by volume and having a closed cup flash point below 60°C/140°F using Pensky−Martens tester or equivalent An ignitable compressed gas A nonliquid capable of burning vigorously when ignited or causes fire by friction, moisture absorption, spontaneous chemical changes at standard pressure and temperature An oxidizer. See §261.21
Corrosivity	Liquids with a pH equal to or less than 2 or equal to or more than 12.5 or which corrode steel at a rate greater than 6.35 mm (0.25 in.) per year @ 55°C/130°F. See §261.22
Reactivity	Unstable substances that undergo violent changes without detonating Reacts violently with water or other substances to create toxic gases Forms potentially explosive mixtures with air. See §261.23
Toxicity	A waste that leaches specified amounts of metals, pesticides, or organic chemicals using Toxicity Characteristic Leaching Procedure (TCLP). See §261, Appendix II, and §268, Appendix I. **Listed Hazardous Wastes**

“F” wastes	Hazardous wastes from nonspecific sources §261.31
“K” Wastes	Hazardous wastes from specific sources §261.32
“U” Wastes	Hazardous wastes from discarded commercial products, off-specification species, container residues §261.34. Covers some 455 compounds and their salts and some isomers of these compounds
“P” Wastes	Acutely hazardous wastes from discarded commercial products, off-specification species, container residues §261.33. Covers some 203 compounds and their salts plus soluble cyanide salts

Note: If a waste is not found on any of these lists, it may be found on state hazardous waste lists.

RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic. Source: 40CFR261.24, Table I. These are listed with regulatory level in mg/L and “D” waste numbers representing the broad waste classes of ignitability, corrosivity, and reactivity.

EPA Hazardous Waste code(s), or RCRA number, appears in its own field. Acute hazardous wastes from commercial chemical products are identified with the prefix “P.” Nonacutely hazardous wastes from commercial chemical products are identified with the prefix “U.”

RCRA Universal Treatment Standards. Lists hazardous wastes that are banned from land disposal unless treated to meet standards established by the regulations. Treatment standard levels for wastewater (reported in mg/L) and nonwastewater [reported in mg/kg or mg/L TCLP (Toxicity Characteristic Leachability Procedure)] have been provided. Source: 40CFR268.48 and revision, 61FR15654.

RCRA Ground Water Monitoring List. Sets standards for owners and operators of hazardous waste treatment, storage, and disposal facilities, and contains test methods suggested by the EPA (see Report SW-846) followed by the Practical Quantitation Limit (PQL) shown in parentheses. The regulation applies only to the listed chemical; and, although both the test methods and PQL are provided, they are *advisory only*. Source: 40CFR264, Appendix IX.

Safe Drinking Water Act (SDWA) Maximum Contaminant Level Goals (MCLG) for Organic Contaminants. Source: 40CFR141 and 40CFR141.50, amended 57FR31776.

- Maximum Contaminant Levels (MCL) for Organic Contaminants. Source: 40CFR141.61.
- Maximum Contaminant Level Goals (MCLG) for Inorganic Contaminants. Source: 40CFR141.51.
- MCL for Inorganic Contaminants. Source: 40CFR141.62.
- MCL for Inorganic Chemicals. The MCL for arsenic applies only to community water systems. Compliance with the MCL for arsenic is calculated pursuant to §141.23. Source: 40CFR141.11.
- Secondary Maximum Contaminant Levels (SMCL). Federal advisory standards for the states concerning substances that effect physical characteristics (i.e., smell, taste, color, etc.) of public drinking water systems. Source: 40CFR143.3.
- CERCLA Hazardous Substances (“RQ” Chemicals). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*.
- Releases of CERCLA hazardous substances in quantities equal to or greater than their reportable quantity (RQ), are subject to reporting to the National response Center under CERCLA. Such releases are also subject to state and local reporting under §304 of SARA Title III (EPCRA). CERCLA hazardous substances, and their reportable quantities, are listed in 40CFR302, Table 302.4. RQs are shown in pounds and kilograms for chemicals that are CERCLA hazardous substances. For metals listed under CERCLA (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, thallium, and zinc), no reporting of releases of the solid is required if the diameter of the pieces of solid metal released is 100 μm (0.004 in.) or greater. The RQs shown apply to smaller particles.
- EPCRA §302 Extremely Hazardous Substances (EHS). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*. The presence of Extremely Hazardous Substances in quantities in excess of the Threshold Planning Quantity (TPQ), requires certain emergency planning activities to be conducted. The Extremely Hazardous Substances and their TPQs are listed in 40CFR355, Appendices A and B. For chemicals that are solids, there may be two TPQs given (e.g., 500/10,000). In these cases, the lower quantity applies for solids in powder form with particle size less than 100 μm; or, if the substance is in solution or in molten form. Otherwise, the higher quantity (10,000 pounds in the example) TPQ applies.
- EPCRA §304 Reportable Quantities (RQ). In the event of a release or spill exceeding the reportable quantity, facilities are required to notify State Emergency Response Commissions (SERCs) and Local Emergency Planning Committees (LEPCs). From Consolidated List of Chemicals Subject to the

Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*.

- EPCRA § 313 Toxic Chemicals. From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*. Chemicals on this list are reportable under §313 and §6607 of the Pollution Prevention Act. Some chemicals are reportable by category under §313. Category codes needed for reporting are provided for the EPCRA§313 categories. Information and Federal Register references have been provided where a chemical is subject to an administrative stay, and not reportable until further notice.
- From "*Toxic Chemical Release Inventory Reporting Form R and Instructions, Revised 2005 Version*," EPA document 260-B-06-001 was used for *de minimis* concentrations, toxic chemical categories.
- Chemicals which EPA has made the subject of Chemical Hazard Information Profiles or "CHIPS" review documents.
- Chemicals which NIOSH has made the subject of "Information Profile" review documents on "Current Intelligence Bulletins."
- Carcinogens identified by the National Toxicology Program of the US Department of Health and Human Services at Research Triangle Park, NC.[10]
- Substances regulated by EPA[7] under the major environmental laws: Clean Air Act, Clean Water Act, Safe Drinking Water Act, RCRA, CERCLA, EPCRA, etc. A more detailed list appears above. Substances with environmental standards set by some international bodies including those in Europe and Canada.[43]
- Hazard Symbols, Risk Phrases, and Safety Phrases. Explanation of these symbols and phrases can be found in Appendix 4. In the year 2018 it is expected that the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) will be phased in by many countries. Hazard statements are an essential element under the GHS, and will eventually replace the risk phrases (R-phrases) described earlier in the paragraph. In addition to hazard statements, containers and Material Safety Data Sheets (MSDS) will often contain, where necessary, one or multiple pictograms, a signal word such as "Warning" or "Danger," and precautionary statements. The precautionary statements will indicate proper handling procedures aimed at protecting the user and other people who might come in contact with the substance during an accident or in the environment. The container and MSDS will also contain the name of the supplier, manufacturer, or importer. Each hazard statement contains a four-digit code, starting with the letter H (in the format Hxxx). Statements appear under various headings grouped together by code number. The purpose of the four-digit code is for reference only; however, following the code is exact *phrase* as it should appear on labels and MSDS. The collection of Risk and Safety phrases in this work my go beyond those found in some, more generalized Material Safety Data Sheets. It is also possible that some of the warnings are based on animal rather than human studies. These statements are usually preceded by the word "suspected" or "potential".
- Water hazard classifications from the German Federal Water Management Act on Water Hazard Classification, *Verwaltungsvorschrift Wassergefährdende Stoffe* (VwVwS). This law requires all chemical substances be evaluated for their detrimental impact on the physical, chemical, or biological characteristics of water. Substances can be classified as nonhazardous to water (*nwg, nicht wassergefährdende*) or assigned to one of three numeric water hazard classes, WGK-1: low hazard to waters (low polluting to water), WGK-2: hazard to waters (water pollutant), or WGK: 3 severe hazard to waters (severe pollutant). The English acronym for WGK is WHC (water hazard class). This work uses the German initial-acronym "WGK" so there is no confusion as to its source. Material Safety Data Sheets (MSDS) that use these water hazards also use the German acronym. If a value was not assigned or not found in the German database, an estimated has been provided using the format, "*WGK (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]*." These estimates are based on other sources, for example, the US DOT *List of Marine Pollutants (§172.101—Appendix B)*. *Warning*: These estimates are to be used only as a guide. In the case of limited information, it is the responsibility of the users of this work to recognize and address those limitations and to engage in additional research, including direct contact with chemical suppliers and all forms of supplier communications such as the legally required Material Safety Data Sheets (MSDSs), Technical Bulletins, etc.

Description: This section contains a quick summary of properties of the substance including physical state (solid, liquid or gas), color, odor description, molecular weight, density, boiling point, freezing/melting point, vapor

pressure, flash point, autoignition temperature, explosion limits in air, Hazard Identification (based on NFPA-704 M Rating System) in the format: Health (ranked 1 to 4), Flammability (ranked 1 to 4), Reactivity (ranked 1 to 4) (see also below for a detailed explanation of the System and Fire Diamond), and solubility or miscibility in water. This section may also contain special and relevant comments about the substance. Terms in this section are also defined in the glossary.

Odor threshold: This is the lowest concentration in air that most humans can detect by smell. Some value ranges are reported. The value cannot be relied on to prevent overexposure, because human sensitivity to odors varies over wide limits, some chemicals cannot be smelled at toxic concentrations, odors can be masked by other odors, and some compounds rapidly deaden the sense of smell.

Molecular weight: The MW as calculated from the molecular formula using standard elemental molecular weights (e.g. carbon = 12.1).

Boiling point at 1 atm: The value is the temperature of a liquid when its vapor pressure is 1 atm. For example, when water is heated to 100°C/212°F its vapor pressure rises to 1 atm and the liquid boils. The boiling point at 1 atm indicates whether a liquid will boil and become a gas at any particular temperature and sea-level atmospheric pressure.

Melting/Freezing point: The melting/freezing point is the temperature at which a solid changes to liquid or a liquid changes to a solid. For example, liquid water changes to solid ice at 0°C/32°F. Some liquids solidify very slowly even when cooled below their melting/freezing point. When liquids are not pure (e.g., salt water) their melting/freezing points are lowered slightly.

Flash point: This is defined as the lowest temperature at which vapors above a volatile combustible substance will ignite in air when exposed to a flame. Depending on the test method used, the values given may be either Tag Closed Cup (cc) (ASTM D56) or Cleveland Open Cup (oc) (ASTM D93). The values, along with those in *Flammable Limits in Air* and *Autoignition temperature* below, give an indication of the relative flammability of the chemical. In general, the open cup value is slightly higher (perhaps 10 to 15°F higher) than the closed cup value. The flash points of flammable gases are often far below 0° (F or C) and these values are of little practical value, so the term “flammable gas” is often used instead of the flash point value.

Autoignition Temperature: This is the minimum temperature at which the material will ignite without a spark or flame being present. Values given are only approximate and may change substantially with changes in geometry, gas, or vapor concentrations, presence of catalysts, or other factors.

Flammable Limits in Air: The percent concentration in air (by volume) is given for the LEL (lower explosive-flammable limit in air, % by volume) and UEL (upper explosive flammable limit in air, % by volume), at room temperature, unless other specified. The values, along with those in “Flash point” and “Autoignition temperature” give an indication of the relative flammability of the chemical.

NFPA Hazard Classifications: The NFPA 704 Hazard Ratings (Classifications) are based on those found in “*Fire Protection Guide to Hazardous Materials*,” 2001 edition, National Fire Protection Association, Quincy, MA, ©1994. The classifications are defined in Table 1.

Table 1. *Explanation of NFPA Hazard Classifications*

Classification	*Definition*
HEALTH HAZARD (blue)	
4	Materials which on very short exposure could cause death or major residual injury (even though prompt medical treatment was given), including those that are too dangerous to be approached without specialized protective equipment
3	Materials which on short exposure could cause serious temporary or residual injury (even though prompt medical treatment was given), including those requiring protection from all bodily contact
2	Materials that, on intense or continued (but not chronic) exposure, could cause temporary incapacitation or possible residual injury, including those requiring the use of protective clothing that has an independent air supply
1	Materials which on exposure would cause irritation but only minor residual injury, including those requiring the use of an approved air-purifying respirator
0	Materials that, on exposure under fire conditions offer no hazard beyond that of ordinary combustible material
FLAMMABILITY (red)	
Classification number and Definition	
4	This degree includes flammable gases, pyrophoric liquids, and Class IA flammable liquids. Materials which will rapidly or completely vaporize at atmospheric pressure and normal ambient temperature, or which are readily dispersed in air and which will burn readily
3	Includes Class IB and IC flammable liquids and materials that can be easily ignited under almost all normal temperature conditions
2	Materials that must be moderately heated before ignition will occur and includes Class II and Class IIIA combustible liquids and solids and semisolids that readily give off ignitable vapors
1	Materials that must be preheated before ignition will occur, such as Class IIIB combustible liquids, and solids and semisolids whose flash point exceeds 200°F/93.4°C, as well as most ordinary combustible materials
0	Materials that will not burn

REACTIVITY (yellow)

4 Materials that, in themselves, are readily capable of detonation, explosive decomposition or explosive reaction at normal temperatures and pressures

3 Materials that, in themselves, are capable of detonation, or explosive reaction, but require a strong initiating source or heating under confinement. This includes materials that are sensitive to thermal and mechanical shock at elevated temperatures and pressures and materials that react explosively with water

2 Materials that are normally unstable and readily undergo violent chemical change, but are not capable of detonation. This includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures. This also includes materials that may react violently with water or that may form potentially explosive mixtures in water

1 Materials that are normally stable, but that may become unstable at elevated temperatures and pressures and materials that will react with water with some release of energy, but not violently

0 Materials that are normally stable, even under fire exposure conditions, and that do not react with water

OTHER (white)

₩ Materials which react so violently with water that a possible hazard results when they come in contact with water, as in a fire situation. Similar to Reactivity Classification 2. Oxy—Oxidizing material; any solid or liquid that readily yields oxygen or other oxidizing gas, or that readily reacts to oxidize combustible materials

It should be noted that OSHA and DOT have differing definitions for the term “flammable liquid” and “combustible liquid.” DOT defines a flammable liquid as one which, under specified procedures, has a flash point of 140°F/60°C or less. A combustible liquid is defined as “having a flash point above 140°F/60°C and below 200°F/93°C.” OSHA defines a combustible liquid as having a flash point above 100°F/37.7°C.

Detection: Only those materials having specific or specialized testing materials have this section. For example, the chemical Abrin or Ricin can be detected using BTA (BioThreat Alert) test strips.

History of the material: This section is reserved for those materials having a useful and interesting background. Some of these materials may be, for example, invasive botanicals that may be found in populated areas Dangerous to both people and pets, these invasive plants may have to be professionally removed to prevent both spreading and accidental poisonings.

Potential Exposure: A brief indication is given of the nature of exposure to each compound in the industrial environment. Where pertinent, some indications are given of background concentration and occurrence from other than industrial discharges such as water purification plants. Obviously in a work of this magnitude, this coverage must be very brief. It is of course recognized that nonoccupational exposures may be important as well.

Incompatibilities: Important, potentially hazardous incompatibilities of each substance are listed where available. Where a hazard with water exists, it is described. Reactivity with other materials are described including structural materials such as metal, wood, plastics, cement, and glass. The nature of the hazard, such as severe corrosion formation of a flammable gas, is described. This list is by no means complete or all inclusive. In some cases a very small quantity of material can act as a catalyst and produce violent reactions such as polymerization, disassociation and condensation. Some chemicals can undergo rapid polymerization to form sticky, resinous materials, with the liberation of much heat. The containers may explode. For these chemicals the conditions under which the reaction can occur are given.

Permissible Exposure Limits in Air: The permissible exposure limit (PEL), has been cited as the federal standard where one exists. Inasmuch as OSHA has made the decision to enforce only pre-1989 PELs, we decided to use these values rather than the transitional limits that were vacated by court order. Except where otherwise noted, the PELs are 8-hour work-shift time-weighted average (TWA) levels. Ceiling limits, Short-Term Exposure Limits (STEL), and TWAs that are averaged over other than full work-shifts are noted.

The Short-Term Exposure Limit (STEL) values are derived from NIOSH,[58] ACGIH,[1] and HSE[33] publications. This value is the maximal concentration to which workers can be exposed for a period up to 15 minutes continuously without suffering from: irritation; chronic or irreversible tissue change; or narcosis of sufficient degree to increase accident proneness, impair self-rescue, or materially reduce work efficiency, provided that no more than four excursions per day are permitted, with at least 60 minutes between exposure periods, and provided that the daily TWA also is not exceeded. The “Immediately Dangerous to Life or Health” (IDLH) concentration represents a maximum level from which one could escape within 30 minutes without any impairing symptoms or any irreversible health effects. However, the 30-minute period is meant to represent a MARGIN OF SAFETY and is NOT meant to imply that any person should stay in the work environments any longer than necessary. In fact, every effort should be made to exit immediately. The concentrations are reported in either parts per million (ppm) or milligrams per cubic meter (mg/m^3).

Most US specifications on permissible exposure limits in air have come from ACGIH[1] or NIOSH.[2] In the In

Germany the DFG has established Maximum Concentrations in the workplace.[3] This section also contains numerical values for allowable limits of various materials in ambient air[60] as assembled by the US EPA. Where available, this field contains legally enforceable airborne Permissible Exposure Limits (PELs) from OSHA. It also contains recommended airborne exposure limits from NIOSH, ACGIH, and international sources and special warnings when a chemical substance is a Special Health Hazard Substance. Each are described below. TLVs have not been developed as legal standards and the ACGIH does not advocate their use as such. The TLV is defined as the time-weighted average (TWA) concentration for a normal 8-hour work-day and a 40-hour work-week, to which nearly all workers may be repeatedly exposed, day after day, without adverse effects. A ceiling value (TLV-C) is the concentration that should not be exceeded during any part of the working exposure. If instantaneous monitoring is not feasible, then the TLV-C can be assessed by sampling over a 15-minute period except for those substances that may cause immediate irritation when exposures are short. As some people become ill after exposure to concentrations lower than the exposure limits, this value cannot be used to define exactly what is a "safe" or "dangerous" concentration. ACGIH threshold limit values (TLVs) are reprinted with permission of the American Conference of Governmental Industrial Hygienists, Inc., from the booklet entitled, *Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices*. This booklet is revised on an annual basis. No entry appears when the chemical is a mixture; it is possible to calculate the TLV for a mixture only when the TLV for each component of the mixture is known and the composition of the mixture by weight is also known. According to ACGIH, "Documentation of the Threshold Limit Values and Biological Exposure Indices, 7th Edition" is necessary to fully interpret and implement the TLVs.

OSHA Permissible Exposure Limits (PELs), are found in Tables Z-1, Z-2, and Z-3 of OSHA, "General Industry Air Contaminants Standard (29CFR1910.1000)" that were effective on July 1, 2001 and which are currently enforced by OSHA.

Unless otherwise noted, PELs are the Time-Weighted Average (TWA) concentrations that must not be exceeded during any 8-hour shift of a 40-hour work-week. An OSHA ceiling concentration must not be exceeded during any part of the work-day; if instantaneous monitoring is not feasible, the ceiling must be assessed as a 15-minute TWA exposure. In addition there are a number of substances from Table Z-2 that have PEL ceiling values that must not be exceeded except for a maximum peak over a specified period (e.g., a 5- minute maximum peak in any 2 hours).

NIOSH Recommended Exposure Limits (RELs) are Time-Weighted Average (TWA) concentrations for up to a 10-hour work day during a 40-hour work week. A ceiling REL should not be exceeded at any time. Exposure limits are usually expressed in units of parts per million (ppm), i.e., the parts of vapor (gas) per million parts of contaminated air by volume at 25°C/77°F and one atmosphere pressure. For a chemical that forms a fine mist or dust, the concentration is given in milligrams per cubic meter (mg/m^3).

Protective Action Criteria (PAC) is emergency exposure limits developed by the US Department of Energy (DOE) for more than 3400 chemicals in revision 29, published May 2016. These exposure limits can be used to estimate the consequences of the uncontrolled release of hazardous materials and to plan for emergency response. These PACs have been added to the 7th edition of Sittig because other well established exposure limits in air are available for an only a limited number of chemicals from other governmental and advisory sources. PAC values are given in parts per million (ppm) for volatile liquids and gases; in milligrams per cubic meter (mg/m^3) for solids, particulates, solids, and nonvolatile liquids. Chemicals for which Acute Emergency Guideline Levels (AEGLs) and Emergency Response Planning Guidelines (ERPGs) have their values displayed in *bolded* font.

PAC Definitions[SCAPA]:

There are subtle difference in the definitions of AEGLs, ERPGs, and TEELs and major differences in how they are developed and issued. Differences in their definitions include:

AEGLs pertain to the "general population, including susceptible individuals," but ERPGs and TEELs pertain to "nearly all individuals."

AEGLs are defined as the level "above which" certain health effects are expected, while ERPGs and TEELs are defined as the level "below which" certain health effects are *not* expected.

Acute Emergency Guideline Levels (AEGLs) are defined as follows:

- *AEGL-1*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience notable discomfort, irritation, or certain asymptomatic, nonsensory effects. However, these effects are not disabling and are transient and reversible upon cessation of exposure.
- *AEGL-2*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience irreversible or other serious, long-lasting, adverse health effects or an impaired ability to escape.
- *AEGL-3*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience life-threatening adverse health effects or death.

Emergency Response Planning Guidelines (ERPGs) are defined as follows:

- *ERPG-1*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to one hour without experiencing other than mild transient adverse health effects or perceiving a clearly defined objectionable odor.
- *ERPG-2*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms that could impair their abilities to take protective action.
- *ERPG-3*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing life-threatening health effects.

Additional information on PAC values and links to other sources of information can be found on the webpage for the *Subcommittee for Consequence Assessment and Protective Action (SCAPA)*: http://orise.orau.gov/emi/scapa/teels.htm

The German MAK (DFG MAK) values are conceived and applied as 8-hour time-weighted average (TWA) values.[3]

Short-Term Exposure Limits (15-minute TWA): This field contains Short-Term Exposure Limits (STELs) from ACGIH, NIOSH and OSHA. The parts of vapor (gas per million parts of contaminated air) by volume at 25°C/77°F and one atmosphere pressure is given. The limits are given in milligrams per cubic meter (mg/m^3) for chemicals that can form a fine mist or dust. Unless otherwise specified, the STEL is a 15-minute TWA exposure that should not be exceeded at any time during the work-day.

Determination in Air: The citations to analytical methods are drawn from various sources, such as the *NIOSH Manual of Analytical Methods*.[18] In addition, methods have been cited in the latest US Department of Health and Human Services publications including the *"NIOSH Pocket Guide to Chemical Hazards"* August, 2006.

Permissible Concentrations in Water: The permissible concentrations in water are drawn from various sources also, including: The National Academy of Sciences/National Research Council, Safe Drinking Water Committee Board on Toxicology and Environmental Health Hazards, *Drinking Water and Health*, 1980.[16]

The priority toxic pollutant criteria published by US EPA 1980.[6]

The multimedia environmental goals for environmental assessment study conducted by EPA.[32] Values are cited from this source when not available from other sources.

The US EPA has come forth with a variety of allowable concentration levels:

For allowable concentrations in "California List" wastes.[38] The California List consists of liquid hazardous wastes containing certain metals, free cyanides, polychlorinated biphenyls (PCBs), corrosives with a pH of less than or equal to 2.0, and liquid and nonliquid hazardous wastes containing halogenated organic compounds (HOCs).

For regulatory levels in leachates from landfills.[37]

For concentrations of various materials in effluents from the organic chemicals and plastics and synthetic fiber industries.[51]

For contaminants in drinking water.[36]

For National Primary and Secondary Drinking Water Regulations.[62]

In the form of health advisories for 16 pesticides,[47] 25 organics,[48] and 7 inorganics.[49]

For primary drinking water standards starting with a priority list of 8 Volatile Organic Chemicals.[40]

State drinking water standards and guidelines [61] as assembled by the US EPA.

Determination in Water: The sources of information in this field have been primarily US EPA publications including the test procedures for priority pollutant analysis[25] and later modifications.[42]

Routes of Entry: The toxicologically important routes of entry of each substance are listed. In other words, the way in which the people or experimental animals were exposed to the chemical is listed, e.g. eye contact, skin contact, inhalation, intraperitoneal, intravenous. Many of these are taken from the *NIOSH Pocket Guide*,[2] but are drawn from other sources as well.

Harmful Effects and Symptoms: These are primarily drawn from NIOSH, EPA publications, and New Jersey and New York State fact sheets on individual chemicals, and are supplemented from information from the draft criteria documents for priority toxic pollutants[26] and from other sources. The other sources include the following:

EPA Chemical Hazard Information Profiles (CHIPS) cited under individual entries.

NIOSH Information Profiles cited under individual entries.

EPA Health and Environmental Effect Profiles cited under individual entries.

Particular attention has been paid to cancer as a "harmful effect" and special effort has been expended to include the latest data on carcinogenicity. See also "Regulatory Authority and Advisory Bodies" section.

Short-Term Exposure: These are brief descriptions of the effects observed in humans when the vapor (gas) is inhaled, when the liquid or solid is ingested (swallowed), and when the liquid or solid comes in contact with the eyes or skin. The term LD50 signifies that about 50% of the animals given the specified dose by mouth will die. Thus, for a Grade 4 chemical (below 50 mg/kg) the toxic dose for 50% of animals weighing 70 kg (150 lb) is $70 \times 50 = 3500$ mg = 3.5 g, or less than 1 teaspoonful; it might be as little as a few drops. For a Grade 1 chemical (5−15 g/kg), the LD50 would be between a pint and a quart for a 150-lb man. All LD50 values have been obtained using small laboratory animals such as rodents,

cats, and dogs. The substantial risks taken in using these values for estimating human toxicity are the same as those taken when new drugs are administered to humans for the first time.

Long-Term Exposure: Where there is evidence that the chemical can cause cancer, mutagenic effects, teratogenic effects, or a delayed injury to vital organs such as the liver or kidney, a description of the effect is given.

Points of Attack: This category is based, in part, on the "Target Organs" in the *NIOSH Pocket Guide*[2] but the title has been changed as many of the points of attack are not organs (blood, for example). This is human data unless otherwise noted.

Medical Surveillance: For each chemical, this information is drawn from many and various government publications and sources including, for example, CDC, NIOSH publications,[27] *New Jersey* or *New york State Fact Sheets*,[70] HSDB/Toxnet, etc. In many cases, statements may refer to known and suspected carcinogen, known or suspected mutagens, reproductive affecters, skin and/or respiratory sensitizers, etc.

First Aid: Guides and guidance to first aid found in this work should not be construed as authorization to emergency personnel to perform the procedures or activities indicated or implied. Care of persons exposed to toxic chemicals must be directed by a physician or other recognized professional or authority. Simple first aid procedures are listed for response to eye contact, skin contact, inhalation, and ingestion of the toxic substance as drawn to a large extent from the *NIOSH Pocket Guide*[2] but supplemented by information from recent commercially available volumes in the United States,[29] in the United Kingdom, and in Japan[24] as well as from state fact sheets. They deal with exposure to the vapor (gas), liquid, or solid and include inhalation, ingestion (swallowing) and contact with eyes or skin. The instruction "Do NOT induce vomiting" is given if an unusual hazard is associated with the chemical being sucked into the lungs (aspiration) while the patient is vomiting. "*Seek medical attention*" or "*Call a doctor*" is recommended in those cases where only competent medical personnel can treat the injury properly. In all cases of human exposure, seek medical assistance as soon as possible. In many cases, medical advice has been included for guidance only. Dosage information has been avoided because dosage recommendations constantly change. Emergency personnel are urged to check all manufacturers' information particularly before administering any drug with which they are not familiar or have not used for some period of time. Also, medications suggested to be administered by qualified medical personnel presume no immediate prior administration of the same, similar or complicating medications.

Personal Protective Methods: This information is drawn heavily from NIOSH publications[2][77] and supplemented by information from the United States,[29] the United Kingdom, and Japan.[24] There are indeed other "personal protective methods" which space limitations prohibit describing here in full. One of these involves limiting the quantities of carcinogens to which a worker is exposed in the laboratory. The items listed are those recommended by (1) NIOSH and/or OSHA, (2) manufacturers, either in technical bulletins or in material safety data sheets (MSDS), (3) the Chemical Manufacturers Association (CMA), or (4) the National Safety Council (NSC), for use by personnel while responding to fire or accidental discharge of the chemical. They are intended to protect the lungs, eyes, and skin.

Respirator Selection: The 7th edition, like its predecessors, presents respirator selection with a full text description. For each line a maximum use concentration (in ppm, mg/m^3, μg/m^3, fibers/m^3, or mppcf) condition (e.g., escape) followed by the NIOSH code and full text related to respirator recommendations. All recommended respirators of a given class, can be utilized at any concentration equal to or less than the class's listed maximum use concentration. Respirator selection should follow recommendations that provide the greatest degree of protection. Respirator codes found in the *NIOSH Pocket Guide* have been included to ease updating.

All respirators selected must be approved by NIOSH under the provisions of 42CFR84. The current listing of NIOSH/MSHA certified respirators can be found in the *NIOSH Certified Equipment List*, which is available on www.cdc.gov/niosh/npptl/topics/respirators/cel. This is the NIOSH Web site.

For firefighting, only self-contained breathing apparatuses with full facepieces operated in pressure-demand or other positive pressure modes are recommended for all chemicals in the *NIOSH Pocket Guide*. In the case of chemical warfare agents, use only SCBA Respirator certified by NIOSH For CBRN environments. CBRN stands for "Chemical, Biological, Radiological, and Nuclear."

Pesticides are not identified as such in the respirator selection tables. For those substances that are pesticides, the recommended air-purifying respirator must be specifically approved by NIOSH/MSHA. Specific information on choosing the appropriate respirator will be provided on pesticide labels. Approved respirators will carry a "TC" number prefix, which signifies they have been tested and certified for a specific level of protection. New respirators may carry a "TC-84A" prefix in compliance with 42 CFR 84 for testing and certifying nonpowered, air-purifying, particulate-filter respirators. The new Part 84 respirators have passed a more demanding certification test than the old respirators (e.g., dust and mist [DM], dust, fume and mist [DFM], spray paint, pesticide, etc.) certified under 30 CFR 11.

Additionally, a complete respirator protection program should be implemented including all requirements in 29CFR1910.134 and 42CFR84. At a minimum, a respirator protection program should include regular training, fit-testing, periodic environmental monitoring, maintenance inspection, and cleaning. The selection of the actual respirator to be used within the classes

of recommended respirators depends on the particular use situation, and should only be made by a knowledgeable person. Remember, air-purifying respirators will not protect from oxygen-deficient atmospheres. For firefighting, only self-contained breathing apparatuses with full facepieces operated in pressure-demand or other positive pressure modes are recommended for all chemicals in the *NIOSH Pocket Guide*.

Storage: The 7th edition now provides, as general guidance, a color-coded classification system similar to those often found in commerce and laboratories. It is the objective of any chemical storage classification system to prevent accidental combination of two or more incompatible materials that might be stored in the same space. To prevent an unwanted and possibly dangerous reaction, chemicals must be separated by space and/or physical barriers. Chemical storage areas should be appropriately labeled. Users must be careful to check the MSDS for both additional and specific information. Some chemical entries contain multiple storage codes because the chemical profile fits more than a single category.

Code	***Hazard***
Red	Flammables (Flash point <100°F)
Blue	Health hazards/toxics/poisons
Yellow	Reactives/oxidizers
White	Contact hazards
Green[a]	General storage

[a] For general storage, the colors gray and orange may also be used by some companies.

- Chemical containers that are not color coded should contain hazard information on the label.
- Check the MSDS to learn what personal protective equipment is required when using the substance
- *Red*: Flammability hazard: Store in a flammable (liquid or materials) storage area or approved cabinet away from ignition sources and corrosive and reactive materials.
- *Blue*: Health hazard/toxics/poisons: Store in a secure poison location.
- *Yellow*: Reactive hazard; store in a location separate from other materials, especially flammables and combustibles.
- *White*: Corrosive or contact hazard; store separately in a corrosion-resistant location.
- *Green (or gray or orange)*: General storage may be used. Generally, for flammability, health, and corrosivity with an NFPA rating of no higher than "2."
- Chemicals with labels that are colored and diagonally striped may react with other chemicals in the same hazard class. See MSDS for more information.
- *Red Stripe*: Flammability hazard: store separately from all other flammable materials. Example: sodium metal.
- *Yellow Stripe*: Reactivity hazard; store separately in an area isolated from flammables, combustibles, or other yellow coded materials. *Example*: reducing agents.
- *White stripe*: Contact hazard; not compatible with materials in solid white category. Store separately. *Example*: Bases.

Other data in this field is drawn from, or based on, various resources, including the NFPA,[17] from Japanese sources[24] and from publications such as the *Hazardous Substance Fact Sheets* published by the New Jersey Department of Health and Senior Services.[70]

Shipping: The shipping guidance offered herein does not replace the training requirements of the DOT and in no way guarantees that you will be in full compliance with the DOT Regulations. *Labeling*: This section refers to the type label or placard required by regulation on any container or packaging of the subject compound being shipped. In some cases a material may require more than one hazardous materials label. *Quantity limitation*: This section lists quantities of material that may be shipped on passenger aircraft, rail, and cargo aircraft. Materials in certain hazard classes may be shipped under the small quantities exception (see 49 CFR 173.4) with specific approval from the Associate Administrator for Hazardous Materials Safety, DOT. *Hazard class or division*: This number refers to the division number or hazard class that must appear on shipping papers. This information is drawn from DOT publications[19] as well as UN publications[20] and also NFPA publications.[17] The US DOT[19] has published listings of chemical substances which give a hazard classification and required labels. The US DOT listing now corresponds with the UN listing[20] and specifies first a hazard class of chemicals as defined in the following table, and then a packing group (I, II, or III) within each of the classes. These groups are variously defined depending on the hazard class but in general define materials presenting: I—a very severe risk (great danger); II—a serious risk (medium danger); and III—a relatively low risk (minor danger).

Hazard Classification System

The hazard class of dangerous goods is indicated either by its class (or division) number or name. For a placard corresponding to the primary hazard class of a material, the hazard class or division number must be displayed in the lower corner of the placard. However, no hazard class or division number may be displayed on a placard representing the subsidiary hazard of a material. For other than Class 7 or the OXYGEN placard, text indicating a hazard (for example, "CORROSIVE") is not required. Text is shown only in the United States. The hazard class or division number must appear on the shipping document after each shipping name.

Class 1—Explosives
Division 1.1: Explosives with a mass explosion hazard
Division 1.2: Explosives with a projection hazard
Division 1.3: Explosives with predominantly a fire hazard
Division 1.4: Explosives with no significant blast hazard
Division 1.5: Very insensitive explosives with a mass explosion hazard
Division 1.6: Extremely insensitive articles
Class 2—Gases
Division 2.1: Flammable gases
Division 2.2: Nonflammable, nontoxic* gases
Division 2.3: Toxic* gases
Class 3—Flammable liquids [and combustible liquids (United States)]
Class 4—Flammable solids; spontaneously combustible materials; and dangerous when wet materials/Water-reactive substances
Division 4.1: Flammable solids
Division 4.2: Spontaneously combustible materials
Division 4.3: Water-reactive substances/dangerous when wet materials
Class 5—Oxidizing substances and organic peroxides
Division 5.1: Oxidizing substances
Division 5.2: Organic peroxides
Class 6—Toxic* substances and infectious substances
Division 6.1: Toxic* substances
Division 6.2: Infectious substances
Class 7—Radioactive materials
Class 8—Corrosive substances
Class 9—Miscellaneous hazardous materials/Products, Substances or Organisms

**Note*: The words "poison" or "poisonous" are synonymous with the word "toxic."

Spill Handling: Spill or leak information provided is intended to be used only as a guide. The term *Issue warning* is used when the chemical is a poison, has a high flammability, is a water contaminant, is an air contaminant (so as to be hazardous to life), is an oxidizing material, or is corrosive. *Restrict access* is used for those chemicals that are unusually and immediately hazardous to personnel unless they are protected properly by appropriate protective clothing, eye protection, and respiratory protection equipment, etc. *Evacuate area* is used primarily for unusually poisonous chemicals or these that ignite easily. *Mechanical containment* is used for water-insoluble chemicals that float and do not evaporate readily. *Should be removed* is used for chemicals that cannot be allowed to disperse because of potentially harmful effects on humans or on the ecological system in general. The term is not used unless there is a reasonable chance of preventing dispersal, after a discharge or leak, by chemical and physical treatment. *Chemical and physical treatment* is recommended for chemicals that can be removed by skimming, pumping, dredging, burning, neutralization, absorption, coagulation, or precipitation. The corrective response may also include the use of dispersing agents, sinking agents, and biological treatment. *Disperse and flush* is used for chemicals that can be made nonhazardous to humans by simple dilution with water. In a few cases the response is indicated even when the compound reacts with water because, when proper care is taken, dilution is still the most effective way of removing the primary hazard. This material safety data sheet information is drawn from a variety of sources including New Jersey Department of Health and Senior Services *Hazardous Substance Fact Sheets*[70] and EPA *Profiles on Extremely Hazardous Substances.*[82]

Fire Extinguishing: Fire information provided is intended to be used only as a guide. Certain extinguishing agents should not to be used because the listed agents react with the chemical and have the potential to create an additional hazard. In some cases they are listed because they are ineffective in putting out the fire. Many chemicals decompose or burn to give off toxic and irritating gases. Such gases may also be given off by chemicals that vaporize in the heat of a fire without either decomposing or burning. If no entry appears, the combustion products are thought to be similar to those formed by the burning of oil, gasoline, or alcohol; they include carbon monoxide (poisonous), carbon dioxide, and water vapor. The specific combustion products are usually not well known over the wide variety of conditions existing in fires; some may be hazardous. This information is drawn from NFPA publications,[17] FEMA,[78] and other sources. Any characteristic behavior that might increase significantly the hazard involved in a fire is described. The formation of flammable vapor clouds or dense smoke, the possibility of polymerization, and explosions is stated in this section and/or the incompatibility section. Unusual difficulty in extinguishing the fire is noted.

Disposal Method Suggested: The disposal methods for various chemical substances have been drawn from various sources, including government documents and a UN publication.[22,79]

References: The general bibliography for this volume follows immediately. It includes both general reference sources and references dealing with analytical methods. The references at the end of individual chemical records are generally restricted to: references dealing only with that particular compound; and references which, in turn, contain bibliographies giving references to the original literature on toxicological and other behavior of the substance in question.

Key to Abbreviations and Acronyms

α	the Greek letter *alpha*; used as a prefix to denote the carbon atom in a straight chain compound to which the principal group is attached.
as-	prefix for asymmetric
ACGIH	American Conference of Governmental Industrial Hygienists
AEGL	Acute Emergency Guideline Level, developed by the EPA
AIHA	American Industrial Hygeine Association
approx	approximately
asym-	prefix for asymmetric
@	at
atm.	atmosphere
ATSDR	Agency for Toxic Substances and Disease Registry
β	the Greek letter *beta*
BEI	Biological Exposure Indices (ACGIH in the USA; South Africa; New Zealand)
BLV	Biological Limit Values
BP	boiling point.
°C	degrees Centigrade
CAA	Clean Air Act
CAAA	Clean Air Act Amendments of 1990
CAMEO	Computer-Aided Management of Emergency Operations (NOAA)
carc.	carcinogen
CAS	Chemical Abstract Service
cc	cubic centimeter
cc	closed cup (Flash point)
CDC	U.S. Center for Disease Control
CEPA	Canadian Environmental Protection Act
CERCLA	Comprehensive Environmental Response, Compensation, And Liability Act
CFCs	chlorofluorocarbons
CFR	*Code of Federal Regulations*
cis-	(Latin: on this side). Indicating one of two geometrical isomers in which certain atoms or groups are on the same side of a plane
CMA	Chemical Manufacturers Association
CPR	Cardiopulmonary Resuscitation
CWA	Clean Water Act
cyclo-	(Greek, circle). Cyclic, ring structure; as cyclohexane
Δ or δ	Greek letter *delta*
DFG	Deutsche Forschungs-gemeinschaft
DOE	U.S. Department of Energy
DOT	U.S. Department of Transportation
DOT ID	Department of Transportation Identification Numbers
EEC or EC	European Economic Community
EEGL	Emergency Exposure Guidance Level
EHS	Extremely Hazardous Substances
EINECS	European Inventory of Existing Commercial Chemical Substances
ε	Greek letter epsilon
EPA (US)	Environmental Protection Agency
EPCRA	Emergency Planning and Community Right-to-Know Act
ESLI	End of Service Life Indicator
est.	estimate
EU	European Union
°F	degrees Fahrenheit
FDA	Food and Drug Administration
FEMA	Federal Emergency Management Agency
FR	*Federal Register* (United States)
γ	Greek letter *gamma*
GHS	Globally Harmonized System of Classification and Labeling of Chemicals
h	hour(s)
HCFC	hydrochlorofluorocarbons
HCS	Hazard Communication Standard
HSDB	Hazardous Substances Data Bank
IARC	International Agency for Research on Cancer
IATA	International Air Transport Association
IDLH	Immediately Dangerous to Life or Health
ILO	International Labor Office
IRIS	Integrated Risk Information System (EPA)
iso-	(Greek, equal, alike). Usually denoting an isomer of a compound.
kg	kilogram(s)
l	liter(s)
lb	pound(s)
$\mathbf{LC_{50}}$	The concentration of a substance in air that kills 50% of the test population.
$\mathbf{LC_{Lo}}$	The lowest concentration of a substance in air that has been shown to cause death in a test population.
$\mathbf{LD_{50}}$	The dose of a substance administered by any route (other than inhalation) that causes death to 50% of the test population.
$\mathbf{LD_{LO}}$	The lowest dose of a substance administered by any route (other than inhalation)that has been shown to cause death in a test population.

LEL	Lower explosive (flammable) limit in air, % by volume at room temperature or other temperature as noted
LEPC	Local Emergency Planning Committees
LTEL	Long Term Exposure Limit (UK)
m-	an abbreviation for “*meta-*,” a prefix used to distinguish between isomers or nearly related compounds
m^3	cubic meter
MACT	Maximum Achievable Control Technology (CAA)
MAK	airborne exposure limit “Maximale Arbeitsplatz-Konzentration” (maximum workplace concentration) from the Deutsche Forschungsgemeinschaft (DFG), German Research Foundation.
MCL	Maximum Contaminant Level (SDWA)
MCLG	Maximum Contaminant Level Goal (SDWA)
mg	milligram(s)
μ	micro
μg	microgram(s)
min	minute(s)
mmHg	millimeters of mercury (non-SI symbol for pressure) Also known as “torr.”
mppcf	million particles per cubic foot
MSDS	Material Safety Data Sheets
n-	abbreviation for “normal,” referring to the arrangement of carbon atoms in a chemical molecule prefix for normal
N-	Symbol used in some chemical names, indicating that the next section of the name refers to a chemical group attached to a nitrogen atom. The bond to the nitrogen atom
NCI	National Cancer Institute (USA)
NFPA	National Fire Protection Association (USA)
NIOSH	National Institute for Occupational Safety and Health (USA)
NLM	National Library of Medicine (USA)
NOAA	National Oceanic and Atmospheric Administration (USA)
NOAEL	No Observed Adverse Effect Level
NOS	not otherwise specified
NPRI	National Pollutant Release Inventory (Canada)
NTIS	National Technical Information Service (USA)
NTP	National Toxicology Program (USA)
o-	*ortho-*, a prefix used to distinguish between isomers or nearly related compounds.
OEL	Occupational Exposure Limit
ω	Greek letter *omega*
oc	open cup
OSHA	Occupational Safety and Health Administration (USA)
Oxy	Oxidizer or oxidizing agent
p-	an abbreviation for “*para-*,” a prefix used to distinguish between isomers or nearly related compounds
PAC	Protective Action Criterion (U.S. DOE)
PBB	polybrominated biphenyl
PCB	polychlorinated biphenyl
PE	polyethylene
PEL	Permissible Exposure Limit (USA, Japan, Mexico)
PNOS	Particulates Not Otherwise Specified
POTW	Publicly Owned Treatments Works
PP	polypropylene
ppb	parts per billion
PPE	Personal Protective Equipment
ppm	parts per million
PQL	Practical Quantitation Limit (RCRA)
prim-	prefix for primary
REL	Recommended Exposure Limits (NIOSH)
RQ	Reportable Quantity
RTECS	Registry of Toxic Effects of Chemical Substances
RTK	Right-to-Know
SARA	Superfund Amendments and Reauthorization Act
s. carc	Suspected Carcinogen
SCAPA	Subcommittee on Consequence Assessment and Protective Actions (DOE)
SCBA	Self-Contained Breathing Apparatus
SDWA	Safe Drinking Water Act
sec-	prefix for secondary
SERC	State emergency response commissions
SMCL	Secondary Maximum Contaminant Levels (SDWA)
STEL	Short-Term Exposure Limit
sym-	abbreviation for “symmetrical,” referring to a particular arrangement of elements within a chemical molecule
t-	prefix for tertiary
TC_{Lo}	The lowest concentration of a substance in air that has been shown to produce toxic effects in a test population.
TD_{Lo}	The lowest dose of a substance that has been shown to produce toxic effects in a test population
TEEL	Temporary Emergency Exposure Limit
TRK	Technical Guiding Concentrations (DFG) for workplace control of carcinogens

***tert*-**	abbreviation for "tertiary," referring to a particular arrangement of elements within a chemical molecule
TLV	Threshold Limit Value (ACGIH)
TQ	Threshold Quantity
***trans*-**	(Latin: across). Indicating that one of two geometrical isomers in which certain atoms or groups are on opposite sides of a plane
TRI	Toxic Release Inventory
TSCA	Toxic Substances Control Act
TWA	Time-Weighted Average. Often shown as TWA - 8h (8 hours)
UEL	Upper Explosive (flammable) Limit in air, % by volume at room temperature or other temperature as noted
UN	United Nations
***unsym*-**	prefix for asymmetric
USDA	United States Department of Agriculture
USCG	United States Coast Guard
VOCs	Volatile Organic Compounds
WEEL	Workplace Environmental Exposure Level (AIHA)
WHMIS	Workplace Hazardous Materials Information System (Canada)
>	symbol for "greater than"
<	symbol for "less than"
≤	symbol for "less than or equal to"
≥	symbol for "greater than or equal to"
°	degrees of temperature
%	percent

A

Abrin A:0025

Formula: None found. *Note*: *Do not confuse with the alkaloid* "L-Abrine, aka Abrine" CAS:526-31-8.

Synonyms: Abrins; *Abrus precatorius* seed; Agglutinin; Aivoeiro; Arraccu-mitim; Buddhist rosary bead; Carolina muida; Crab's eyes; Deadly crab's eye; Indian bead; Indian licorice seed; Jequirite; Jequirity bean; John Crow bead Jumble bead; Juquiriti; Lectin protein; Love bean; Lucky bean; Mienie-Mienie; Phytotoxin (*abrus precatorius* seed); Prayer bead; Precatory bean; Rosary beads; Rosary Pea; Ruti; Seminole bead; Tentos da America (Spanish); Tentos dos mundos (Spanish); Toxalbumin; Vegetable Toxalbumin; Weather plant; Wild licorice

CAS Registry Number: 1393-62-0; 53597-23-2 (A-toxin); 53597-24-3 (C-toxin)

RTECS Number: AA5250000; AA5250100 (A-toxin); AA5250300 (C-toxin)

UN/NA & ERG Number: UN3462 (Toxin, extracted from living sources, solid)/153; UN3172 (Toxins, extracted from living sources, n.o.s.)/153

EC Number: Not assigned

Regulatory Authority and Advisory Bodies

Hazard Alert: Exposure can be lethal, Biotoxin, Suspected of causing genetic defects, Sensitization Hazard, Suspected reprotoxic hazard, Drug

Report any release of WMD to National Response Center 1-800-424-8802

Hazard symbols, risk, & safety statements: Hazard symbol: T + , Xi; risk phrases: R26/27/28; R42/43; R62; R63; safety phrases: S23; S28; S36/37; S41; S45 (see Appendix 4).

Description: Abrin is a lethal, delayed-action cytotoxin/biotoxin. It is stable under ambient conditions and can persist in the environment for a long time despite extreme conditions and temperatures. Abrin is a yellowish-white powder. Molecular weight = (approx.) 63,000–67,000 Da; boiling point = decomposes @ 80°C (most of the toxicity is lost in 30 minutes); volatility = negligible; vapor pressure = negligible @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability—unknown; reactivity 0. Sparingly soluble in water; solubility = 160 mg/L.

Detection: The BTA (BioThreat Alert) test strips (Tetracore Inc., 9901 Belward Campus Drive, Rockville, MD; phone: 240/268-5400) allows for screening of Abrin. Abrin is detectable in urine, plasma, and environmental samples. Instant Chek Abrin/Ricin Detection Kit, Catalog Number: IC-RA-003-10 Kit Contents: 10 test units each test contains 2 tests (1 Abrin and 1 Ricin) per unit, lyophilized reagent, reconstitution buffer, wash buffer, transfer pipettes, instruction booklet. Ey Laboratories, Inc, 107 N. Amphlett Blvd, San Mateo, CA. 94401 USA, Toll Free (North America)1-800-821-0044; Telephone: 1-650-342-3296, Option 2 or 3 Fax. +1 (650) 342 2648.

History of the material: Abrin has not been known to have been used as a biological weapon in any wars or terrorist attacks. Rosary pea vines, or abrus precatorius, are perennial plants that are native to India and other tropical areas throughout the world. The vines can grow to 10 to 20 ft, producing smallish colored flowers ranging in color from pink to red and purple bean-bearing legume pods that are 1 to 1.5 in. in length. Rosary peas or jequirity beans are uniform in size and weight and are an attractive bright red color with black spots on one end. Rosary pea vines are capable of growing in warm climates around the world, including the United States, where they are established in Florida. The beans, in Florida, are called "Seminole beads." Dangerous to both people and pets, these invasive plants should be professionally removed to prevent both spreading and accidental poisonings.

Potential Exposure: Abrin is a lectin, plant glycoprotein, and cytotoxin that is present in the rosary pea (*abrus precatorius*). The poison in Abrin binds and agglutinates animal cells. Abrin is among the most potent and lethal substances known to humankind. A single seed can be fatal; a single milligram is capable of killing an adult within a few days. When the seeds of the rosary pea are damaged, these drilled beads (drilled with holes for making beaded jewelry or rosaries/prayer beads) can be fatally dangerous if swallowed. The dust inside the beads remains stable, and years following collection some people can be poisoned if the beads are broken, and the dust is inhaled, ingested, gets in the eyes, or comes in contact with broken skin. Many, perhaps most, cases of *abrus* seed poisonings are unintentional and in children who are attracted to the colorful looking beans. The severity of an exposure is often dependent on how much Abrin is released when the seeds are chewed or masticated, releasing poisonous vegetable *toxalbumins*. Some cases of *abrus* exposure, even after ingestion of large amounts of plant material, may result in little or no clinical effects. This situation may reflect variations in toxicity and/or poor GI absorption. If the seeds of these plants are *not chewed and swallowed whole*, symptoms are much less likely to occur. Due to the hard shell, it is possible for the seeds to pass through the gastrointestinal (GI) tract without incident.

This relatively inexpensive, accessible, natural source may allow for easy preparation of large and dangerous quantities of Abrin. It can be made in various forms: as a powder or mist that can be inhaled; in the form of a pellet for injection in the skin; or, a powder that can be dissolved in water and ingested. One can also be exposed by touching surfaces on which Abrin particles or droplets of Abrin have landed; or, if particles or droplets of Abrin land on injured or broken skin, or in the eyes. Abrin can contaminate water and food, and it can be released into outdoor air as an aerosol which has the potential to contaminate agricultural products.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00001-6

Abrin is much more poisonous than a related cytotoxin, Ricin [LD_{50} = (Ricin) 3 μg/kg; (Abrin) 0.04 μg/kg in laboratory mice]. Abrin poisoning is not contagious and does not spread from person to person. Because Abrin isn't a living thing but rather a chemical made by living things, it probably would NOT make as effective a military weapon such as viruses or bacteria (i.e., ebola virus or anthrax). Nevertheless, it would make an effective terrorist weapon because it's both easy to make and use. With no known antidote, vaccine, or other effective therapy available for Abrin poisoning, the threat of this agent being released into the environment as an aerosol, or added to the food or water supply, could be catastrophic. Leaves and roots have of the rosary pea vine have been used as a herbal remedy in traditional or folk medicine. It should be noted that although Abrin has the potential to be used as a terrorist weapon, it also has some potential medical uses. In modern medicine, Abrin may be used in medical research and to kill malignant cells in cancer treatment. Ricin is extremely hazardous when freeze-dried, forming a light, easily dispersed powder. For this reason, researchers are directed to avoid freeze−drying Ricin. Abrin potentially has similar properties and dangers.

Incompatibilities: Toxic proteins of Abrin are resistant to digestive enzymes but are destroyed in cooking. The toxic portion of Abrin is heat stable at ambient temperatures and begins to decompose at 60°C/140°F. At 80°C/176°F, most of the toxicity is lost in about 30 minutes. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

ChemWatch: 0.00006 milligram per cubic meter, ceiling limit (sensitizer)[92]

Determination in Air: No NIOSH or OSHA methods available.

Routes of Entry: Abrin can be absorbed by all routes of exposure but normally enters the body by ingestion. Aerosolized Abrin can enter the body by inhalation. The toxin attaches to cell surfaces of various tissues, particularly the stomach lining if ingested; or, in the moist, upper respiratory tissues if inhaled.

Harmful Effects and Symptoms

Abrin inhibits protein synthesis by penetrating the body's cells and blocks the body's ability to regenerate essential proteins in vital organs of the body such as the liver, central nervous system (CNS), kidneys, and adrenal glands. The toxin A-chain is an *N-glycosidase* protein that removes an adenine residue from 28S RNA, which disrupts protein synthesis throughout the body. Once this cellular protein synthesis mechanism is disrupted, within hours the body's systems begins to shut down and die due to multisystem organ failure. EXTREMELY TOXIC-estimated human fatal dose after oral consumption by humans is approximately 0.005−0.007 mg/kg[77]. LD_{50} = (oral-mice) about 3 g/kg by injection or aerosol; LD_{50} = (oral-mice) 0.04 μg/kg.

The major symptoms of Abrin poisoning are dependent on the purity, route, and level (dose) of exposure (inhalation, ingestion, or injection), though multiple organs may be affected in severe cases. Initial symptoms of Abrin poisoning by inhalation may occur within 8 hours of exposure. The American Medical Association's *Quick Reference Guide to Biological Weapons* estimates "8−24 hours (acute symptoms may appear as early as 4−8 hours following exposure)." Following ingestion of Abrin, initial symptoms may occur in less than 6 hours but are often delayed for 1 to 3 days. Intravenous or intramuscular injection (parenteral administration) of Abrin is of greatest concern because a high fatality rate is normally expected. Although symptoms may be delayed for several days, patients frequently develop the GI effects in under 6 hours[88]. It is possible for death from Abrin poisoning to take place within 36 to 72 hours of exposure. Within several days, the person's liver, spleen, and kidneys might stop working, and the person will die. If death has not occurred after 5 days following symptoms of exposure, without complications, it is possible that the victim may not die and recovery is possible.

When directly exposed, toxalbumins (poisonous vegetable matter) in Abrin can cause severe GI lesions with irritation of the area of the throat, at the back of the mouth (oropharynx), esophagus, or stomach. Although clinically similar to alkaline caustic burns, they are usually delayed two or more hours following exposure. This exposure can be severe and life threatening, particularly in those locales not having advanced healthcare systems. There are a few reported cases of Abrin causing an acute and diffuse inflammation of the brain and spinal cord usually caused by a hypersensitivity response to tissue surrounding a blood vessel.

Short-Term Exposure: The following lists do not convey prioritization or indicate specificity. ***Ingestion:*** Generally within a few hours symptoms will appear, including nausea, profuse vomiting, abdominal pain and cramping, watery diarrhea (possibly bloody), later vomiting of blood (hematemesis) and stools or vomit stained black by blood pigment or dark blood products melena (melena), hemagglutination (the agglutination of red blood cells caused by an antibody either for red blood cell antigens or for antigens that coat red blood cells or by the presence of viruses or other microbes); lowered blood pressure, hallucinations, seizures, tetany, GI bleeding, pancreatitis, tachycardia, low or no urinary output, dilation of the pupils, hallucinations, drowsiness, fever, thirst, sore throat, headache, dilated pupils, vascular collapse, and shock. *Note*: abnormal liver function tests (elevated liver enzymes); multiple ulcerations, and hemorrhages of gastric and small-intestinal mucosa on endoscopy. Severe vomiting and diarrhea may result from severe dehydration (hypovolaemic-shock), followed by low blood pressure, and multisystem organ failure. Within 36 to 72 hours following exposure, organs (liver, spleen, and kidneys) might stop working, and the victim may die. *Inhalation*: Within a few hours of inhaling significant amounts of Abrin, the likely symptoms would be respiratory distress, difficult or labored breathing; shortness of breath; chest tightness, hypoxemia, fever, cough, nausea, sweating, aching muscles. Heavy sweating may follow as noncardiogenic pulmonary edema develops.* This would make breathing even more difficult, and the skin might turn blue. Excess fluid in the lungs would be diagnosed by X-ray or by listening to the chest with a stethoscope. Finally, low blood pressure, Blue skin, multisystem organ failure, respiratory failure may occur, and possible death. *Skin*: It is generally believed that the risk of Abrin toxicity is low from contact with unbroken skin; however, it may be absorbed through irritated, damaged, abraded, wounded, or injured skin; or, through normal skin when Abrin is dissolved in solvents, such as hydrocarbons or petroleum products. If enough Abrin gets through the skin, the symptoms will be similar to those described for ingestion. If Abrin is injected, the muscles and lymph nodes near the injection site would die. This could lead to possible seizures, liver and kidney failure, cardio-collapse, and death. *Eyes*: Abrin in the powder or mist form can cause redness and pain of the skin and the eyes. Tearing, swelling of the eye-lids, pain, redness, corneal injury, fever, fatigue, weakness, muscle pain, dehydration, possible seizures, cardio-collapse, and death. Like Ricin, urinary excretion of Abrin is probably slow and limited, with the estimated half-life being about 8 days. *Late phase complications*: based on Ricin, it is expected that complications are related to Abrin's cell killing (cytotoxic) effects on the liver, central nervous, kidneys, and adrenal glands, typically 2 to 5 days after exposure. The patient may be asymptomatic (showing no symptoms of exposure) during the preceding 1 to 5 days[92]. *Note:* Based on Ricin, Abrin-induced pulmonary edema would be expected to occur much later (1−3 days postexposure) compared to that induced by other agents such as phosgene (about 6 hours postexposure).

Long-Term Exposure: Based on its similarity to Ricin, repeated exposure to Abrin may cause allergic/asthma-like symptoms with congestion of nose and throat; itchy, watery eyes; hives; tightness of the chest; and in acute cases, wheezing. May affect kidneys, liver, pancreas. Based on exposure of Ricin to animals, Abrin may be capable of causing severe lung damage in humans. Information about carcinogenicity, developmental toxicity, or reproductive toxicity from chronic or repeated exposure to Abrin is unknown at this time.

Points of Attack: Lungs, eyes, skin (primarily through cuts and bruises). The risk of toxicity from unbroken skin exposure to Abrin is low, but there may still be a danger of allergic skin reactions.

Medical Surveillance: On the contrary, Abrin symptoms resemble those that are similar to other diseases, especially the common flu. Laboratory testing might include metabolic acidosis; increased liver function tests; increased renal function tests; hematuria; leukocytosis (2-to-5-fold higher than normal).

First Aid: No antidote exists for Abrin. Make all exposed people go to the nearest hospital emergency department. Make all potentially exposed people shower and change clothes. In case you have gotten Abrin on your skin or your clothing, immediately shower and change clothes. See a doctor as soon as possible: as it can take only a day and a half for symptoms to appear, all exposed persons should get to a doctor the same day. If exposure includes contact with Abrin, remove it *off or out* of the body as quickly as possible. Treatment needs to be provided in a hospital setting. Make the doctors and nurses aware of the potential for exposure so that they can protect themselves and provide the most appropriate treatments and therapies. If you have to wait for medical assistance, make the victim comfortable. If Abrin has been ingested, the airway must be secured and stomach pumping (gastric lavage) may be considered. Gastric lavage is recommended only if it can be done shortly after ingestion (generally within 1 hour). Risk of aggravating injury to the lining of the GI tract must be considered.

To minimize the effects of the poisoning and to keep the patient stable, Abrin poisoning is treated through supportive therapy. The types of supportive medical care would depend on several factors, such as the route by which victim(s) were poisoned (i.e., whether poisoning was by inhalation, ingestion, eye, or skin exposure). Do not induce vomiting. Rinse mouth, flush stomach with activated charcoal* (if the Abrin has been very recently ingested), washing out the victim's eyes with water, especially if the eyes are red and irritated. Supportive care could include intravenous fluid input and support of circulation and respiration; giving medications to treat conditions such as seizure and low blood pressure. Fluid input is critical, as fluid losses of up to 2.5 L are probable. If individual is drowsy or unconscious, do not give anything by mouth. In the event of vomiting, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration. Fluid and electrolyte balance should be monitored and restored if abnormal. Early and aggressive IV fluid and electrolyte replacement. If the victim's lungs fill with fluid, you administer oxygen if his breathing is difficult or labored. **Note*: Superactivated charcoal may be of little value for large molecules such as Abrin and Ricin[191].

Decontamination: When Abrin symptoms appear and you know the location of the attack, the area should be decontaminated with responders wearing level A (fully encapsulated suit with SCBA). Otherwise, stay away. Move as fast as possible; extra minutes before decontamination might make a big difference. If the Abrin attack was by small particles floating in the air (aerosol), and you have the equipment, (*this is very important*) then you have to decontaminate as soon as you can. If you don't have the equipment and training, don't enter the hot zone to rescue and decontaminate victims. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident. If possible, place all clothing in a labeled durable 6-mil polyethylene bags. If the victim can't move, decontaminate, if possible, without touching and without entering the hot zone. To prevent spreading the agent, be certain that victims are decontaminated as much as possible before allowing them to leave the area. During the decontamination process, be careful not to break the patient/victim's skin and take care to cover all open wounds. The centers for disease control and prevention (CDC) recommends a decontamination procedure solution of detergent and water (with a pH value in the alkaline range of more than 8 but less than 10.5). Soft brushes should be available to remove contamination from the personal protective equipment (PPE). Also recommended for cleanup of people and surfaces is household bleach. Use a fresh (made daily) solution of 0.5% sodium hypochlorite [diluted household bleach (10%, or one part bleach to nine parts water)]. Contact time: 15 minutes. Do not get bleach solution in the victim's eyes, open wounds (especially of the abdomen, spinal cord, or brain), or mouth. Wash off the diluted bleach solution after 15 minutes. Labeled, durable 6-mil polyethylene bags should be available for disposal of clothing and contaminated PPE. In the absence of pH-adjusted solutions, wash the victim with lots of warm water with soap. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing (at least down to undergarments), begin washing immediately. Immediate flush the eyes with water for at least 15 minutes. Wash—strip—wash—evacuate up wind and uphill: The idea is to immediately wash with water, then have the victim (not the responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and up-hill direction.

Personal Protective Methods:

General information: First responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) self-contained breathing apparatus (SCBA) with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.*

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using air purifying respirators (APR) or powered APR (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Recommenced protective clothing and materials may include Tychem BR or Responder CSM. Safe use of protective clothing and equipment requires specific skills developed through training and experience. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Pressure demand, SCBA(CBRN), if available, is recommended in response to nonroutine emergency situations.

Storage: Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked poison location. Store in a cool, dry, well-ventilated area, and away from food stuff containers.

Shipping: UN3462 Toxins, extracted from living sources, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3172 Toxins, extracted from living sources, solid or liquid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: You must be careful! Avoid generating dust. Since an Abrin attack may be by small particles of Abrin floating in the air (aerosol), don't breathe it or get it on you. Remember that the victim's clothes or body may have Abrin; touch them and you can become a victim. If you think Abrin particles might be in the area, stay out until you are equipped with level A (fully encapsulated suit with SCBA), proper PPE, including protective clothing and respiratory protection. Shut off heating, ventilation, and air conditioning (HVAC) systems to prevent the tiny aerosolized (floating in the air) Abrin droplets from spreading throughout the building. Keep the public away. Immediately call for medical assistance. For those contaminated by Abrin, don't allow anyone to leave the hot zone. The Abrin chemical doesn't dissipate quickly, and "survives" in clothing and bedding for long periods of time. Consequently, people as well as "things" must be quarantined and decontaminated. Don't allow anyone leave until medical people examine them. Don't breathe, touch, or eat anything that might be contaminated with Abrin. Notify the federal authorities, local health, and pollution/environmental agencies. See Decontamination.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. If a tank, rail car, or tank truck is involved in a fire, isolate it for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions[92]. On fire, use foam, dry chemical powder, BCF [bromochlorodiflouromethane (Halon 1211)] where regulations permit, carbon dioxide, water spray or fog-large fires only. If the situation allows, control and properly dispose of run-off (effluent).

Disposal Method Suggested: Do not clean up or dispose of Abrin, except under supervision of a specialist. Disposal of spillage in sealed 6 mi polyethylene or polypropylene containers.

Acenaphthene A:0050

Formula: $C_{12}H_{10}$; $C_{10}H_6(CH_2)_2$

Synonyms: Acenafeno (Spanish); Acenaphthylene, 1,2-dihydro; 1,8-Dihydroacenaphthalene; 1,2-Dihydro-acenaphthylene; 1,8-Dihydroacenaphthylene; 1,8-Ethylenenaphthalene; Ethylenenaphthalene; Naphthyleneethylene; Periethylenenaphthalene

CAS Registry Number: 83-32-9

HSDB Number: 1178 as naphthenic acids; 7092 as polycyclic aromatic hydrocarbons (PAHs).

RTECS Number: AB0000000

UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 201-469-6

Regulatory Authority and Advisory Bodies

Carcinogenicty: NIOSH has recommended that coal tar pitch volatiles, including PAHs be treated as potential human carcinogen. Acenaphthene has not been identified as a carcinogen. Handle with caution as several related PAHs are known carcinogens.

Hazard Alert: Combustible, Environmental hazard.

OSHA, 29CFR1910 Specifically Regulated Chemicals (see CFR1910.1002) as coal tar pitch volatiles

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 307(a)(1) Toxic pollutant designated, pursuant to of the and is subject to effluent limitations as PAHs

United States National Primary Drinking Water Regulations: MCLG = 0 mg/L; MCL = 0.0002 mg/L as PAHs.

RCRA 40CFR258, Appendix 2

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.059; Nonwastewater (mg/kg), 3.4

RCRA, 40CFR264, Appendix 9, Ground Water Monitoring List, Suggested Testing Methods (PQL μg/L): 8100 (200); 8270 (10)

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg)

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%. as coal tar pitch volatiles

Mexico, Drinking Water, Criteria (Ecological): 0.02 mg/L; wastewater: organic toxic pollutant

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as naphthalenes

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N, T, F, Xn; risk phrases: R40; R11; R36/37/38; R50/53; R23/24/25; R39; R51/53; R67; R65; safety phrases: S7; S16; S26; S29; S36/37/39; S45; S60; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Acenaphthene is a white combustible, crystalline solid. PAHs are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Molecular weight = 154.2; specific gravity (H_2O:1) = 1.024; boiling point = 277.5−279°C; freezing/melting point = 93.6−97°C; vapor pressure = 2.8×10^{-3} mmHg @ 20°C; vapor density = 5.32. Flash point = 135°C; explosive limits: LEL: 6000 ppm[138]; UEL: Unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 1. Practically insoluble in water; solubility = 3.5−7.4 mg/L @ 25°C.

Potential Exposure: Acenaphthene occurs naturally in coal tar and in coal tar produced during the high-temperature carbonization or coking of coal; coal tar distilling; petroleum processing; shale oil processing. It is used as an intermediate for dyes, fungicides, insecticides, herbicides, pharmaceuticals, plant growth hormones; 1,8 naphthalic acid; in the manufacture of some plastics; and has been detected in cigarette smoke and gasoline exhaust condensates; a constituent of coal tar creosote, asphalt, and diesel fuel. It has been used as an polyploidy agent.

Incompatibilities: Ozone and strong oxidizing agents, including perchlorates, chlorine, fluorine, and bromine.

Permissible Exposure Limits in Air

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

OSHA PEL: 0.2 milligram per cubic meter TWA[1910.1002] (benzene, soluble fraction). OSHA defines “coal tar pitch volatiles” in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (*cyclohexane-extractable fraction*). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen

PAC Ver. 29[138]

PAC-1: 3.6 milligram per cubic meter

PAC-2: 40 milligram per cubic meter

PAC-3: 240 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; #5515, PAHs by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms, therefore, the levels that may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/L, respectively. State Drinking Water Standards: Minnesota 400 μg/L.

Determination in Water: Gas chromatography (GC) or high performance liquid chromatograph (EPA Method 610) or GC and mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} \geq 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Routes of Entry: Ingestion, inhalation, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Acenaphthene is irritating to eyes, skin and respiratory tract, causing coughing and wheezing. May cause vomiting if swallowed in large quantities. LD_{50} = (ipr-rat) 600 mg/kg.

Long-Term Exposure: Although acenaphthene has not been identified as a carcinogen, it should be handled with care as several related PAHs are carcinogens. NIOSH has recommended that coal tar pitch volatiles, including polycyclic aromatic hydrocarbons (PAHs) be treated as potential human carcinogen. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies. Repeated or high exposures may cause lung irritation, bronchitis with cough, phlegm, and/or shortness of breath. Acenaphthene may affect the liver and kidneys. The most thoroughly investigated effect of acenaphthene is its ability to produce nuclear and cytological changes in microbial and plant species. Most of these changes, such as an increase in cell size and DNA content, are associated with disruption of the spindle mechanism during mitosis and the biological impact of acenaphthene on mammalian cells. These effects are reported here because they are the only substantially investigated effects of acenaphthene. Reported to be a mutagen[11]. Points of attack: Skin, respiratory system; bladder, liver, kidneys. Lung cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Preplacement and regular physical examinations are indicated for workers having contact with acenaphthene in the workplace. Complete blood count (CBC), chest X-ray, pulmonary function tests, photopatch testing, sputum cytology, urinalysis (cytology, hematuria), liver, kidney, and bladder function tests recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash with soap immediately. When this chemical has been swallowed, get immediate medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, Available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *NIOSH* (as coal tar pitch volatiles): *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. May be isolated using bentonite lined dam.

Fire Extinguishing: This chemical is a combustible solid; containers may explode when heated. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated run-off enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Incineration or permanganate oxidation.

EPCRA Section 313 Form R *de minimus* concentration reporting level: 0.1%. Form R Toxic Chemical Category Code: N590 as polycyclic aromatic compounds (PACs)
Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg)
Highly persistent in the environment (PACs)
Mexico: Wastewater, Organic Toxic Pollutant
United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as naphthalenes
Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%. *as coal tar pitch volatiles*; Class D2B; NDSL list.
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbols: Xi; risk phrases: R40; R36/37/38; R62; safety phrases: S26; S29/35; S36/37/39; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters
Description: Acenaphthylene is a flaky yellow crystalline powder or solid. Molecular weight = 152.19; specific gravity (H_2O:1) = 0.8987 @ 16°C; boiling point = 280°C; freezing/melting point = 91.8°C; vapor pressure = 9.12×10^{-4} mmHg @ 25°C; flash point = 122°C. Explosive limits: LEL: 0.6%; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. Water soluble; solubility = l6 mg/L @ 25°C; <1 mg/mL @ 21°C[193].
Potential Exposure: PAHs are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Acenaphthylene is an aromatic hydrocarbon used in coal tar processing, as a dye intermediate; making insecticides, fungicides, plastics.
Incompatibilities: Keep away from ozone and strong oxidizing agents. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.
Permissible Exposure Limits in Air
NIOSH IDLH = 80 milligram per cubic meter, *coal tar pitch volatiles*
OSHA PEL: 0.2 milligram per cubic meter TWA[1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.
NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens
ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); confirmed human carcinogen; BEIp assigned *as*
PAC Ver. 29[138]
PAC-1: 10 milligram per cubic meter
PAC-2: 110 milligram per cubic meter
PAC-3: 660 milligram per cubic meter
DFG MAK: [skin]; Category 1, human carcinogen
Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; NIOSH Analytical Method #5515, PAHs by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms, therefore, the levels that may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/L, respectively. Kansas[61] has set a guideline for drinking water of 0.03 μg/L.

Determination in Water: Use EPA Method #610. Octanol−water coefficient: Log $K_{ow} \geq 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Routes of Entry: Ingestion, inhalation, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Acute systemic toxin: short-term high hazard effects [SCAPA].

Long-Term Exposure: May cause dermatitis. May cause lung irritation; bronchitis may develop. May be a potential occupational carcinogen based on being a PAH compound. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies.

Points of Attack: Skin, respiratory system; bladder, liver, kidneys as PAH.

Medical Surveillance: NIOSH has recommended that coal tar pitch volatiles, including PAHs be treated as potential human carcinogen. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Preplacement and regular physical examinations are indicated for workers having contact with acenaphthene in the work-place. CBC, chest X-ray, pulmonary function tests, photopatch testing, sputum cytology, urinalysis (routine) [cytology, hematuria], liver, kidney, and bladder function tests recommended for coal tar pitch volatiles[2].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing, and wash with soap immediately. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Good particulate emission controls are the indicated engineering control scheme. Contact lenses should not be worn when working with coal tar pitch volatiles. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *NIOSH* (as coal tar pitch volatiles): *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN3143 Dye intermediates, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material, Hazard, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use foam, dry chemical, and carbon dioxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Product residues and sorbent media may be packaged in epoxy-lined drums, then destroyed by incineration, permanganate oxidation or microwave plasma treatment. The United States Environmental Protection Agency has investigated chemical precipitation for wastewater treatment.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen

Hazard Alert: Poison inhaltion hazard, Neurotoxin (cumulative), Suspected of causing genetic defects, Suspected reprotoxic hazard, Agricultural chemical.

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R33; R51; R62; safety phrases: S2; S36; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Colorless crystalline solid (80% or more pure) or white powder (technical). Has an odor of rotten cabbage or mercaptans (like sulfur). Molecular weight = 183.17; specific gravity (H_2O:1) = 1.347 @ 20°C; freezing/melting point = 92–93°C; 82–89°C (technical grade 80% to 90% purity); vapor pressure = 1.7×10^{-6} mmHg @ 25°C. Hazard identification (based on NFPA-704M Rating System): Health 1; flammability 0; reactivity 0. Soluble in water; solubility = 800 mg/kg @ 20°C.

Potential Exposure: Acephate is a general use contact and systemic insecticide. Banned in the EU for use as a biocide and agricultural insecticide. Used on green- and limabeans, Brussels sprouts, cauliflower, celery, cotton, cottonseed, cranberries, head lettuce, macadamia nuts, peanuts, bell-and nonbell peppers, peppermint, spearmint, tobacco, and soybeans (Special Local Need Registration required in Mississippi and Texas only). Also used to control cockroach (spot treatment only) in residential and industrial buildings and insect control in forests, and on ornamental plants and to target armyworms, aphids, beetles, bollworms, borers, budworms, cankerworms, crickets, cutworms, fire ants, fleas, grasshoppers, leafhoppers, loopers, mealybugs, mites, moths, roaches, spiders, thirps, wasps, weevils, whiteflies, etc. banned for use in the EU.

Incompatibilities: May react with strong oxidizers such as chlorates, peroxides, nitrates, etc. In the presence of strong reducing agents such as hydrides, organophosphates form highly toxic and flammable phosphine gas. Contact with oxidizers can cause the release of toxic oxides of phosphorus. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water, and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; GC/Flame ionization detection; NIOSH IV(18), Method #5600, Organophosphorus pesticides.

Determination in Water: NIOSH Method #1657. The determination of organophosphorus pesticides in municipal and industrial wastewater by GC. Detection limit = 6.0 ηg/L. Octanol−water coefficient: $\log K_{\mathrm{ow}} \leq 1.0$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—2725.54621 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Inhalation, ingestion, dermal contact, passes through the skin

Harmful Effects and Symptoms

Acephate can cause cholinesterase inhibition in humans—it can overstimulate the nervous system—causing nausea, dizziness, confusion, and at very high exposures (e.g., accidents or major spills), respiratory paralysis and death[118].

Short-Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. Contact may cause burns to skin and eyes. Eye pupils appear small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. Delayed pulmonary edema may occur after inhalation. LD_{50} = (rat, oral) 1.4 g/kg[9]; LD_{50} (dermal, rat) ≥ 2.5 g/kg[83]. Human toxicity (long-term)[101]: High −2.80 ppb, health advisory.

Long-Term Exposure: May cause cancer. Cholinesterase inhibitor; cumulative effect is possible. A neurotoxin. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. May cause skin sensitization; reproductive effects. A suspected neurotoxin. May cause reproductive and fetal effects.

Points of Attack: Skin, respiratory system, CNS, cardiovascular system, blood cholinesterase. Reproductive cells.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. Routine biological monitoring of pesticide applicators and field workers includes testing of plasma and red blood cell acetylcholinesterase levels (for enzyme poisoned by this chemical). These tests are normally accurate only if done within about 2 hours of exposure. If exposure stops, plasma levels return to normal in 1−2 weeks, whereas red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate pesticides is recommended until enzyme levels recover. Do not drink any alcoholic beverages before or during use as it promotes absorption of organophosphates. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt. Speed in removing material from eyes and skin is of extreme importance. *Eyes*: Contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin*: Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation*: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion*: Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions*, do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, *do not induce vomiting*. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes*: Two antidotes are administered to treat organophosphate poisoning. Atropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions that are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning. As first aid for pulmonary edema, a doctor or authorized paramedic might consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this pesticide, all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the

United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).
Small spills (from a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2
Large spills (from a large package or from many small packages)
First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5
Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. Combustible material: may burn but does not ignite readily. Containers may explode when heated. Runoff may pollute waterways. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Highly toxic, may be fatal if inhaled, swallowed or absorbed through skin. Contact with molten substance may cause severe burns to skin and eyes. Avoid any skin contact. Effects of contact or inhalation may be delayed. Runoff from fire control or dilution water may be corrosive and/or toxic and cause pollution. *Small fire*: Dry chemical, carbon dioxide, or water spray. *Large fire*: Dry chemical, carbon dioxide, or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in the case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Alkaline hydrolysis or incineration. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Carcinogenicity: Not listed. However, similar aldehydes are known to be carcinogenic.

Hazard Alert: Poison, Highly flammable, Primary irritant (w/o allergic reaction), Environmental hazard.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R36/37/38; R52; safety phrases S9; S16; S21; S33 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Acetal, an aldehyde, is a clear, volatile liquid with an agreeable odor. Molecular weight: 118.2[136]; boiling point = 138°C @ 1 atm[136]; melting/freezing point = −100°C[136]; vapor pressure = 0.83 mmHg @ 20°C; flash point = −5°C. Autoignition temperature = 230°C; hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 3; reactivity 0. Explosive limits: LEL: 1.65%; UEL: −5%. Slightly soluble in water.

Potential Exposure: Used as a solvent; in synthetic perfumes, such as jasmine, cosmetics, flavors; in organic synthesis.

Incompatibilities: Aldehydes are frequently involved in self-condensation or polymerization reactions. These reactions are exothermic; they are often catalyzed by acid. Aldehydes are readily oxidized to give carboxylic acids. Flammable and/or toxic gases are generated by the combination of aldehydes with azo, diazo compounds, dithiocarbamates, nitrides, and strong reducing agents. Aldehydes can react with air to give first peroxo acids, and ultimately carboxylic acids. These autoxidation reactions are activated by light, catalyzed by salts of transition metals, and are autocatalytic (catalyzed by the products of the reaction). The addition of stabilizers (antioxidants) to shipments of aldehydes retards autoxidation[101]. Presumed to form explosive peroxides on contact with air and light. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: No criteria established. Harmful to aquatic organisms.

Routes of Entry: Ingestion, inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of the eyes with redness and pain. Inhalation can cause coughing, headache, and dizziness. Skin contact can cause irritation with redness and pain. Ingestion can cause stomach pain; nausea, sleepiness, and high exposure can cause unconsciousness. Affects the CNS; acts as a narcotic or hypnotic.

Long-Term Exposure: A narcotic; may be addictive.

Medical Surveillance: Test for narcotic effects.

Points of Attack: Inhalation, ingestion; skin and/or eye contact.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash with soap immediately. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure, and transfer promptly to a medical facility.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1088 Acetal, Hazard Class: 3; Labels: 3-Flammable liquid. UN1988 Aldehydes, flammable, toxic, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until

clean-up is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Use dry chemicals, Alcohol-resistant foam, carbon dioxide. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbols: F + , Xn; risk phrases: R45; R12; R19; R36/37; R40; R62; safety phrases: S1; S2; S16; S33; S36/37 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acetaldehyde is a flammable, volatile, colorless liquid, or gas. It has a characteristic, penetrating, fruity odor. Molecular weight = 44.05; specific gravity (H_2O:1) = 0.7834 @ 18°C; boiling point = 20 to 21°C; melting/freezing point = −123 to 124°C; electrical conductivity = 1.2×10^8 pS/m; flash point = −38°C(oc); autoignition temp 185−193°C. Heat of combustion = −5890 cal/g[136]; maximum ignition energy = 0.37 mJ; vapor pressure = 740 to 750 mmHg @ 20°C; specific gravity (water: 1) = 0.804. Flammable limits: LEL: 4.1%; 40,000 ppm; UEL: 60%; hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 4; reactivity 2. Freely soluble in water.

Potential Exposure: Acetaldehyde is used as a chemical intermediate and can be found in many processed foods; in crafts, arts, automotive, and home improvement products.

Incompatibilities: Reacts with air to form unstable peroxides which can explode. Contact with air causes acetaldehyde to chemically degrade to acetic acid. Strong oxidizers, acids, bases, alcohols, ammonia, amines, halogens, phenols, acid anhydrides, ketones, hydrogen cyanide, hydrogen sulfide. May dissolve rubber. Slightly corrosive to mild steel. May explode without warning when exposed to heat, dust, corrosives, or oxidizers.

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 ppm

Odor threshold = 0.067 ppm. (mean)

OSHA PEL: 200 ppm/360 milligram per cubic meter TWA

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV[1]: 25 ppm/45 milligram per cubic meter Ceiling Concentration, confirmed animal carcinogen with unknown relevance to humans.

PAC* Ver. 29[138]

PAC-1: $\mathbf{45}_{\mathrm{A}}$ ppm

PAC-2: $\mathbf{270}_{\mathrm{A}}$ ppm

PAC-3: $\mathbf{840}_{\mathrm{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript “A” and correspond to 60 minute values.

DFG MAK: 50 ppm/91 milligram per cubic meter TWA; Peak Limitation Category I [a momentary value of 100 mL/m^3/180 milligram per cubic meter should not be exceeded]; Carcinogen Category 5; Pregnancy risk Group C

Arab Republic of Egypt: (TWA) 100 ppm (180 milligram per cubic meter), 1993; Australia: (TWA) 100 ppm (180 milligram per cubic meter); STEL 150 ppm, 1993; Austria: MAK 50 ppm (90 milligram per cubic meter), suspected carcinogen, 1999; Belgium: (TWA) 100 ppm (180 milligram per cubic meter); STEL 150 ppm (270 milligram per cubic meter), 1993; Denmark: (TWA) 25 ppm (45 milligram per cubic meter), 1999; Finland: (TWA) 50 ppm (90 milligram per cubic meter); STEL 75 ppm (135 milligram per cubic meter), 1993; France: VME 100 ppm (180 milligram per cubic meter), continuous; carcinogen, 1999; the Netherlands: MAC-TGG 180 milligram per cubic meter, 2003; India: (TWA) 100 ppm (180 milligram per cubic meter); STEL 150 ppm (270 milligram per cubic meter), 1993; Japan: 50 ppm (90 milligram per cubic meter), 2B carcinogen, 1999; the Philippines: (TWA) 200 ppm (360 milligram per cubic meter), 1993; Poland: MAC: (TWA) 5 milligram per cubic meter, MAC (STEL) 10 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter [skin] 1993; Sweden: NGV 25 ppm (45 milligram per cubic meter), KTV 50 ppm (90 milligram per cubic meter), carcinogen, 1999; Switzerland: MAK-W 50 ppm (90 milligram per cubic meter), KTV 100 ppm (180 milligram per cubic meter), 1999; Turkey: (TWA) 200 ppm (360 milligram per cubic meter), 1993; United Kingdom: (TWA) 20 ppm (37 milligram per cubic meter); STEL 50 ppm (92 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV[1]: 25 ppm. ceiling concentration.

Determination in Air: NIOSH Analytical Method, #1994: Acetaldehyde by GC, #2538; by HPLC, #3507; Aldehydes, screening, #2539; OSHA ANALYTICAL METHOD ID-68.

Permissible Concentration in Water: Human exposure to acetaldehyde probably antedates recorded history, inasmuch as acetaldehyde is the major metabolite of ethyl alcohol. An additional source of widespread human exposure is tobacco smoke. The pharmacology and toxicology of acetaldehyde have been studied most extensively in its relationship to alcohol toxicity and human metabolism. Because of this background of human and laboratory experience, there appears to be no need to establish limits for acetaldehyde in drinking water[32]. However, EPA has set an ambient environmental goal of 2480 μg/L for acetaldehyde on a health basis. This compares with a standard of 0.2 mg/L for domestic water supplies set by Russia[43].

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.39$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can cause intense irritation and cause severe eye burns. Inhalation can irritate the nose, throat and lungs, causing coughing and/or shortness of breath. When the victim is removed from exposure, the symptoms may clear up. Higher exposure can affect the CNS causing symptoms similar to acute alcoholic intoxication, sleepiness, dizziness, and possible unconsciousness. High levels may cause pulmonary edema, a medical emergency, which may be delayed. LD_{50} = (oral-rat) 50 g/kg.

Long-Term Exposure: Acetaldehyde may be a carcinogen in humans since it has been shown to cause cancer in animals and may be a teratogen in humans since it has been shown to be a teratogen in animals. Exposure to acetaldehyde has produced nasal tumors in rats and laryngeal tumors in hamsters. Exposure to malonaldehyde has produced thyroid gland and pancreatic islet cell tumors in rats. NIOSH therefore recommends that acetaldehyde be considered a potential occupational carcinogen in conformance with the OSHA carcinogen policy. This chemical may cause dermatitis and skin allergy. If allergy develops, very low future exposure can cause itching and skin rash. Repeated exposure may cause chronic irritation of the eyes leading to permanent damage. May affect the CNS; respiratory tract, and kidneys, causing chronic alcohol-like intoxication. See also “NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes” [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Eyes, skin, respiratory system; kidneys, CNS; reproductive system. Cancer site in animals: nasal cancer.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air; urine (chemical/metabolite), during exposure. Consideration should be given to skin, eyes, and respiratory tract in any preplacement or periodic examinations. Lung function tests are recommended. If symptoms develop or overexposure is suspected, consider chest X-ray and evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin allergy. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, quickly remove contaminated clothing. Immediately wash area with large amounts of soap and water. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once, and perform artificial respiration. Transfer promptly to medical facility. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact; **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber (gloves, Suits, Boots), Responder suits; Trychem 1000 suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Teflon gloves, suits, boots; 4H, and Silver Shield gloves. Wear eye protection to prevent any potential for eye contact. Employees should wash promptly when skin is wet. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Provide eye-wash.

Respirator Selection*: At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Keep away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. See incompatibilities. Acetaldehyde should be stored in tightly closed airtight containers in a cool, dark, well-ventilated area. Nitrogen or other inert gas should be used as an "inert gas blanket" over liquid acetaldehyde in storage containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of acetaldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers.

Shipping: UN1088 Acetaldehyde, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: *Liquid:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar noncombustible absorbent material and deposit in sealed containers. Keep liquid out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty.

Fire Extinguishing: Acetaldehyde is a flammable and reactive liquid or gas. Poisonous decomposition products may include oxides of carbon. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Use dry chemicals, alcohol-resistant foam, CO_2. Water or regular foam may be ineffective on fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming),

withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

Acetaldehyde Oxime A:0130

Formula: C_2H_5NO; $CH_3CH = NOH$

Synonyms: β-Acetaldehyde oxime; Acetaldoxime; β-Acetaldoxime; Aldoxime; Ethanal oxime; Ethylidenehydroxylamine

CAS Registry Number: 107-29-9

RTECS Number: AB2975000

UN/NA & ERG Number: UN2332/129

EC Number: 203-479-6

Regulatory Authority and Advisory Information

Hazard Alert: Extremely flammable, Polymerization hazard (*beta* form), Chronic health hazard

Hazard symbols, risk, & safety statements: Hazard symbols: F, Xi, Xn; risk phrases: R11; R20/21/22; R36/37/38; R40; safety phrases: S16; S21; S24/25/26; S36/37 (see Appendix 4).

Description: Acetaldehyde oxime is an extremely flammable, colorless liquid or crystalline solid; low melting crystalline compound. Pungent odor. Molecular weight = 59.12; boiling point = 115°C (decomposes); freezing/melting point = 46.5°C (α-); 12°C (β-); vapor pressure = 9.8 mmHg @ 20°C; 9.9 mmHg @ 26°C; specific gravity (H_2O:1) = 0.97; flash point = 38−40°C (pure); <22°C (technical grade); explosive limits: LEL: 4.2%, UEL: 50%; hazard identification Health 2; flammability 3[70]; reactivity 0. Soluble in water.

Potential Exposure: Used as a chemical intermediate and as an antioxidant and radical scavenger with applications in many industries, including detergents, pharmaceuticals, plastics, paints and lacquers, rubber, and textiles.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids (such as hydrochloric, sulfuric, and nitric), strong bases. The beta-form is able to form unstable peroxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes and skin. Inhalation can irritate nose, throat, and respiratory tract.

Long-Term Exposure: Chronic health effects are unknown at this time.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Preemployment and regular physical exams are recommended. For those with frequent or high exposure, lung function tests are recommended.

First Aid: Immediately remove any contact lenses and flush eyes with water for 15 minutes, occasionally lifting upper and lower lids. Quickly remove contaminated clothing. Immediately wash contaminated skin with soap and water. Remove person from exposure area and begin (using universal precautions, including resuscitation mask) if breathing has stopped and cardiopulmonary resuscitation (CPR) if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear impact-and splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of acetaldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers.

Shipping: UN2332 Acetaldehyde oxime, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use foam spray to reduce vapors. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep acetaldehyde oxime out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Thermal decomposition products may include nitrous oxides; and carbon monoxide. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acetamide is a colorless to yellow, deliquescent, crystalline solid. Odorless if pure, “mousy” odor if impure. Odor threshold = 140−160 milligram per cubic meter. Molecular weight = 59.07; specific gravity (H_2O:1) = 1.159 @ 20°C; boiling point = 222°C; freezing/melting point = 80.16°C; vapor pressure = 133 Pa @ 65°C; autoignition temperature: 558°C. Flammable limits: LEL: 36,000 ppm; UEL: unknown; hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. Decomposes slowly in cold water; solubility in water = 200 g/100 mL.

Potential Exposure: Used as a stabilizer, plasticizer, wetting agent; solvent in plastics, lacquers, explosive; soldering flux ingredient; and chemical manufacturing.

Incompatibilities: Reacts with strong acids, such as hydrochloric, sulfuric, and nitric, strong oxidizers; strong bases; strong reducing agents such as hydrides; ammonia, isocyanates, phenols, cresols. Contact with water causes slow hydrolyzation to ammonia and acetate salts.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 21 milligram per cubic meter

PAC-2: 230 milligram per cubic meter

PAC-3: 1400 milligram per cubic meter

DFG MAK: Carcinogen Category 3B (2004)

Austria: suspected carcinogen, 1999; Finland: carcinogen, 1993; Sweden: TWA 10 ppm (23 milligram per cubic meter); STEL 25 ppm (60 milligram per cubic meter), carcinogen, 1999; the Netherlands: MAC-TGG 25 milligram per cubic meter, 2003

New York State: 0.03 μ/m^3 for ambient air[60].

Permissible Concentration in Water: No criteria set; not very toxic to fish but increases biological oxygen demand.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -1.25$; -1.16. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Powdered form irritates eyes and respiratory tract. Acute systemic toxin: short-term high hazard effects [SCAPA]. LD_{50} = (oral-rat) 7000 mg/kg.

Long-Term Exposure: Acetamide may be a carcinogen in humans since it has been shown to cause cancers in animals. May cause injury to the liver, kidney, and brain. Reproductive toxin [SCAPA].

Points of Attack: Cancer site in animals: liver and lymph cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once, and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Should be stored in cool, well-ventilated area. Store in a dry area away from water because of deliquescent properties. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Material is very water soluble and hydrolyzes slowly to ammonia and acetate salts. May be removed from alkaline solutions with adsorbent carbon. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This substance is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming),

withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add to alcohol or benzene as a flammable solvent and incinerate; oxides of nitrogen produced may be scrubbed out with alkaline solution. All federal, state, and local environmental regulations must be observed.

EC Number: 203-150-7

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects

Banned or Severely Restricted (in analgesic drugs) (Japan)[13]

Hazard symbols, risk, & safety statements: Hazard symbols: Xn; risk phrases: R22; R33; R36; R62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acetanilide orthorhombic plates or scales; or white, shining, crystalline solid or powder. Odorless. Molecular weight = 135.18; specific gravity (H_2O:1) = 1.2105 @ 4°C; boiling point = 304.8°C @ 760 mmHg; freezing/melting point = 113.7°C; vapor pressure = 1 mmHg @ 114.0°C, vapor density = 4.65; flash point = 169°C (oc); autoignition temperature = 530°C; specific gravity (H_2O:1) = 1.21 @ 4°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. Sinks in water; slightly soluble; solubility = 0.541 g/mL; <1 mg/mL @ 22°C.

Potential Exposure: This amide compound is used in rubber industry as accelerator, in plastics industry as cellulose ester stabilizer, in pharmaceutical manufacture, stabilizer for hydrogen peroxide, azo dye manufacture.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alkyl nitrates, alkalis (liberate aniline), chloral hydrate, phenols, ferric salts.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2 milligram per cubic meter

PAC-2: 22 milligram per cubic meter

PAC-3: 130 milligram per cubic meter

Permissible Concentration in Water: Russia MAC is 0.004 mg/L in water bodies used for fishery purposes[43].

Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq 1.2$ @ 23°C. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Routes of Entry: Ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous if ingested; may cause hallucinations, sleepiness, cyanosis, respiratory, kidney damage, cyanosis, blood toxin: methemoglobinemia, decreased body temperature. Acute respiratory irritant and may be toxic. LD_{50} = (oral-rat) 800 mg/kg. Animals tolerate doses of 200−400 mg/kg for many weeks[11]. Has been lethal to man @ 59 mg/kg.

Long-Term Exposure: May cause kidney damage, skin allergy, eczema. An allergen. Causes contact dermatitis; inhalation or ingestion can cause eczema and cyanosis and methemoglobinemia.

Points of Attack: Skin and blood stream.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: If warranted, treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear skin protection. Avoid dust inhalation (see respirator selection below).

Respirator Selection: Wear filter mask unless high vapor concentrations are encountered; then use NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in a pressure-demand or other positive-pressure mode. For increased protection use in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation distance, spill: 25 m/75 ft.(NJ). Isolation distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Solids may be dredged. Carbon adsorbent may be used on dissolved portion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add to flammable solvents (alcohol or benzene) and incinerate. Oxides of nitrogen may be scrubbed from combustion gases with alkaline solution[22].

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acetic acid is a colorless liquid or crystals with a sour, vinegar-like odor. Pure compound is a solid below 17°C. Often used in an aqueous solution. Glacial acetic acid contains 99% acid. Molecular weight = 60.05; specific gravity (H_2O:1) = 1.0446 @ 20°C (aq. solution)[136]; boiling point = 117.9°C[136]; melting/freezing point = 16.7°C[136]; electrical conductivity = 6×10^5 pS/m; critical pressure = 57.1 atm; heat of combustion = −3136 cal/g[136]; vapor pressure = 11 mmHg @ 20°C; 7.5 mmHg @ 14.2°C; flash point = 39°C [NFPA] (glacial); autoignition temperature = 425−463°C (glacial) [NFPA]. Explosive limits: LEL: 4.0%; 40,000 ppm[138]; UEL: 19.9%. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 2; freely soluble in water.

Potential Exposure: Acetic acid is widely used as a chemical feedstock for the production of vinyl plastics, acetic anhydride, acetone, acetanilide, acetyl chloride, ethyl alcohol, ketene, methyl ethyl ketone, acetate esters, and cellulose acetates. It is also used alone in the dye, rubber, pharmaceutical, food preserving, textile, and laundry industries. It is utilized, too; in the manufacture of Paris green, white lead, tint rinse, photographic chemicals, stain removers, insecticides, and plastics.

Incompatibilities: Vapor may form explosive mixture with air. Violent reaction with oxidizers, organic amines, and bases, such as hydroxides and carbonates. Incompatible with strong acids; aliphatic amines; alkanolamines, isocyanates, alkylene oxides; epichlorohydrin, acetaldehyde, 2-aminoethanol, ammonia, ammonium nitrate, chlorosulfonic acid, chromic acid; ethylene diamine, ethyleneimine, halides, peroxides, perchlorates, perchloric acid, permanganates, phosphorus isocyanate, phosphorus trichloride, potassium *tert*-butoxide, and xylene. Attacks cast iron, stainless steel; and other metals forming flammable/explosive hydrogen gas. Will attack many forms of rubber or plastic.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 ppm

Conversion factor: 1 ppm = 2.46 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 0.3 to 0.9 ppm

OSHA PEL: 10 ppm/25 milligram per cubic meter TWA

NIOSH REL: 10 ppm/25 milligram per cubic meter TWA; 15 ppm/37 milligram per cubic meter STEL

ACGIH TLV[1]: 10 ppm/25 milligram per cubic meter TWA; 15 ppm/37 milligram per cubic meter ppm STEL

PAC* Ver. 29[138]

PAC-1: $\mathbf{5}_{\mathbf{E}}$ ppm

PAC-2: $\mathbf{35}_{\mathbf{E}}$ ppm

PAC-3: $\mathbf{250}_{\mathbf{E}}$ ppm

*PAC values marked with a subscript "**E**" correspond to ERPG (Emergency Response Planning Guideline) values.

DFG MAK: 10 ppm/25 milligram per cubic meter TWA; Peak Limitation Category I(2)

Australia: TWA 10 ppm (25 milligram per cubic meter); STEL 15 ppm, 1993; Austria: MAK 10 ppm (25 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (25 milligram per cubic meter); STEL 15 ppm, 1993; Denmark: TWA 10 ppm (25 milligram per cubic meter), 1999; Finland: TWA 10 ppm (25 milligram per cubic meter); STEL 15 ppm (37 milligram per cubic meter) [skin] 1993; France: VLE 10 ppm (25 milligram per cubic meter), 1999; Hungary: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 25 milligram per cubic meter, 2003; Japan; 10 ppm (25 milligram per cubic meter), 1999; Norway: TWA 10 ppm (25 milligram per cubic meter), 1999; the Philippines: TWA 10 ppm (25 milligram per cubic meter), 1993; Poland: MAC (TWA) 5 milligram per cubic meter, MAC (STEL) 35 milligram per cubic meter, 1999; Russia: TWA 10 ppm; STEL 5 milligram per cubic meter [skin] 1993; Sweden: NGV 5 ppm (13 milligram per cubic meter), KTV 10 ppm (25 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (25 milligram per cubic meter), KZG-W 20 ppm (50 milligram per cubic meter), 1999; Thailand: TWA 10 ppm (25 milligram per cubic meter), 1993; Turkey: TWA 10 ppm (25 milligram per cubic meter), 1993; United Kingdom: TWA 10 ppm (25 milligram per cubic meter); STEL 15 ppm (37 milligram per cubic meter), Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 15 ppm. Russia[43] MAC for ambient air in residential areas is 0.2 milligram per cubic meter on a momentary basis and 0.06 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for acetic acid in ambient air[60]. They range from 0.25 milligram per cubic meter (North Dakota) to 0.4 milligram per cubic meter (Virginia) to 0.5 milligram per cubic meter (Connecticut and South Dakota) to 0.595 milligram per cubic meter (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #1603, OSHA Analytical Method 186SG.

Permissible Concentration in Water: No United States limit has been established. However, EPA[32] has proposed an ambient environmental goal of 345 μg/L based on health effects.

Determination in Water: Acetic acid in water may be determined by titration. Harmful to aquatic life. Octanol−water coefficient: Log $K_{\mathrm{ow}} = -0.2$ to -0.31. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can cause severe irritation, burns, and permanent eye damage. Skin contact can cause severe irritation and burns. Breathing can cause irritation of the mouth, nose, and throat; coughing, and shortness of breath. Higher exposures can cause bronchopneumonia and pulmonary edema, a medical emergency.

Long-Term Exposure: Repeated exposure may cause bronchitis to develop, with cough, phlegm, and/or shortness of breath. Repeated skin exposure can cause thickening and cracking of the skin, particularly the skin of the hands. Chronic exposure may result in pharyngitis and catarrhal bronchitis. Ingestion, though not likely to occur in industry, may result in penetration of the esophagus, bloody vomiting, diarrhea, shock, hemolysis; and hemoglobinuria that is followed by anuria. Repeated or prolonged exposure to acetic acid may cause darkening, irritation of the skin, erosion of the exposed front teeth, and chronic inflammation of the nose, throat and bronchi.

Points of Attack: Respiratory system, skin, eyes, teeth.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute overexposure. Consideration should be given to the skin, eyes, teeth, and respiratory tract in placement or periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing, and wash with soap immediately. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. If this chemical has been inhaled, remove from exposure, begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. If swallowed, do not induce vomiting. Transfer promptly to a medical facility. Medical observation recommended for 24 to 48 hours following inhalation overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Contact lenses should not be worn when working with acetic acid. Prevent skin contact; 8 hours (more than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Butyl rubber (gloves, suits, and boots), Teflon gloves, suits, boots; Viton, 4H, and Silver Shield gloves, Responder suits; Trychem 1000 suits; **4 hours** (at least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$.) Neoprene, Barricade. Remove clothing immediately if wet or contaminated with liquids containing 50% and promptly remove if liquid contains 10%−49% acetic acid. Provide emergency eyewash if liquids containing $>5\%$ acetic acid are involved, drench if $>50\%$ acetic acid is involved.

Respirator Selection: NIOSH/OSHA *50 ppm*: Sa:Cf$^{£}$ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv$^{£}$ (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge (s)]; CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA). *Note*$^{£}$: Substance causes eye irritation or damage; eye protection needed.

Storage: (1) Color code—White: Corrosive or contact hazard; store separately in a corrosion-resistant location. (2) Color code—Red: Flammability hazard: store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Should be stored in cool dry place away from heat and incompatible substances listed above. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN2789 Acetic acid, glacial or Acetic acid solution, with >80 % acid, by mass, hazard class: 8; labels: 8-Corrosive material, 3-flammable liquid. UN2790 acetic acid solution, not $<50\%$ but not $>80\%$ acid, by mass, hazard class: 8; labels: 8-Corrosive material; acetic acid solution, with $>10\%$ and $<50\%$, by mass, hazard class: 8; labels: 8-Corrosive material.

Spill Handling: Warn other workers of spill. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; or similar material and deposit in sealed containers, and transport to outdoor location. With expert help, cautiously neutralize spilled liquid with lime or sodium bicarbonate. Wash away remainder with plenty of water (extra personal protection: chemical protection suit including SCBA). Alternatively cover with soda ash and then flush to sewer with water[24]. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use water spray, dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers.

Wear goggles and SCBA when fighting fires. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Acetic Anhydride A:0170

Formula: $C_4H_6O_3$; $(CH_3CO)_2O$

Synonyms: Acetic acid, anhydride; Acetic oxide; Acetyl anhydride; Acetyl ether; Acetyl oxide; Anhidrido acetico (Spanish); Anhydride acetique (French); Essigsaeureanhydrid (German); Ethanoic anhydrate; Ethanoic anhydride

CAS Registry Number: 108-24-7

HSDB Number: 233

RTECS Number: AK1925000

UN/NA & ERG Number: UN1715/137

EC Number: 203-564-8 [*Annex I Index No.*: 607-008-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction), Violently water reactive.

Banned or Severely Restricted (Singapore) (UN)[13]

List II, DEA chemical code 8519 (Title 21 CFR1310.02)

FDA, Controlled Substance Act, Essential Chemicals

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg)

Controlled Substance Act (FDA): TV (domestic and import/export) = 250 gal (1023 kg weight)

Canada, WHMIS, Ingredient Disclosure Concentration: 1%. Hazard symbols, risk, & safety statements: Hazard symbol: F, C; risk phrases: R10; R20/21/22; R29; R34; R36/37/38; safety phrases: S1/2; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acetic anhydride is a combustible, colorless, strongly refractive, liquid which has a strongly irritating odor. Molecular weight = 102.09[136]; specific gravity (H_2O:1) = 1.082 @ 20°C; boiling point @ 1 atm = 139.55°C; melting/freezing point = −73.1°C; critical temperature = 296°C[136]; critical pressure = 679 psia = 46.2 atm = 4.68 MN/m^2[136]; vapor pressure = 10 mmHg @ 36°C; flash point = 49.4°C (cc); heat of combustion = −7058 Btu/lb = −3921 cal/g[136]; autoignition temperature = 316°C. Explosive limits: LEL: 2.7%; 27.000 ppm; UEL: 10.3%. Specific gravity (H_2O:1) = 1.08[136]; hazard Identification (based on NFPA-704 M Rating System): Health 3; flammability 2, reactivity 2~~W~~; soluble in water; violent reaction.

Potential Exposure: Acetic anhydride is used as an acetylating agent or as a solvent in the manufacture of cellulose acetate, acetanilide, aspirin, synthetic fibers, plastics, explosives, resins, perfumes, and flavorings; and it is used in the textile dyeing industry. It is widely used as a pharmaceutical intermediate and as a pesticide intermediate.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alcohols, chromic acid (violent reaction), amines, strong caustics; finely divided metals. Contact with water forms acetic acid and liberates a large amount of heat. Corrosive to iron, steel and other metals.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm

Odor threshold = 0.14 ppm.

OSHA PEL: 5 ppm/20 milligram per cubic meter TWA

NIOSH REL: 5 ppm/21 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 5 ppm TWA

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.5_E}$ ppm

PAC-2: $\mathbf{15_E}$ ppm

PAC-3: $\mathbf{100_E}$ ppm

*PAC values marked with a subscript "**E**" correspond to ERPG (Emergency Response Planning Guideline) values.

DFG MAK: 5 ppm/21 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group C

Austria: MAK 5 ppm (20 milligram per cubic meter), 1999; Denmark: TWA 5 ppm (20 milligram per cubic meter), 1999; France: VLE 5 ppm (20 milligram per cubic meter), 1999; Japan: 5 ppm (21 milligram per cubic meter), 1999; Poland: TWA 10 milligram per cubic meter, 1999; Sweden: Ceiling 5 ppm (20 milligram per cubic meter), 1999; the

Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; United Kingdom: TWA 0.1 ppm (0.5 milligram per cubic meter); STEL 0.4 ppm (2 milligram per cubic meter), 2000.

Determination in Air: Use NIOSH Analytical Method #3506[18]. OSHA Analytical Methods 82, 102.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: $\text{Log}\,K_{\text{ow}} = -0.2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can cause severe skin and eye irritation. Permanent damage to the eyes may result from exposure to high concentrations. Breathing acetic anhydride can irritate the respiratory tract and high concentrations can cause severe lung damage and/or coughing and shortness of breath. In high concentrations, vapor may cause conjunctivitis, photophobia, lacrimation, and severe irritation of the nose and throat. Liquid acetic anhydride does not cause a severe burning sensation when it comes in contact with the skin. If it is not removed, the skin may become white and wrinkled, and delayed severe burns may occur. Both liquid and vapor may cause conjunctival edema and corneal burns, which may develop into temporary or permanent interstitial keratitis with corneal opacity due to progression of the infiltration. Contact and, occasionally, hypersensitivity dermatitis may develop. Immediate complaints following concentrated vapor exposure include conjunctival and nasopharyngeal irritation, cough, and dyspnea. Necrotic areas of mucous membranes may be present following acute exposure. Inhalation may cause pulmonary edema, a medical emergency. Medical observation recommended for 24 to 48 hours following inhalation overexposure, as pulmonary edema may be delayed.

Long-Term Exposure: Prolonged or repeated exposure to this chemical may cause skin disorders or allergy. If allergy develops, very low future exposure can cause itching and a skin rash.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately with large amounts of water. If this chemical contacts the skin, quickly remove clothing and immediately wash area with large amounts of water. If a person breathes this chemical, move the exposed person to fresh air at once and perform (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if hearth action has stopped. When this chemical has been swallowed, get medical attention immediately. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Prevent skin contact. 8 hours (more than 8 hours of resistance to breakthrough $>0.1\ \mu\text{m} > \text{g/cm}^2\text{/min}$): butyl rubber gloves, suits, boots; 4H and Silver Shield gloves; Barricade, Trellchem HPS suits; Trychem 1000 suits; **4 hours** (at least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu\text{m} > \text{g/cm}^2\text{/min}$): Teflon gloves, suits, boots. Contact lenses should not be worn when working with this chemical. Wear splash proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA, *125 ppm*: Sa:Cf$^{£}$ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv$^{£}$ (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *200 ppm*: CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or PaprTOv$^{£}$ (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece, and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note* $^{£}$: Substance causes eye irritation or damage; eye protection needed.

Storage: (1) Color code—White: Corrosive or contact Hazard; store separately in a corrosion resistant location. (2) Red: Flammability hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Outside or detached storage is preferred. Store in tightly closed containers in a cool, well-ventilated place, away from moisture, sources of ignition, and heat. Avoid pits, depressions and basements. Separate from other storage. Inside storage should be in a standard flammable liquids storage room or cabinet. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN1715 Acetic anhydride, Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use foam spray to reduce vapors. Cover with vermiculite, dry sand; earth, or similar absorbent material and neutralize with lime or sodium bicarbonate. Deposit absorbent material in sealed containers. Alternatively cover with soda ash and then flush away with water[24]. Ventilate area of spill or leak after clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep acetic anhydride out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. You may want to seek assistance from EPAs Environmental Response Team at (908) 548-8730. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include acetic acid and oxides of carbon. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Use water spray to disperse vapors only, as water contact will form acetic acid. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[24].

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acetone is a highly flammable, colorless liquid with a sweet, mint-like odor. Molecular weight: 58.08; boiling point = 56°C; melting/freezing point = −95°C; critical temperature = 235°C[136]; critical pressure = 682 psia = 46.4 atm = 4.70 MN/m^2[136]; specific gravity (H_2O:1) = 0.791 @ 20°C (liquid)[136]; relative vapor density (air = 1) = 2.0[136]; ratio of specific heats of vapor (gas) = 1.127; latent heat of vaporization = 122 cal/g[136]; heat of combustion = −12,250 Btu/lb = −6808 cal/g[136]; heat of fusion = 23.42 cal/g[136]; vapor pressure = 75 mmHg @ 1.3°C; minimum ignition energy = 1.15 mJ; electrical conductivity = 4.9×10^5 pS/m; autoignition temperature = 465°C; flash point = −18°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 2. Explosive limits: LEL: 2.5%; 25,000 ppm; UEL: 12.8%. Freely soluble in water.

Potential Exposure: It is used as a solvent in nail polish remover and many other chemicals. Used in the production of lubricating oils and as an intermediate in the manufacture of chloroform and of various pharmaceuticals and pesticides.

Incompatibilities: May explode when mixed with chloroform, chromic anhydride. Incompatible with acids, bases, and oxidizing materials, such as peroxides, chlorates, perchlorates, nitrates, and permanganates. Unstable peroxides formed with strong oxidizers. May accumulate static electrical charges and may cause ignition of its vapors. Dissolves most rubber, resins, and plastics.

Permissible Exposure Limits in Air

NIOSH IDLH is 2500 ppm (10% LEL)

Odor threshold = 4.58 ppm

OSHA PEL: 1000 ppm/2400 milligram per cubic meter TWA

Determination in Air: Use NIOSH Analytical Method #1300, #2555, #3800[1,18]. OSHA Analytical Method 69.

Permissible Concentration in Water: Massachusetts has set a guideline of 250 μg/L and Maryland a guideline of 3,600 μg/L[61].

Determination in Water: Octanol−water coefficient: Log $K_{\text{ow}} = -0.23$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the skin. Exposure can irritate the eyes and respiratory tract. Exposure to high concentrations can cause dizziness, lightheadedness, and unconsciousness. Alcohol consumption exacerbates toxic effects. LD_{50} (oral, rat) = 5800 mg/kg.

Long-Term Exposure: Repeated skin exposure can cause dryness and skin cracking. This chemical has not been adequately evaluated to determine whether brain or nerve damage could occur with repeated exposure. However, many solvents and other petroleum-based chemicals have been shown to cause such damage. Effects may include reduced memory and concentration; personality changes (withdrawal, irritability) and fatigue; sleep disturbances; reduced coordination; and/or effects on the nerves to the arms and legs (weakness, "pins and needles").

Points of Attack: Eyes, skin, respiratory system; CNS.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); expired exposure, during exposure; pulmonary function tests; urine (chemical/metabolite); end-of-shift. Evaluation for brain effects, such as changes in memory, concentration, sleeping patterns and mood, as well as headaches and fatigue. Consider evaluations of the cerebellar, autonomic, and peripheral nervous systems. Positive and borderline individuals should be referred to for neuropsychological testing. See also NIOSH Criteria Document: 78-173 *Ketones*.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once, and irrigate immediately with large amounts of water for at least 15 minutes. If this chemical contacts the skin, quickly remove contaminated clothing, and wash with large amounts of soap immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once, and perform (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber gloves, suits, boots; 4H and Silver Shield gloves; Barricade, CPF3 suits; Responder suits, Trellchem HPS suits; Trychem 1000 suits. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, *2500 ppm*: CcrFOv* (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or Sa* (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

*Note**: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1090 Acetone, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep acetone out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Acetone is a highly flammable liquid. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration[22].

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical as EDF Substance ID#-041

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T + , N; risk phrases: R26/27/28; R50/R53; safety phrases: S1/2; S7/9; S27; S29; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Acetone cyanohydrin is a flammable, colorless to light yellow liquid. Almond-like odor. Molecular weight = 85.10[136]; specific gravity (H_2O:1) = 0.932 @ 19°C (liquid)[136]; boiling point = 95°C @ 760 mmHg; freezing/melting point = − 19°C[136]; vapor pressure = 0.8 mmHg @ 20°C[136]; relative vapor density (air = 1) = 2.93[136]; ratio of specific heats of vapor (gas) = (estimate) 1.074[9]. Flash point = 74°C; hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 2; reactivity 2; autoignition temperature = 688°C. LEL: 2.2%, 9800 ppm; UEL: 12.0%. Freely soluble in water but decomposes, forming hydrogen cyanide.

Potential Exposure: Used in the manufacture of insecticides and making other chemicals, such as methyl methacrylate.

Incompatibilities: May form explosive mixture with air. Not compatible with strong reducers, strong bases; strong oxidizers, and strong acids, such as hydrochloric, sulfuric (explosive), and nitric. Contact with strong acid and strong bases may cause explosions. Slowly decomposes to acetone and hydrogen cyanide gas at room temperatures; rate is accelerated by an increase in pH, contact with water, or temperature.

Permissible Exposure Limits in Air

Conversion 1 ppm = 3.48 milligram per cubic meter

OSHA PEL: None

NIOSH REL: 1 ppm/4 milligram per cubic meter [15 min] Ceiling Concentration

ACGIH TLV[1]: 5 mg[CN]/m^3 Ceiling Concentration [skin]

PAC* Ver. 29[138]

PAC-1: $\mathbf{2}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{7.1}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{15}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 2 ppm TWA; 5 ppm STEL; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group C

Hungary: STEL 0.9 milligram per cubic meter, carcinogen, 1993; Russia: STEL 0.9 milligram per cubic meter [skin] 1993; the Netherlands: MAC-TGG 3.5 milligram per cubic meter [skin] 2003

Determination in Air: NIOSH Analytical Method 2506[18].

Permissible Concentration in Water: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg[CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; short-term consumption; raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Use NIOSH Analytical Method #7904; #6010, cyanides.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. May be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause eye and skin irritation. Breathing this chemical can irritate the respiratory tract causing wheezing and shortness of breath. Slows down tissue respiration. High exposure can cause sudden death without warning. Symptoms of exposure include weakness, headache, confusion, nausea, vomiting, and a pounding heart. High exposure can cause liver and kidney damage. Inhalation may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases.

Long-Term Exposure: Can cause thyroid gland to enlarge and interfere with normal thyroid function. May cause kidney and liver injury. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Eyes, skin, respiratory system; CNS; cardiovascular system, liver, kidneys, GI tract.

Medical Surveillance: Test for urine thiocyanate and blood cyanide levels.

First Aid: Move victim to fresh air; call emergency medical care. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, quickly remove contaminated clothing and wash with large amounts of water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. When this chemical has been swallowed, get medical attention immediately. If this chemical has been inhaled, remove from exposure, and transfer promptly to a medical facility. If not breathing, give artificial respiration (avoid mouth to mouth resuscitation). If breathing is difficult, give oxygen. If heart has stopped begin CPR. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. Avoid contact with contaminated skin. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1–2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be available within 1–2 minutes of exposure.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: NIOSH, *10 ppm*: Sa (APF = 10) (any supplied-air respirator); 25 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); *50 ppm*: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece); *250 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code—Blue: Health hazard/poison (Toxic): Store in a secure, locked, and cool, ventilated area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Do not store for long periods of time; toxic fumes may form in closed container. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Outside storage and separated storage is preferred.

Shipping: UN1541 Acetone cyanohydrin, stabilized, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, Inhalation Hazard Zone B.

Spill Handling:

Acetone cyanohydrin when spilled in water

Initial Isolation and Protective Action Distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/2500

Then: Protect persons downwind (mi/km)

Day 0.2/0.3

Night 0.7/1.2

Issue poison warning. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Acetone cyanohydrin is a combustible liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. *Note*: Water may cause frothing if it gets below surface of liquid and turns to steam. Water fog gently applied to surface will cause frothing which may extinguish fire.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Add with stirring to strong alkaline calcium hypochlorite solution. Alternatively dissolve in flammable solvent and burn in incinerator with afterburner and scrubber.

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 217-137-9

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Highly toxic (oral).

CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg)[72]. *Note*: The lower quantity applies for solids in powder form with particulate size less than 100 μm. Otherwise the 10,000 pound TPQ applies.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R21; R25; R26; R50/53; safety phrases: S2; S28; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Acetone thiosemicarbazide is a white to yellow crystalline solid. Molecular weight = 131.22; freezing/melting point = 172–175°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. No reaction with water.

Potential Exposure: Acetone thiosemicarbazone is used as an intermediate in the manufacture of pharmaceuticals and pesticides. May be used as an agricultural chemical.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: 9.1 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 600 milligram per cubic meter

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

High oral toxicity reported. The LD_{low} oral (rat) = 10 mg/kg (highly toxic). LD_{50} = (oral-rat) 48,500 μg/kg[RTECS, NTIS].

Points of Attack: Eyes, skin, respiratory system; CNS; cardiovascular system; liver, kidneys, GI tract.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Contact lenses should not be worn when working with this chemical. Wear splash proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: For emergency situations, wear a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in a pressure-demand or other positive-pressure mode. For increased protection use in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation distance, Fire: 800 m/0.5 mi[70]. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Acetonitrile is an extremely flammable, colorless liquid with an ethereal odor. Molecular weight = 41.05; specific gravity (H_2O:1) = 0.78745 @ 15°C; boiling point @ 1 atm = 81.6°C[9]; melting/freezing point = −45.7°C[9]; critical temperature = 274.7°C[9]; critical pressure = 47.7 atm; specific gravity (H_2O:1) = 0.787 @ 20°C (liquid)[9]; relative vapor density (air = 1) = 1.4[9]; ratio of specific heats of vapor (gas) = 1.192[9]; ionization potential = 12.20 eV; latent heat of vaporization = 313 Btu/lb = 174 cal/g; heat of combustion = − 13,360 Btu/lb = −7420 cal/g[9]; vapor pressure = 73.7 mmHg @ 20°C[9]; electrical conductivity = 6×10^4 pS/m. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 4; reactivity 2; flash point = 6°C (oc) [NFPA]; 12.8°C (c.c.); autoignition temperature = 524°C. Explosive limits: LEL: 3.0%, 30,000 ppm[138]; UEL: 16.0%. Freely soluble in water.

Potential Exposure: Acetonitrile is used as an extractant for animal and vegetable oils, as a solvent; particularly in the pharmaceutical industry, and as a chemical intermediate in pesticide manufacture; making batteries and rubber products. It is present in cigarette smoke.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, chlorosulfonic acid, oleum, epoxides. May accumulate static electrical charges, and may cause ignition of its vapors. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

Conversion factor: 1 ppm = 1.68 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 40 ppm; Irritating: 875 milligram per cubic meter.

Determination in Air: Use NIOSH Analytical Method 1606[18].

Permissible Concentration in Water: Acetonitrile is infinitely soluble and stable in water. No criteria have been set, but EPA has proposed[32] an ambient environmental goal of 970 μg/L based on health effects. Russia[43] set a MAC of 0.7 mg/mL for water bodies used for domestic purposes. Harmful to aquatic organisms.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Routes of Entry: Inhalation, percutaneous absorption, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin and respiratory tract. Exposure can cause fatal cyanide poisoning. Symptoms include flushing of the face, chest tightness, headache, nausea, and vomiting, weakness, and shortness of breath. These reactions may begin hours following overexposure.

Long-Term Exposure: Repeated exposure may cause the thyroid gland to enlarge and cause permanent damage. Acetonitrile may cause damage to the developing fetus. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Kidneys, liver, lungs, skin, eyes, CNS; cardiovascular system.

Medical Surveillance: Consider the lung, skin, respiratory tract, heart, CNS; renal and liver function in placement and periodic examinations. A history of fainting spells or convulsive disorders might present an added risk to persons working with toxic nitriles. Blood cyanide test and/or urine thiocyanate test. Blood cyanide over 0.1 mg/L or urine thiocyanate over 20 mg/L indicate overexposure. Maintain close medical monitoring. Slow release of cyanide from absorbed acetonitrile may cause delayed symptoms. Blood plasma, expired air, urine (chemical/metabolite).

First Aid: Acetonitrile can cause fatal Cyanide poisoning. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be available within 1−2 minutes. In the event of overexposure, and/or symptoms: move victim to fresh air; call emergency medical care. Give Amyl Nitrate capsules (as directed, by trained personnel only). If this chemical gets into the eyes, remove any contact lenses at once, and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, quickly remove contaminated clothing and wash with large amounts of water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. When this chemical has been swallowed, get medical attention immediately. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility. If not breathing, give artificial respiration (avoid mouth to mouth resuscitation). If breathing is difficult, give oxygen. If heart has stopped, begin CPR. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. Avoid contact with contaminated skin. Observe victim for 24 to 48 hours.

Personal Protective Methods: Prevent skin contact. **8 hours** (More than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber gloves, suits, boots; Teflon gloves, suits, boots; 4H and Silver Shield gloves; Barricade, Responder suits, Trellchem HPS suits; Trychem 1000 suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: NIOSH: *200 ppm*: CcrOv (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s)]; Sa (APF = 10) (any supplied-air respirator); or SCBA (any SCBA); *500 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge (s)]; or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-, or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA

(APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where acetonitrile may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1648 Acetonitrile, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling:

Nitriles spill

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Water may be ineffective for fighting fires. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with nitrogen oxide removal from effluent gases by scrubbers or incinerators[22].

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R45; R22; R50/53; R62; R63; safety phrases: S53; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Acetophenetidin is a fine, white, crystalline powder or solid. Odorless with a slightly bitter taste. Molecular weight = 179.22; boiling point = about 100°C (decomposes); freezing/melting point = 134−137°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Slightly soluble in water.

Potential Exposure: Phenacetin is used as an analgesic and antipyretic drug. It is used alone or in combination with aspirin and caffeine for mild to moderate muscle pain relief. Phenacetin has also been used as a stabilizer for hydrogen peroxide in hair bleaching preparations. A laboratory reagent. In veterinary medicine; it is used as an analgesic and antipyretic.

Incompatibilities: Oxidizing agents, iodine and nitrating agents[52].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 7.3 milligram per cubic meter

PAC-2: 80 milligram per cubic meter

PAC-3: 330 milligram per cubic meter

Russia[43] set a MAC of 0.5 milligram per cubic meter in working zones for phenacetin.

Determination in Water: EPA Method 8250A. Octanol−water coefficient: Log $K_{ow} \leq$ 3.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Ingestion, inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure to high levels of this chemical can cause methemaglobinemia which lowers the ability of the blood to carry oxygen. This can result in a bluish color to skin and lips (cyanosis), headache, dizziness, collapse, and possible death.

Long-Term Exposure: This chemical is a probable cancer-causing agent in humans. It has been shown to cause bladder, urinary tract, and nose cancer in animals. Mutation, reproductive, teratogenic data reported. There is limited evidence that this chemical may damage the developing fetus. High or repeated exposures can destroy red blood cells, causing low blood count; aplastic anemia; jaundice, kidney damage; and brownish color to urine. Can lead to a general allergic reaction with rash and itching.

Points of Attack: Bladder, kidneys, eyes, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: Blood test for methemoglobin level, CBC and reticulocyte count, Blood and urine bilirubin, Blood Phenacetin level.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to Physician*: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Wear chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any exposure level*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-, or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health hazard: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where Phenacetin is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak after clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include nitrogen oxides. Use any extinguishing agent suitable for surrounding fire. If material or contaminated run-off enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible, return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Permanganate oxidation, microwave plasma treatment, alkaline hydrolysis or incineration.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acetophenone is a colorless, oily liquid with a sweet, floral odor. Molecular weight = 120.15[9]; specific gravity (H_2O:1) = 1.028 @ 20°C (liquid)[9]; boiling point @ 1 atm = 201.7°C[9] @ 760 mmHg; melting/freezing point = 19.7°C[9]; critical temperature = 428°C[9]; critical pressure = 38 atm[9]; surface tension = 39.8 dyn/cm @ 20°C (in contact with vapor); Liquid surface tension = 12 dyn/cm = 0.012 N/m @ 30°C[9]; liquid water interfacial tension = (estimate) 40 dyn/cm = 0.04 N/m @ 27°C[9]; relative vapor density (air = 1) = 4.15[9]; ratio of specific heats of vapor (gas) = (estimate) 1.071[9]; latent heat of vaporization = 150 Btu/lb = 83.6 cal/g[9]; 11,731.5 gcal/gmole; heat of combustion = −14,850 Btu/lb = −8250 cal/g[9]; 991.60 kcal/g @ 25°C (liquid); vapor pressure = 0.99 mmHg @ 20°C[9]; electrical conductivity = 3.12 × 105 pS/m[52]. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 2; reactivity 0; flash point = 77°C (cc); 82°C (oc); autoignition temperature = 570°C. Explosive limits: LEL: 1.1%, 11,000 ppm; UEL: 6.7%. Poor solubility in water; solubility = 0.73 g/100 mL @ 20°C.

Potential Exposure: Acetophenone is used as a solvent and in perfume manufacture to impact a pleasant jasmine or orange-blossom odor. It is used as a catalyst in olefin polymerization and as a flavorant in tobacco. It is also used in the synthesis of pharmaceuticals.

Incompatibilities: May form explosive mixture with air. See flash point, above. Reacts violently with strong oxidizers, many acids, bases, amines, amides, and inorganic hydroxides; alkali metals; hydrides, and nitrides. Reacts with reducing agents; alkali metals; hydrides, nitrides. Contact with all preceding materials release heat and flammable gases, including hydrogen; the heat may be sufficient enough to result in fire. Incompatible with aldehydes, aliphatic amines, alkanolamines, cyanides, isocyanates, organic acids, peroxides; perchloric acid. May attack plastics, and some rubbers and coatings.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 10 ppm/49 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water for domestic purposes and 0.04 mg/L in water used for fishery purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.6$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin, and respiratory tract. Skin contact can cause burning and rash. Exposure can result in headache, dizziness, nausea, and loss of coordination. A hypnotic, high levels of exposure may affect the nervous system. Toxic effects exacerbated by alcohol consumption.

Long-Term Exposure: There is evidence that this chemical can cause genetic changes; mutations, and acne-like skin rash. Long-term exposure may cause CNS damage.

Points of Attack: Skin, eyes, CNS.

Medical Surveillance: Testing for hippuric acid levels in the urine is recommended.

First Aid: Remove any contact lenses at once, then flush eyes, wash contaminated areas of body with soap and water. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. ACGIH recommends Teflon as a protective material. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where acetophenone may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use foam spray to reduce vapors. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep acetophenone out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably with a flammable solvent.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: 2-Acetylaminofluorene (AAF) is a combustible, tan powder or crystalline solid. Molecular weight = 223.27; freezing/melting point = 193°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0.

Potential Exposure: 2-AAF was intended to be used as a pesticide, but it was never marketed because this chemical was found to be carcinogenic. AAF is used frequently by biochemists and technicians engaged in the study of liver enzymes and the carcinogenicity and mutagenicity of aromatic amines as a positive control. Therefore, these persons may be exposed to AAF.

Incompatibilities: Hygroscopic. Contact with strong oxidizers may cause fire and explosions. Not compatible with cyanides, acids, and/or acid anhydrides. May form unstable and explosive peroxides; a possible polymerization hazard. Contact with strong oxidizers or strong reducing agents may form flammable gases and cause fire and explosions. A weak base that may react as an acid. Incompatible with strong bases (forming potentially dangerous salts), chlorinated hydrocarbons, nitro compounds. Reacts with azo and diazo compounds, generating toxic gases. Contact with mixture of acetic acid + dinitrogen trioxide may cause explosion.

Permissible Exposure Limits in Air

NIOSH IDLH = Not determined. Potential occupational carcinogen.

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and PPE, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: potential occupational carcinogen; limit exposure to the lowest feasible concentration.

PAC Ver. 29[138]

PAC-1: 1.2 milligram per cubic meter

PAC-2: 14 milligram per cubic meter

PAC-3: 480 milligram per cubic meter

Belgium carcinogen, 1993; Finland: carcinogen, 1993; Sweden; carcinogen, 1999

New York: 0.03 μ/m^3 for ambient air[60].

Routes of Entry: Ingestion, inhalation, mucous membrane; skin absorption; skin and/or eye contact.

Harmful Effects and Symptoms

A carcinogen. Handle with extreme care.

Short-Term Exposure: This chemical has limited use in industry, and contact is kept to a minimum to prevent cancer. Reduced function of liver, kidneys, bladder, pancreas (Potential occupational carcinogen).

Long-Term Exposure: Reduced function of liver, kidneys, bladder, pancreas. Incorporation of this compound in feed caused increased incidences of malignant tumors in a variety of organs in the rat. Long-term studies in which mice were given 2-AAF in their diet showed that this compound caused increased incidences of tumors and cancer of the liver, kidney, urinary bladder, lung, skin, and pancreas. There is limited evidence that this chemical is a teratogen in animals.

Points of Attack: Liver, bladder, kidney, pancreas, skin, lungs.

Medical Surveillance: Urine cytology for abnormal cells in the urine. This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Personal Protective Methods: Prevent skin contact Contact the manufacturer for recommendations. Because AAF is a carcinogen, on February 11, 1974, OSHA promulgated a standard for this chemical designating protective clothing, hygiene procedures for workers, and special engineering requirements for the manufacture or processing of AAF. Open vessel operations are prohibited. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where 2-AAF is handled, used, or stored. 2-AAF must be stored to avoid contact with cyanides, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: If 2-AAF is spilled or leaked, only specifically trained personnel should be involved in the clean-up. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Cover with lime or soda ash; collect material in the most convenient and safe manner, and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Presumably high-temperature incineration with scrubber for any produced nitrogen oxides can be used.

Acetyl Benzoyl Peroxide A:0270

Formula: $C_9H_8O_4$; $CH_3CO \cdot OO \cdot COC_6H_5$

Synonyms: Acetozone; Benzozone; Peroxide, acetyl benzoyl; Peroxido de acetil benzoilo (Spanish)

CAS Registry Number: 644-31-5

HSDB Number: 968

RTECS Number: SD7860000

UN/NA & ERG Number: UN3105/145

EC Number: 211-412-7

Regulatory Authority and Advisory Information

Hazard Alert: Powerful oxidizer, Explosive (when dry); Violently water reactive.

Hazard symbols, risk, & safety statements: Hazard symbol: O, E; Risk phrases: R1; R14; R8; R9; R23/24/25; R41; Safety phrases: S7/8; S24/25; S27/28; S36/37/39; S45(see Appendix 4).

Description: Acetyl benzoyl peroxide is a white crystalline solid, forming needles. Molecular weight = 180.16;

freezing/melting point = 36−39°C; boiling point = 130°C; flash point: 104°C. Decomposes in water; violent reaction; solubility = 639 mg/L @ 25°C.

Potential Exposure: Used in disinfectants, to bleach flour; and in medications.

Incompatibilities: Acetyl benzoyl peroxide is an organic peroxide which can detonate if shocked, heated, or on contact with contaminants. A powerful oxidizer. Violent reaction with many compounds, including reducing agents; chemically active metals; combustible materials, strong acids, alkaline earth sulfides, aluminum carbides, aluminum, amines, calcium sulfide, carbides, chlorine trifluoride, glycerin, hydrides, hydrochloric acid, hydrogen peroxide, hydrogen sulfide, hydroxylamine, magnesium, metal powders, metal sulfides, molybdenum, phenylhydrazine, phosphorous red/friction, phosphorous trichloride, silicon, sulfides, sulfur, sulfur dioxide, sulfur/friction, sulfuric acid, tungsten, hydrogen trisulfide. Avoid contact with moisture, water, steam, sources of ignition, combustible materials. Not compatible with strong bases; reducing materials; other oxidizers.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: No criteria set. Reacts violently with water.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq 2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Contact can severely irritate and burn the eyes and skin. It may cause permanent damage. Breathing Acetyl benzoyl peroxide can irritate the nose, throat and lungs, causing a cough, difficulty breathing and chest tightness. Higher levels of exposure can cause pulmonary edema, a medical emergency, which can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated exposure may cause chronic irritation of the skin and eczema-like rash. Repeated lung exposure can cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, nose, throat, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once, and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Avoid skin contact with Acetyl Benzoyl Peroxide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. Contact lenses should not be worn when working with this chemical. Wear impact-resistant goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential exists for exposures to solid acetyl benzoyl peroxide, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. Where there is potential for high exposures and to the liquid form of Acetyl Benzoyl Peroxide exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Storage: Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

This chemical is an organic peroxide that can detonate if shocked or heated. Before entering confined space where acetyl benzoyl peroxide may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN3105 Organic peroxide type D, liquid, Hazard Class: 5.2; Labels: 5.2-Organic peroxide, Technical Name Required.

Spill Handling: Restrict persons not wearing butyl rubber protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep this substance out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical or carbon dioxide extinguishers. Irritating fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS Number: AO5955000

UN/NA & ERG Number: UN1716/156

EC Number: 208-061-7

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Combustible, Corrosive, Temperature sensitive, Violently water reactive, Air reactive (forms hydrogen bromide gas).

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg)

Canada, WMIS Ingredients Disclosure List Concentration Reporting Level: 1%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; Risk phrases: R14; R34; R36/R37; Safety phrases: S1; S25; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Acetyl bromide is a colorless, fuming liquid that turns yellow on contact with air. It has a sharp, unpleasant odor. Molecular weight = 122.95; specific gravity (H_2O:1) = 1.52 @ 9.5°C; boiling point = 76.7°C; freezing/melting point = −97°C; vapor pressure = 101 mmHg @ 20°C; relative vapor density (air = 1) = 4.2; difficult to ignite; flash point = 75°C[92]; 110°C [lit.S-A]. Explosive limits: LEL: 35,960 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 2₩. Sinks in water with violent decomposition, releasing toxic hydrogen bromide.

Potential Exposure: Acetyl bromide is used as an acetylating agent in the organic synthesis of other chemicals, pesticides, perfume, pharmaceuticals, and it is also used as a dye intermediate.

Incompatibilities: Acetyl bromide Vapor may form explosive mixture with air. Instability increases as temperature rises, Contact with moisture, water, steam, alcohols cause a violent reaction releasing corrosive carbonyl bromide, hydrogen bromide, and bromine gases. Incompatible with organic solvents, ethers, oxidizers, and strong bases. Corrodes or attacks most metals and wood in the presence of moisture. Contact with combustibles may cause ignition.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.16 ppm

PAC-2: 1.8 ppm

PAC-3: 11 ppm

Routes of Entry: Eye and/or skin contact, inhalation; and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Skin and eye contact can cause severe irritation and possible permanent damage including blindness. Inhalation and swallowing are very toxic Exposure can irritate the nose, throat, air passages, and lungs with coughing and/or shortness of breath. Higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated respiratory exposure can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Repeated skin exposure can cause chronic skin irritation.

Points of Attack: Skin, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, lung function tests are recommended. If symptoms develop or overexposure is suspected, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear corrosive-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to Acetyl Bromide exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and sunlight. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1716 Acetyl bromide, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Acetyl bromide when spilled in water

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.1/1.8

Prevent liquid from reaching water if possible. This material creates large amounts of toxic hydrogen bromide (HBr) vapor when spilled in water, and is considered by the North American Emergency Response Guide to be dangerous from 0.5 to 10 km (0.3−6.0 mi downwind). Evacuate area and issue warning of danger, including possible explosion. Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors-containing runoff. Water spray may reduce vapor but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable

Fire Extinguishing: This chemical is a combustible liquid but does not readily ignite. Thermal decomposition products may include hydrogen bromide, carbonyl bromide, and oxides of carbon. Reacts violently with water-based extinguishers, such as foam. *Do not use water or foam extinguishers. Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed. Slow addition to sodium bicarbonate solution in a glass or plastic container. Mix slowly in another container containing lots of water. It is inappropriate and possibly dangerous to the environment to dispose of chemical waste by flushing them down the toilet or discarding them to the trash.

Description: Acetyl chloride is a highly flammable, colorless, fuming liquid with a pungent odor. The odor threshold is 1.0 ppm (as acetic acid or as HCl). Molecular weight = 78.5[9]; specific gravity (H_2O:1) = 1.1[9]; boiling point @ 1 atm = 51°C[9]; melting/freezing point = −112°C[9]; critical temperature = (estimate) 246°C[9]; critical pressure = (estimate) 845 psia = 57.5 atm[9]; specific gravity (H_2O:1) = 1.1039 @ 21°C (liquid); liquid surface tension = 26 dyn/cm = 0.026 N/m @ 20°C[9]; relative vapor density (air = 1) = 2.7[9]; electrical conductivity = 4×10^7 [du]; ratio of specific heats of vapor (gas) = 1.1467[9]; latent heat of vaporization = 160 Btu/lb = 88 cal/g[9]; heat of combustion =

−6000 Btu/lb = −3300 cal/g[9]; heat of solution = (estimate) −54 Btu/lb = −30 cal/g[9]; vapor pressure = 213 mmHg @ 20°C[9]; 287 mmHg @ 25°C; flash point = 4°C; autoignition temperature = 390°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 3 ₩. Explosive limits: LEL: 7.3%, UEL: 19.0%. Violent decomposition in water.

Potential Exposure: Acetyl chloride is used in organic synthesis as an acetylating agent and in testing for water and/or cholesterol in organic liquids, in the pharmaceutical industry and in pesticide manufacture.

Incompatibilities: Avoid contact with moisture, steam, water, alcohols, dimethylsulfoxide, strong bases; phosphorus trichloride; oxidizers, and amines, since violent reactions may occur. Keep away from heat, fire, and welding operations.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 0.85 ppm
PAC-2: 9.4 ppm
PAC-3: 56 ppm

Permissible Concentration in Water: No criteria set. However, acetyl chloride reacts violently with water. Thus, its half-life in ambient water should be short and exposure from water should be nil. The degradation products should likewise pose no exposure problems if the pH of the water remains stable.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Acetyl chloride is an irritant and a corrosive. Cutaneous exposure results in skin burns, while vapor exposure causes extreme irritation of the eyes and mucous membranes. Inhalation of 2 ppm acetyl chloride has been found irritating to humans. Death or permanent injury may result after short exposures to small quantities of acetyl chloride. An aquatic toxicity rating has been estimated to range from 10 to 100 ppm.

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Skin and eye contact can cause severe irritation and possible permanent damage including blindness. Inhalation and swallowing are very toxic Exposure can irritate the nose, throat, air passages, and lungs with coughing and/or shortness of breath. Higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated respiratory exposure can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Repeated skin exposure can cause chronic skin irritation.

Points of Attack: Skin, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, lung function tests are recommended. If symptoms develop or overexposure is suspected, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once, and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear corrosive-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to Acetyl Chloride, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—Red Stripe: Flammability hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) White: Corrosive or contact hazard; store separately in a corrosion-resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and sunlight. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1717 Acetyl chloride, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material

Spill Handling: Acetyl chloride, when spilled in water.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/60
Then: Protect persons downwind (mi/km)
Day 0.6/0.9
Night 1.8/2.8

Prevent liquid from reaching water if possible. This material creates large amounts of toxic hydrogen chloride (HCl) vapor when spilled in water and is considered by the North American Emergency Response Guide to be dangerous from 0.5 to 10 km (0.3−6.0 mi downwind). Enter area from upwind side. Evacuate area and issue warning of danger, including possible explosion. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids using dry lime or soda ash. *Do not use water or wet method*. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid, but does not ignite readily. Thermal decomposition products may include hydrogen bromide, carbonyl bromide and bromine. ***IMPORTANT*:*Use dry chemical or carbon dioxide (CO_2) extinguishers only***. *Do not use water or foam extinguishers*. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. May be mixed slowly with sodium bicarbonate solution and then flushed to sewer with large volumes of water. May also be incinerated.

WGK[100] (German Aquatic Hazard Class): Nonhazardous to water

Description: Acetylene is an extremely flammable, colorless, compressed gas. It has a faint ethereal odor when pure; a garlic-like odor when contaminated. Molecular weight = 26.04[9]; specific gravity (H_2O:1) = 0.613 @ −80°C (liquid)[9]; boiling point @ 1 atm = 84.0°C (sublimes)[9]; melting/freezing point = −81°C (sublimes)[9]; critical temperature = 35.2°C[9]; critical pressure = 890.7 psia = 60.59 atm = 6.138 MN/m^2[136]; relative vapor density (air = 1) = 0.907[9]; ratio of specific heats of vapor (gas) = 1.235[9]; heat of combustion = −20,747 Btu/lb = −11,526 cal/g = −482.57 × 10^5 J/kg[9]; vapor pressure = 44.2 atm[77]; 33,592 mmHg @ 25°C; autoignition temperature: 305°C; adiabatic flame temperature: 1597°C (estimate)[9]; minimum ignition energy = 0.017 mJ[du]; stoichiometric air-to-fuel ratio: 13.18 (estimate); explosive limits: LEL: 2.5%, 25,000 ppm; UEL: 82%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 4; reactivity (gas) 3; (dissolved in acetone) 2. Low solubility in water = 1.65 g/100 mL @ 20°C.

Potential Exposure: Acetylene can be burned in air or oxygen and is used for brazing, welding, cutting, metallizing, hardening, flame scarfing; and local heating in metallurgy. The flame is also used in the glass industry. Chemically, acetylene is used in the manufacture of vinyl chloride, acrylinitrile, synthetic rubber; vinyl acetate; trichloroethylene, acrylate, butyrolactone, 1,4-butanediol, vinyl alkyl ethers, pyrrolidone, and other substances.

Incompatibilities: The substance may polymerize due to heating. The substance decomposes on heating and increasing pressure, causing a fire and explosion hazard. The substance is a strong reducing agent and reacts violently with oxidants and with fluorine or chlorine under influence of light, causing fire and explosion hazard. Reacts with copper, silver, and mercury or their salts, forming shock-sensitive compounds (acetylides). The content of lines carrying acetylene must not exceed 63% copper. May form explosive mixture with air. Forms shock-sensitive mixture with copper and copper salts; mercury and mercury salts; and silver and silver salts. Reacts with brass, bromine, cesium hydride, chlorine, cobalt, cuprous acetylize; fluorine, iodine, mercuric nitrate; nitric acid, potassium, rubidium hydride; trifluoromethyl hypofluorite; and sodium hydride.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.06 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: none established.

NIOSH REL: 2500 ppm/2662 milligram per cubic meter Ceiling Concentration.

ACGIH TLV[1]: simple asphyxiant with no TLV value.

PAC Ver. 29[138]

PAC-1:65,000 ppm*

PAC-2: 230,000 (2.30E + 05) ppm*

PAC-3: 400,000 (4.00E + 05) ppm*

* All PAC values are higher than the LEL (lower explosive limit)

Arab Republic of Egypt: TWA 1 ppm (14 milligram per cubic meter), 1993; Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: MAK-W 1000 ppm (1080 milligram per cubic meter), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV

Determination in Air: see NIOSH Acetylene Criteria Document.

Permissible Concentration in Water: No criteria set but EPA[32] suggests an ambient water limit of 73,000 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Rapid evaporation of the liquid may cause frostbite. Initial signs and symptoms of exposure to harmful concentrations of impure acetylene are rapid respiration, air hunger, followed by impaired mental alertness and muscular uncoordination. Other manifestations include cyanosis, weak and irregular pulse, nausea; vomiting, prostration, impairment of judgment and sensation; loss of consciousness; convulsions, and death. Low-order sensitization of myocardium to epinephrine resulting in ventricular fibrillation may be possible. At high concentrations pure acetylene may act as a mild narcotic and asphyxiant. Most accounted cases of illness or death can be attributed to acetylene containing impurities of arsine, hydrogen sulfide; phosphine, carbon disulfide; or carbon monoxide.

Long-Term Exposure: The substance may cause effects on the nervous system.

Points of Attack: CNS; respiratory system.

Medical Surveillance: Watch for complications due to impurities, such as arsine, hydrogen sulfide, phosphine, carbon disulfide; or carbon monoxide.

First Aid: Move victim to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. If breathing is difficult, give oxygen. Remove and isolate contaminated clothing and shoes. In the case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. See also NIOSH criteria document cited below. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Acetylene poisoning can quite easily be prevented if (1) there is adequate ventilation and (2) impurities are removed when acetylene is used in poorly ventilated areas. General industrial hygiene practices for welding, brazing, and other metallurgical processes should also be observed.

Respirator Selection: See NIOSH criteria document for Acetylene, cited below. In an emergency use NIOSH/MSHA or European Standard EN 149-approved SCBA.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. After use for welding, turn valve off, regularly check tubing, etc. and test for leaks with soap and water. Acetylene in process may be stored in atmospheric gas holders. May be stored in conventional compressed gas cylinders. Content of lines carrying acetylene must not exceed 63% copper (Cu). Storage of liquid acetylene should be avoided. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1001 Acetylene, dissolved, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: If possible, stop flow of gas. Vapors in confined areas may explode when exposed to fire. Gases may travel long distances to ignition sources and flash back. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Use dry chemicals, carbon dioxide. From a secure explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure position.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Acetylene tetrabromide is a combustible, colorless to yellow liquid. Strong odor. Molecular weight = 345.7; specific gravity (H_2O:1) = 2.96; boiling point = 245.5°C (decomposes); freezing/melting point = −1°C; vapor pressure = 0.02 mmHg @ 20°C; relative vapor density (air = 1) = 11.9; autoignition temperature = 335°C. Explosive limits: LEL: 23,000 ppm[138]; UEL: unknown; hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 1. Very slightly soluble in water; solubility = 0.07%.

Potential Exposure: Acetylene tetrabromide is used as a solvent; a gauge fluid, and as a refractive index liquid in microscopy.

Incompatibilities: Chemically active metals (sodium, potassium, magnesium, and zinc), strong caustics; hot iron. Contact with strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air

NIOSH IDLH = 8 ppm

OSHA PEL: 1 ppm/14 milligram per cubic meter TWA

NIOSH REL: After reviewing available published literature, NIOSH provided comments to OSHA on August 1, 1988, regarding the "Proposed Rule on Air Contaminants" (29 CFR 1910, Docket No. H-020). In these comments, NIOSH questioned whether the PELs proposed for this chemical were adequate to protect workers from recognized health hazards.

ACGIH TLV[1]: 0.1 ppm/1.4 milligram per cubic meter, inhalable fraction and vapors TWA

PAC Ver. 29[138]

PAC-1: 0.3 ppm

PAC-2: 4.3 ppm

PAC-3: 10 ppm

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 1 ppm (15 milligram per cubic meter), 1993; Austria: MAK 1 ppm (14 milligram per cubic meter), 1999; Belgium: TWA 1 ppm (14 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (14 milligram per cubic meter), 1999; Finland: TWA 1 ppm (14 milligram per cubic meter); STEL 3 ppm (42 milligram per cubic meter), 1999; France: VME 1 ppm (15 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 7 milligram per cubic meter [skin] 2003; the Philippines: TWA 1 ppm (14 milligram per cubic meter), 1993; Sweden: TWA 1 ppm (14 milligram per cubic meter); STEL 2 ppm (30 milligram per cubic meter), 1999; Turkey: TWA 1 ppm (14 milligram per cubic meter), 1993; United Kingdom: 0.5 ppm (7.2 milligram per cubic meter) [skin] 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 ppm.

Determination in Air: Silica absorption followed by THF treatment and gas chromatographic analysis. See NIOSH Analytical Method, 1994: 1,1,2,2-Tetrabromoethane, #2003.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin, and respiratory tract. Can cause headaches, fatigue, dizziness, lightheadedness, and unconsciousness. High concentrations can cause death. Prolonged skin contact can cause burns.

Long-Term Exposure: There is limited evidence that acetylene tetrabromide causes cancer; possibly stomach cancer. Repeated exposures can cause liver, kidney, and lung damage, and drying and cracking of the skin.

Points of Attack: Eyes, upper respiratory system; liver, kidneys, lungs, CNS.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests; expired air[58].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of salt water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 8 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry in unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Acetylene tetrabromide begins to decompose @ 245°C producing flammable and highly toxic vapors of bromine and carbonyl bromide. Avoid contact with incompatible materials cited above. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2504 Tetrabromoethane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Thermal decomposition products may include bromine and carbonyl bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with combustible fuel and with scrubber to remove halo acids produced.

Acetylsalicylic Acid A:0340

Formula: C_9H_8O4; $HOOCC_6H_4OCOCH_3$

Synonyms: Acenterine; Acesa; Acetaldehyde diethyl acetal; Acetal diethylique (French); Aceticyl; Acetol; Acetophen; Acetosal; Acetosalin; Acetylin; 2-(Acetyloxybenzoic) acid; Acetylsal; Acisal; Acylpyrin; Asagran; Aspirin; Aspro; Asteric; Benzoic acid, 2-(acetyloxy)-; Caprin; 1,1-Diaethoxy-aethan; Diaethylacetal (German); 1,1-Diethoxyethane; Diethyl acetal; Duramax; Ecotrin; Empirin; Ethylidene diethyl ether; Neuronika; Polopiryna; Rhodine; Salacetin; Salicylic acid, acetate; Xaxa

CAS Registry Number: 50-78-2; *(alt.)* 2349-94-2; *(alt.)* 11126-35-5; *(alt.)* 11126-37-7; *(alt.)* 26914-13-6; (alt.) 98201-60-6

HSDB Number: 652

RTECS Number: VO0700000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 200-064-1

Regulatory Authority and Advisory Information

California Proposition 65 Chemical[102]: developmental, female (*Note*: It is especially important not to use aspirin during the last three months of pregnancy, unless specifically directed to do so by a physician because it may cause problems in the unborn child or complications during delivery) developmental, female. (Aspirin: CAS: 50-78-2) 7/1/1990.

United States Environmental Protection Agency Gene-Tox Program, Negative: Sperm morphology-mouse; Inconclusive: Mammalian micronucleus

Hazard alert: poison, neurotoxin. Possible risk of forming tumors, suspected of causing genetic defects, suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; Risk phrases: R22; R25; R36/37/38; R62; R63; Safety phrases: S24; S26; S27; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acetylsalicylic acid is a white crystalline solid with a slightly bitter taste. It is odorless but hydrolyzes in moist air to give an acetic acid odor. Molecular weight = 180.15; boiling point = decomposes @ $<140°C$; freezing/melting point = 135°C [A1]; density = 1.4 g/cm^3; vapor pressure = 0 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Poor solubility in water = 0.3% @ 15°C.

Potential Exposure: Used as an over-the counter and proprietary pharmaceutical and veterinary drug. Those engaged in manufacture of aspirin or, more likely, in its consumption in widespread use as an analgesic, antipyretic, and antiinflammatory agent.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, carbonates, moisture. Dust dispersed in air is explosive.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 ppm TWA

ACGIH TLV[1]: 5 ppm TWA

Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; Russia: STEL 0.5 milligram per cubic meter, 1993; Switzerland: MAK-W 5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 milligram per cubic meter Some states have set guidelines or standards for aspirin in ambient air[60] ranging from 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Determination in Water: Octanol−water coefficient: $\text{Log}\,K_{ow} \leq 1.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Primarily oral in medicinal use.

Harmful Effects and Symptoms

Short-Term Exposure: Eye and skin contact can cause irritation. Burns to the eyes and scarring can occur. High exposures may cause headache, dizziness, depression, and irritability. This chemical can be absorbed through the skin, thereby increasing exposure. Adverse effects from the usual doses of aspirin are infrequent, most common are GI disturbances. Prolonged administration of large doses results in occult bleeding and may result in anemia. LD_{50} = (oral-rat) 200 mg/kg.

Long-Term Exposure: Repeated exposures may cause headache, dizziness, depression, and irritability; allergy may develop causing hives. Animal tests show that this substance possibly causes toxic effects upon human reproduction; possible teratogen. This chemical can decrease the clotting ability of blood.

Points of Attack: *Cancer site*: Eyes, skin, respiratory system' blood, liver, kidneys.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be indicated. Tests of blood clotting ability. People taking anticoagulants may be at increased risk. Skin testing with dilute Acetylsalicylic acid may help diagnose allergy, if done by a qualified allergist. If allergy is confirmed, all future exposure to this chemical should be avoided, since even small exposure can cause an allergic reaction. It is possible for severe allergic reaction to occur.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH; however, where the potential exists for exposure, the following might be considered: P2 filter respirator for harmful particles meeting NIOSH classified N95. The use of N95 respirators is restricted to use in atmospheres free of oil aerosols. In Europe, similar respirators may contain the prefix “FF” (for filtering facepiece), and may be classified as FFP2.

Storage: Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked, and cool, ventilated area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all forms of moisture.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Sweep spilled substance into containers; if appropriate, moisten first to prevent dusting. Carefully collect remainder, then remove to safe place (extra personal protection: P2 filter respirator for harmful particles). Use a vacuum or wet method to reduce dust during clean-up. *Do not dry sweep*. The spilled material may be dampened with 60%−70% ethanol to avoid airborne dust and the material then scooped up for disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Acetylsalicylic acid itself may burn but does not readily ignite. Dust of this chemical dispersed in air is explosive. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be flushed to sewer with large volumes of water.

1-Acetyl-2-Thiourea A:0350

Formula: $C_3H_6N_2OS$; $CH_3CONHCSNH_2$

Synonyms: Acetamide, *N*-(aminothioxomethyl)-; Acetyl thiourea

CAS Registry Number: 591-08-2

HSDB Number: 6034

RTECS Number: YR7700000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN2588 (pesticides, solid, toxic, n.o.s.)/155

EC Number: 209-699-9

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Highly toxic, Corrosive.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P002, as Acetamide, *N*-(aminothioxomethyl)-

RCRA Land Ban Waste Restrictions

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 1000 lb (454 kg)

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R23/24/25; safety phrases: S23; S24/25; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: 1-Acetyl-2-thiourea is a white crystalline solid; forming needles. Molecular weight = 118.16; freezing/melting point = 165−168°C; flash point = 80°C. Slightly soluble in water.

Potential Exposure: Studied as possible rodenticide; used in organic synthesis.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

An LD_{50} value (oral-rat) has been reported as 50 mg/kg and is the apparent basis for EPA classification as hazardous substance[4] and hazardous waste[5]. Acts as poison in humans by ingestion and intraperitoneal routes.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection*:*Where potential for exposure exists: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation distance, spill: 25 m/75 ft.(NJ). Isolation distance, fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and sulfur. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Acifluorfen A:0360

Formula: $C_{14}H_7ClF_3NO_5$; $F_3C\text{-}C_6H3(Cl)\text{-}O\text{-}C_6H_3(NO_2)(COOH)$

Synonyms: Acifluorfen; Acifluorfene; Benzoic acid, 5-[2-chloro-4-(trifluoromethyl)phenoxy]-2-nitro-; Blazer; Carbofluorfen; 5-[2-Chloro-4-(trifluoromethyl)phenoxy]-2-nitrobenzoic acid; 5-(2-chloro-α,α,α-trifluoro-*p*-tolyloxy)-2-nitrobenzoic acid; Tackle

CAS Registry Number: 50594-66-6; 62476-59-9 (sodium salt, the parent chemical)

HSDB Number: 6551

RTECS Number: DG5643200

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 256-634-5 [*Annex I Index No.*: 604-041-00-0]

Regulatory Authority and Advisory Information

Carcinogenicity: Possible human; animal positive (EPA), possibly carcinogenic to humans, Group 2B, as sodium salt

Clean Water Act: CFR 455, Table 1

California Proposition 65 Chemical[102]: Cancer 1/1/1990 (CAS: 62476-59-9)

Hazard Alert: Poison, Environmental hazard.

SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0% (sodium salt)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*includes sodium*): Hazard symbol: Xn, N; Risk phrases: R45; R22; R38; R41; R50/53; safety phrases: S2; S24; S29; S39; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)].

Description: A diphenyl ether, is a combustible, off-white, light tan or brown solid. Molecular weight = 361.65; freezing/melting point = 152−157°C;[23] 124−126°C (sodium salt). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. The sodium salt is soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this selective preemergence and postemergence herbicide used to control weeds and grass in soybean and peanut crops.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Avoid contact with all sources of ignition.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. A no-adverse-effect level (NOAEL) has been determined to be 20 mg/kg. Body weight/day based on fetotoxicity. However, a NOAEL of 5.6 was determined on the basis of increase in liver size of male rats; further a NOAEL of 1.25 mg/kg/day was determined in a 2-generation rat reproduction study. On this last basis, a long-term health advisory for acifluorfen has been set at 0.44 mg/L for a 70-kg adult. A lifetime health advisory: for that same adult of 0.009 mg/L. The EPA has also determined a reference dose (acceptable daily intake) of 0.013 mg/kg/day. *Fluoride ion*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Analysis of acifluorfen is by a gas chromatographic (GC) method applicable to the determination of certain chlorinated acid pesticides in water samples. In this method, approximately 1 L of sample is acidified. The compounds are extracted with ethyl ether using a separatory funnel. The derivatives are hydrolyzed with potassium hydroxide, and extraneous organic material is removed by a solvent wash. After acidification, the acids are extracted and converted to their methyl esters using diazomethane as the derivatizing agent. Excess reagent is removed, and the esters are determined by electron capture GC. The method detection limit has not been determined for this compound, but it is estimated that the detection limits for analytes included in this method are in the range of 0.5−2 μg/L. Fish Tox: 1499.99565000 ppb MATC (VERY LOW).

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Acifluorfen is a moderate dermal irritant. LD_{50} (oral, male rat) = 2025 mg/kg; (oral, female rats) = 1370 mg/kg.

Long-Term Exposure: A known carcinogen. Similar chlorinated diphenyl ethers have caused liver damage in laboratory animals. Human Tox = 3.27103 ppb CHCL (Chronic Human Carcinogen Level) (HIGH)

Points of Attack: Skin and liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Do not flush spilled material into sewer. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Reverse osmosis (RO) is a promising treatment method for pesticide-contaminated water. As a general rule, organic compounds with molecular weights greater than 100 are candidates for removal by RO, which yields 99% removal efficiency of chlorinated pesticides by a thin-film composite polyamide membrane operating at a maximum pressure of 1000 psi and at a maximum temperature of 45°C. More operational data are required, however, to specifically determine the effectiveness and feasibility of applying RO for the removal of acifluorfen from water. Also, membrane adsorption must be considered when evaluating RO performance in the treatment of acifluorfen-contaminated drinking water supplies. Soil Adsorption Index (K_{oc}) = 113 (Estimate).

Fire Extinguishing: This chemical is a combustible solid but does not easily ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include nitrogen oxides; carbon monoxide, chlorides, and fluorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Acridine A:0370

Formula: $C_{13}H_9N$

Synonyms: 10-Azaanthracene; 9-Azaanthracene; 2,3-Benzoquinoline; Benzo(*b*)quinoline; Dibenzo(*b*,*e*)pyridine; Dibenzopyridine

CAS Registry Number: 260-94-6

HSDB Number: 634

RTECS Number: AR7175000

UN/NA & ERG Number: UN2713/153

EC Number: 205-971-6

Regulatory Authority and Advisory Information

Carcinogenicity: Coal-tar and similar materials may contain dibenzo(*b*,*e*)pyridine, a carcinogen. (See also Coal Tar Pitch Volatiles.) Acridine has not been identified as a carcinogen. Handle with caution as several related polynuclear aromatic hydrocarbons (PAHs) are known carcinogens. NIOSH has recommended that coal tar pitch volatiles, including PAHs be treated as potential human carcinogen.

California Proposition 65 Chemical[102]: (*Coke oven emissions*) Cancer 2/27/1987

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Environmental hazard.

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 307(a)(1) Toxic pollutant designated, pursuant to of the and is subject to effluent limitations as PAHs

United States National Primary Drinking Water Regulations: MCLG = 0 mg/L; MCL = 0.0002 mg/L as PAHs.

OSHA, 29CFR1910 Specifically Regulated Chemicals (see CFR1910.1002) as coal tar pitch volatiles

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1% as coal tar pitch volatiles

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn; Risk phrases: R22; R36/37/38; R62; Safety phrases: S22; S24/25; S36; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Acridine is crystalline solid made up of small, colorless or light yellow orthorhombic plates or needles. Molecular weight 179.22; density = 1.005 @ 20°C; boiling point = 346°C @ 760 mmHg; freezing/melting point = 108−110.5°C (sublimes @ 100°C); vapor pressure = 1 mmHg; heat of combustion = −15,800 Btu/lb = −8790 cal/g = −368 × 105 J/kg. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0.

Solubility in water = 38 mg/L; highly soluble in boiling water.

Potential Exposure: Acridine and its derivatives are widely used in the production of dyestuffs, such as acriflavine, benzoflavine, and chrysaniline; and in the synthesis of pharmaceuticals; such as aurinacrine, proflavine, and rivanol. A constituent of coal tar, coal tar creosote; found in wastes from gas and tar plants and coke oven emissions.

Incompatibilities: Strong acids, strong oxidizers.

Permissible Exposure Limits in Air

NIOSH IDLH = 80 milligram per cubic meter as benzene soluble aerosol or coal tar pitch volatiles

No PAC available.

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen

DFG MAK: Category 1, human carcinogen

EPA[32] suggests an ambient air limit of 162 μ/m^3 based on health effects.

Determination in Air: By fluorometry; NIOSH Analytical Method 5800, PACs

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms; therefore, the levels that may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/L, respectively.

Determination in Water: Harmful to aquatic life in small quantities. Octanol−water coefficient: Log $K_{ow} = \sim 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Acridine is a severe irritant to the conjunctiva of the eyes, the mucous membranes of the respiratory tract, and the skin. It is a powerful photosensitizer of the skin. Acridine causes sneezing on inhalation. Poisonous by ingestion and subcutaneous routes. Toxicity by ingestion = Grade 2; LD_{50} oral rat = 2000 mg/kg.

Long-Term Exposure: Yellowish discoloration of sclera and conjunctiva may occur. Mutational properties have been ascribed to acridine, but its effect on humans is not known. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies.

Points of Attack: Eyes, skin, and respiratory tract.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Evaluate the skin, eyes, and respiratory tract in the course of any placement or periodic examinations. CBC, chest X-ray, pulmonary function tests, photopatch testing, sputum cytology, urinalysis (routine) [cytology, hematuria], liver, kidney, and bladder function tests recommended for coal tar pitch volatiles[2].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. A protective layer of petroleum jelly, lanolin or castor oil has been recommended in ILO literature. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *NIOSH* (as coal tar pitch volatiles): *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2713 Acridine, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Apply carbon or peat absorbants to dissolved material. Dredge up solid material for removal to disposal area. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use water spray; or foam extinguishers, CO_2 and dry chemicals may not be effective. Thermal decomposition products may include oxides of nitrogen and carbon. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with nitrogen oxide removal from the effluent gas by scrubber, catalytic, or thermal device.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Acrolein is a highly flammable, clear to yellowish liquid. It has a piercing, disagreeable odor and causes tears. Molecular weight = 56.06; specific gravity (H_2O:1) = 0.843 @ 20°C (liquid)[9]; boiling point @ 1 atm = 53°C[9]; melting/freezing point = −88°C[9]; critical temperature = (estimate) 254°C[9]; critical pressure = (estimate) 737 psia = 50.0 atm[9]; Liquid surface tension = 24 dyn/cm = 0.024 N/m @ 20°C[9]; liquid water interfacial tension = (estimate) 35 dyn/cm = 0.035 N/m @ 20°C; relative vapor density (air = 1) = 1.94[9]; ratio of specific heats of vapor (gas) = 1.1487[9]; latent heat of vaporization = 216 Btu/lb = 120 cal/g[9]; heat of combustion = −12,500 Btu/lb = −6,950 cal/g[9]; heat of polymerization = (estimate) −50 Btu/lb = −28 cal/g = −1.2 × 105 J/kg[9]; vapor pressure = 210 mmHg @ 20°C[9]; 274 mmHg @ 25°C; flash point = −26°C (cc); autoignition temperature (unstable) = 220°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 3; reactivity 3; *(dimer)*: Health 1; flammability 2; reactivity 1₩. Explosive limits: LEL: 2.8%, UEL: 31.0%. Soluble in water; 20 g/100 mL @ 20°C.

Potential Exposure: Used as pharmaceutical; slimicide; and in production of cosmetics and food supplements; as an intermediate in the production of glycerine and in the production of methionine analogs (poultry feed protein supplements). It is also used in chemical synthesis (1,3,6-hexametriol and glutaraldehyde); as a liquid fuel; antimicrobial agent, in algae and aquatic weed control; and as a slimicide in paper manufacture; making plastics, drugs, and tear gas. Also, most allyl compounds may be metabolized to allyl alcohol which is metabolized to acrolein.

Incompatibilities: May form explosive mixture with air. Elevated temperatures or sunlight may cause explosive polymerization. A strong reducing agent; reacts violently with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Polymerizes exothermically on contact with small amounts of acids (including sulfur dioxide), alkalis, volatile amines and pyridines, salts, thiourea, oxidizing agents (air) and on exposure to light, and heat. Polymerization initiated by amines and pyridines occurs after a deceptive induction period. Water solutions of mineral acids and metal ions can initiate polymerization. The inhibitor (usually hydroquinone) greatly reduces tendency to polymerize[101]. Reacts with acids, alkalis, ammonia, amines, oxygen, peroxides. Shock-sensitive peroxides or acids may be formed over time. Attacks zinc and cadmium.

Permissible Exposure Limits in Air

NIOSH IDLH = 2 ppm

Conversion factor: 1 ppm = 2.33 milligram per cubic meter [A1]@ 25°C & 1 atm

Odor threshold = 0.174 ppm.

OSHA PEL: 0.1 ppm/0.25 milligram per cubic meter TWA

NIOSH REL: 0.1 ppm/0.25 milligram per cubic meter TWA; 0.3 ppm/ 0.8 milligram per cubic meter STEL

ACGIH TLV[1]: 0.1 ppm/0.23 milligram per cubic meter Ceiling concentration [skin]; not classifiable as a human carcinogen

PAC* Ver. 29[138]

PAC-1: **0.030**$_{\mathbf{A}}$ ppm

PAC-2: **0.10**$_{\mathbf{A}}$ ppm

PAC-3: **1.4**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category 3B

Arab Republic of Egypt: TWA 0.1 ppm (0.25 milligram per cubic meter), 1993; Australia: TWA 0.1 ppm (0.25 milligram per cubic meter); STEL 0.3 ppm, 1993; Austria: MAK 0.1 ppm (0.25 milligram per cubic meter), 1999; Belgium: TWA 0.1 ppm (0.23 milligram per cubic meter); STEL 0.3 ppm, 1993; Finland: STEL 0.1 ppm (0.25 milligram per cubic meter) [skin] 1993; France: VLE 0.1 ppm (0.25 milligram per cubic meter), 1999; Hungary: TWA 0.25 milligram per cubic meter; STEL 0.5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 0.05 milligram per cubic meter, 2003; Japan; 0.1 ppm (0.23 milligram per cubic meter), 1999; Norway: TWA 0.1 ppm (0.25 milligram per cubic meter), 1999; the Philippines: TWA 0.1 ppm (0.25 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.2 milligram per cubic meter, MAC (STEL) 0.5 milligram per cubic meter, 1999; Russia: TWA 0.1 ppm; STEL 0.2 milligram per cubic meter, 1993; Sweden: NGV 0.1 ppm (0.2 milligram per cubic meter), KTV 0.3 ppm (0.7 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (0.25 milligram per cubic meter), KZG-W 0.2 ppm (0.5 milligram per cubic meter), 1999; Turkey: TWA 0.1 ppm (0.25 milligram per cubic meter), 1993; United Kingdom: TWA 0.23 milligram per cubic meter; STEL 0.70 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: ceiling 0.1 ppm [skin].

Determination in Air: Use NIOSH Analytical Method #2501, OSHA Analytical Method #52.

Permissible Concentration in Water: To protect freshwater aquatic life on an acute basis 68 μg/L and on a chronic basis 21 μg/L. *To protect saltwater aquatic life*: 55 μg/L on an acute toxicity basis. To protect human health-320 μg/L[6]. In addition, two states have set guidelines for acrolein in drinking water[61]. These are both 320 μg/L as set by Arizona and Kansas.

Determination in Water: GC (EPA Method #603) or GC and mass spectrometry (EPA Method #624).

Octanol–water coefficient: Log $K_{ow} = 0.88$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: LD_{50} = (oral-rat) 44 mg/kg. This chemical can be absorbed through the skin, thereby increasing exposure. Eye and skin contact may cause intense tearing, irritation, blisters, and burns. Inhalation can irritate the lungs, causing irritation, coughing, wheezing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. If swallowed, produces acute abdominal pains. Extremely toxic; probable oral human lethal dose is 5–50 mg/kg, between sevendrops and one teaspoon for a 70-kg (150 lb) person. Inhalation of air containing 10 ppm of acrolein may be fatal in a few minutes. Death from cardiac failure accompanied by hyperemia and hemorrhage of the lungs and degeneration of the bronchial epithelium is possible. Acrolein causes acute respiratory and eye irritation; severe GI distress with slowly developing pulmonary edema (lung fill up with fluid), and skin irritation.

Long-Term Exposure: This chemical is a metabolite of cyclophosphamide, a well-recognized carcinogen and animal teratogen. Acrolein may cause mutations. Such chemicals have a cancer risk. Long-term exposure can cause drying and cracking of the skin. High or repeated lower exposure may cause permanent lung damage. Testing has not been completed to determine the carcinogenicity of acrolein. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55*: *Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Heart, lungs, eyes, skin, respiratory system.

Medical Surveillance: Preplacement and periodic medical examinations should consider respiratory, skin, and eye disease. For those with frequent or potentially high exposure, lung function tests are recommended before beginning work and at regular times after that. Chest X-ray, expired air, pulmonary function tests[2].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Prevent skin contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber gloves, suits, boots; Barricade coated suits; Trychem 1000 suits. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA/NIOSH *2 ppm*: Sa:Cf * (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge (s)]; or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. *Do not* store uninhibited acrolein under any circumstances. Protect against physical damage. Outside or detached storage is preferable. Inside storage should be in a standard flammable liquids storage room or cabinet. Before entering confined space where acrolein may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat and light. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Acrolein, stabilized, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquids. Inhalation Hazard Zone A.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.9/1.5
Night 2.5/4.1

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 2500/800
Then: Protect persons downwind (mi/km)
Day 5.8/9.3
Night 7.0+/11.0+*

*+ means distance can be larger in certain atmospheric conditions.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Take up very small spills for disposal by absorbing it in vermiculite, dry sand; or earth and disposing in a secured landfill or combustion chamber. Alternatively, cover with sodium bisulfite, add small amount of water and mix. Then, after 1 hour, flush with large amounts of water and wash site with soap solution. Liquid should not be allowed to enter confined space, such as a sewer, because of potential for explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. This chemical is a flammable liquid and explosion hazard. Under fire conditions, polymerization may occur, blocking relief valves leading to tank explosion. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration. Conditions are 816°C, 0.5 second minimum for primary combustion; 1093°C, 1.0 second for secondary combustion.

Canada, WHMIS, Ingredients Disclosure List concentration reporting Level: 0.1%.
Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; Risk phrases: R45; R46; R19; R20/21; R24/25; R33; R36/37/38; R43; R48/23/24/25; S41; R46; R53; R62; R63; Safety phrases: S41; S45; S53 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Acrylamide, in monomeric form, is an odorless, flake-like crystals. May be dissolved in a flammable liquid. Molecular weight = 71.08; specific gravity (H_2O:1) = 1.05 @ 25°C (liquid); 1.122 @ 30°C; boiling point = (decomposes) 175−300°C @ 1 atm; melting/freezing point = 85°C; vapor pressure = 0.0068 mmHg @ 20°C; relative vapor density (air = 1) = 1.0 @ 20; vapor density = 2.46; autoignition temperature = 240°C; flash point = 138°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 2. Soluble in water; solubility = 2155 g/L @ 30°C; 2045 g/L @ 25°C.

Potential Exposure: Added to water during sewage/wastewater treatment. Used in the manufacture of plastics, resins, rubber, synthetic textiles; as a dye, pigment. A major application for monomeric acrylamide is in the production of polymers as polyacrylamides. Polyacrylamides are used for soil stabilization, gel chromatography, electrophoresis, papermaking strengtheners, clarifications, and treatment of potable water and foods.

Incompatibilities: Acrylamide may decompose with heat and polymerize at temperatures above 84°C, or exposure to light, releasing ammonia gas. Reacts violently with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Reacts with reducing agents; peroxides, acids, bases, and vinyl polymerization initiators. Fine particles of dust form explosive mixture with air.

Permissible Exposure Limits in Air
NIOSH IDLH = 60 milligram per cubic meter, potential occupational carcinogen.
OSHA PEL: 0.3 milligram per cubic meter TWA [skin]
NIOSH REL: 0.03 milligram per cubic meter TWA [skin] Potential occupational carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV[1]: 0.03 milligram per cubic meter TWA inhalable fraction and vapors [skin]; confirmed animal carcinogen with unknown relevance to humans (2003)
PAC Ver. 29[138]
PAC-1: 0.09 milligram per cubic meter
PAC-2: 44 milligram per cubic meter
PAC-3: 100 milligram per cubic meter
DFG MAK: [skin]; danger of skin sensitization; Carcinogen Category 2; Germ Cell Mutagen Group 2 (2004).
Australia: TWA 0.3 milligram per cubic meter [skin], carcinogen, 1993; Austria:[skin], carcinogen, 1999; Belgium: TWA 0.3 milligram per cubic meter [skin], Carcinogen 1993; Denmark: TWA 0.03 milligram per cubic meter [skin], 1999; Finland: TWA 0.3 milligram per cubic meter; STEL 0.9 milligram per cubic meter, 1993; France: VME 0.1 ppm (0.3 milligram per cubic meter) [skin], continuous; carcinogen, 1999; Hungary: STEL 0.3 milligram per cubic meter [skin], carcinogen, 1993; Japan; 0.3 milligram per cubic meter [skin], 2A carcinogen, 1999; Norway: TWA 0.3 milligram per cubic meter, 1999; the Philippines: TWA 0.3 milligram per cubic meter [skin], 1993; Poland: TWA 0.1 milligram per cubic meter, 1999; Russia: STEL 0.2 milligram per cubic meter [skin], 1993; Sweden: NGV 0.03 milligram per cubic meter, KTV 0.1 milligram per cubic meter [skin], 1999; Switzerland; MAK-W 0.03 milligram per cubic meter [skin], carcinogen, 1999; United Kingdom: TWA 0.3 milligram per cubic meter [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans.

Determination in Air: Filter/Si gel; Methanol; GC/nitrogen/phosphorus detection; OSHA Analytical Method 21: The sampling train consists of a 13-mm glass fiber filter in a Swinnex cassette (available from the laboratory), followed by a standard silica gel tube. The filter and gaskets, within the cassette used to hold the filter, are extracted in the field in exactly 1 mL of methanol. This extraction is very important so a volumetric pipette calibrated to 1 mL must be used. The silica gel tube is extracted with methanol at the laboratory. Analysis is performed by GC using a nitrogen/phosphorous detector; or OSHA Analytical Method PV 2004: Samples are collected by drawing known volumes of air through OSHA versatile sampler (OVS-7) tubes, each containing a glass fiber filter and two sections of XAD-7 adsorbent. Samples are desorbed with a solution of 5% methanol 95% water and analyzed by high performance liquid chromatography (HPLC) using an ultraviolet detector.

Permissible Concentration in Water: Health advisories have been developed by EPA[48] on a long-term (7-year) basis as 0.02 mg/L for a 10-kg child and 0.07 mg/L for a 70-kg adult. A guideline for acrylamide in drinking water of 0.10 μg/L has been developed by the state of Minnesota[61].

Determination in Water: There is no standardized method for the determination of acrylamide in drinking water. An analytical procedure for the determination of acrylamide has been reported in the literature. This procedure consists of bromination, extraction of the brominated product from water with ethyl acetate and quantification using HPLC with an ultraviolet detector. The concentration of the ethyl acetate to dryness and dissolution in a small volume of distilled water prior to HPLC analysis allows the detection of acrylamide at concentrations of 0.2 μg/L[48]. Octanol−water coefficient: Log $K_{ow} = -0.65$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Eyes, skin, central, and peripheral nervous systems, reproductive system. Acrylamide can be absorbed through unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Symptoms of exposure include: complaints of drowsiness, fatigue, tingling of fingers. A stumbling, propulsive type of walking with sense of unsteadiness have been reported. Motor and sensory impairment, numbness, tremor, abnormal feelings in the lower limbs accompanied by weakness, and speech disturbances were also reported. Classified as very toxic; probably oral lethal human dose is between 50 and 500 mg/kg or between 1 teaspoon and 1 ounce for a 150-lb person. Polymerized acrylamide may not be toxic, but the monomer can cause peripheral nerve damage. Toxic effects exacerbated by alcohol consumption.

Long-Term Exposure: There is evidence that acrylamide causes cancer in animals. It may cause skin and lung cancer in humans. There is limited evidence that this chemical damages the male testes. It can cause damage to the CNS; causing numbness, and weakness of the hands and feet. Acrylamide is a cumulative neurotoxin and repeated exposure to small amounts may cause serious injury to the nervous system. The neurological effects may be delayed. Polymer inhibitors or stabilizers added to the monomer may also produce toxicity. The symptoms of acrylamide toxicity are consistent with mid-brain lesions and blocked transport along both motor and sensory axons.

Points of Attack: CNS; peripheral nervous system; skin and eyes.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Since skin contact with the substance may result in localized or systemic effects, NIOSH recommends that medical surveillance be made available to all employees working in an area where acrylamide is stored, produced, processed, or otherwise used, except as an unintentional contaminant in other materials at a concentration of less than 1% by weight. For those with frequent or potentially high exposure, nerve condition tests should be considered The use of alcoholic beverages may enhance the harmful effects. Nerve conduction studies[2].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately. If this chemical contacts the skin, flush with water immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform artificial respiration. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. **8 hours** (More than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber gloves, suits, boots; Tychem 1000 suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): nitrile rubber gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Viton gloves, suits; 4H; and Silver Shield gloves. Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. Wear-protective eye protection, gloves, and clothing to prevent repeated or prolonged skin contact. Wear dust-proof eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately when skin is wet or contaminated. Work clothing should be changed daily if clothing is contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store only if stabilized, under inert gas. Before entering confined space where acrylamide may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2074 Acrylamide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Use water spray to reduce vapors. Remove all ignition sources. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Should you need to seek emergency information, call CHEMTREC at (800) 424-9300, or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Fire Extinguishing: A combustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Dike fire control water for later disposal; do not scatter the material.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Acrylamide residue and sorbent material may be packaged in epoxy-lined drums and taken to an EPA-approved disposal site. Incineration with provisions for scrubbing of nitrogen oxides from flue gases. Deep well injection.

Hazardous to aquatic life or environment, with possible long-lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C, N, Xi; Risk phrases: R10; R19; R20/21/22; R35; R36/37/38; R50; R62; R63; Safety phrases: S1/2; S26; S29/35; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Acrylic acid is a colorless, flammable, and corrosive liquid or solid (below 13°C) with an irritating, rancid, odor. Sinks and mixes with water; irritating vapor is produced. Molecular weight = 72.07; specific gravity (H_2O:1) = 1.05; vapor pressure = 3 mmHg @ 20°C; freezing/melting point = 12−14°C; boiling point = 141°C; relative vapor density (air = 1): 2.48; flash point = 50°C (oc) [glacial]; 54°C (oc); autoignition temperature = 438°C[17]; 360°C. Explosive limits: LEL: 2.4%, UEL: 8.02%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 2. Soluble in water.

Potential Exposure: Acrylic acid is chiefly used in manufacture of plastics, acrylates, polyacrylic acids, polymer, and resins; as a monomer in the manufacture of acrylic resins and plastic products, leather treatment, and paper coatings. Also, it is used as a tackifier and flocculant.

Incompatibilities: May form explosive mixture with air. Light, heat, and peroxides can cause polymerization. Use MEHQ (monomethyl ether of hydroquinone) as an inhibitor. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with sulfuric acid, caustics, ammonia, amines, isocyanates, alkylene oxides; epichlorohydrin, toluene diamine, oleum, pyridine, methyl pyridine, *n*-methyl pyrrolidone, 2-methyl-6-ethyl aniline, aniline, ethylene diamine, ethyleneimine, and 2-aminoethanol. Severely corrodes carbon steel and iron; attacks other metals. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion: 1 ppm = 2.95 milligram per cubic meter

Odor threshold = 0.092 ppm.

OSHA PEL: None

NIOSH REL: 2 ppm/6 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 2 ppm/5.9 milligram per cubic meter TWA [skin]; not classifiable as a human carcinogen

PAC* Ver. 29[138]

PAC-1: $\mathbf{1.5_A}$ ppm

PAC-2: $\mathbf{46_A}$ ppm

PAC-3: **180_A** ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 10 ppm/30 milligram per cubic meter; Peak Limitation Category I(1); Pregnancy Risk Group C

Australia: TWA 10 ppm (30 milligram per cubic meter), 1993: Belgium: TWA 10 ppm (29 milligram per cubic meter), 1993: Denmark: TWA 2 ppm (5.9 milligram per cubic meter) [skin], 1999: France: VME 10 ppm (30 milligram per cubic meter), 1999:Norway: TWA 10 ppm (30 milligram per cubic meter), 1999: Russia: STEL 5 milligram per cubic meter, 1993: The Netherlands: MAC-TGG 5.9 milligram per cubic meter, 2003: Switzerland: MAK-W 0.03 milligram per cubic meter [skin], carcinogen, 1999: United Kingdom: TWA 10 ppm (30 milligram per cubic meter), STEL 20 ppm (60 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen.

Determination in Air: XAD[2]; Methanol/Water; High-pressure liquid chromatography/Ultraviolet detection; OSHA Analytical Method #28.

Determination in Water: Toxic to marine organisms. Octanol−water coefficient: Log $K_{ow} \leq 0.4$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin and eye contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Skin and eye contact can cause burns and permanent damage. Inhaling this chemical can cause respiratory tract irritation.

Long-Term Exposure: Acrylic acid may cause skin allergy and lung and kidney damage.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Consider Lung function tests in preplacement and regular physical examinations. Kidney function tests if symptoms develop or overexposure is suspected. Skin testing with dilute acrylic acid may be used by a qualified allergist to diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Prevent skin contact. **8 hours** (More than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber gloves, suits, boots; Saranex, Responder suits, Trellchem HPS suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Teflon gloves, suits, boots; Viton gloves, suits; 4H and Silver Shield gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. In an emergency use NIOSH/MSHA or European Standard EN 149-approved SCBA.

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Do not allow to solidify. Can be stored only in glass, stainless steel, aluminum, or polyethylene-lined containers. Before entering confined space where acrylic acid may be present, check to make sure that an explosive concentration does not exist. Acrylic acid is a dangerous explosion hazard unless it is stored with an inhibitor. Store in tightly closed containers in a cool, well-ventilated area away from heat and sunlight. Do not freeze or refrigerate acrylic acid. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2218 Acrylic acid, stabilized, Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Cover spill with soda ash or sodium bicarbonate. Mix and add water. Neutralize and flush into sewer. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Keep acrylic acid out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. In advanced or massive fires, firefighting should be done from a safe distance or from a protected location. If a leak or spill has not ignited, use water spray to disperse the vapors. Water spray may be used to flush spills away from exposures and to dilute spills to nonflammable mixtures. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration. 100−500 ppm potassium permanganate will degrade acrylic acid to a hydroxy acid which can be disposed of at a sewage treatment.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+ , F, N, Xi; Risk phrases: R45; R11; R19; S21; R23/24/25; R36/37/38; R41; R43; R50/53; R62; R63; Safety phrases: S1; S; S16; S29/35; S36/36; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Acrylonitrile is a highly flammable, clear, colorless or light yellowish liquid. Irritating, faint garlic- or onion-like odor. Its odor threshold is 17 ppm; odor can only be detected above the PEL. Molecular weight = 53.06; specific gravity (H_2O:1) = 0.801 @ 20°C; boiling point = 77.4°C @ 1 atm; melting/freezing point = −83.6°C; critical temperature = 263°C; critical pressure = 660 psia = 45 atm = 4.6 MN/m^2; specific gravity (H_2O:1) = 0.8075 @ 20°C; relative vapor density (air = 1) = 1.83; ratio of specific heats of vapor (gas) = 1.151; latent heat of vaporization = 265 Btu/lb = 147 cal/g = 6.16 × 105 J/kg; heat of combustion = −14,300 Btu/lb = −7930 cal/g = −332 × 105 J/kg; ionization potential = 10.9 eV; vapor pressure = 83 mmHg @ 20°C; saturation concentration in air = 257 g/m^3 @ 20°C; flash point = 0°C[17]; −5°C[52]; autoignition temperature = 480°C; explosive limits: LEL = 3%, 30,000 ppm; UEL = 17%. Hazard identification (based on NFPA-704 M Rating System) = Health 4; flammability 3; reactivity 2. Floats on water and is moderately soluble; solubility = 7.3 g/mL @ 20°C.

Potential Exposure: Acrylonitrile is used in the manufacture of synthetic fibers, polymers, acrylostyrene plastics, acrylonitrile−butadiene−styrene plastics, nitrile rubbers, chemicals, and adhesives. It is also used as a pesticide. In the past, this chemical was used as a room fumigant and pediculicide (an agent used to destroy lice).

Incompatibilities: May form explosive mixture with air. Reacts violently with strong acids; strong alkalis; bromine, and tetrahydrocarbazole. Copper, copper alloys, ammonia, and amines may cause breakdown to poisonous products. Unless inhibited (usually with methylhydroquinone), acrylonitrile may polymerize spontaneously. It may also polymerize on contact with oxygen, heat, strong light, peroxides, and concentrated or heated alkalis. Reacts with oxidizers, acids, bromine, amines. Attacks copper and copper alloys. Attacks aluminum in high concentrations. Heat and flame may cause release of poisonous cyanide gas and nitrogen oxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 85 ppm, potential occupational carcinogen.

Conversion factor: 1 ppm = 2.21 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 17 ppm; odor can only be detected above the PEL.

OSHA PEL:[1910.1045] 2 ppm TWA [skin]; 10 ppm [15 min.] Ceiling Concentration

NIOSH REL: 1 ppm TWA; 10 ppm [15 min.] Ceiling Concentration; [skin] potential occupational carcinogen

ACGIH TLV[1]: 2 ppm/4.3 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC* Ver. 29[138]

PAC-1: 0.15 ppm

PAC-2: $\mathbf{1.7_A}$ ppm

PAC-3: $\mathbf{28_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: [skin]; Carcinogen Category: 2; Danger of skin sensitization (2006); TRK: 3 mL/m^3/7 milligram per cubic meter; Sampling time: not fixed; 420 μg[erythrocytes cyanoethylvaline]/L blood.

Arab Republic of Egypt: TWA 2 ppm [skin], 1993; Australia: TWA 2 ppm (4.5 milligram per cubic meter) [skin], carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 2 ppm (4.3 milligram per cubic meter) [skin], Carcinogen 1993; Denmark: TWA 2 ppm (4 milligram per cubic meter) [skin], 1999; Finland: TWA 2 ppm (4.5 milligram per cubic meter); STEL 4 ppm [skin], carcinogen, 1993; France: VME 2 ppm (4.5 milligram per cubic meter), VLE 15 ppm (32.4 milligram per cubic meter), carcinogen, 1999; Hungary: STEL 0.5 milligram per cubic meter [skin], carcinogen, 1993; India: TWA 2 ppm (4.5 milligram per cubic meter) [skin], carcinogen, 1993; Japan; 2 ppm (4.3 milligram per cubic meter) [skin], 2A carcinogen, 1999; Norway: TWA 2 ppm (4 milligram per cubic meter), 1999; the Philippines: TWA 20 ppm (45 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 2 milligram per cubic meter, MAC (STEL) 10 milligram per cubic meter, 1999; Russia: TWA 2 ppm; STEL 0.5 milligram per cubic meter [skin], 1993; Sweden: NGV 2 ppm (4.5 milligram per cubic meter), KTV 6 ppm [skin], carcinogen, 1999; Switzerland: MAK-W 2 ppm (4.5 milligram per cubic meter) [skin], carcinogen, 1999; Turkey: TWA 20 ppm (45 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 2 ppm (4.4 milligram per cubic meter) [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for acrylonitrile in ambient air[60]: 0.0147 μ/m^3 (Indiana) to 0.145 μ/m^3 (North Carolina) to 0.15 μ/m^3 (Massachusetts) to 11.3 μ/m^3 (Pennsylvania) to 15.0 μ/m^3 (New York) to 22.0 μ/m^3 (Connecticut and South Dakota) to 22.5 μ/m^3 (South Carolina) to 45.0 μ/m^3 (Florida and Virginia).

Determination in Air: Charcoal adsorption followed by acetone extraction and gas chromatographic analysis. Use NIOSH Analytical Method 1604[18], or OSHA Analytical Method 37 where samples are collected on charcoal, desorbed with acetone, and analyzed by GC using a nitrogen/phosphorus detector.

Permissible Concentration in Water: The substance is toxic to aquatic organisms. Acrylonitrile usually breaks down in about 1 or 2 weeks, but this can vary depending on conditions. For example, high concentrations (such as might occur following a spill) tend to be broken down more slowly. In one case, measurable amounts of acrylonitrile were found in nearby wells 1 year after a spill (ATSDR public Health Statement, December 1990). See RCRA and Clean Water Act under "Regulatory Authority and Advisory Information." To protect freshwater aquatic life (on an acute basis), 7550 μg/L and on a chronic basis, 2600 μg/L over 30 days. *To protect saltwater aquatic life*: insufficient data to yield a value. *To protect human health*: preferably zero. Water concentration should be below 0.58 μg/L to keep lifetime cancer risk below 10^{-5}. Russia[43] set a MAC of 2.0 mg/L for water bodies used for domestic purposes. The Mexico drinking water ecological criteria is 0.0006 mg/L, reduce human exposure to a minimum. Several states have set guidelines for acrylonitrile in drinking water[61] ranging from 0.67 μg/L (Minnesota) to 3.8 μg/L (Kansas) to 10 μg/L (Arizona) to 35 μg/L (Connecticut).

Determination in Water: GC/Flame ionization detection; NIOSH Analytical Method (IV) #1604. Also, by GC (EPA Method #603) or GC plus mass spectrometry (EPA Method #624). Octanol−water coefficient: $\text{Log}\,K_{\text{ow}} = -0.91$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation and percutaneous absorption. It may be absorbed from contaminated rubber or leather. Routes include ingestion and eye and skin contact. Acrylonitrile vapor is absorbed readily from the lungs; and inhalation is an important route of exposure. This chemical's odor generally provides inadequate warning of hazardous concentrations and olfactory fatigue develops rapidly.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin, and respiratory tract. Splashes in the eye may result in corneal damage. Skin contact can cause severe irritation and blistering. Breathing acrylonitrile can irritate the lungs, causing coughing, and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can result in death. Skin contact contributes significantly in overall exposure and can lead to systemic toxicity. Acrylonitrile reaction causes redness, blisters and some systemic signs. Symptoms derive from tissue anoxia in order of onset: limb weakness, dyspnea (difficult breathing); burning sensation in throat; dizziness, impaired judgment; cyanosis (turning blue); nausea, collapse, irregular breathing; convulsions and death. In later stages collapse, irregular breathing or convulsions and cardiac arrest may occur without warning. Some patients appear hysterical or may even be violent. Acrylonitrile is classified as very toxic. Probable oral lethal dose for human is 50−500 mg/kg (between 1 teaspoon and 1 oz.) for a 70-kg (150 lb) person. Toxic concentrations have been reported @ 16 ppm/20 min. Acute toxicity is similar to that due to cyanide poisoning and the level of cyanide ion in blood is related to the level of poisoning. Inhalation or ingestion can result in fatal systemic poisoning, collapse and death due to tissue anoxia (lack of oxygen) and cardiac arrest (heart failure). At higher concentrations, there may be damage to red blood cells and the liver. Jaundice may develop 24 hours following exposure and persist for several days. Because of continued metabolic release of cyanide, symptoms of severe poisoning may recur and the patient may relapse.

Long-Term Exposure: This chemical is a probable carcinogen in humans. There is some evidence that it causes lung and large intestine cancer in humans and has been shown to cause brain and stomach cancer in animals. Exposure may cause the thyroid gland to enlarge and interfere with normal thyroid function. There is limited evidence that acrylonitrile may damage the developing fetus and the male reproductive system. Repeated exposure can irritate the nose, causing discharge, nose bleeds, and sores inside the nose. Acrylonitrile may affect the liver function.

Points of Attack: Eyes, skin, cardiovascular system, liver, kidneys, CNS. *Cancer site*: brain tumors, lung, and bowel cancer.

Medical Surveillance: For those with frequent or high exposure, consider urine thiocyanate levels, blood cyanide levels, liver function tests; fecal occult blood screening, pulmonary function tests. Consider the skin, respiratory tract, heart, CNS; renal and liver function in placement and periodic examinations. A history of fainting spells or convulsive disorders might present and added risk to persons working with toxic nitriles. Fecal occult blood screening for workers 40 years of age or older and chest X-ray *Code of Federal Regulations. 29 CFR Part 1910* Occupational Safety and Health Standards. Part 1910.1045, Page 319[2]. Pulmonary function tests, Blood cyanide, Blood plasma, Blood serum, Expired air, Urine (chemical/metabolite)[2].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Prevent skin contact. **8 hours** (More than 8 hours of resistance to breakthrough $>0.1\ \mu\text{m} > \text{g/cm}^2\text{/min}$): butyl rubber gloves, suits, boots; 4 H and Silver Shield gloves; Barricade coated suits; Responder suits; Trychem 1000 suits. Wear-protective eye protection, gloves, and clothing to prevent repeated or prolonged skin contact. Leather should not be used in protective clothing since it is readily penetrated by acrylonitrile; contaminated leather shoes and gloves should be destroyed. rubber clothing should be frequently washed and inspected because it will soften and swell. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Contact lenses should not be worn when working with this substance. Employees should wash immediately when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Provide emergency showers. See also NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: < or = 20 ppm (parts per million): (1) Chemical cartridge respirator with organic vapor cartridge(s) and half-mask facepiece; or (2) Supplied-air respirator with half-mask facepiece. < or = 100 ppm or maximum use concentration of cartridges or canisters, whichever is lower: (1) Full-facepiece respirator with (A) organic vapor cartridges, (B) organic vapor gas mask, chin-style, or (C) organic vapor gas mask canister, front- or back-mounted; (2) Supplied-air respirator with full facepiece; or (3) SCBA with full facepiece. < or = 4000 ppm: Supplied-air respirator operated in positive-pressure mode with full facepiece, helmet, suit, or hood. >4000 ppm or unknown concentration: (1) Supplied-air and auxiliary SCBA with full facepiece in positive-pressure mode or (2) SCBA with full facepiece in positive-pressure mode.

Firefighting: SCBA with full facepiece in positive-pressure mode. *Escape*: (1) Any organic vapor respirator or (2) Any SCBA.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. See incompatibilities for materials and physical conditions not permitted in storage room or cabinet. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store in tightly closed containers in a cool, well-ventilated area. Do not store uninhibited acrylonitrile under any conditions. Store drums on end with bungs up, no more than two high. Outside tanks should be above ground and surrounded with dikes of sufficient capacity to hold entire tank contents. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1093 Acrylonitrile, stabilized, Hazard Class 3; Labels: 3 Flammable liquids, 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep acrylonitrile out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Acrylonitrile is a dangerously reactive and flammable liquid. Thermal decomposition products may include hydrogen cyanide. A few "whiffs" of vapor could cause death. Vapor or liquid could be fatal on penetrating the fire fighter's normal full protective clothing. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. May react with itself without warning, blocking relief valves, and leading to container explosion. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. *Small fires*: dry chemical, carbon dioxide; water spray or foam. *Large fires*: water spray, fog, or foam. Stay away from ends of tanks. Do not get water inside container. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. From a secure explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with provision for nitrogen oxides removal from effluent gases by scrubbers or afterburners. A chemical disposal method has also been suggested involving treatment with alcoholic NaOH; the alcohol is evaporated and calcium hypochlorite added; after 24 hours the product is flushed to the sewer with large volumes of water. Recovery of acrylonitrile from acrylonitrile process effluents is an alternative to disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Acryloyl chloride is a highly flammable, polymerizable, and toxic (inhalation), light yellow liquid. A lacrimator. Molecular weight = 90.51; boiling point = 75°C; specific gravity (H_2O:1) = 1.114 @ 20°C. Flash point = 14°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 2₩. Reacts violently with water.

Potential Exposure: May be used as a monomer in preparation of specialty polymers or as a chemical intermediate.

Description: Molecular weight = 90.5; specific gravity (H_2O:1) = 1.114 @ 20°C; boiling point = 72−77°C; vapor pressure = 300 mmHg @ 20°C (more?).

Incompatibilities: Use MEHQ (monomethyl ether of hydroquinone) as an inhibitor. Incompatible with oxidizers, polymerizes on contact with oxygen; alcohols, amines, alkalis. Reacts violently with water, releasing hydrochloric acid and acrylic acid. Attacks some metals.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.022 ppm

PAC-2: 0.24 ppm

PAC-3: 0.87 ppm

Routes of Entry: Inhalation and percutaneous absorption. Can be absorbed through the eyes.

Harmful Effects and Symptoms

Short-Term Exposure: A highly toxic and corrosive lacrimator. Inhalation, skin absorption, or ingestion can be fatal. Highly destructive to the mucous membranes and upper respiratory system, skin, and eyes. May cause blindness. Skin contact can cause burns.

Harmful Effects and Symptoms

LC_{50} (inh., mouse, 2 hours) = 92 milligram per cubic meter; this may be the basis for inclusion in the EPA "Extremely Hazardous Substances" list[72]. Inhalation may cause burning feeling, coughing, shortness of breath, headache, dizziness, nausea, and vomiting; spasm, inflammation; chemical pneumonitis. Exposure an cause pulmonary edema, a medical emergency that can result in death.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: PIH; check oxygen content prior to entering storage area. Polymerizable on contact with oxygen. Use MEHQ (monomethyl ether of hydroquinone) as an inhibitor. (1) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (3) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3383 Poisonous Toxic by inhalation liquid, flammable, n.o.s. with an LC50 $\leq$ 200 mL/m^3 and saturated vapor concentration $\geq$500 LC50, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid, Technical Name Required, Inhalation Hazard Zone A. UN2924 Flammable liquids, corrosive, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.5/0.8
Night 1.1/1.8

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 2.5/4.1
Night 4.1/6.6

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Violent reaction with water. Thermal decomposition products may include oxides of carbon. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Actinomycin D A:0430

Formula: $C_{62}H_{86}N_{12}O_{16}$

Synonyms: Actinomicina D (Spanish); Actinomycindioic D acid, dilactone; Actinomycin I; AD; Cosmegen; Dactinomycin; Dactinomicina (Spanish); Dilactone actinomycindioic D acid; HBF 386; Lyovac cosmegen; Meractinomycin; Oncostatin K

CAS Registry Number: 50-76-0

HSDB Number: 3220 as Dactinomycin

RTECS Number: AU1575000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 200-063-6

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Carcinogenesis Studies (ipr); clear evidence rat; no evidence mouse; IARC: Animal Inadequate Data; Human No Available Data, Group 3, 1987

California Proposition 65 Chemical[102]: Cancer 10/1/1989; Developmental/Reproductive toxin 1/1/1989.

Hazard Alert: Exposure can be lethal, Possible risk of forming tumors, Reproductive toxin: Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Drug.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xi; Risk phrases: R45; R61; R14; R26/27/28; R36/37/38; R40; R61; Safety phrases: S1; S22; S28; S36/37/39; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (Est.)]

Description: Actinomycin D is a combustible, bright red crystalline solid. Molecular weight = 1255.5; freezing/melting point = 241.5° to 243°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 0; reactivity 0. Soluble in water.

Potential Exposure: An antibiotic product from *streptomyces*, used as anticancer and veterinary drug.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: intravenous, skin, eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Highly Toxic. Irritates eyes and skin. A poison if ingested. LD_{50} = (oral-rat) 7.2 mg/kg.

Long-Term Exposure: Has been shown to cause peritoneal and local sarcomas in animals. May damage the developing fetus.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. CBC, EKG.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers may be able to provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or other cool, dry place.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen with 60%−70% ethanol to avoid airborne dust then transfer to a suitable sealed container in the most convenient and safe manner. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xi; Risk phrases: R45; R23/25; R36/37/38; R50/53; R68/20; Safety phrases: S29; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Adamsite, or Agent DM, is a light green to yellow, crystalline, organometallic solid at room temperature; it can be dark green depending on purity and age; canary yellow when concentrated; colorless when diluted with air. Odorless but irritating; similar to pepper. Molecular weight = 277.6; specific gravity (H_2O:1) = 1.65; boiling point = 410°C; freezing/melting point = 193−195°C; vapor pressure = very low; 2×10^{-13} mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. Practically insoluble in water. Not readily soluble in any of the liquid chemical warfare agents.

Potential Exposure: Adamsite (military designation DM), a chloroarsenical, was first produced during World War I. Adamsite (DM) is used as a riot control or harassing agent, tear gas, and (vomiting agent) gas. It was designed as a battlefield agent and can be dissolved in acetone and dispersed as an aerosol. Adverse health effects due to exposure to adamsite (DM) are generally self-limited and do not require specific therapy. Most adverse health effects resolve within 30 minutes. Exposure to large concentrations of adamsite (DM), or exposure to adamsite (DM) within an enclosed space or under adverse weather conditions, may result in more severe adverse health effects, serious illness, or death. Adamsite (DM) is more disagreeable than tear gas, but less dangerous than sarin. It is considered to be too extreme for use against civilian populations, and was banned for this use in the 1930s by western nations. Produced worldwide, DM was superseded by the CN series of tear agents. It produces irritation to the upper respiratory tract and the eyes. Although DM has been replaced by CS, it might be mixed with a nerve agent. This may cause a vomiting victim to remove respiratory protection and be exposed to the more lethal agent.

Persistence of Chemical Agent: Short, because compounds are disseminated as an aerosol. *Soil*: persistent; *Surface of materials* (wood, metal, masonry, rubber, paint): persistent. *Water*: persistent; when material is covered with water, an insoluble film forms which prevents further hydrolysis.

Incompatibilities: A reducing agent and an organometallic, reacts, possibly violently, with oxidizers, acids and bases. Slowly hydrolyzes in water. *Stability*: stable in pure form; after 3 months, caused extensive corrosion of aluminum, anodized aluminum, and stainless steel; will corrode iron, bronze, and brass when moist. *Corrosive properties*: titanium—71°C, 6 months, appeared good. Stainless steel—43°C, 30 days, slight discoloration. Common steel—43°C, 30 days, covered with rust. Aluminum anodized—43°C, 30 days, minor corrosion and pitting. Aluminum—43°C, 30 days, severe corrosion. Contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air

PAC* ver.29

PAC-1: $\mathbf{0.016_A}$ milligram per cubic meter

PAC-2: $\mathbf{2.6_A}$ milligram per cubic meter

PAC-3: $\mathbf{6.4_A}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

NOAEL (no-observed-adverse-effect-level, inhalation) = 4 mg min/m^3.

Determination in Air: No method is available to detect Adamsite in environmental samples.

Permissible Concentration in Water: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry. People should not drink water containing DM. Warn pollution control authorities and advise shutting water intakes. Octanol−water coefficient: Log K_{ow} = ~4. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation

Harmful Effects and Symptoms

Adamsite (Agent DM) is a vomiting compound. It is normally a solid, but upon heating, DM first vaporizes and then condenses to form aerosols. It is toxic through inhalation, ingestion, and skin contact. Adamsite is dispersed as an aerosol, irritating to the eyes and respiratory tract but not necessarily to the skin. Under field conditions, vomiting agents can cause great discomfort to the victims; when released indoors, they can cause serious illness or death. Symptoms include irritation of eyes and mucous membranes; coughing, sneezing, severe headache, acute pain, and tightness in the chest; nausea and vomiting. DM has been noted to cause necrosis of corneal epithelium in humans. The human body will detoxify the effects of mild exposures within 30 minutes of evacuation. Severe exposures may take several hours to detoxify and minor sensory disturbances may persist for Up to one day. The majority of exposures occur by inhalation and typically lead to symptoms of ocular, nasal, and respiratory tract irritation. Nonspecific GI symptoms (e.g., vomiting or diarrhea) might also occur. The effects of adamsite poisoning take minutes to begin and might last for hours. If a rapid onset of manifestations of one of the following respiratory effects occurs, the clinical description for adamsite poisoning has been met: nose or throat irritation, cough, or dyspnea.

Short-Term Exposure: The majority of exposures occur by inhalation and typically lead to symptoms of ocular, nasal, and respiratory tract irritation. Nonspecific GI symptoms (e.g., vomiting or diarrhea) might also occur. The effects of adamsite poisoning appear within minutes of exposure and might last for hours. If a rapid onset of manifestations of one of the following respiratory effects occurs, the clinical description for adamsite poisoning has been met: nose or throat irritation, cough, or dyspnea (CDC).

Long-Term Exposure: No assessment has been made of possible long-term effects of short-term exposures to Adamsite. However, see medical surveillance, below.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pulmonary function tests and radiographic imaging, especially those who have persistent symptoms of dyspnea, cough, or chest discomfort.

First Aid: *Inhalation*: *Never* perform mouth to mouth resuscitation, or you will get sick. Remove victim to fresh air; wear a mask/respirator in spite of coughing, sneezing, salivation, and nausea; lift the mask from the face briefly, if necessary, to permit vomiting or to drain saliva from the facepiece; seek medical attention immediately. *Eye contact*: Don a respiratory protective mask; seek medical attention immediately. *Skin contact*: Rinse the nose and throat with saline water or bicarbonate of soda solution; wash exposed skin and scalp with soap and water and allow to dry on the skin; dust the skin with borated talcum. *Ingestion*: seek medical attention immediately; carry on duties as vigorously as possible; this will help to lessen and shorten the symptoms.

Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Decontamination: Decontaminate as soon as possible. This is extremely important. Victims will be removed immediately to an uncontaminated atmosphere. Personnel handling casualty cases will give consideration to their own safety and will take precautions and employ the prerequisite protective equipment to avoid becoming exposed themselves. If you don't have the equipment and training don't enter the hot or the warm zone to rescue and decontaminate victims. If the victim can't move, begin the decontamination process without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Wash—strip—wash—evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and up-hill direction. Contaminated clothes and personal belongings should be placed in a sealed double bag. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but don't let any of the bleach solution get in the victim's eyes, open wounds, or mouth. Rinse off the diluted bleach solution after 15 minutes. In order to prevent spreading the agent, be certain the victims have been decontaminated as much as possible before they leave the decontamination area. If you get any amount of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. Note: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE)*: select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APR or PAPR are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, *Inorganic Arsenic*. Protective Gloves: Wear Norton chemical protective glove set, Wear chemical goggles; wear a mask/respirator in open areas.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.*

At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location away from acids. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or cool, well-ventilated area. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1698 DPA chloroarsine, Hazard class: 6.1; Label: 6.1-Poisonous materials. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling: Issue poison warning. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Agent DM when used as a weapon

Initial Isolation and Protective Action Distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.9/1.5

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, arsenic, arsine, and oxides of nitrogen and carbon. In case of fire, *do not put out the fire*. DM vapor and liquid are so bad that the fire is safer than the unburned DM. If there is some reason that you have to put out the fire—for example, there are things you can't let burn nearby—use water or ordinary foam. It's always best to use a spray or fog pattern rather than a solid stream, to avoid spreading the burning liquid around. In the unlikely situation where there is a pile of DM canisters adjacent to a fire, cool the canisters with large amounts of water, but first evacuate the area—if the canisters rupture from heating, toxic gases could kill. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Approximately 9 t of Adamsite were discovered on the territory of Poland after World War II. This agent was stored in steel barrels and special preventive measures were undertaken in order to protect it against spreading. The Polish government decided to destroy the abandoned Adamsite and different suitable technologies were considered. The first laboratory experiments have started in 1996 and elimination of the Adamsite on semitechnical scale will begin by June 1998. In this paper, methods of neutralization of Adamsite, based on its hydrolysis with hydrochloric acid, reduction with phosphorous acid and fusion with sulfur are discussed. These methods were found to be useful at the laboratory scale. Advantages and disadvantages of considered methods of destruction of organic arsenical agents have been discussed. The most promising method seems to be the reduction of Adamsite with phosphorous acid. The products of this reaction are: metallic arsenic, DPA and hydrogen chloride. These products can be separated and reused or neutralized.

Adipic Acid A:0440

Formula: $C_6H_{10}O_4$; $HOOC(CH_2)_4COOH$
Synonyms: Acido adipico (Spanish); Acifloctin; Acinetten; Adilac-tetten; Adipinic acid; 1,4-Butanedicarboxylic acid; Dicarboxylic acid C_6; 1,6-Hexanedioic acid; Hexanedioic acid
CAS Registry Number: 124-04-9
HSDB Number: 188
RTECS Number: AU8400000
UN/NA & ERG Number: UN3077 (solid)/177
EC Number: 204-673-3 [*Annex I Index No*.: 607-144-00-9]
Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Negative: Cell transformation-SA7/SHE; TRP reversion.

Hazard Alert: Combustible, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Clean Water Act, 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg), SARA 313[4]

Canada, WHMIS, Ingredients Disclosure List Concentration 1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; Risk phrases: R36/37/38; R62; Safety phrases: S26; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Adipic acid is a combustible, white, crystalline solid or powder. Odorless. Molecular weight = 146.15; specific gravity (H_2O:1) = 1.37 @ 20°C (solid); boiling point = (decomposes) 337.5°C @ 760 mmHg; freezing/melting point = 152°C; vapor pressure = 7.7×10^{-4}; 10 Pa @ 18.5°C; relative vapor density (air = 1) = 5.04; flash point = 196°C (cc). Explosive limits: LEL: 16,000 ppm: 3% (*dust*): 10−15 mg/L; autoignition temperature = 421°C; heat of combustion = −8242 Btu/lb = −4579 cal/g = -191.6×10^5 J/kg; heat of vaporization = 19,570.2 g cal/g mol. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0. Slightly soluble in hot water; solubility = 1.5%.

Potential Exposure: Workers in manufacture of nylon, plasticizers, urethanes, adhesives, and food additives.

Incompatibilities: Dust may form explosive mixture with air. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates, and dithionites (releasing hydrogen sulfate and oxides of sulfur). Reacts with oxidizers, reducing agents; and strong bases. Dust forms an explosive mixture with air. Friction from stirring, pouring, or pneumatic transfer can form electrostatic charge on dry material. React violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Mixture with some silver compounds forms explosive salts of silver oxalate. Incompatible with silver compounds. Corrosive to some metals.

Permissible Exposure Limits in Air

ACGIH TLV 5 milligram per cubic meter TWA, averaged over an 8-hour work-shift.

No PAC available

Netherlands: MAC-TGG 5 milligram per cubic meter, 2003

Permissible Concentration in Water: Regulated as a hazardous substance by the Clean Water Act.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq 0.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation can cause burns to nose, throat and respiratory tract. May cause eye irritation and burns. There may be an asthmatic reaction.

Long-Term Exposure: Repeated prolonged exposure may cause asthma. The symptoms of asthma may not be apparent for hours following exposure and may be aggravated by physical effort. Anyone with symptoms of asthma due to this chemical should avoid all further contact with it.

Medical Surveillance: Consult a qualified allergist if asthma is suspected.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved

SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White (liquid): Corrosive or Contact Hazard. Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Moisten spilled material to prevent dust buildup. This is a weak acid: use lime or sodium bicarbonate to neutralize, and absorb with peat, vermiculite, or carbon. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include acidic vapors and valeric acid. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Suspected reprotoxic hazard, Environmental hazard.

CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)[7]

CERCLA/SARA 40CFR304, Appendix A, RQ (EHS, RQ): 1 lb (0.454 kg), SARA 313: (as cyanide compounds) Form R *de minimis* Concentration Reporting Level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures or solutions

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T; Risk phrases: R23/25; R36/37/38; R63; Safety phrases: S26; S36; R45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Adiponitrile is a combustible, water-white to yellow, oily liquid. A solid below 1.1°C. Practically odorless. Molecular weight = 108.16; specific gravity (H_2O:1) = 0.97 @ 25°C (liquid); boiling point = 295°C; freezing/melting point = 1 to 2.3°C; latent heat of vaporization = (estimate) 240 Btu/lb = 134 cal/g = 5.59×10^5 J/kg; heat of combustion = −14,230 Btu/lb = −7910 cal/g = -331×10^5 J/kg; flash point = 93°C, technical grade (oc); 163°C (pure); vapor pressure = 6.8×10^{-4} mmHg @ 25°C; explosive limits: LEL: 1%, 10,000 ppm; UEL: 5.0%; autoignition temperature = 550°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 1. Floats on water; slightly soluble.

Potential Exposure: Is used to manufacture corrosion inhibitors, rubber accelerators, and Nylon 66; and in organic synthesis.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause violent reactions: fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Also incompatible with strong reducing agents such as hydrideds and active metals.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 4 ppm/18 milligram per cubic meter TWA

ACGIH TLV[1]: 2 ppm/8.8 milligram per cubic meter TWA [skin]

PAC Ver. 29[138]

PAC-1: 0.35 ppm

PAC-2: 3.8 ppm

PAC-3: 8.1 ppm

Russia: STEL 10 milligram per cubic meter, 993; the Netherlands: MAC-TGG 8.8 milligram per cubic meter, 2003A guideline or standard in ambient air has been set in Connecticut[60] @ 360 μ/m^3.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg[CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg [CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Octanol–water coefficient: $\text{Log}\ K_{\text{ow}} = -0.32$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin and respiratory tract. Skin and eye contact can cause burns. This chemical can be absorbed through the skin, thereby increasing exposure. Inhalation can cause coughing and shortness of breath. Exposure can cause fatal cyanide poisoning with symptoms of flushing of the face, chest tightness; nausea and vomiting; weakness, lightheadedness, confusion, headache, trouble breathing; and convulsions. Higher exposure can lead to convulsions, irregular heartbeat; coma, and death. Ingestion of a few milliliters may cause weakness, mental confusion; vomiting, rapid respiration; fast heartbeat; and convulsions.

Long-Term Exposure: Adiponitrile produces disturbances of the respiration and circulation, irritation of the stomach and intestine; and loss of weight. Repeated exposure may cause personality changes; depression, anxiety, and irritability, thyroid gland damage and enlargement; and nervous system damage. Adiponitrile may damage the developing fetus. Adiponitrile may have effects on the blood and adrenal gland, resulting in anemia and tissue lesions. See also NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Eyes, skin, respiratory system; CNS; cardiovascular system.

Medical Surveillance: Consider urine thiocyanate test for preemployment and regular medical testing. If symptoms develop or overexposure is suspected, have blood cyanide levels, nervous system; and thyroid function tested.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1–2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Prevent skin contact **4 hours** (At least 4 but < 8 hours of resistance to breakthrough >0.1 μm > g/cm^2/min): Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Up to 40 ppm*: Sa (APF = 10) (any supplied-air respirator). *100 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *200 ppm*: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other *positive-pressure mode*). *Emergency or planned entry into unknown concentrations* *or IDLH Conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Outside or detached storage is preferred. Before entering confined space where adiponitrile may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2205 Adiponitrile, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. *Small spills*: absorb liquids in vermiculite, dry sand; earth, peat, activated carbon, or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line). Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep adiponitrile out of a confined space, such as a sewer, because of the potential for an explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include deadly hydrogen cyanide, nitrogen oxides; hydrogen, and carbon monoxide. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add excess alcoholic KOH. Than evaporate alcohol and add calcium hypochlorite. After 24 hours, flush to sewer with water[22]. Can also be incinerated with afterburner and scrubber to remove nitrogen oxides.

Adriamycin A:0460

Formula: $C_{27}H_{29}O_{11}N$

Synonyms: ADM; Adriablastine; Adriamycin-HCl; Adriamycin semiquinone; Adriblastina; Doxorubicin; DX; 14′-Hydroxydaunomycin; 14-Hydroxydaunomycin; 14-Hydroxydaunorubicine

CAS Registry Number: 23214-92-8; 25316-40-9

HSDB Number: 3070 as doxorubicin

RTECS Number: AV9800000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *probably carcinogenic to humans*, Group 2A, 1987.

California Proposition 65 Chemical[102]: cancer, 7/1/1987; developmental, male 1/29/1999, as doxorubicin hydrochloride (adriamycin) CAS: 25316-40-9.

Hazard Alert: Poison, Drug.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xi; Risk phrases: R45; R22; R26/27/27; R34; R36/38; R40; R61; Safety phrases: S7/9; S22; S36/37/39; S41; S45; S53 (see Appendix 4).

Description: Adriamycin is an orange to red cake-like or needle-like crystalline solid. Molecular weight = 543.6; freezing/melting point = 205°C. Slightly soluble in water.

Potential Exposure: An antibiotic product from streptomyces, used as anticancer drug.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Intravenous, skin, eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic. Irritates eyes and skin. A poison if ingested. This chemical can be absorbed through the skin, thereby increasing exposure.

Long-Term Exposure: Has been shown to cause breast cancer in animals. There is limited evidence that adriamycin is a teratogen in animals. Causes baldness, stomatitis, and bone marrow aphasia in humans. Fatal human cardiac disturbances have been reported.

Points of Attack: Cardiovascular system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. CBC, EKG, examination of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: A regulated, marked area should be established where Adriamycin is handled, used, or stored. All operations should be enclosed and locally ventilated through high efficiency particulate absolute (HEPA) filters. Wear protective work clothing. Wash thoroughly immediately after exposure to Adriamycin and at the end of the work-shift. Medical personnel preparing solutions of Adriamycin should only do so under a biological safety hood with a vertical laminar flow. Workers whose clothing has been contaminated by Adriamycin should change into clean clothing promptly. Do not take contaminated work clothes home. Family members could be exposed. Contaminated work clothes should be laundered by individuals who have been informed of the hazards of exposure to Adriamycin. Do not eat, smoke, or drink where Adriamycin is handled, processed, or stored, since the chemical can be swallowed. Wash hands carefully before eating or smoking. When vacuuming, a HEPA filter should be used, not a standard shop vacuum.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where Adriamycin is handled, used, or stored.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material using a HEPA filter vacuum cleaner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; alcohol foam; or polymer foam extinguishers. Thermal decomposition products may include nitrogen oxides and hydrogen chloride. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, Known to be a Human Carcinogen; IARC: Naturally occurring aflatoxins, *carcinogenic to humans*, Group 1; Aflatoxin M_1, *possibly carcinogenic to humans*, Group 2B, 1997; Human Sufficient Evidence, naturally occurring mixtures of aflatoxins and aflatoxin B_1; Animals Sufficient Evidence, naturally occurring mixtures of aflatoxins and aflatoxins B_1, G_1, and M_1; Human Inadequate Evidence, aflatoxin M1; Animal Limited Evidence aflatoxin B_2; Animal Inadequate Evidence aflatoxin G_2; NTP: Known to be a human carcinogen

California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: 1402-68-2: Poison, Suspected of causing genetic defects, Suspected reprotoxic hazard.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents[5].

Hazard symbols, risk, & safety statements: Hazard symbol: T; Risk phrases: R45; R10; R27/28; R50; R62; R63; Safety phrases: S13; S28; S45 (see Appendix 4)

Description: The aflatoxins are a group of molds produced by the fungus *Aspergillus flavus*. They are natural contaminants of fruits, vegetables, and grains. They are also described as a series of condensed ring heterocyclic compounds. They form colorless to pale yellow crystals. Practically insoluble in water. Molecular weight = 312.3 (b1), 383.2 (b1 dichloride), 314.3 (b2), 328.3 (g1), 330.3 (g2), 328.3 (m1), 314.3 (Ro); freezing/melting point = 268–269°C (b1), 247–250°C (g1), 237–240°C (g2), 290°C (m1), 225°C (Ro).

Potential Exposure: Aflatoxins are a group of toxic metabolites produced by certain types of fungi. Aflatoxins are not commercially manufactured; they are naturally occurring contaminants that are formed by fungi on food during conditions of high temperatures and high humidity. Most human exposure to aflatoxins occurs through ingestion of contaminated food. The estimated amount of aflatoxins that Americans consume daily is estimated to be 0.15–0.50 μg. Grains, peanuts, tree nuts, and cottonseed meal are among the more common foods on which these fungi grow. Meat, eggs, milk, and other edible products from animals that consume aflatoxin-contaminated feed may also contain aflatoxins. Aflatoxins can also be breathed in.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air
No standards or PAC available.
DFG MAK: [skin]; Carcinogen Category 2B [CAS: 6795-23-9 (m1)].

Routes of Entry: Ingestion and inhalation. An unavoidable contaminant in foods: the FDA limits the levels of aflatoxin contamination that are permitted in food. The complete elimination of aflatoxin contamination of food is probably not technically feasible. The FDA has lowered the maximum amount allowed in food products as methods of detection and methods of control have improved. Upper limits of 20 ppb (total B1, B2, G1, and G2) in foods and feeds and 0.5 ppm (M1) in milk are now in effect.

Harmful Effects and Symptoms
Aflatoxins are carcinogenic in mice, rats, fish, ducks, marmosets, tree shrews and monkeys by several routes of administration (including oral), producing mainly cancers of the liver, colon and kidney. Epidemiological studies have shown a positive correlation between the average dietary concentrations of aflatoxins in populations and the incidence of primary liver cancer. These studies were undertaken to test this specific hypothesis; however, no studies have been carried out which could link an increased risk of liver cancer to actual aflatoxin intake in individuals.

Short-Term Exposure: May be fatal by ingestion, inhalation and skin contact.

Long-Term Exposure: Aflatoxins are carcinogens in humans. They may cause liver cancer. They have also been shown to be teratogens in animals. Aflatoxins may cause liver and kidney damage.

Points of Attack: Liver, kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver and kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: A Class I, Type B, biological safety hood should be used when handling, mixing, or preparing aflatoxins. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Latex gloves are recommended as a protective material, *unless using aflatoxins in chloroform.* Contact lenses should not be worn when working with this chemical. Wear indirect-vent, impact and splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where aflatoxins are handled, used, or stored. Store in a refrigerator and protect from exposure to air and light.

Shipping: UN3172 Toxins, extracted from living sources, solid or liquid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60%–70% of acetone to avoid airborne dust then transfer to a suitable sealed container for disposal. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but will not easily ignite. Thermal decomposition products may include oxides of a carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Use of oxidizing agents, such as hydrogen peroxide or 5% sodium hypochlorite bleach. Acids and bases may also be used[22].

California Proposition 65 Chemical[102]: Cancer 1/1/1989

Hazard Alert: Poison, Endocrine disruptor (high) [EU], Possible risk of forming tumors, Suspected of causing genetic defects, Sensitization hazard [skin], Environmental hazard. Listed for Tier 1 screening as an endocrine disruptor[88].

United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Supported

Banned or Severely Restricted (EPA-FIFRA) (See “References” below)

(102); (31).

United States National Primary Drinking Water Regulations: MCL = 0 mg/L; MCL = 0.002 mg/L.

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 1 lb (0.454 kg), SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N, Xi; Risk phrases: R45; R22; R40; R43; R50/53; Safety phrases: S2; S29; S36/37; S41; S46; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Alachlor is an acetanilide pesticide is a cream-colored solid. Molecular weight = 269.79; density = 1.1 g/cm^3; freezing/melting point = 39.5−41.5°C; flash point = 137°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Slightly soluble in water.

Potential Exposure: A chloracetanilide herbicide. In manufacture, formulation and application of this preemergence herbicide, personnel may be exposed. Its major use (99%) is as a preemergence herbicide for field crops (corn, soybeans, and peanuts, etc.).

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Corrosive to iron and steel.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 1 milligram per cubic meter TWA (inhalable fraction and vapor). Excursion Limit Recommendation: Excursions in worker exposure levels may exceed 3 times the TLV-TWA for no more than a total of 30 minutes during a work day, and under no circumstances should they exceed 5 times the TLV-TWA, provided that the TLV-TWA is not exceeded. A3: Confirmed animal carcinogen with unknown relevance to humans. A3, confirmed animal carcinogen with unknown relevance to humans.

Permissible Concentration in Water: Safe Drinking Water Act, MCL, 0.002 mg/L; MGLC, zero. No adverse-effect-level in drinking water has been calculated by NSA/NRC[46] as 0.7 mg/L. Acceptable daily intake (ADI) has been calculated at 0.1 mg/kg/day. More recently, the EPA[47] has reviewed alachlor and determined a 10-day Health advisory: value of 0.1 mg/L for a 10-kg child. An acceptable daily intake was calculated as 0.01 mg/kg/day in the study. A maximum level in drinking water of 0.002 mg/L has been proposed by EPA[62]. Several states[61] have set guidelines for alachlor in drinking water ranging from 0.15 μg/L (Arizona) to 0.2 μg/L (Illinois) to 2.0 μg/L (Massachusetts) to 10.0 μg/L (Minnesota) to 15 μg/L (Kansas) to 200 μg/L (Maine).

Determination in Water: May be accomplished by liquid extraction gas chromatographic procedure[47]. Octanol−water coefficient: Log $K_{ow} \geq 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Ingestion, dermal contact.

Harmful Effects and Symptoms

No effects found in human studies[47]. Exhibits relatively low acute oral toxicity; the LD_{50} value for rats is 0.93 g/kg. The technical product has only slight skin and eye irritation potential after an acute exposure[47]. However, alachlor feeding studies have demonstrated oncogenic effects including lung tumors in mice, and stomach, thyroid and nasal turbinate tumors in rats.

Short-Term Exposure: Toxic by skin contact, ingestion, and inhalation. Eye contact may cause severe irritation or injury. Skin contact may irritate and burn skin.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. May cause liver damage. A suspected endocrine disruptor and carcinogen; developmental toxin. Human mutation data reported.

Points of Attack: Liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Do not reuse container; see disposal methods, below.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapors. Take up with diatomite, clay, expanded mineral, foamed glass, or synthetic treated absorbent material and deposit in sealed containers for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. For *large spills* seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Fire Extinguishing: This chemical is not flammable, but may support combustion. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Stay upwind of fire. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This compound is hydrolyzed under strongly acid or alkaline conditions, to chloroacetic acid, methanol, formaldehyde and 2,6-diethylanilne. Incineration is recommended as a disposal procedure. Techniques for alachlor removal from potable water have been reviewed by EPA[47] but the data revealed no superior method. Improper disposal of pesticides is a violation of federal law. Dispose In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T + , N; Risk phrases: R24; R26/28; R50/53; R62; Safety phrases: S1/2; S22; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Aldicarb is a noncombustible, white crystalline solid with a slight sulfurous odor. Molecular weight = 190.3; boiling point = (decomposes); freezing/melting point = 99−100°C; specific gravity (H_2O:1) = 1.18; vapor pressure = 2.9×10^{-5} mmHg @ 25°C. Relative vapor density (air = 1) = 6.59. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 1. Slightly soluble in water; solubility = 0.6 g/L @ 25°C.

Potential Exposure: A systemic, restricted use (RUP), carbamate pesticide. It is available for purchase and use by certified pesticide applicators or by those under their direct supervision. Personnel involved in manufacture, formulation, or application of this insecticide to crops are at risk.

Incompatibilities: Strong alkalis.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.027 milligram per cubic meter

PAC-2: 0.3 milligram per cubic meter

PAC-3: 1.8 milligram per cubic meter

Finland: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, 1999.

Determination in Air: Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601.

Permissible Concentration in Water: EPA/Safe Drinking Water Act levels: MCL, 0.003 mg/L; MCLG 0.001 mg/L. Federal Drinking Water Guidelines: United States Environmental Protection Agency 7 μg/L for Aldecarb,

Aldecarb sulfoxide, & Aldecarb sulfone; State Drinking Water Standards: Illinois 2 μg/L for Aldecarb & Aldecarb sulfone; 4 μg/L for Aldecarb sulfoxide; New York 3 μg/L for Aldecarb; 2 μg/L Aldecarb sulfone; 4 μg/L for Aldecarb sulfoxide; State Drinking Water Guidelines: Arizona 9 μg/L; California 7 μg/L; Maine 7 μg/L for Aldecarb & Aldecarb sulfone; Minnesota 1 μg/L; Wisconsin 10 μg/L; Massachusetts 3 μg/L for Aldecarb; 4 μg/L for Aldecarb sulfoxide; 2 μg/L for Aldecarb sulfone.

Determination in Water: Aldicarb may be determined in water by gas−liquid chromatography with flame photometric detection after oxidation to the sulfone (aldoxycarb) by peracetic acid or 3-chloro-perbenzoic acid. Colorimetric methods have also been used based on hydrolysis to hydroxyl-amine which is oxidized to nitrous acid, the latter used to diazotize sulfanilic acid which is then coupled to give a dye[23]. Fish Tox = 3.75027000 MATC (HIGH). Octanol−water coefficient: Log $K_{ow} \leq 1.2$. Unlikely to bioaccumulate in marine organisms. $EC_{50} = 0.41$ mg/L (48 h, *Daphnia magna*).

Routes of Entry: Ingestion, skin contact.

Harmful Effects and Symptoms

Aldicarb is a carbamate pesticide. This material is super toxic; the probable oral lethal dose for humans is less than 5 mg/kg, or a taste (less than 7 drops) for a 150-lb person; it is extremely toxic by both oral and dermal routes. Symptoms include headache, blurred vision; nausea, vomiting, diarrhea, and abdominal pain. In severe cases, unconsciousness and convulsions may occur.

Short-Term Exposure: This chemical is one of the most highly toxic pesticides. It can be harmful or fatal if swallowed, inhaled or absorbed through the skin. Exposure can cause rapid severe poisoning with headache, sweating, nausea, and vomiting; diarrhea, loss of coordination; and possible death. Aldicarb may affect the nervous system causing convulsions and respiratory failure. It is a cholinesterase inhibitor. Exposure may result in death. The effects may be delayed; medical observation is recommended. $LD_{50} = 1$ mg/kg[77]

Long-Term Exposure: Human mutation data reported. May affect the immune system. Aldicarb is a questionable carcinogen with no firm human evidence. Human tox = 7.00 ppb (MCL) (HIGH)[77]

Points of Attack: skin, lungs.

Medical Surveillance: Plasma and red-blood-cell cholinesterase levels (test for enzyme poisoned by this chemical). For this substance, these tests are accurate only if done within about 2 hours of exposure.

First Aid: Move victim to fresh air; call emergency medical care. Speed in removing material from eyes and skin is of extreme importance. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. All users of Temik 150G must have attended a training program and be issued with a Bayer CropScience Certificate of Temik Accreditation prior to purchase and use of this product.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where Aldicarb is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as sodium hydroxide, sodium bicarbonate, etc.).

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with diatomite, clay, expanded mineral, vermiculite, sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line). It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 30.

Fire Extinguishing: May burn but does not ignite readily. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen sulfur and carbon. Toxic gases may also contain fumes of aldicarb nitrile, aldicarb oxime, and methylamine. *Small fires*: dry chemical, carbon dioxide; water spray; or alcohol foam. *Large fires*: water spray, fog or alcohol foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with effluent gas scrubbing is recommended[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Aldol A:0500

Formula: $C_4H_8O_2$

Synonyms: Acetaldol; Aldehido, β-hidroxibutirico (Spanish); 3-Butanolal; Butyraldehyde, 3-hydroxy-; 3-Hydroxybutanal; β-Hydroxybutyraldehyde; 3-Hydroxybutyraldehyde; Oxybutanal; Oxybutyric aldehyde

CAS Registry Number: 107-89-1

HSDB Number: 2663

RTECS Number: ES1500000

UN/NA & ERG Number: UN2839/153 (P)

EC Number: 203-530-2

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Polymerization hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; Risk phrases: R10; R19; R24; R36; Safety phrases: S26; S28; S36/37; S41; S45 (see Appendix 4).

Description: Aldol is a flammable, colorless to pale yellow, syrupy liquid. Pungent odor. Molecular weight = 88.1; specific gravity (H_2O:1) = 1.1; boiling point = 80°C @ 20 mmHg[17] (decomposes above 83°C); freezing/melting point = 0°C; vapor pressure ≤ 7.6×10^{-3} mmHg @ 20°C[52]; vapor density (air = 1) = 2.98; flash point = 66°C; autoignition temperature = 250°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 2. Good solubility in water.

Potential Exposure: Aldol is used as a solvent and to manufacture rubber accelerators, perfumes; in fungicides; and in engraving, cadmium plating.

Incompatibilities: Danger! May be subject to spontaneous polymerization. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with metals may evolve flammable hydrogen gas. Heat above 83°C causes the formation of crotonaldehyde vapor (which may cause explosion) and water.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin, eyes and respiratory tract. This chemical can be absorbed through the skin, thereby increasing exposure. Exposure to vapor may cause sore throat, coughing, dizziness, lightheadedness, and unconsciousness. Ingestion causes abdominal pain.

Long-Term Exposure: Prolonged or repeated skin contact may cause redness, irritation and dryness.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where Aldol may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2839 Aldol, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

List of Stockholm Convention POPs: Annex A (Elimination)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T + , N; Risk phrases: R45; R24/25; R40; R45; R48/24/25; R50/53; R62; R63; Safety phrases: S1/2; S22; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Aldrin is a colorless, crystalline solid. The technical grade is a tan to dark brown solid. It has a mild, chemical odor. Molecular weight = 364.93; boiling point = 145°C (decomposes); freezing/melting point = 104°C (pure); 49−60°C (technical grade); specific gravity (H_2O:1) = 1.6 @ 20°C (solid); vapor pressure = 6.6×10^{-6} mmHg. Although noncombustible, aldrin may be dissolved in a flammable liquid. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 1; reactivity 0. Practically insoluble in water; solubility = 0.003%[2].

Potential Exposure: Compound

Description: Formerly used as an insecticide in the United States Pesticide manufacturers, formulators and applicators. Some people in the United States may be exposed to aldrin (and dieldrin) in air, water and food because of its persistence in the environment. See "Dieldrin" for more details.

Incompatibilities: Avoid concentrated mineral acids; acid catalysts; acid oxidizing agents; phenol, or active metals.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 milligram per cubic meter, potential occupational carcinogen.

Odor threshold = 0.3 milligram per cubic meter.

OSHA PEL: 0.25 milligram per cubic meter TWA [skin]

NIOSH REL: 0.25 milligram per cubic meter TWA [skin], potential occupational carcinogen; Limit exposure to lowest feasible level.

ACGIH TLV[1]: 0.05 milligram per cubic meter TWA inhalable fraction and vapors [skin]; confirmed animal carcinogen with unknown relevance to humans (2006)
PAC Ver. 29[138]
PAC-1: 0.91 milligram per cubic meter
PAC-2: 10 milligram per cubic meter
PAC-3: 100 milligram per cubic meter
DFG MAK: 0.25 milligram per cubic meter measured as, inhalable fraction [skin]; Peak limitation Category II(8)
Australia: TWA 0.25 milligram per cubic meter [skin], 1993; Austria: MAK 0.25 milligram per cubic meter [skin], 1999; Belgium: TWA 0.25 milligram per cubic meter [skin], 1993; Denmark: 0.25 milligram per cubic meter [skin], 1999; Finland: TWA 0.25 milligram per cubic meter; STEL 0.75 milligram per cubic meter [skin], 1999; France: VME 0.25 milligram per cubic meter [skin], carcinogen, 1999; the Netherlands: MAC-TGG 0.25 milligram per cubic meter [skin], 2003; Norway: TWA 0.25 milligram per cubic meter, 1999; the Philippines: TWA 0.25 milligram per cubic meter [skin], 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, 1999; Russia: STEL 0.01 milligram per cubic meter [skin], 1993; Switzerland: MAK-W 0.25 milligram per cubic meter [skin], 1999; Thailand: TWA 0.25 milligram per cubic meter, 1993; Turkey: TWA 0.25 milligram per cubic meter [skin], 1993; United Kingdom: TWA 0.25 milligram per cubic meter; STEL 0.75 milligram per cubic meter [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for Aldrin in ambient air:[60] 0.035 μ/m^3 (Pennsylvania) to 0.595 μ/m^3 (Kansas) to 1.5 μ/m^3 (Connecticut) to 2.5 μ/m^3 (North Dakota) to 4.0 μ/m^3 (Virginia) to 6.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5502[18]. A filter plus bubbler containing isooctane followed by workup with isooctane and analysis by GC.

Permissible Concentration in Water: State Drinking Water Standards: Illinois 1 μg/L; State Drinking Water Guidelines: Arizona 0.002 μg/L; Florida 0.002 μg/L; California 0.02 μg/L; New Hampshire 0.002 μg/L; Maine 0.02 μg/L. Aldrin is highly toxic to aquatic organisms and every care must be taken to avoid release to the environment. In the food chain important to humans, bioaccumulation takes place, specifically in aquatic organisms. It is strongly advised not to let the chemical enter into the environment because of its persistence.

Determination in Water: GC (EPA Method 608) or GC plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{\text{ow}} \geq 7$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment. Fish toxicity (threshold)[77]: 0.18049 ppb MACT. (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption; ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Eye and skin contact can cause irritation and burns. Can be fatal if swallowed or absorbed through the skin. Aldrin tends to produce convulsions before other, less serious signs of illness have appeared. Victims have reported headache, nausea, vomiting, dizziness, and mild chronic jerking. Some victims have convulsions without warning. Poisoning by Aldrin usually involves convulsions due to its effects on the CNS. Probable oral lethal dose for humans is between 7 drops and one ounce for a 150-pound adult human.

Long-Term Exposure: May cause tumors, cancer, mutations, reproductive effects. Reproductive effects and liver effects have also been reported. It is classified as an extremely toxic chemical. Conflicting reports of carcinogenicity of this compound remain an area of controversy. Similar chemically and toxicologically to dieldrin. Cancer site in animals: tumors of the lungs, liver, thyroid & adrenal glands[2]. Human Tox = 0.02058 ppb CHCL (Chronic Human Carcinogen Level)(EXTRA HIGH).

Points of Attack: CNS; liver, kidneys, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Consider the points of attack in preplacement and periodic physical examinations. NIOSH recommends the following tests: blood plasma, CBC; liver function tests; urinalysis (routine), reticulocyte count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink. Do NOT induce vomiting.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA. 0.91 milligram per cubic meter *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area, preferably outdoors. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72].

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. For large spill seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Fire Extinguishing: The solid material is not combustible, but Aldrin is often dissolved in a flammable liquid. Thermal decomposition products may include hydrogen chloride and chlorine. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Aldrin is very stable thermally with no decomposition noted @ 250°C. Aldrin (along with the structurally related compounds dieldrin and isodrin) is remarkably stable to alkali (in contrast to chlordane and heptachlor) and refluxing with aqueous or alcoholic caustic has no effect. Incineration methods for aldrin disposal involving 816°C, 0.5 second minimum for primary combustion, 1760°C, 1.0 second for secondary combustion, with adequate scrubbing and ash disposal facilities have been recommended. The combustion of aldrin in polyethylene on a small scale gave more than 99% decomposition. Aldrin can be degraded by active metals, such as sodium in alcohol (a reaction which forms the basis of the analytical method for total chlorine), but this method is not suitable for the layman. A disposal method suggested for materials contaminated with aldrin, dieldrin or endrin consists of boring 8−12 ft underground in an isolated area away from water suppliers, with a layer of clay, a layer of lye and a second layer of clay beneath the wastes. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Formula: $C_{19}H_{26}O_3$ (I); $C_{10}H_{26}O_5$ (II)

Synonyms: (+)-Allelrethonyl; D-Allethrin; D-*trans* Allethrin; Allethrin I; Alleviate; Allyl cinerin; Allyl homolog of cinerin I; DL-2-Allyl-4-hydroxy-3-methyl-2-cyclopenten-1-one-DL-chrysanthemum monocarboxylate; 3-Allyl-4-keto-2-methylcyclopentenyl chrysanthemummonocarboxylate 3; 3-Allyl-2-methyl-4-oxo-2-cyclopenten-1-yl chrysanthemate; DL-3-Allyl-2-methyl-4-oxocyclopent-2-enyl DL-*cis,trans*-chrysanthemate; Allylrethronyl DL-*cis,trans*-chrysanthemate; Bioallethrin; Bioaltrina; (+)-*cis,trans*-Chrysanthemate; Cinerin I allyl homolog; Depallethrin; ENT 17,510; Exthrin; FDA 1446; FMC 249; Necarboxylic acid; NIA 249; OMS 468; Pallethrine; Pynamin; Pynamin-forte; Pyresin; Pyresyn; Synthetic pyrethrins

CAS Registry Number: 584-79-2 (I); 497-92-7 (II)

HSDB Number: 1511

RTECS Number: GZ1925000

UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171; UN2902 (Pesticides, liquid, toxic, n.o.s.)/151

EC Number: 584-79-2 (I) 209-542-4 [*Annex I Index No.*: 006-025-00-3]; 497-92-7 (II) not listed.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Highly toxic, Environmental hazard, Agricultural chemical.

AB 1803-Well Monitoring Chemical (CAL) as pyrethrins

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum

Clean water act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins

EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg) as pyrethrins.

Water Polluting Substance Annex II

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations [584-79-2 (I)]: Hazard symbol: Xn, N; Risk phrases: R20/22; R50/53; Safety phrases: S2; S29/35; S36; S46; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Allethrin is a clear, yellow to amber, oily liquid which is also available as a wettable powder or granules. Boiling point = 140−160°C; flash point = approx. 120−123°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0-1; reactivity 0. Practically insoluble in water.

Potential Exposure: Allethrin is used to control insects in homes and animal shelters, and to treat lice in humans.

Incompatibilities: Strong alkalis and oxidizers.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \geq 4.7$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Water Polluting Substance Annex II.

Routes of Entry: Skin, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Skin and eye contact causes irritation and burns. Inhalation can cause respiratory tract irritation with coughing and wheezing. High exposure may cause dizziness, shaking, irritability, seizures, and unconsciousness. Allethrins may affect the nervous system.

Long-Term Exposure: May cause skin allergy. If the allergy develops, very low future exposure can cause itching and skin rash. Allethrin may cause an asthma-like allergy. Future exposure can cause asthma attacks with shortness of breath; wheezing, cough and/or chest tightness. Allethrin can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. This chemical may cause liver and kidney damage. There is no evidence that allethrin affects reproduction[2].

Points of Attack: Skin, lungs, liver, and kidneys.

Medical Surveillance: Liver and kidney function tests. Lung function test. (These could be normal if the person is not having an attack at the time of the test). Evaluation by a qualified allergist may help to diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation.

All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: *50 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *250 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *5000 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN2902 Pesticides, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: *Allethrin*", Trenton, NJ (January 2007).

Allidochlor A:0525

Formula: $C_8H_{12}ClNO$

Synonyms: Acetamide, 2-Chloro-*N*,*N*-di-2-propenyl-; Alidochlor; CDAA; CDAAT; 2-Chloro-*N*,*N*-diallylacetamide; α-Chloro-*N*,*N*-diallylacetamide; 2-Chloro-*N*,*N*-di-2-propenylacetamide; CP 6343; Diallylchloroacetamide; *N*,*N*-Diallylchloroacetamide; *N*,*N*-Diallyl-α-chloroacetamide; *N*,*N*-Diallyl-2-chloroacetamide; Actox; Radox; Randox; Rantox T

CAS Registry Number: 93-71-0

HSDB Number: 1560 as Randox
RTECS Number: AB5250000
UN/NA & ERG Number: UN2996 (organochlorine pesticides, liquid, toxic, n.o.s.)/151; UN2902 (Pesticides, liquid, toxic, n.o.s)/151
EC Number: 202-277-7 [*Annex I Index No.*: 616-004-00-6]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Organochlorine herbicide, Poison Category: 4

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; Risk phrases: R21/22; R36/38; R51/R53; Safety phrases: S2; S26; S28; S36/37/39; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: An oily, amber liquid. Slightly irritating odor. Molecular weight = 173.66; boiling point = 240; 116; 74°C @ 0.3 mm; freezing/melting point = 145−150°C; vapor pressure = 1.0×10^{-2} mmHg. Slightly soluble in water.

Potential Exposure: Acetamide, and organochlorine herbicide, primarily used to control weeds growing in onion crops. Used as a preemergence and postemergence control for most annual grasses and broadleaf weeds on corn, sorghum, lima beans, snap beans, soybeans, cabbage, peas for canning, celery, onions and some fruits and ornamentals. There are no products registered with the United States Environmental Protection Agency revoked all tolerances on July 21, 1999. There are 25 manufacturers worldwide with 6 located in the U.S.

Incompatibilities: Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); strong acids. Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: Fish toxicity (threshold)(77): Low—269.85657 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Inhalation, ingestion. Absorbed through the intact skin.

Harmful Effects and Symptoms

Short-Term Exposure: Attacks the CNS. Apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death. LD_{50} (oral, rat) = 700 mg/kg; LD_{50} (dermal, rat) = 360 mg/kg.

Long-Term Exposure: Organochlorine pesticides are highly toxic to mammals and will accumulate in the tissues of living organisms. May cause kidney damage.

Points of Attack: May be fatal if inhaled, ingested, or absorbed through the skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes*: Contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. *Skin*: Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. Ingestion: Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. In cases of ingestion, Do not induce vomiting *; the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 g/kg (usual adult dose 60−90 g, child dose 25−50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *UNCONSCIO United States OR HAVING CONVULSIONS*, do nothing except keep victim warm. **In some cases you may be specifically instructed by Poison Control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water*. Do NOT give activated charcoal *before or with* ipecac syrup. *Inhalation*: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked and cool, ventilated area.

Shipping: UN2996 Organochlorine pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2902 Pesticide, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Do not touch spilled material. Use water spray to reduce vapors. Stay upwind. Avoid breathing vapors. Wear positive-pressure breathing apparatus and full protective clothing. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Small spills*: absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may be dissolved in flammable or combustible liquids for commercial application. Thermal decomposition products may include chlorine, phosgene, hydrogen chloride. If the flammable or combustible commercial material catches fire, use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Organochlorines may be completely dechlorinated by sodium in isopropyl alcohol. The UN Recommends incineration methods for disposal of organochlorines. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Allyl Acetate A:0530

Formula: $C_5H_8O_2$

Synonyms: Acetic acid, allyl acetate; Acetic acid, 2-propenyl ester; 3-Acetoxypropene; 2-Propenyl methanoate

CAS Registry Number: 591-87-7

HSDB Number: 2697

RTECS Number: AF1750000

UN/NA & ERG Number: UN2333/131

EC Number: 209-734-8

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Highly flammable, Possible risk of forming tumors, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1%.

Hazard symbols, risk, & safety statements: Hazard symbol: F,T, Xi; Risk phrases: R11; R21; R23; R25; R26; R34; R36/37/38; Safety phrases: S16; S21; S25; S26; S36; S45.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Allyl acetate is a flammable, colorless liquid with an acrid odor. Molecular weight = 100.13; boiling point = 103−104°C; freezing/melting point = −95°C; flash point = 22°C; autoignition temperature = 374°C. Explosive limits: LEL: 21,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 0. Insoluble in water.

Potential Exposure: Allyl Acetate is used to control insects in homes and animal shelters, and to treat lice in humans. May be used to enhance taste of dairy products and fruit. Generally speaking, most allyl compounds may be metabolized to allyl alcohol (see A:0540) which is metabolized to acrolein (see A:0380).

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with strong acids (liberates heat), nitrates, strong alkalis (liberates heat). Contact with alkali metals and strong reducing agents such as hydrides evolves highly flammable hydrogen gas. Attacks some plastics, coatings, and rubber. Flow or agitation of substance may generate electrostatic charges due to low conductivity; ground all equipment containing this material

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.42 ppm

PAC-2: 4.6 ppm

PAC-3: 28 ppm

Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq 1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Skin, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Prolonged or repeated contact can cause rash, redness, and itching. Skin and eye contact causes irritation, severe burns, and permanent damage. Inhalation can cause respiratory tract irritation with coughing and wheezing. High exposure may cause pulmonary edema, a medical emergency, with severe shortness of breath. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Allyl acetate can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. This chemical may cause liver and kidney damage.

Points of Attack: Skin, lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color code—Red: Flammability hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where allyl acetate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2333 Allyl acetate, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Allyl acetate is a highly flammable liquid. Irritating gases, including carbon dioxide and carbon monoxide. Use propylene foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xi; Risk phrases: R11; R19; R23/24/25; R36/37/38; R51; R62; Safety phrases: S1/2; S21; S29/35; S36/37/39; S38; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Allyl alcohol is a flammable, colorless liquid. It has a pungent, mustard-like odor. Molecular weight = 58.08. Boiling point = 97.4°C; melting/freezing point = −129°C; critical temperature = 271.9°C; critical pressure = 840 psia = 57 atm = 5.8 MN/m^2; specific gravity (H_2O:1) = 0.852 @ 20°C (liquid); relative vapor density (air = 1) = 2.0; ratio of specific heats of vapor (gas) = 1.12; latent heat of vaporization = 295 Btu/lb = 164 cal/g = 6.87×10^5 J/kg; saturation concentration in air = 57 g/m^3 @ 20°C; heat of combustion = −13,720 Btu/lb = −7620 cal/g = -319.0×10^5 J/kg; heat of polymerization = 100°C; vapor pressure = 24 hPa @ 20°C; 18 mmHg @ 20°C; electrical conductivity = 6.5 × 105 pS/m; flash point = 21°C (cc); 32°C (oc); autoignition temperature = 378°C. Explosive limits: LEL: 2.5%, 25,000 ppm. UEL: 18.0%. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 3; reactivity 1. Highly soluble in water.

Potential Exposure: Used to make other chemicals and pharmaceuticals; as a laboratory chemical. Not currently registered in the United States as a pesticide or fungicide.

Description: Allyl alcohol is used without formulation for weed control and applied as a drench to tobacco beds; in the production of allyl esters. These compounds are used as monomers and prepolymers in the manufacture of resins and plastics. Allyl alcohol is also used in the preparation of pharmaceuticals; in organic syntheses of glycerol and acrolein; and as a fungicide and herbicide.

Incompatibilities: May form explosive mixture with air. Reacts explosively with carbon tetrachloride, strong bases. Also incompatible with strong acids. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Polymerization may be caused by heat above 99°C, peroxides, or oxidizers.

Permissible Exposure Limits in Air

NIOSH IDLH value = 20 ppm.

Conversion factor: 1 ppm = 2.38 milligram per cubic meter

Odor threshold = 1.4−2.1 ppm. The odor @ 25°C @ 1 atm and irritant properties of allyl alcohol is above the TLV and nearly the same as the PEL.

OSHA PEL: 2 ppm/5 milligram per cubic meter TWA [skin]

NIOSH REL: 2 ppm/5 milligram per cubic meter TWA; 4 ppm/10 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.5 ppm/1.19 milligram per cubic meter TWA [skin]; not classifiable as a human carcinogen

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.09_A}$ ppm

PAC-2: $\mathbf{1.7_A}$ ppm

PAC-3: $\mathbf{13_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin]; Carcinogen Category 3B

Determination in Air: Adsorption on charcoal, workup with CS_2 and gas chromatographic analysis. Use NIOSH Analytical Method #1402[18].

Permissible Concentration in Water: No criteria set. Toxic to aquatic organisms.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq$ 0.2. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Allyl alcohol vapor can cause serious irritation and burns of eyes, nose and throat. Eye irritation may be accompanied by sensitivity to light, pain, blurred vision leading to permanent damage. The pain may not begin until 6 hours after exposure. Contact with the liquid may cause first and second degree burns of skin and blister formation. Areas of contact will become swollen and painful and local muscle spasms may occur. Allyl alcohol causes burns on contact; and may cause pulmonary edema, a medical emergency, if inhaled. It is poisonous in small quantities. The probable oral lethal dose is 50−500 mg/kg, or between 1 teaspoonful and 1 ounce for a 150-lb person.

Long-Term Exposure: Allyl alcohol may cause mutations; such chemicals may have a cancer or reproductive risk. This chemical may cause liver and kidney damage. Repeated exposure may cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Preplacement and periodic examinations should include lung function tests, liver and kidney function tests. Following acute exposure, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Prevent skin contact. **8 hours** (More than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber gloves, suits, boots; Teflon gloves, suits, boots; Barricade coated suits; Responder suits; Trychem 1000 suits; **4 hours** (At least 4 but $<$ 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Viton gloves, suits. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *20 ppm*: Sa:Cf * (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: PIH; check oxygen content prior to entering storage area.(1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a fireproof tightly closed containers under an inert atmosphere separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1098 Allyl alcohol Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquids, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.3/0.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep allyl alcohol out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration after dilution with a flammable solvent.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Allylamine is a highly flammable, colorless liquid. Strong ammonia odor. Molecular weight = 57.11; freezing/melting point = −88°C; boiling point = 53° to 58°C; specific gravity (H_2O:1) = 0.760 @ 20°C; flash point = −29°C; autoignition temperature = 374°C; vapor pressure = 195 mmHg @ 20°C. Explosive limits: LEL: 2.2%, 22,000 ppm; UEL: 22.0%. Vapors are highly disagreeable; it is unlikely that any person would voluntarily stay in dangerous concentration. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 3; reactivity 1. Highly soluble in water.

Potential Exposure: Compound

Description: Used in manufacture of pharmaceuticals (mercurial diuretics, e.g.,) and in organic synthesis. Used to improve dyeability of acrylic fibers.

Incompatibilities: May form explosive mixture with air. Oxidizing materials and acids may cause a violent reaction. Attacks copper and corrodes active metals (i.e., aluminum, zinc, etc.).

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.23 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 2.5 ppm.

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.42}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{3.3}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{18}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Denmark: TWA 2 ppm (4.7 milligram per cubic meter) [skin], 1999; Norway: TWA 2 ppm (5 milligram per cubic meter), 1999; Russia: STEL 0.05 milligram per cubic meter [skin], 1993; Sweden: NGV 2 ppm (5 milligram per cubic meter), KTV 6 ppm (14 milligram per cubic meter) [skin], 1999

Permissible Concentration in Water: No criteria set. Toxic to aquatic organisms.

Routes of Entry: Inhalation, ingestion and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to eyes, skin, and respiratory tract which is highly toxic if inhaled or ingested and moderately toxic if absorbed on skin. Ingestion or inhalation may cause death or permanent injury after very short exposure to small quantities. Inhalation may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. Swallowing liquid may cause pneumonia. Vapors are extremely unpleasant and may ensure voluntary avoidance of dangerous concentrations. Symptoms include irritation of nose, eyes, and mouth with tearing, runny nose; and sneezing. Can cause excitement, convulsions, and death. Skin absorption may cause irreversible and reversible changes. Toxic air concentration in humans is 5 ppm over 5 minutes.

Long-Term Exposure: Mutation data reported. May cause heart muscle damage.

Points of Attack: Skin, pulmonary, system, cardiovascular system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Following acute exposure, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers recommend butyl rubber as a protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2

Night 0.4/0.6

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/150

Then: Protect persons downwind (mi/km)

Day 1.1/1.8

Night 1.9/3.1

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Keep allylamine out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High temperature incineration; encapsulation by resin or silicate fixation.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Allyl bromide is a highly flammable, colorless to light yellow liquid with an unpleasant, pungent odor. Molecular weight = 120.98; boiling point = 71.3°C; freezing/melting point = −119°C; specific gravity (H_2O:1) = : 1.4161 @ 20°C; vapor pressure = about 111−112 mmHg @ 20°C; liquid surface tension = : 0.0269 N/m @ 20°C; relative vapor density (air = 1) = 4.2; latent heat of vaporization = (estimate) 2.5×10^5 J/kg; heat of combustion = (estimate) -150×10^5 J/kg; flash point = −1°C; autoignition temperature = 295°C. Explosive limits: LEL: 4.4%, UEL: 7.3%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 1. Insoluble in water.

Potential Exposure: Used as an insecticide; in the manufacture of resins, fragrances, and other chemicals.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Heat or light exposure may cause decomposition and corrosive vapors.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 0.1 ppm TWA [skin] Not classifiable as a human carcinogen.

PAC Ver. 29[138]

PAC-1: 0.2 ppm
PAC-2: 12 ppm
PAC-3: 71 ppm
DFG MAK: Suspended 2004
European OEL: 0.1 ppm/0.7 milligram per cubic meter TWA (2004)

Permissible Concentration in Water: No criteria set. Toxic to aquatic organisms.

Routes of Entry: Skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous if swallowed. This chemical can be absorbed through the skin, thereby increasing exposure. Irritates eyes, skin, and respiratory tract. Can cause burns and permanent damage. Inhalation can cause respiratory tract irritation with coughing and wheezing. Exposure can cause headache, dizziness, nausea, and vomiting. High exposure may cause pulmonary edema, a medical emergency, with severe shortness of breath. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Allyl bromide can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Allyl bromide may damage cardiovascular system, kidneys, liver, nervous system. May cause skin disorders and affect the unborn fetus.

Points of Attack: Skin, lungs, reproductive system.

Medical Surveillance: If symptoms develop or overexposure is suspected, chest X-ray should be considered. Kidney and Liver function tests. Consult a dermatologist if skin disorders result from exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: For bromine, OSHA/NIOSH: *2.5 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern. *3 ppm*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprTS (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed. Only non-oxidizable sorbents are allowed (not charcoal).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where allyl bromide may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1099 Allyl bromide, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover with activated charcoal adsorbent and deposit in sealed containers. Keep allyl bromide out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Allyl bromide a highly flammable liquid. Irritating gases, including carbon monoxide and hydrogen bromide gas. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn, N, Xi; Risk phrases: R11; R20/21/22; R36/37/38; R48/20; R51; R68; R50; R62; R63; Safety phrases: S2; S16; S21; S25; S26; S36/37; S41; S46; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Allyl chloride is a highly reactive and flammable, colorless, brown or purple liquid, with an unpleasant, pungent odor. Molecular weight = 76.53; specific gravity (H_2O:1) = 0.938 @ 20°C; boiling point = 45.1°C; freezing/melting point = −135°C; relative vapor density (air = 1) = 4.15; ratio of specific heats of vapor (gas) = 1.0804; latent heat of vaporization = (estimate) 2.3×10^5 J/kg; heat of combustion = (estimate) -180×10^5 J/kg; vapor pressure = 295 mmHg @ 20°C; 393 hPa @ 20°C; flash point = −32°C; autoignition point = 485°C. Explosive limits: LEL: 2.9%, 29,000 ppm, UEL: 11.1%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 1. Slightly soluble in water; solubility = 0.4%.

Potential Exposure: Allyl chloride is used as a chemical intermediate and in making allyl compounds, epichlorohydrin, and glycerol.

Incompatibilities: Contact with water forms hydrochloric acid. Keep away from strong oxidizers, acids, aluminum, amines, peroxides, chlorides of iron and aluminum; magnesium, zinc.

Permissible Exposure Limits in Air

NIOSH IDLH value = 250 ppm

Conversion factor: 1 ppm = 3.13 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 0.48−5.9 ppm.

OSHA PEL: 1 ppm/3 milligram per cubic meter TWA

NIOSH REL: 1 ppm/3 milligram per cubic meter TWA; 2 ppm/6 milligram per cubic meter STEL

ACGIH TLV[1]: 1 ppm/3 milligram per cubic meter TWA; 2 ppm/6 milligram per cubic meter STEL [skin]; Confirmed Carcinogen with unknown relevance to humans

PAC* Ver. 29[138]

PAC-1: **2.8**$_{\mathbf{A}}$ ppm

PAC-2: **54**$_{\mathbf{A}}$ ppm

PAC-3: **140**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minutes values.

DFG MAK: [skin] Carcinogen Category 3B (2004)

Australia: TWA 1 ppm (3 milligram per cubic meter); STEL 2 ppm, 1993; Austria: MAK 1 ppm (3 milligram per cubic meter), suspected carcinogen, 1999; Belgium: TWA 1 ppm (3 milligram per cubic meter); STEL 2 ppm, 1993; Denmark: TWA 1 ppm (3 milligram per cubic meter), 1999; Finland: TWA 1 ppm (3 milligram per cubic meter); STEL 3 ppm (9 milligram per cubic meter), 1999; France: VME 1 ppm (3 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 3 milligram per cubic meter, 2003; India: TWA 1 ppm (3 milligram per cubic meter); STEL 2 ppm (6 milligram per cubic meter), 1993; Norway: TWA 1 ppm (3 milligram per cubic meter), 1999; Russia: STEL 0.3 milligram per cubic meter [skin], 1993; Sweden: TWA 1 ppm (3 milligram per cubic meter); STEL 3 ppm (9 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 1 ppm (3 milligram per cubic meter), KZG-W 2 ppm (6 milligram per cubic meter), 1999; Turkey: TWA 1 ppm (3 milligram per cubic meter), 1993; United Kingdom: LTEL 1 ppm (3 milligram per cubic meter); STEL 2 ppm (6 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 2 ppm.

Determination in Air: Charcoal tube; Benzene; GC/Flame ionization detection; Use NIOSH Analytical Methods (IV) #1000.

Permissible Concentration in Water: State Drinking Water Guidelines: Florida 35 μg/L; New Hampshire 7.4 μg/L; Minnesota 30 μg/L.

Determination in Water: Toxic to aquatic organisms.

Routes of Entry: Employees may be exposed by dermal or eye contact, inhalation, or ingestion. This chemical can be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Corrosive to eyes, skin, and respiratory tract; can cause burns and permanent damage. In addition to burns, skin contact can cause deep aching and "bone pain." Effects on the skin may not be apparent for some hours following contact. Inhalation can cause respiratory tract irritation with coughing and wheezing. Exposure can cause headache, dizziness, nausea, and vomiting. High exposure may cause pulmonary edema, a medical emergency, with severe shortness of breath. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause liver and kidney damage, lung irritation and bronchitis, drying and cracking skin. Allyl chloride has caused mutations. There is limited evidence that this chemical causes cancer of the stomach. The potential for damage to the respiratory tract, liver, and kidneys from inhalation was recognized through experimental evidence during the early commercial development of the industry involving this compound and is reflected in the precautions taken during its manufacture and use. Industrial experience in the United States has pointed to such problems as orbital pain and deep-seated aches after eye or skin contact. Both of these phenomena are believed to be transient when they occur and have been minimized through improved work practices.

Points of Attack: Respiratory system, lungs, skin, eyes, liver and kidneys, nervous system.

Medical Surveillance: Preplacement and periodic physical examinations have been detailed by NIOSH. They give special attention to the respiratory system, liver, kidneys, skin and eyes. Urine, blood, and pulmonary function testing are required by NIOSH[45]. If symptoms of over exposure develop, chest X-ray should be considered. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Prevent skin contact. **8 hours** (More than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Tychem 1000 suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Teflon gloves, suits, boots; 4H and Silver Shield gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove non impervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls shall be used to maintain allyl chloride vapor concentrations below the permissible exposure limits. Compliance with the permissible exposure limits may be achieved by the use of respirators only in the following situations: (1) During the time necessary to install or test the required engineering controls. (2) For nonroutine operations, such as maintenance or repair activities, in which concentrations in excess of the permissible exposure limits may occur. (3) During emergencies when air concentrations of allyl chloride may exceed the permissible limits. When a respirator is permitted, it shall be selected as follows: *Up to 25 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 ppm*: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1100 Allyl chloride, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover with activated charcoal adsorbent and deposit in sealed containers. Do not wash into sewer. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Allyl chloride is a highly flammable liquid. Thermal decomposition products may include hydrogen chloride and phosgene. Use dry chemical, carbon dioxide; polymer or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration at a temperature of 982°C for 2 seconds minimum.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Extremely flammable, Polymerization hazard, Environmental hazard, Environmental hazard.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F+, Xi; Risk phrases: R12; R19; R36/37/38; Safety phrases: S16; S26; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Allyl ethyl ether is an extremely flammable liquid. Molecular weight = 86.12; boiling point = 66°C; specific gravity (H_2O:1) = 0.79; vapor pressure = 136 mmHg @ 20°C; flash point = −21°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 4; reactivity 4. Insoluble in water.

Potential Exposure:Used for making other chemicals.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with strong acids. May form explosive peroxides during storage.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Through the skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Irritates eyes, skin, and respiratory tract. Exposure can cause headache, dizziness, nausea, and vomiting. May affect the CNS.

Long-Term Exposure: May cause CNS damage. Removes the skin's natural oils, leading to dryness, irritation, redness, possible cracking.

Points of Attack: Skin, lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, chest X-ray and nervous system tests should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce

vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid/refrigerated storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where allyl ethyl ether may be present, check to make sure that an explosive concentration does not exist. Check for peroxides and inhibit if necessary. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2335 Allyl ethyl ether, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover with activated charcoal adsorbent and deposit in sealed containers. Keep allyl chloride out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Allyl ethyl ether is a highly flammable and reactive liquid. Use dry chemical, carbon dioxide; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Allyl Ethyl Ether, Trenton, NJ (August 1998).

Allyl Glycidyl Ether A:0590

Formula: $C_6H_{10}O_2$

Synonyms: AGE; Alil glicidikico eter (Spanish); Allyl-2,3-epoxypropyl ether; Allylglycidaether (German); 1-Allyloxy-2,3-epoxy-propan (German); 1-(Allyloxy)-2,3-epoxypropane; 1,2-Epoxy-3-allyloxypropane; Oxirane [(2-propenyloxy) methyl]; [(2-Propenyloxy) methyl]oxirane

CAS Registry Number: 106-92-3

HSDB Number: 505

RTECS Number: RR0875000

UN/NA & ERG Number: UN2219/129

EC Number: 203-442-4 [*Annex I Index No.*: 603-038-00-1]

Regulatory Authority and Advisory Information
Carcinogenicity: NTP: Carcinogenesis Studies (inhalation); some evidence: mouse; equivocal evidence: mouse, rat.

Hazard Alert: Flammable, Possible polymerization hazard, Possible risk of forming tumors, Sensitization hazard, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn, N, Xi; Risk phrases: R10; R20/22; R37/38; R40; R41; R43; R52/53; R62; R63; R68; Safety phrases: S2; S24/25; S26; S36/37/39; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Allyl glycidyl ether is a colorless liquid with a strong, sweet odor. Molecular weight = 114.16; boiling point = 154°C; freezing/melting point = −100°C; density (H_2O:1) = 0.97; vapor density (air = 1) = 3.9; vapor pressure = 3.69 mmHg @ 20°C; flash point = 57°C. Soluble in water.

Potential Exposure: Used as a solvent and emulsifier; making epoxy resins, chlorinated compounds; and rubber.

Incompatibilities: May form explosive mixture with air. Contact with acids or bases may cause explosive polymerization. Contact with oxidizers or amines may cause fire and explosions.

Permissible Exposure Limits in Air
NIOSH IDLH = 50 ppm.

Conversion factor: 1 ppm = 4.67 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/45 milligram per cubic meter Ceiling Concentration

NIOSH REL: 5 ppm/22 milligram per cubic meter TWA; 10 ppm/44 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 1 ppm/4.7 milligram per cubic meter TWA; not classifiable as a human carcinogen

No PAC available.

DFG MAK: [skin] Carcinogen Category 2; danger of skin sensitization (2004)

Australia: TWA 5 ppm (22 milligram per cubic meter); STEL 10 ppm [skin], 1993; Austria: carcinogen, 1999; Belgium: TWA 5 ppm (23 milligram per cubic meter); STEL 10 ppm (47 milligram per cubic meter) [skin], 1993; Denmark: TWA 5 ppm (22 milligram per cubic meter) [skin], 1999; Finland: STEL 5 ppm (22 milligram per cubic meter) [skin], 1999; France: VME 5 ppm (22 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; the Philippines: TWA 10 ppm (45 milligram per cubic meter), 1993; Switzerland: MAK-W 0.05 ppm (0.1 milligram per cubic meter), 1999; Thailand: TWA 10 ppm (45 milligram per cubic meter), 1993; Turkey: TWA 10 ppm (45 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (24 milligram per cubic meter); STEL 10 ppm (47 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for AGE in ambient air:[60] 22 milligram per cubic meter; STEL 44 22 milligram per cubic meter (California), 22 milligram per cubic meter (Connecticut), 44 milligram per cubic meter (North Dakota), 40 milligram per cubic meter (Virginia), 52.4 milligram per cubic meter (Nevada).

Determination in Air: Adsorption in a Tenax-tilled tube, workup with ethyl ether, analysis by GC. Use NIOSH Analytical Method #2545.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed by the skin.

Harmful Effects and Symptoms
Short-Term Exposure: Skin contact contributes significantly to overall exposure. Inhalation of vapors may irritate the eyes, skin and respiratory tract, causing shortness of breath and coughing. Higher exposure may cause dizziness, lightheadedness, unconsciousness, pulmonary edema; a medical emergency that can cause death. Skin or eye contact with the liquid may cause irritation, burns and skin rash. The DFG warns of the danger of skin sensitization. Use of alcoholic beverages enhances the harmful effect.

Long-Term Exposure: This chemical may be a human carcinogen. It may cause mutations, and damage male reproductive glands. Repeated exposures may cause permanent lung damage.

Points of Attack: Eyes, skin, respiratory system; blood, reproductive system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests, lung function tests, examination of the eyes for corneal opacities. A qualified allergist may be consulted concerning potential skin allergy. Following acute overexposure, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers recommend natural rubber, butyl rubber; nitrile, polyvinyl alcohol, polyvinyl chloride, Neoprene/natural rubber material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2219 Allyl glycidal ether, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquid in vermiculite, dry sand; earth, or similar material and deposit in sealed containers. Wash away residue with plenty of water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. This chemical is a combustible liquid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Carcinogenesis Studies (gavage); clear evidence: rat; (gavage); no evidence: mouse; IARC: Animal Limited Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999.

Hazard Alert: Poison inhalation hazard, Flammable, Possible risk of forming tumors, Possible sensitization hazard [skin], Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, T, N, Xi; Risk phrases: R10; R23/24/25; R34; R36/37; R42/43; R50/53; R62; R63; Safety phrases: S16; S23; S24; S26; S29; S36/37/39; S41; S45; S60 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Allyl isothiocyanate is a highly flammable, colorless to pale yellow, oily liquid. Air contact may cause darkening. Pungent, irritating odor and acrid taste. Molecular weight = 99.16; boiling point = 151°C; flash point = 46°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 0. Insoluble in water. Allyl isothiocyanate may be inhibited, causing a change in various toxicological, chemical and/or physical properties.

Potential Exposure: Used in fumigants, veterinary drugs, ointments and counter irritants, mustard plasters, and as a flavoring agent.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alcohols, amines.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 1 ppm
PAC-2: 2.8 ppm
PAC-3: 17 ppm

DFG MAK: [skin] May cause skin sensitization.

Russia: TWA 0.3 milligram per cubic meter; STEL 0.6 milligram per cubic meter, 1993

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Eye and skin contact can cause skin irritation. Prolonged contact can cause burns and blisters. This chemical can be absorbed through the skin, thereby increasing exposure. Potential for dermal sensitization.

Long-Term Exposure: There is limited evidence that this chemical causes cancer in animals, It may cause bladder cancer in male rats. May damage the developing fetus. Exposure can cause an allergy-type reaction to develop with symptoms of asthma, watery eyes, sneezing, runny nose; coughing, sneezing, chest tightness. Skin allergy may develop, small exposures can cause symptoms to appear.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: Preemployment and regular lung function tests are recommended (these may be normal if the persons is not having an attack at the time of the test). If symptoms develop or if overexposure is suspected, evaluation by a qualified allergist may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1545 Allyl isothiocyanate, stabilized, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3 flammable liquids.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover with vermiculite, dry sand; soil, or similar adsorbent, and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Allyl isothiocyanate is a highly flammable liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen, sulfur and carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 203-485-9

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade). (stabilized)

Hazard Alert: Highly flammable, Corrosive, Violently water reactive.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C; Risk phrases: R11; R14; R34; R35/36/37; Safety phrases: S1; S16; S21; S26; S33; S36/37/39; S41; S43; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Allyl trichhlorosilane is a volatile, corrosive, flammable, colorless liquid. Irritating odor. Molecular weight = 175.5; specific gravity (H_2O:1) = 1.215 @ 20°C (liquid); boiling point = 117°C; liquid surface tension = (estimate) 20 dyn/cm; relative vapor density (air = 1) = 6.05; ratio of specific heats of vapor (gas) = 1.0863; latent heat of vaporization = 2.3×10^5 J/kg; heat of combustion = (estimate) = -120×10^5 J/kg; flash point = 35°C (oc). Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 2₩. Reacts violently with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: Used to make silicones and glass fiber finishes.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride gas. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture. Avoid all sources of ignition.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.60_A}$ ppm

PAC-2: $\mathbf{7.3_A}$ ppm

PAC-3: $\mathbf{33_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Permissible Concentration in Water: No criteria set. Reacts vigorously with water.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Allyl trichlorosilane is corrosive and contact can cause severe eye and skin burns. Exposure can irritate the eyes, nose and respiratory tract. Higher levels can irritate the lungs, causing coughing and shortness of breath; still higher exposures can cause pulmonary edema, a medical emergency that can cause death.

Long-Term Exposure: Corrosives may cause long-term lung problems, although it is not known at this time that this chemical causes lung damage.

Points of Attack: Eyes, skin, respiratory tract.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Following acute overexposure, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA for HCl: *50 ppm*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprS (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern); or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece).

Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where allyl trichlorosilane may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from contact with water and sources of ignition. Use and store allyl trichlorosilane under nitrogen. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1724 Allyltrichlorosilane, stabilized, Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use foam spray to reduce vapors. Cover with dry lime, dry sand; soda ash, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep allyl trichlorosilane out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.2/1.9

Fire Extinguishing: Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. This chemical is a highly flammable liquid. Thermal decomposition products may include hydrogen chloride and phosgene. Do Not Use Water. Use dry chemical, CO_2 or foam extinguishers. Low or medium expansion AFFF foam or dry chemical if available in sufficient amounts (FEMA). Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 212-075-9 (CAS: 760-19-0); 202-477-2 (CAS: 96-10-6); 209-248-6 (CAS: 563-43-9); 235-137-7 (CAS: 12075-68-2); 235-698-8 (CAS: 12542-85-7)

Regulatory Authority and Advisory Information

Hazard Alert: Pyrophoric hazard, Extremely flammable, Violently reactive with water; Organometallic, Strong reducing agent.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg)

Canada, WHMIS, Ingredients Disclosure List 1% as aluminum alkyl compounds.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, C; Risk phrases: R12; R14/15; R17; R29; R34; R35; R37; R48/20; R50/51/53; R62; R63; R65; R67; Safety phrases: S1/2; S16; S21; S26; S29; S36/37/39; S43; S45; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (*96-10-6; 760-19-0*)

Description: The aluminum alkyl halides are flammable, reactive, and may be spontaneously combustible in air. They are colorless to yellow liquids. *Ethylaluminum dichloride*: (*563-43-9*): Molecular weight = 126.95; specific gravity (H_2O:1) = 1222; boiling point = 194°C; freezing/melting point = 32°C; hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 4; reactivity 3-₩.

Ethyl aluminum sesquichloride: Molecular weight = 247.49; (Boiling point = 114.5−116.5°C; flash point = −20°C. NFPA-704 M Rating System): Health 3, flammability 3, reactivity 3-₩; violent reaction with water. *Methylaluminum sesquichloride*: Boiling point = 120−140°C; flash point = −17°C. *Methylaluminum sesquibromide*: Freezing/melting point = −3.8°C; boiling point = (about) 165°C.

Potential Exposure: These materials are used as components of olefin polymerization catalysts. The reader is referred to the entry on "Aluminum alkyls" for additional information on this entry. The aluminum alkyl halides parallel very closely the aluminum alkyls.

Incompatibilities: The aluminum alkyl halides are strong reducing agents; they react—possibly violently—with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. These chemicals react violently with nitromethane. Ethylaluminum sesquichloride reacts explosively with carbon tetrachloride at room temperature. This chemical reacts violently with water, forming corrosive hydrogen chloride and flammable ethane gas. Diethylaluminum chloride may form an explosive product with chlorine azide.

Permissible Exposure Limits in Air
as aluminum alkyls

OSHA PEL: None

NIOSH REL: 2 milligram per cubic meter TWA

96-10-6

PAC Ver. 29[138]

PAC-1: 27 milligram per cubic meter

PAC-2: 290 milligram per cubic meter

PAC-3: 1800 milligram per cubic meter

563-43-9

PAC-1: 28 ppm

PAC-2: 310 ppm

PAC-3: 1800 ppm

Determination in Air: Use NIOSH #7013 Aluminum; #7300, Elements; #7303; OSHA Analytical Method ID-121.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Points of Attack: Skin, respiratory system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

Storage: Spontaneously combustible. (1) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Outside or detached storage is preferable. Inside storage must be in a standard flammable liquids storage room or cabinet. Before entering confined space where acrolein may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat and light. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3052 Spontaneously combustible. Water reactive releasing large quantities of toxic and deadly hydrogen gas. (Note: this number does not appear in the 49/CFR HazMat tables)[101]

Spill Handling:

Ethyl aluminum sesquichloride is flammable, reactive, and a dangerous fire and explosion hazard. Ethyl aluminum sesquichloride is spontaneously combustible in air and reacts violently with water.

Initial isolation and protective action distances—aluminum alkyl halides, liquid or solids (when spilled in water)

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.8/1.3
See ERG Guide 135

Aluminum alkyl halides

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.8/1.3

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. These chemicals ignite spontaneously in air. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Do not use water or wet method.* It may be necessary to contain and dispose of this chemical as a hazardous waste. Ventilate area of spill or leak. Keep ethyl aluminum sesquichloride out of confined spaces, such as sewers, because of the possibility of an explosion. *Do not* wash into sewer. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Aluminum Alkyls A:0650

Formula: C_3H_9Al (trimethyl-); $C_6H_{15}Al$ (triethyl-); $C_9H_{21}Al$ (tripropyl-); $C_{12}H_{27}Al$ (triisobutyl)

Synonyms: Trialkylaluminum (general)

tributyl-isomer: Aluminum, Tributyl-; TNBA; Tributylalane; tri-*n*-Butyl aluminum

triethyl-isomer: Aluminum, triethyl-; TEA; Triethylalane

triisobutyl-isomer: Aluminum, triisobutyl-; Aluminum, tris (2-methylpropyl); Triisobutylalane; Tris(2-methylpropyl) aluminum

trimethyl-isomer: Trimethylalane

tripropyl-isomer: Aluminum, tripropyl-; Tripropylalane

CAS Registry Number: 75-24-1 (trimethyl-); 97-93-8 (triethyl-); 102-67-0 (tripropyl-); 1116-70-7 (tributyl-); *(alt.)* 100-99-2; 130565-62-7 (triisobutyl-)

HSDB Number:

RTECS Number: BD2204000 (trimethyl-); BD2050000 (triethyl-); BD2208000 (tripropyl-); BD1820000 (tributyl-); BD2203500 (triisobutyl-)

UN/NA & ERG Number: UN3399/138; UN3051/135 (*Note*: According to NOAA/Cameo, this number does not appear in the 49 CFR HazMat tables.)[101]

EC Number: 200-853-0 (CAS: 75-24-1); 202-619-3 (CAS: 97-93-8); 203-045-6 (CAS: 102-67-0); 214-240-0 (CAS: 1116-70-7); 202-906-3 (CAS: 100-99-2)

Regulatory Authority and Advisory Information

Hazard Alert: Pyrophoric hazard, Chemically unstable, Extremely flammable and highly reactive, Dangerously water reactive, Organometallic, Strong reducing agent.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F+ , C, N; Risk Statements: R12; R14/15; R17; R20; R29; R34; R48; R50/51/53; R62; R65; R67; Safety Statements: S6A; S16; S24; S24/25; S26; S29; S33; S36/37/39; S41; S43; S45; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: The aluminum alkyls are highly flammable and reactive, colorless to yellow liquids at room temperature. The lighter trialkylaluminums ignite spontaneously in air. They are normally supplied and used in a 20% solution with a hydrocarbon solvent, such as hexane, heptane, benzene, toluene. Properties may depend on solvent. Reacts violently with water. Molecular weight = 198.33 (triisobutyl-); 114.19 (triethyl-); specific gravity (H_2O:1) = 0.84 @ 20°C (triethyl-); boiling point = 86°C (triisobutyl-); 185−194°C (triethyl-); freezing/melting point = 4−6°C (triisobutyl); −52.5°C (triethyl-); 72.09 (trimethyl-75-24-1); vapor pressure = 69.3 mmHg @ 60°C (trimethyl, 75-24-1); 4 mmHg @ 83°C (triethyl-); flash point = ignites spontaneously in air; explosive limits: LEL: 9000 ppm 75-24-1 (trimethyl-); hazard identification (triethyl-, triisobutyl-): Health 3; flammability 4; reactivity 3₩ (water reactive; violent).

Potential Exposure: Alkyl aluminum compounds are used as components of olefin polymerization catalysts. They are also used in the synthesis of higher primary alcohols and in pyrophoric fuels, as a catalyst in making ethylene gas; and in plating aluminum.

Incompatibilities: The lighter trialkylaluminums ignite spontaneously in air; can self-heat in the air at room temperature without any added energy and may ignite. These compounds are strong reducing agents. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with water, oxygen (air), acids, alcohols, phenols, amines, carbon dioxide; sulfur oxides; halogenated compounds, and many other substances.

Permissible Exposure Limits in Air

as aluminum alkyls

OSHA PEL: None

NIOSH REL: 2 milligram per cubic meter TWA

PAC Ver. 29[138]

75-24-1 (trimethyl-)

PAC-1: 16 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter

97-93-8 (triethyl-)

PAC-1: 25 milligram per cubic meter

PAC-2: 280 milligram per cubic meter

PAC-3: 1700 milligram per cubic meter

Determination in Air: Use NIOSH #7013 Aluminum; #7300, Elements; #7303; OSHA Analytical Method ID-121.

Permissible Concentration in Water: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. These compounds react violently with water.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Can cause severe eye and skin irritation and burns. Inhaling vapors or fumes can irritate the respiratory tract, causing coughing, wheezing, and/or shortness of breath. They can cause "metal fume fever" with symptoms of head-ache, nausea, vomiting, chills, cough and shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute overexposure. See also NIOSH #8310, Metals in Urine.

First Aid: I If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: In case of fume inhalation, treat pulmonary edema. Consider administering prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation Exposure to large quantities, as in plant transfers, require full body aluminized proximity suit. Gloves, used in plant transfers or operations should be aluminized leather, preformed Neoprene, aluminized vinyl, or other fire-resistant, nonreactive material. Preformed rubber gloves may be used in the laboratory. All gloves used when handling aluminum alkyls should be loose-fitting for instant removal if necessary. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL*: *2 milligram per cubic meter* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Protect against physical damage. Outside or detached storage is preferable. Before entering confined space where aluminum alkyls may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. All transfer lines must be free of water, oxygen and other substances that react with aluminum alkyls. All vessels must be dry and oxygen free. Transfer lines should be blanked when not in use. Vessels should be top unloading when feasible with remote manual pressure relief. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3399 Organometallic substance, liquid, water-reactive, flammable, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 3-Flammable liquid, technical name Required. UN3051-Spontaneously combustible. Also, this material is dangerous when wet. (*Note*: this number does not appear in the 49/CFR HazMat tables)[101].

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. These chemicals ignite spontaneously in air. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Stop flow of liquid, if possible, before extinguishing fire. Thermal decomposition products may include poisonous and flammable gases, including ethylene and oxides of metal and carbon. These chemicals may ignite spontaneously in air, and are flammable liquids. *Do not use water, foam*, or a *halogenated* extinguishing agent. Use dry chemical, graphite powder, soda ash; or lime extinguishers. On solvent-based material use carbon dioxide or dry chemical. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, carefully use water spray to cool fire-exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Careful incineration.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): D003

Safe Drinking Water Act (47FR 9352): 47FR9352, regulated contaminants; 53FR1896, list of contaminants, 55FR1470, Priority List; 40 CFR143.3, SMLC, 0.05−0.2 mg/L

SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0% (Al, dust and fume); 0.1% (Aluminum oxide, fibrous form only).

Hazard symbols, risk, & safety statements: Hazard symbol: F; Risk phrases: R11; R15; R17; Safety phrases: S1; S2; S7/8; S21; S43 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Aluminum is a combustible, light, silvery-white, soft, ductile, malleable, amphoteric metal. Molecular weight = 26.98 (aluminum); 101.96 [aluminum oxide (Al_2O_3)] and (corundum); 137.99 (aluminum oxide hydrate); specific gravity (H_2O:1) = 2.7 (aluminum); 3.99 (aluminum oxide); boiling point = 2519°C (aluminum); 7.5 mmHg @ 2351°C (aluminum oxide); freezing/melting point = 660.3°C (aluminum); 2054°C (aluminum oxide); vapor pressure = 1 mmHg @ 1284°C (aluminum); 2054°C (aluminum oxide); autoignition temperature = 590°C (aluminum). Ignition temperature of dust cloud = 650°C (aluminum); minimum explosive concentration = 0.045 oz/ft^3 [USBM] (aluminum). Hazard identification (*dust*): Health 0; flammability 3; reactivity 1. Insoluble in water. Relative explosion hazard of dust: Severe.

The primary sources are the ores cryolite, gibbsite and bauxite, found as boehmite; aluminum is never found in the elemental state. Aluminum oxide is a noncombustible, white, crystalline powder or granules. Molecular weight = 101.96; boiling point = about 3000°C; freezing/melting point = 2050°C. Insoluble in water.

Pyrophoric aluminums include aluminum powder, trimethyl aluminum (75-24-1), tripropyl aluminum (102-67-0).

Potential Exposure: Most hazardous exposures to aluminum occur in smelting and refining processes. Aluminum is mostly produced by electrolysis of Al_2O_3 dissolved in molten cryolite (Na_3AlF_6). Aluminum is alloyed with copper, zinc, silicon, magnesium, manganese, and nickel; special additives may include chromium, lead, bismuth, titanium, zirconium, and vanadium. Aluminum and its alloys can be extruded or processed in rolling mills, wire works, forges, or foundries; and are used in the shipbuilding, electrical, building, aircraft, automobile, light engineering, and jewelry industries. Aluminum foil is widely used in packaging. Powdered aluminum is used in the paints and pyrotechnic industries. Alumina, emery, and corundum has been used for abrasives, refractories, and catalysts; and in the past in the first firing of china and pottery.

Incompatibilities: Aluminum powder forms an explosive mixture with air and is a strong reducing agent that reacts violently with oxidizers, strong bases; strong acids; some halogenated hydrocarbons; nitrates, sulfates, metal oxides and many other substances. Keep away from combustible materials.

Permissible Exposure Limits in Air

as aluminum metal and insoluble compounds

OSHA PEL: 15 mg[Al]/m^3, total dust; 5 mg[Al]/m^3, respirable fraction TWA

NIOSH REL: 10 mg[Al]/m^3, total dust; 5 mg[Al]/m^3, respirable fraction TWA

ACGIH TLV[1]: 1 mg[Al]/m respirable fraction TWA

PAC Ver. 29[138]

1333-84-2, aluminum oxide hydrate

PAC-1: 15 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 780 milligram per cubic meter

1344-28-1, aluminum oxide

PAC-1: 15 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 990 milligram per cubic meter

1333-84-2, aluminum oxide hydrate

PAC-1: 15 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 780 milligram per cubic meter

DFG MAK: 4 mg[Al]/m^3, total dust; 1.5 mg[Al]/m^3, respirable fraction; Pregnancy risk Group D.

Australia: TWA 10 milligram per cubic meter, 1993; Australia: TWA 2 milligram per cubic meter (salts), 1993; Australia: TWA 5 milligram per cubic meter (fumes); TWA 5 milligram per cubic meter (resp. dust); MAK 6 milligram per cubic meter, dust, 1999; Belgium: TWA 10 milligram per cubic meter; TWA 2 milligram per cubic meter (salts); TWA 5 milligram per cubic meter (fumes), 1993; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Denmark: TWA 10 milligram per cubic meter, dust or fume, 1999; Finland: TWA 2 milligram per cubic meter (salts), 1993; France: VME 10 milligram per cubic meter; VME 5 milligram per cubic meter (fumes); VME 5 milligram per cubic meter (resp. dust), 1993; Hungary: STEL 5 milligram per cubic meter; TWA 2 milligram per cubic meter; STEL 4 milligram per cubic meter (salts), 1993; Norway: TWA 5 milligram per cubic meter, 1999; Russia: STEL 2 milligram per cubic meter, 1993; Sweden: NGV 4 milligram per cubic meter (resp. dust); NGV 10 milligram per cubic meter (total dust), 1999; Switzerland: MAK-W 6 milligram per cubic meter, 1999; United Kingdom: TWA 4 milligram per cubic meter, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 milligram per cubic meter (welding fumes-total particulates).

(Aluminum oxide)

ACGIH 10 milligram per cubic meter Not suspected as a human carcinogen; (for total dust containing no asbestos and less than 1% crystalline silica).

DFG MAK: 1.5 mg[Al]/m^3 [(fume) respirable fraction (previously "fine dust")]; 4 mg[Al]/m^3 [(fume) inhalable fraction (previously "total dust")]; Pregnancy Risk Group D; BAT: 200 μg[Al]/L in urine, end-of-shift.

Australia: TWA 10 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, dust, 1999; Belgium: TWA 10 milligram per cubic meter, 1993; Denmark: TWA 10 mg[Al]/m^3, 1999; France: VME 10 milligram per cubic meter, 1999; Norway: TWA 2 mg[Al]/m^3, 1999; Poland: MAC (TWA) 2 milligram per cubic meter, MAC (STEL) 16 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Sweden: TWA 4 mg[Al]/m^3 (respirable dust); TWA 10 mg[Al]/m^3 (total dust), 1999; Switzerland: MAK-W 2 mg[Al]/m^3, 1999; United Kingdom: TWA 10 milligram per cubic meter, total inhalable dust; TWA 4 milligram per cubic meter, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen.

Determination in Air: For alumina dusts use NIOSH Analytical Method #0500, total dusts, #0600, OSHA Analytical Method ID-109SG, ID-198SG. For aluminum, metal, powder, coated and uncoated use NIOSH Analytical Method #7013, #7300, #7301, #7303, OSHA Analytical Method #ID-121. For aluminum, pyrophoric powders and welding fumes use NIOSH Analytical Method #7300, #7301, and #7303. For aluminum, soluble salts and alkyls use NIOSH Analytical Method #7013, #7300, #7301, #7303, OSHA Analytical Method #ID-12.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50−200 μg[Al]/L; State Drinking Water Standards: California: 1000 μg[Al]/L. State Drinking Water Guidelines: Arizona 73 μg[Al]/L; California 200 μg[Al]/L; Maine 1430 μg[Al]/L.

Routes of Entry: Inhalation, eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Aluminum dust can cause irritation, and particles can scratch the eyes. Aluminum oxide can irritate the eyes, nose and respiratory tract. Particles of aluminum deposited in the eye may cause necrosis of the cornea. Salts of aluminum may cause dermatoses, eczema, conjunctivitis, and irritation of the mucous membranes of the upper respiratory system by the acid liberated by hydrolysis. The effects on the human body caused by inhalation of aluminum dust and fumes are not known with certainty at this time. Present data suggest that pneumoconiosis might be a possible outcome. In the majority of causes investigated, however, it was found that exposure was not to aluminum dust alone, but to a mixture of aluminum, silica fume, iron dusts, and other materials.

Long-Term Exposure: There is evidence of an increase in bladder, lung, and other cancers among aluminum smelter workers. The increase appears to be due to PAC exposure, not to aluminum compounds. Aluminum salts are toxic to the animal fetus and cause fetal damage. Exposure to fine dust from aluminum or aluminum oxide can cause lung damage, pneumonia, and pulmonary fibrosis; with symptoms of coughing, wheezing and shortness of breath. Very high levels of aluminum may cause brain damage.

Points of Attack: Skin, respiratory system.

Medical Surveillance: Preemployment and periodic physical examinations should give special consideration to the skin, eyes, and lungs. Lung function should be followed, including chest X-ray, pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Actual working conditions will determine the need and type of PPE. Determine CPC based on working conditions. Dust masks are recommended in areas exceeding the nuisance levels. Aluminum workers generally should receive training in the proper use of PPE. Workers involved with salts of aluminum may require protective clothing, barrier creams, and where heavy concentrations exist, full face air supplied respirators may be indicated. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit.

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. UN1309; UN1383(1) Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. UN1396 Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1309 Aluminum powder, coated, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN1383 Pyrophoric metals, n.o.s. or Pyrophoric alloys, n.o.s., Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material, Technical Name Required. UN1396 Aluminum powder, uncoated, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

NA9260 (North America) Aluminum, molten, Hazard class: 9; Labels: 9-Miscellaneous hazardous material.

Spill Handling: For aluminum metal spills, special care must be taken with aluminum powder which may be very reactive. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not use water to clean up spilled aluminum powder. Do not raise dust level by sweeping. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. May be disposed of as an inert solid in a landfill.

Fire Extinguishing: With aluminum metal, do not use water or halogenated agents. Aluminum powder is a combustible solid. Aluminum oxide is not flammable. Use dry chemical, carbon dioxide; foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal of Aluminum Oxide-Disposal in a sanitary landfill. Mixing of industrial process wastes and municipal wastes at such sites is not encouraged however. Aluminum powder may be recovered and sold as scrap. Recycling and recovery is a viable option to disposal for aluminum metal and aluminum fluoride (A-57).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Aluminum chloride is a noncombustible but highly reactive whitish-gray, yellow, or green powder or liquid. Strong, acidic, irritating odor like hydrochloric acid. Molecular weight = 133.34; relative density = 2.5; vapor pressure = 3×10^{-3}; hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 2, ₩ (water reactive). Sinks in water and reacts, forming toxic and corrosive hydrogen chloride gas.

Potential Exposure: It is used as ethylbenzene catalyst, dyestuff intermediate, and detergent alkylate; in making other chemicals and dyes, astringents, deodorants, in the petroleum refining, and the rubber industries.

Incompatibilities: A strong reducing agent. Contact with air or water forms hydrochloric acid and hydrogen chloride gas. Reaction with water may be violent. Water, alcohol, and alkenes can cause polymerization. Incompatible with nitrobenzene, organic material, and bases. Attacks metal in presence of moisture, forming flammable hydrogen gas.

Permissible Exposure Limits in Air

Odor threshold = 6.31 ppm (as hydrogen chloride).

as aluminum, soluble salts

OSHA PEL: None

NIOSH REL: 2 mg[Al]/m^3 TWA

PAC Ver. 29[138]

7446-70-0

PAC-1: 30 milligram per cubic meter

PAC-2: 60 milligram per cubic meter

PAC-3: 360 milligram per cubic meter

Australia: TWA 2 mg[Al]/m^3, 1993; Belgium: TWA 2 mg [Al]/m^3, 1993; Denmark: TWA 2 mg[Al]/m^3, 1999; France: VME 2 mg[Al]/m^3, 1999; Norway: TWA 2 mg[Al]/m^3, 1999; Russia: TWA 2 mg[Al]/m^3, 1993; Sweden: NGV 2 mg[Al]/m^3, 1999; Switzerland: MAK-W 2 mg[Al]/m^3, 1999; United Kingdom: TWA 2 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 mg[Al]/m^3

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50−200 μg[Al]/L; State Drinking Water Standards: California: 1000 μg[Al]/L. State Drinking Water Guidelines: Arizona 73 μg[Al]/L; California 200 μg[Al]/L; Maine 1430 μg[Al]/L.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to eyes, skin, and respiratory tract. Inhalation may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. Ingestion can cause severe burns of mouth, throat and stomach, vomiting, watery or bloody diarrhea; kidney damage; jaundice and liver damage; collapse and convulsions. Estimated lethal dose is about 8 ounces for an average 150 pound adult.

Long-Term Exposure: May cause pulmonary fibrosis, and reduced lung function with symptoms of coughing, wheezing, and shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquid or solid, wear indirect vent, splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: If dust levels are high, wear a dust mask. If hydrogen chloride is present, use: *Up to 50 ppm*: CcrS* (APF = 10) (any NIOSH/MSHA or European Standard EN 149-approved chemical cartridge respirator with cartridge(s) providing protection against the compound of concern); or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprS* (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]; or Sa* (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

*Note**: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry area in tightly closed container away from moisture, heat, and sunlight.

Shipping: *UN1726 Aluminum chloride, anhydrous, Hazard class: 8; Labels: 8-Corrosive material. UN2581 Aluminum chloride solution, Hazard class: 8; Labels: 8-Corrosive material

Spill Handling:

*UN1726 Aluminum chloride, anhydrous (when spilled in water large amounts of toxic HCl gas can be released).

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase

with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.4/2.3

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Sweep carefully, being careful not to raise dust. Do not get water inside containers; keep combustibles away. For liquid aluminum chloride, absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Do not use water or water-based foams; will form poisonous fumes of hydrochloric acid. On solid material use any extinguishing medium suitable for surrounding fire. On solution, use dry chemical, carbon dioxide; or polymer foam extinguishers. Thermal decomposition products may include hydrochloric acid, aluminum oxide, and nitrogen oxides. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be sprayed with aqueous ammonia in the presence of ice and, when reaction is complete, flushed down drain with running water[22].

Regulatory Authority and Advisory Information

Hazard Alert: Corrosive; Primary irritant (w/o allergic reaction).

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2 mg[F]/L, as fluorides; SMCL = 0.05 to 0.2 mg [Al]/L as aluminum.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as aluminum, water soluble salts.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn; Risk phrases: R26; R36/37/38; Safety phrases: S26; S37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Aluminum fluoride is a white, odorless powder or granule. Molecular weight = 83.98; specific gravity (H_2O:1) = 2.88 @ 25°C; freezing/melting point = 1291°C. Boiling point = 1537°C; vapor pressure = 1 mmHg @ 1238.4°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Slightly soluble in water.

Potential Exposure: Used as component of electrolyte from which aluminum metal is produced; in the manufacture of ceramics, enamels, aluminum silicate; as flux in metallurgy; as a fermentation inhibitor.

Incompatibilities: Reacts violently with potassium or sodium.

Permissible Exposure Limits in Air

as aluminum soluble salts

OSHA PEL: None

DFG MAK: 1 mg[F]/m^3, inhalable fraction; [skin]; Peak Limitation Category I(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50−200 μg[Al]/L; State Drinking Water Standards: California: 1000 μg[Al]/L. State Drinking Water Guidelines: Arizona 73 μg[Al]/L; California 200 μg [Al]/L; Maine 1430 μg[Al]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride. Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L.

Routes of Entry: Inhalation, cutaneous absorption.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical (aerosol form) irritates eyes, skin, and respiratory tract. Skin and eye contact can cause severe burns. Inhalation can cause nose and throat irritation, with possible nose bleeding.

Long-Term Exposure: May cause lung irritation, the development of bronchitis, with coughing, shortness of breath; phlegm. This chemical may cause asthma-like allergy that may be delayed. If signs of allergy are detected, the exposed person(s) should avoid all further contact with this chemical. Also, exposure may lead to dense but brittle bones. It may also lead to stiffening of the joints.

Points of Attack: Lungs, bones, joints.

Medical Surveillance: Medical observation and rest is recommended for 24 to 48 hours after breathing overexposure, as asthma symptoms may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. NIOSH lists the following tests for fluorides, inorganic: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and post-shift; urinalysis (routine); CBC/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection:

NIOSH/OSHA *12.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter*: 95XQ (APF = 10)*[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter*: Sa:Cf (APF = 25) * + (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter*: 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *Note:* $^+$May need acid gas sorbent.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases and combustible materials, such as wood, paper, and oil.

Shipping: UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Avoid contact with dust. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Aluminum fluoride is not combustible. Thermal decomposition products may include fluorines. Do not use water as flammable hydrogen gas if formed. Use any extinguishing agent suitable for surrounding fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Neutralize with soda ash; add slaked lime; let stand for 24 hours. Transfer sludge to sewage facility.

Aluminum Nitrate A:0690

Formula: $AlH_{18}N_3O18$; $AlN_3O_9 \cdot 9H_2O$

Synonyms: Aluminum nitrate, nonahydrate; Aluminum(III) nitrate, nonahydrate (1:3:9); Aluminum trinitrate nonahydrate; Nitrato aluminico (Spanish); Nitric acid, aluminum salt; Nitric acid, aluminum(3 +) salt; Nitric acid, aluminum(III) salt

CAS Registry Number: 13473-90-0

HSDB Number: 574

RTECS Number: BD1040000

UN/NA & ERG Number: UN1438/140

EC Number: 236-751-8

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Strong oxidizer, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

United States National Primary Drinking Water Regulations: SMCL = 0.05 to 0.2 mg[Al]/L as aluminum; 10 mg/L; MCL = 10 mg[N]/L as nitrate (measured as nitrogen).

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, O; Risk phrases: R8; R36/37/38; Safety phrases: S17; S26/37/38; S41; (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Aluminum nitrate is an odorless, white crystalline solid, often in liquid solution. Molecular weight = 375.13[136]; 375.19 (nonahydrate); boiling point = 135°C (decomposes); freezing/melting point = 70–74°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Soluble in water; solubility = about 65 g/100 mL @ 25°C.

Potential Exposure: Aluminum nitrate is used in tanning leather; as an antiperspirant, as a corrosion inhibitor, in the extraction of uranium and as a nitrating agent.

Incompatibilities: Aluminum nitrate is a strong oxidizer; avoid contact with flammable or combustible materials; and reducing agents, including chlorides. In solution this chemical is a strong acid; avoid contact with bases. Explosions may occur when aluminum nitrate is shocked or exposed to heat.

Permissible Exposure Limits in Air

13473-90-0 & 13473-90-0, nonahydrate

PAC Ver. 29[138]

PAC-1: 47 milligram per cubic meter

PAC-2: 68 milligram per cubic meter

PAC-3: 410 milligram per cubic meter

as aluminum soluble salts

OSHA PEL: None

NIOSH REL: 2 mg[Al]/m^3 TWA

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50–200 μg[Al]/L; State Drinking Water Standards: California: 1000 μg[Al]/L. State Drinking Water

Guidelines: Arizona 73 μg[Al]/L; California 200 μg[Al]/L; Maine 1430 μg[Al]/L.

Routes of Entry: Inhalation, eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Eye contact may cause permanent damage. High exposures can cause unconsciousness. Prolonged contact can cause skin disorders. Ingestion can cause stomach cramps, nausea, Blue skin; weakness, and possible blood problems due to formation of methemoglobin. The oral LD_{50} for rats is 264 mg/kg.

Long-Term Exposure: Repeated contact can cause skin problems and eczema. This chemical is a corrosive, and it may cause lung problems.

Points of Attack: Respiratory system, eyes, skin, gastric system.

Medical Surveillance: A qualified allergist should be consulted if skin problems occur. Medical observation and rest is recommended for 24 to 48 hours after breathing overexposure, as asthma symptoms may be delayed. If signs of allergy are detected, the exposed person(s) should avoid all further contact with this chemical. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Aluminum nitrate poisoning requires special first aid and antidote.

Personal Protective Methods: Wear acid-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Rubber or Neoprene gloves will offer some hand protection. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly capped or sealed containers in a cool, well-ventilated area away from combustible materials; heat or flame. Protect containers from physical shock. See OSHA Standard 1910.104 and NFPA 43 A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1438 Aluminum nitrate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Sweep into a beaker. Dilute by adding slowly to water. Add soda ash then neutralize with HCl. Flush to sewer with large volume of water[22]. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable per se. Thermal decomposition products may include nitrogen oxides. Use dry chemical, carbon dioxide; or water spray. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the

containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: See Spill Handling above.

Regulatory Authority and Advisory Information

Hazard Alert: Strong oxidizer, Corrosive.

United States National Primary Drinking Water Regulations: SMCL = 0.05 to 0.2 mg[Al]/L as aluminum.

Canada: On DSL List; no WHMIS classification.

Hazard symbols, risk, & safety statements: Hazard symbol: C; Risk phrases: R8; R34; Safety phrases: S26; S24/25; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Aluminum orthophosphate is a white crystalline solid which is often used in liquid or gel form. Molecular weight = 121.95; freezing/melting point ≥ 1450°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Used as a flux in ceramics; in dental cements; in the manufacture of special glasses, paints and varnishes, cosmetics; making pulp and paper; as an antacid.

Incompatibilities: A strong oxidizer; keep away from combustible materials. Violent reaction with reducing agents; strong bases. Material is an inorganic acid and will react, possibly violently, with bases; corrosive to metals, some plastics and body tissues.

Permissible Exposure Limits in Air

as aluminum soluble salts

OSHA PEL: None

NIOSH REL: 2 milligram per cubic meter

ACGIH TLV[1]: withdrawn

PAC Ver. 29[138]

PAC-1: 14 milligram per cubic meter

PAC-2: 200 milligram per cubic meter

PAC-3: 1200 milligram per cubic meter

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50−200 μg[Al]/L; State Drinking Water Standards: California: 1000 μg[Al]/L. State Drinking Water Guidelines: Arizona 73 μg[Al]/L; California 200 μg[Al]/L; Maine 1430 μg[Al]/L.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Aluminum phosphate can affect you when breathed in. Aluminum phosphate is a corrosive substance. It can cause severe burns of the eyes and skin on contact. Exposure to the liquid or dust can irritate the eyes, nose, throat, and bronchial tubes. Fine powder can irritate the lungs.

Long-Term Exposure: Can irritate the lungs, causing bronchitis with coughing, shortness of breath; and phlegm.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Medical observation and rest is recommended for 24 to 48 hours after breathing overexposure, as bronchitis symptoms may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear acid-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 2 milligram per cubic meter of aluminum, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases and combustible materials, such as wood, paper, and oil. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43 A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1760 Corrosive liquids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill until clean-up is complete. Ventilate area of spill or leak. Collect spilled material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Absorb liquid containing aluminum phosphate in vermiculite, dry sand; earth or similar material. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Aluminum Phosphate is nonflammable. Thermal decomposition products may include phosphine and phosphorus oxides. Use dry chemical powder extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Aluminum phosphide is a pyrophoric, dark gray or dark yellow crystalline solid. Molecular weight = 57.95; freezing/melting point = (decomposition) >1000°C; specific gravity (H_2O:1) = 2.9 @ 25°C. NFPA-704 Hazard Identification (based on NFPA-704 M Rating System): Health 4, flammability 4, reactivity 2, ₩ water reactive; decomposes slowly releasing poisonous and highly flammable phosphine gas.

Potential Exposure: Used as a rodenticide; wood preservative; as a source of phosphine; as an insecticidal fumigant for grain, peanuts, processed food, animal feed, leaf tobacco, cottonseed; and as space fumigant for flour mills, warehouses and railcars. Used in semiconductor research.

Incompatibilities: Able to ignite spontaneously in moist air; forms toxic and explosive phosphine gas on contact with moisture in air. Reacts violently with water, steam, carbon dioxide; acids, alcohols, and foam fire extinguishers. Contact with water and bases slowly releases highly flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 2 milligram per cubic meter aluminum, soluble salts

ACGIH 2 milligram per cubic meter aluminum, soluble salts *Note*: Metallic phosphides on clothes, skin, or hair can react with water or moisture to generate phosphine gas (colorless gas; odor of garlic or decaying fish). Vomitus containing phosphides can also off-gas phosphine. For *phosphine*: see P:0580

PAC-2: $\mathbf{2.0_A}$ ppm

PAC-3: $\mathbf{3.6_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50−200 μg[Al]/L; State Drinking Water Standards: California: 1000 μg[Al]/L. State Drinking Water Guidelines: Arizona 73 μg[Al]/L; California 200 μg[Al]/L; Maine 1430 μg[Al]/L.

Determination in Water: Toxic to aquatic organisms.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Acute toxicity occurs primarily by the inhalation route when aluminum phosphide decomposes into the toxic gas, phosphine. The human median lethal dose for aluminum phosphide has been reported to be 20 mg/kg. Rated as super toxic: probable oral lethal dose is less than 5 mg/kg or less than 7 drops for a 70 kg (150 lb) person. Symptoms of phosphine gas poisoning include restlessness, headache, dizziness, fatigue, nausea, vomiting, coma, convulsions; lowered blood pressure; pulmonary edema; respiratory failure; and disorders of the kidney, liver, heart, and brain may be observed. LD_{50} (oral, male rat) = 13.9 mg/kg.

Short-Term Exposure: A severe health hazard. Irritates the eye, skin and respiratory tract. Inhalation can cause lung irritation with coughing, wheezing, and shortness of breath. Affects metabolism and the CNS; exposure can lead to death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause lung, kidney, and liver damage. May be able to cause skin rash or eczema.

Points of Attack: CNS; liver, kidney, lungs.

Medical Surveillance: Lung, liver, kidney, and nervous system function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when

skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 2 milligram per cubic meter (aluminum), use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed, or where any potential for exposures to Phosphine gas exist, use a NIOSH/MSHA (US) or EN149 (Europe)-approved gas mask (Approval number TC-14-98) equipped with a canister offering protection against phosphine, chlorine, hydrogen sulfide, organic vapors, acid gases, and dusts and mists. If the potential for exposure to more than 15 ppm of phosphine gas exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. See Phosphine entry.

Storage: (1) Color code—Red Stripe: Dangerous when wet materials release flammable gases On contact with water: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Aluminum phosphide decomposes in water, forming phosphine gas. Consult the entry on Phosphine for more information.

Shipping: UN1397 Aluminum phosphide, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.6/1.0

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1500/500
Then: Protect persons downwind (mi/km)
Day 1.3/2.0
Night 4.7/7.5

Shut off ignition; no flares, smoking, or flames in hazard area. Do not touch spilled material. Do not get water on spilled material or inside container. Dike spill for later disposal. Blanket release with dry sand, clay, or ground limestone. Shovel small spill into clean, dry container, and cover. Move containers from spill area. Avoid breathing dust. Wear appropriate protective clothing and use appropriate respiratory protection. Cover large powder spill with plastic sheet or tarp to minimize spreading. Clean-up only under supervision of an expert. DOT warns that this

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include phosphorus oxides and oxides of metal (aluminum). Do not use water or water-based foam, as deadly and explosive phosphine gas is formed. Small fires can be extinguished with dry chemical, soda ash; clay, or ground limestone, or use an approved Class D extinguisher. Large fires: withdraw from area and let fire burn. Move container from fire only if you can do it without risk. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. Wear SCBA when fighting fires involving this material. If contact with the material is anticipated, wear full protective clothing.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Allow to react slowly with moisture in the open, being sure that phosphine gas evolved is dissipated. Alternatively, mix with dry diluent and incinerate at temperature above 1000°C with effluent gas scrubbing[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Hazard Alert: Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg)[4]

Water Polluting Substance Annex II

United States National Primary Drinking Water Regulations: SMCL = 0.05 to 0.2 mg[Al]/L as Aluminum; SMCL = 250 mg[SO_4^{-2}]/L as Sulfate.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; Risk phrases: R36/37/38; R41; R51/53; R62; Safety phrases: S23; S26; S29; S37; S39; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Aluminum sulfate is a white powder, often used in water solution. The solution is a strong acid. Molecular weight = 342.12; freezing/melting point = 770°C (decomposes, forming corrosive sulfur trioxide). Soluble in water.

Potential Exposure: Widely used in the paper industry, in waste and water treatment and treating sewage; in antiperspirants, deodorants; in flame-retardants; in tanning leather, sizing paper; mordant in dyeing, purifying water, waterproofing cloth, clarifying oils and fats; in agricultural pesticides; manufacturing aluminum salts and others.

Incompatibilities: In aqueous solution, aluminum sulfate forms sulfuric acid; reacts with bases and many other substances. Corrodes metals, some plastics and body tissues, especially in the presence of moisture.

Permissible Exposure Limits in Air

as aluminum soluble salts

OSHA PEL: None

NIOSH REL: 2 milligram per cubic meter aluminum, soluble salts

PAC Ver. 29[138]

PAC-1: 38 milligram per cubic meter

PAC-2: 64 milligram per cubic meter

PAC-3: 380 milligram per cubic meter

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50−200 μg[Al]/L; State Drinking Water Standards: California: 1000 μg[Al]/L. State Drinking Water Guidelines: Arizona 73 μg[Al]/L; California 200 μg[Al]/L; Maine 1430 μg[Al]/L.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Aluminum sulfate powder can irritate the eyes, skin and respiratory tract. It is capable of causing eye damage. Ingestion of large doses can cause stomach irritation, nausea and vomiting.

Long-Term Exposure: Aluminum sulfate may cause skin disorders; and may cause lung problems.

Points of Attack: Lungs, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquid wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. When working with solid or powder wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above 2 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA). Wear a dust mask.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Aluminum sulfate powder should be kept dry since it forms sulfuric acid when wet.

Shipping: UN3264 Corrosive liquid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Sweep up or vacuum powdered material being careful not to raise dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable. Thermal decomposition products may include sulfur oxides. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. When involved in fire, wear goggles and SCBA and rubber clothing including gloves[41].

Disposal Method Suggested: Pretreatment involves hydrolysis followed by neutralization with NaOH. The insoluble aluminum hydroxide formed is removed by filtration and can be heated to decomposition to yield alumina which has valuable industrial applications. The neutral solution of sodium sulfate can be discharged into sewers and waterways as long as its concentration is below the recommended provisional limit of 250 mg/L.

Ametryn A:0740

Formula: $C_9H_{17}N_5S$

Synonyms: Ametrex; Amyphyt; Cemerim; Doruplant; EPA pesticide code 080801; 2-Ethylamino-4-isopropylamino-6-methylmercarpo-*s*-triazine; 2 Ethylamino-4-isopropyl amino-6-methylthio triazine; 2-Ethylamino-4-isopropylamino-6-methylthio-1,3,5-triazine; Evik; Gesapax; 2-Methylmercapto-4-ethylamino-6-isopropylamino-*s*-triazine; 2-Methylmercapto-4-isopropylamino-6-ethylamino-*s*-triazine; 2-Methylthio-4-ethylamino-6-isopropylamino-*s*-triazine

CAS Registry Number: 834-12-8

HSDB Number: 1710

RTECS Number: XY9100000

UN/NA & ERG Number: UN2763 (triazine, pesticides, solid, toxic)/151

EC Number: 212-634-7 [*Annex I Index No.*: 613-010-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Agricultural chemical (triazine), Environmental hazard.

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 100 lb (45.5 kg), 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; Risk phrases: R22; R51/53; Safety phrases: S2; S29; S36; S41; S60; S61 (see Appendix 4).

Water Polluting Substance Annex II.

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Ametryn is a colorless powder. Freezing/Melting point = 84–86°C; vapor pressure = 2.7×10^{-6} mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Soluble in water; solubility = 200 mg/L @ 20°C. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: Ametryn, a triazine and an organosulfide, amine compound A potential danger to those involved in the manufacture, formulation and application of this selective herbicide.

Incompatibilities: Triazines are incompatible with nitric acid. Amines are chemical bases, they neutralize acids to form salts plus water with an exothermic reaction. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen is generated by amines in combination with strong reducing agents such as hydrides, nitrides, alkali metals, and sulfides.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 60 μg/L; State Drinking Water Guidelines: Florida 60 μg/L; Maine 60 μg/L. Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

Determination in Water: Extraction with methylene chloride may be followed by GC using a nitrogen phosphorus detector. Octanol–water coefficient: $\text{Log } K_{ow} = \sim 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Ingestion, skin.

Harmful Effects and Symptoms

Short-Term Exposure: Ametryn is an eye and skin irritant. It is mildly toxic by skin contact. Poisonous if swallowed or inhaled.

Long-Term Exposure: It apparently causes liver degeneration. The LD_{50} value for male Charles River rats was 1207 mg/kg and 1543 mg/kg for female rats. Human Tox: 60.00000 ppb Health advisory: (LOW).

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no NIOSH REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids.

Shipping: UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid inhalation of dust; wear respirator. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Granular activated carbon will remove ametryn from water. Soil Adsorption Index (K_{oc}) = 300.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Wear positive-pressure SCBA when fighting fires involving this herbicide. Avoid breathing dusts and fumes from burning material. Keep upwind. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. Use extinguishing agents suitable for surrounding fire or dry chemical, carbon dioxide; or alcohol foam. Use water in flooding quantities as fog.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

EC Number: 204-208-4

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat; IARC: Animal Limited Evidence; Human No Adequate Data; Group 3, 1987. United States Environmental Protection Agency Gene-Tox Program, Positive: Carcinogenicity-mouse/rat.

California Proposition 65 Chemical[102]: Cancer 10/1/1989.

Hazard Alert: Exposure can be lethal, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects.

CERCLA/SARA 313: Form R *de minimis* Concentration Reporting Level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn: Risk phrases: R45; R36/37/38; R51/53; Safety phrases: S26; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 2-Aminoanthraquinoneforms red or orange-brown needle-shaped crystalline solid. Molecular weight = 223.24; freezing/melting point = 302–306°C; flash point = 282.5°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 0. Boiling point = sublimes. Insoluble in water.

Potential Exposure: 2-Aminoanthraquinone is used as a dye intermediate; in the industrial synthesis of anthraquinone and pharmaceuticals. It is the precursor of five dyes and one pigment, including Color Index Vat Blues 4, 6, 12, and 24; Vat Yellow 1; and Pigment Blue 22. Because AAQ is used on a commercial scale solely by the dye industry, the potential for exposure to the compound is greatest for workers at dye manufacturing facilities. However, no additional data are available on the number of facilities using AAQ. The Consumer Product Safety Commission staff believes that trace amounts of unreacted AAQ may possibly be present in some dyes based on this chemical and in the final consumer product. Exposure even to trace amounts may be a cause for concern. This concern is based on experience with other dyes derived from aromatic amines.

Incompatibilities: Keep away from strong oxidizing and reducing agents. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 9 milligram per cubic meter

PAC-2: 99 milligram per cubic meter

PAC-3: 590 milligram per cubic meter

Determination in Air: NIOSH Analytical Method #5013, Dyes

Routes of Entry: Inhalation and skin contact.

Harmful Effects and Symptoms

Technical grade 2-aminoanthraquinone (impurities unspecified), administered in the feed, was carcinogenic in male Fisher “344” rats, causing a combination of hepato-cellular carcinomas and neoplastic nodules of the liver. The compound was also carcinogenic in B6C3F1 mice, causing hepato-cellular carcinomas in both sexes and malignant gematopoietic lymphomas in females. An IARC: working group considered that the evidence for the carcinogenicity in experimental animals of the material tested was limited. In view of another evaluation of NCl bioassay results, the evidence can be considered as sufficient.

Short-Term Exposure: Irritates eyes and skin.

Long-Term Exposure: A confirmed carcinogen in animals; causes liver and lymph system cancer. May cause mutations.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or cool, well-ventilated area away from strong oxidizers.

Shipping: UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in vapor-tight, sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence, Possibly carcinogenic to humans, Group 2B

California Proposition 65 Chemical[102]: Cancer 1/1/1990

Hazard Alert: Poison, Flammable, Explosive, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

CERCLA/SARA 313: Form R *de minimis* Concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; E; Risk phrases: R45; R18; R45; R50/53; R62; R63; Safety phrases: S29; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 4-Aminoazobenzene forms yellow to tan crystals or orange needles. Molecular weight = 666.4 (solid)[136]; 1235 (liquid)[136]; specific gravity (H_2O:1) = 1.7 @ 20°C; boiling point $\geq$ 360°C; freezing/melting point = 126−128°C. Hazard identification (based on NFPA-704 M Rating System) (in hydrocarbon solvent): Health 3, flammability 2, reactivity 1; (*dry*) Health 3, flammability 0, reactivity 0 [ASU]. Slightly soluble in water.

Potential Exposure: An azo compound used in form of salts in dyeing; used as intermediate in manufacture of acid yellow and diazo dyes; in insecticides, waxes, lacquers, varnishes, stains, styrene resins.

Incompatibilities: Dust may form explosive mixture with air. Azo compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides. This chemical is sensitive to prolonged exposure to heat. This chemical is incompatible with strong oxidizing agents[101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.66 milligram per cubic meter

PAC-2: 7.2 milligram per cubic meter

PAC-3: 43 milligram per cubic meter

Determination in Water: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical is highly toxic and may be fatal by ingestion, inhalation or skin absorption. Symptoms of exposure to this compound include methemoglobinemia, cyanosis, bluish discoloration of the lips, earlobes and fingernails, headache, dizziness and skin sensitization[193].

Long-Term Exposure: A possible human carcinogen.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is

worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Aminoazotoluene forms golden yellow or reddish-brown crystalline solid. Molecular weight = 225.32; freezing/melting point = 101.7°C; vapor pressure = 7.5 × 10−7 mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Slightly soluble in water; solubility = 7.64 mg/L @ 25°C.

Potential Exposure: An azo compound used in dyes, medicines; as a colorant in shoe polishes and other wax-based polishes.

Incompatibilities: Dust may form explosive mixture in air. Azo compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides. This chemical is sensitive to prolonged exposure to heat. This chemical is incompatible with strong oxidizing agents[101].

PAC Ver. 29[138]

PAC-1: 1.9 milligram per cubic meter

PAC-2: 21 milligram per cubic meter

PAC-3: 120 milligram per cubic meter

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category: 2; Germ Cell Mutagen Group 3B (2006)

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = ~4 (est). Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Harmful Effects and Symptoms

Routes of Entry: Skin, inhalation, ingestion.

Short term Exposure: Symptoms of exposure to this compound may include allergic reactions. This may include eczema of the hands and arms. This compound is harmful if ingested, inhaled or absorbed through the skin. May cause irritation of the skin, eyes, and respiratory tract. Moderately toxic by several routes[44].

Long-Term Exposure: A known animal carcinogen. May cause skin sensitization; possible allergy.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Examination by a qualified allergist.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: 4-Aminobiphenyl is a combustible, colorless to tan crystalline solid that turns purple on exposure to air. May be used in a liquid solution. Floral odor. Molecular weight = 169.24; specific gravity (H_2O:1) = 1.16; boiling point = 302°C; freezing/melting point = 49°C; autoignition temperature = 450°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: 4-Aminobiphenyl is no longer manufactured commercially and is only used for research purposes. 4-Aminobiphenyl was formerly used as a rubber antioxidant and as a dye intermediate. Is a contaminant in 2-aminobiphenyl.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides and acid anhydrides.

Permissible Exposure Limits in Air

NIOSH IDLH = Not determined; potential occupational carcinogen.

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and PPE, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

ACGIH TLV[1]: [skin] Confirmed Human Carcinogen

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter
PAC-2: 17 milligram per cubic meter
PAC-3: 99 milligram per cubic meter
DFG MAK: [skin] Carcinogen Category 1

Australia: [skin] carcinogen, 1993; Austria: carcinogen, 1999; Finland: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter [skin] carcinogen, 1999; France: VME 0.001 ppm (0.007 milligram per cubic meter), 1 carcinogen, 1999; Norway: TWA 0.1 milligram per cubic meter, 1999; Sweden: carcinogen, 1999; Switzerland: [skin], carcinogen, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. Several states have set guidelines or standards for 4-aminobiphenyl in ambient air [60]: zero for North Dakota, New York and South Carolina; 0.8 μ/m^3 (Pennsylvania); 4.0 μ/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method (II-4) #P&CAM 269, OSHA Analytical Method 93.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient water limit of 200 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.8$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation and percutaneous absorption.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Irritates the skin. Exposure may cause methemoglobinemia, which interferes with the blood's ability to carry oxygen. This can cause headache, dizziness, fatigue, fast heart rate; blue color of the lips and skin. Higher levels can cause difficult breathing; collapse and death.

Long-Term Exposure: 4-Aminobiphenyl is a known human bladder carcinogen. An exposure of only 133 days has been reported to have ultimately resulted in a bladder tumor and blood in the urine. The latent period is generally 15−35 years. Acute exposure produces headaches, lethargy, cyanosis, urinary burning, and hematuria. Cystoscopy reveals diffuse hyperemia, edema, and frank slough.

Points of Attack: Bladder, skin, blood.

Medical Surveillance: OSHA mandates the following: *Increased Risk*; reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking; NIOSH lists the following tests: cystoscopy, urine (chemical/metabolite), urinalysis (routine). Blood test for hemoglobin levels. Placement and periodic examinations should include an evaluation of exposure to other carcinogens; use of alcohol, smoking, and medications; and family history. Special attention should be given on a regular basis to urine sediment and cytology. If red cells or positive smears are seen, a cystoscopy should be performed by a urologist at once. The general health of exposed persons should also be evaluated in periodic examinations. Blood methemoglobin level. CBC.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to Physician*: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. These are designed to supplement engineering controls (such as the prohibition of open-vessel operations) and to prevent all skin or respiratory contact. Full-body protective clothing and gloves should be used by those employed in handling operations. Full-face, supplied air respirators of continuous flow or pressure demand type should also be used. On exit from a regulated area, employees should shower and change into street clothes, leaving their clothing and equipment at the point of exit to be placed in impervious containers at the end of the work shift for decontamination or disposal. Effective methods should be used to clean and decontaminate gloves and clothing.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Escape: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Keep this material away from heat, sparks, flame and any sources of ignition. Store in a tightly closed container. Store in a cool, dry, well-ventilated area away from incompatible substances. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045 and 1910.1003.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Cover spills with dry lime or soda ash and collect powdered material, then collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal devices[22].

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: 4-Aminodiphenyl, Trenton, NJ (June 1998).

2-Amino-4-Chlorophenol A:0790

Formula: C_6H_6ClNO; $HOC_6H_3(NH_2)Cl$

Synonyms: 2-Amino-4-clorofenol (Spanish); *p*-Chloro-*o*-aminophenol

CAS Registry Number: 95-85-2

RTECS Number: SJ5700000

UN/NA & ERG Number**:**UN2673/151

EC Number: 202-458-9

Regulatory Authority and Advisory Information

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn: risk phrases: R20/21/22; R36/37/38; safety phrases: S26; S36/37/39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: 2-Amino-4-chlorophenol is a grayish to light brown crystalline solid or powder. Molecular weight = 143.57; freezing/melting point = 134−140°C; autoignition temperature = 500°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0, reactivity 0. Insoluble in water; solubility $\leq$ 0.1 g/100 mL @ 20°C.

Potential Exposure: Used as a chemical raw material, especially in dye manufacture.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, iron, moisture and temperatures >43°C.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Air: NIOSH Analytical Method #5013, Dyes

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous if inhaled or ingested. Exposure can lower the ability of the blood to carry oxygen. This can result in a bluish color to the skin and lips, headaches, dizziness, collapse and even death. LD_{50} = (oral-rat) <700 mg/kg.

Long-Term Exposure: Unknown at this time.

Points of Attack: Blood.

Medical Surveillance: Test for blood hemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area way from iron, moisture, and temperatures above 110°C.

Shipping: UN2673 2-Amino-4-chlorophenol, Hazard Class: 6.1; Labels: 6.1-Poisonous materials

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 2-Amino-4-chlorophenol may burn, but does not readily ignite. Thermal decomposition products may include chlorides and nitrogen oxides. Use dry chemical, CO_2, water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

1-Amino-2,4-Dibromoanthraquinone A:0795

Formula: $C_{14}H_7Br_2NO_2$

Synonyms: 1-Amino-2,4-dibromo-9,10-anthracenedione; 9,10-Anthracenedione,1-amino-2,4-dibromo-; Anthraquinone, 1-amino-2,4-dibromo-; 2,4-Dibromo-1-anthraquinonylamine; NCI-C55458

CAS Registry Number: 81-49-2

HSDB Number: 5241

RTECS Number: CB5500000

UN/NA & ERG Number: UN3259 (solid)/154; UN2735 (liquid)/153

EC Number: 201-354-0

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen.

California Proposition 65 Chemical[102]: Cancer 8/26/1997.

Hazard Alert: Poison, Corrosive, Suspected reprotoxic hazard

CERCLA/SARA 313: Form R *de minimis* Concentration Reporting Level: 0.1%.

Hazard symbols, Risk & safety statements: Hazard symbol: Xn: risk phrases: R45; R36/37/38; R61; safety phrases: S26; S36/37/39; S41 (see Appendix 4).

Description: 1-Amino-2,4-dibromoanthraquinone is a red powder or a red solid needles. Odorless. Molecular weight = 381; melting point: 224°C; flash point: >200°C. Practically insoluble in water; solubility ≤ 0.2 mg/mL @

25°C. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: A halide-and amine-substituted aromatic compound. (halogenated amine). Intermediate in the production of dyes.

Incompatibilities: May be combustible. Powder mixture with air may be explosive. Sensitive to air and light exposure, long term. A chemical base: will neutralize acids to form salts plus water with an exothermic reaction. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen is generated by amines in combination with strong reducing agents such as hydrides, nitrides, alkali metals, and sulfides.

Permissible Exposure Limits in Air: No value assigned.

Permissible Concentration in Water:

Determination in Water: Octanol−water coefficient: Log $K_{ow} \geq 5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation and dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: May cause irritation of the eyes, skin and respiratory tract. Inhalation exposure may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases.

Long-Term Exposure: May be tumorigenic and carcinogenic.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: *Eyes*: First check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20 to 30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: Immediately flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, Immediately call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation*: Immediately leave the contaminated area; take deep breaths of fresh air. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician and be prepared to transport the victim to a hospital. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBASCBA should be used; if not available, use a level of protection greater than or equal to that advised under Protective Clothing. *Ingestion*: *Do Not induce vomiting*. If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and Immediately call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. *Do Not induce vomiting*. Immediately transport the victim to a hospital. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Wear positive-pressure SCBASCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: You should protect this chemical from exposure to light. Keep the container tightly closed under an inert atmosphere, and store under refrigerated temperatures. Chemically stable for at least 14 days @ 54°C[72]. (1) Color code—White: Corrosive or Contact Hazard; store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3259 Amines, solid, corrosive, n.o.s, or Polyamines, solid, corrosive, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN2735 Amines, liquid, corrosive, n.o.s, or Polyamines, liquid, corrosive, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. For fire, see next section. *Spill*: Increase, in the downwind direction, as necessary, the isolation distance shown above. Eliminate all ignition sources (no smoking, flares, sparks or flames in immediate area). Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. *Do not get water inside containers.*

Fire Extinguishing: When heated to decomposition 1-amino-2,4-dibromoanthraquinone releases poisonous and toxic fumes of hydrogen bromide, bromides, and nitrogen oxides. *Fire*: If tank, rail car or tank truck is involved in a fire, *isolate* for 800 m (1/2 m) in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire*: Dry chemical, CO_2 or water spray. *Large fire*: Dry chemical, CO_2, alcohol-resistant foam or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

2-(2-Aminoethoxy)ethanol A:0810

Formula: $C_4H_{11}NO_2$

Synonyms: 2-Aminoethyoxyethanol; (Amino-2 éthoxy)-2 éthanol (French); 1-Amino-2-(2-hydroxyethoxy)ethane; 2-Amino-2-hydroxydiethyl ether; 2-(2-Aminoetoxi)etanol (Spanish); 5-Amino-3-oxapentan-1-ol; Diethylene glycol amine; Diethylene glycol monoamine; DGA; Diglycolamine; Ethanol, 2-(2-aminoethioxy)-; β-Hydroxy-β′-aminoethyl ether; 2-(2-Hydroxyethoxy)ethylamine; β-(β-Hydroxyethoxy) ethylamine; 2-(Hydroxyethoxy)ethylamine

CAS Registry Number: 929-06-6

HSDB Number: 5770

RTECS Number: KJ6125000

UN/NA & ERG Number: UN3055/154

EC Number: 213-195-4

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Corrosive.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, Risk & safety statements: Hazard symbol: C; risk phrases: R21; R34; safety phrases: S26; S24; R25; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 2-(2-Aminoethoxy)ethanol is a combustible, colorless to light yellow, thick liquid. Fishy odor. Molecular weight = 105.1; specific gravity (H_2O:1) = 1.028 @ 25°C; boiling point @ 1 atm = ~220°C; melting/freezing point = −13°C; relative vapor density (air = 1) = 3.59; latent heat of vaporization = (estimate) 4.85 × 105 J/kg; heat of combustion = (estimate) −287 × 105 J/kg; heat of solution = (estimate) −0.1 × 105 J/kg; vapor pressure = 0.001 mmHg @ 20°C. (approximately); flash point = 127°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1, reactivity 0. Soluble in water.

Potential Exposure: Used to remove gases from natural gas; in coatings in plastics; textiles, fibers, and metals; and in making other chemicals.

Incompatibilities: Reacts with oxidizers, strong acids; and chemically active metals, such as potassium, sodium, magnesium and zinc.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 9 milligram per cubic meter

PAC-2: 99 milligram per cubic meter

PAC-3: 590 milligram per cubic meter

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical is highly corrosive. Contact can severely irritate and burn the eyes and skin. Inhalation can irritate the respiratory tract and lungs, causing shortness of breath; coughing and wheezing. Higher exposures can cause pulmonary edema, a medical emergency. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause lung irritation, the development of bronchitis, with coughing, shortness of breath; phlegm.

Points of Attack: Lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way* *valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL*: (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3055 2-(2-Aminoethoxy) ethanol, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 2-(2-Aminoethoxy)ethanol may burn, but does not readily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol resistant foam to extinguish fire. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Animal Positive (hydrochloride); European Directive 67/548/EEC: May cause cancer. Toxic if swallowed.

California Proposition 65 Chemical[102]: (*hydrochloride*) Cancer 7/1/1989
Hazard Alert: Poison.
Hazard symbols, Risk & safety statements: Hazard symbol: T; risk phrases: R45; R25; R23/24/25; R36/37/38; R61; safety phrases: S22; S26; S28; S36/37/39; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 3-Amino-9-ethylcarbazole is a brown or tan, crystalline compound. The hydrochloride is a bluish-green powder. Molecular weight = 210.3; freezing/melting point = 99°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0, reactivity 0. The hydrochloride forms blue-green crystals.

Potential Exposure: Plant workers engaged in the manufacture of this compound and its use in pigment manufacture. Laboratory workers using this material in colorimetric enzyme assays and as a biological stain.

Incompatibilities: 3-Amino-9-ethylcarbazole neutralizes acids in exothermic reactions to form salts plus water. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. May generate hydrogen, a flammable gas, in combination with strong reducing agents such as hydrides[101].

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.
DFG MAK: Germ Cell Mutagen Group 3B

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous if swallowed.

Long-Term Exposure: A suspected carcinogen and mutagen.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked and cool, ventilated area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place. Protect from exposure to air.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters

waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include nitrogen oxides and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

Regulatory Authority and Advisory Information
Hazard Alert: Combustible, Corrosive, Sensitization hazard, Environmental hazard.
United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.
Hazard symbols, Risk & safety statements: Hazard symbol: C, T, Xi; risk phrases: R34; R43; R61; R62; safety phrases: S26; S28; S36/37/39; S41; S45; S53 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Aminoethylethanolamine is combustible, colorless, liquid with an ammonia-like odor. A strong base [pH (10 M) = 12.3] molecular weight = 104.15; specific gravity (H_2O:1) = 1.028 @ 25°C; boiling point: 243°C; vapor pressure = 8.17×10^{-4} mmHg @ 25°C; vapor pressure = 0.01 mmHg @ 20°C; flash point = 132°C; autoignition temperature = 368°C. Explosive limits: LEL: 1.0%, 10.000 ppm; UEL: 8.0%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1, reactivity 0. Highly soluble in water.
Potential Exposure: Used to make textile finishing compounds, dyes, resins, rubber, insecticides, medicines, and other chemicals.
Incompatibilities: Contact with cellulose nitrate may cause fires upon contact. Reacts with Oxidizers, strong acids.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 9 milligram per cubic meter
PAC-2: 99 milligram per cubic meter
PAC-3: 590 milligram per cubic meter
Permissible Concentration in Water: No criteria set.
Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq -1.50$. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation, skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: Contact can severely irritate and burn the eyes and skin; this can lead to permanent damage. May cause second degree burns in a short period of time. Inhalation can irritate the respiratory tract and lungs, causing shortness of breath; coughing and wheezing. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Toxicity by Ingestion: Grade 2; LD_{50} = 0.5 to 5 g/kg[136]
Long-Term Exposure: May cause lung irritation, the development of bronchitis, with coughing, shortness of breath; phlegm. May cause skin allergy. If allergy develops, very low future exposure can cause itching and skin rash.
Points of Attack: Lungs, skin.
Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Evaluation by a qualified allergist may diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL*: (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2735 Amines, liquid, corrosive, n.o.s, or Polyamines, liquid, corrosive, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Aminoethylethanolamine is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol resistant foam to extinguish fire. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Corrosive, Sensitization hazard (skin), Environmental hazard.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, Risk & safety statements: Hazard symbol: F, C, N, Xi; risk phrases: R10; R21/22; R34; R43; R52/53; safety phrases: S1/2; S26; S36/37/39; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *N*-Aminoethypiperazine is a combustible and corrosive aliphatic amine It is a colorless to light yellow liquid. Molecular weight = 129.2; specific gravity (H_2O:1) = 0.98; boiling point = 222°C; melting/freezing point = 17.7°C; flash point = 93°C; autoignition temperature ≥ 300°C; vapor pressure = 0.076 mmHg @ 20°C; hazard Identification (based on NFPA-704 M Rating System): Health 2; flammability 2, reactivity 0. Very soluble in water.

Potential Exposure: Used as an epoxy curing agent and making pharmaceuticals; synthetic fibers, and other chemicals.

Incompatibilities: Solution is a strong base. Reacts with nitrosating agents (e.g., nitrites, nitrous gases, nitrous acid); capable of releasing carcinogenic nitrosamines. Incompatible with nonoxidizing mineral acids; strong acids; organic acids, acid chlorides; acid anhydrides; organic anhydrides; isocyanates, chloroformates, vinyl acetate; acrylates, substituted allyls; alkylene oxides; epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution; strong oxidizers. Contact with copper alloys, zinc or galvanized steel may cause violent reaction.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 6.4 milligram per cubic meter

PAC-2: 71 milligram per cubic meter

PAC-3: 420 milligram per cubic meter

Determination in Water: Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can severely irritate and burn the eyes and skin (can cause second and third degree burns); this can lead to permanent damage. Inhalation can irritate the respiratory tract and lungs, causing shortness of breath; coughing and wheezing. Exposure can cause headache, nausea, and vomiting. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause lung irritation, the development of bronchitis, with coughing, shortness of breath; phlegm. Mutation data reported.

Points of Attack: Lungs, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear indirect-vent, impact and splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL*: (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2815 *N*-Aminoethylpiperazined, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, water, or alcohol; or polymer foam to extinguish fire. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: 1-Amino-2-methylanthraquinone is a red crystalline substance or powder. Molecular weight = 237.27; freezing/melting point = 205−206°C. Practically insoluble in water; solubility ≤ 1 mg/mL @ 20°C.

Potential Exposure: 1-Amino-2-methylanthraquinone is used almost exclusively as a dye intermediate for the production of a variety of anthraquinone dyes. May be used as a dye for a variety of synthetic fibers, especially acetates, as well as wool, sheepskins, furs, and surface dyeing of thermoplastics. None of the dyes that can be prepared from it are presently produced in commercial quantities.1-Amino-2-methylanthraquinone had been produced commercially in the United States since 1948, but production was last reported by a single company in 1970. The potential for exposure is greatest among workers engaged in the dyeing of textiles. 1-Amino-2-methylanthraquinone is not presently used in consumer products according to the CPSC.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Air: NIOSH Analytical Method #5013, Dyes

Routes of Entry: Inhalation, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may irritate the eyes and skin.

Long-Term Exposure: There is evidence that this chemical causes liver and kidney cancer. A mutagen. Technical-grade 1-amino-2-methylanthraquinone (impurities unspecified), administered in the feed, was carcinogenic in Fischer 344 rats, inducing hepatocellular carcinomas in rats of both sexes, and kidney tumors (such as tubular-cell adenomas and adenocarcinomas) in males.

Points of Attack: Liver, kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored. Should be stored in a refrigerator in a tightly closed container under an inert atmosphere[52].

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 204-316-1

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence, animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: rat: positive, mouse: negative

California Proposition 65 Chemical[102]: Cancer January 1, 1999

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, Risk & safety statements: Hazard symbol: T, Xn, Xi; risk phrases: R45; R22; R36/37/38; R62; safety phrases: S1/2; S22; S24/25; S26; S37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 4-Amino-2-nitrophenol is a dark red crystalline or reddish-purple solid. Molecular weight = 154.12; freezing/melting point = 125−131°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0. Practically insoluble in water; solubility ≤ 1 mg/mL @ 21°C.

Potential Exposure: In dye formulation for furs and hair.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. It is unknown if this nitro compound is explosive; some are flammable and explosive, and the contact with alkali increases thermal sensitivity of these materials.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: [skin] Carcinogen Category 3B

Determination in Air: NIOSH Analytical Method #5013, Dyes

Routes of Entry: Inhalation of dust; eye, and/or skin contact.

Harmful Effects and Symptoms

Severe eye irritant in rabbits. A suspected carcinogen. LD_{50} (oral, rat) = 1.470 mg/kg.

Short-Term Exposure: Poisonous if swallowed or upon skin contact. Irritates eyes and may irritate skin and respiratory tract.

Long-Term Exposure: May be carcinogenic in humans. Similar compounds can cause chronic poisoning with fatigue, headache, dizziness, insomnia, cyanosis, anemia, and weight loss. May result in liver and kidneys damage, with toxic hepatitis and fatty degeneration of the kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is

worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in cool dry place away from air and from mineral acids and bases[52].

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with 60%−70% acetone to avoid airborne dust and remove to sealed containers for disposal[52]. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Sensitization hazard, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%. (*m*-, *o*-, *p*-isomers).

Listed on the TSCA inventory, CFR721.5820.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects.(*m*- isomer); Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. (*o*- & *p*-isomer, mixed isomers).

Hazard symbols, Risk & safety statements: Hazard symbol (*o-isomer*): T, Xi, Xn; risk phrases: R20/22; R36/37/38, R62; R63; R68; safety phrases: S28; S36/37; (*m*-isomer): Hazard symbol: Xn, N; risk phrases: R20/22; R51/53; safety phrases: S2; S28; S29; S41; S61. (*p*-isomer): Hazard symbol: Xn, N; risk phrases: R20/22; R50/53; R68; safety phrases: S2; S28; S29; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*o*-isomer); 3-Severe hazard to water (*p*-isomer).

Description: *o*-Aminophenol appears as colorless needles or as white crystalline substance turning tan to brown on exposure to air. Molecular weight = 109.13; specific gravity (H_2O:1) = 1.33; boiling point = (sublimes) 153°C @ 11 mmHg; freezing/melting point = 172−174°C. Slightly soluble in water.

p-Aminophenol is a white or reddish-yellow crystalline or light brown powder; turns violet on exposure to light.

Molecular weight = 109.14; specific gravity (H_2O:1) = 1.2; boiling point = (sublimes) 284°C @ 11 mmHg; freezing/melting point = (decomposes) 186−187°C; vapor pressure = 5×10^{-4} @ 25°C. Slightly soluble in water.

m-Aminophenol is a white crystalline substance. Molecular weight = 143.57; boiling point = 164 C @ 11 mmHg; freezing/melting point = 123−126°C. Hazard identification (based on NFPA-704 M Rating System) (*mixed isomers*): Health 2; flammability 1; reactivity 0. Low solubility in water; solubiliy ≤ 10 mg/mL @ 24°C.

Potential Exposure: Workers may be exposed to *o*-Aminophenol during its use as a chemical intermediate; in the manufacture of azo and sulfur dyes; and in the photographic industry. There is potential for consumer exposure to *o*-Aminophenol because of its use in dyeing hair, fur, and leather. The compound is a constituent of 75 registered cosmetic products suggesting the potential for widespread consumer exposure. *p*-Aminophenol is used mainly as a dye, dye intermediate and as a photographic developer; and in small quantities in analgesic drug preparation. Consumer exposure to *p*-aminophenol may occur from use as a hair-dye or as a component in cosmetic preparations. *m*-Aminophenol is used mainly as a dye intermediate.

Incompatibilities: These phenol/cresol materials can react with oxidizers; reaction may be violent. Incompatible with strong reducing substances such as alkali metals, hydrides, nitrides, and sulfides. Flammable gas (H_2) may be generated, and the heat of the reaction may cause the gas to ignite and explode. Heat may be generated by the acid-base reaction with bases; such heating may initiate polymerization of the organic compound. Reacts with boranes, alkalies, aliphatic amines, amides, nitric acid, sulfuric acid. Phenols are sulfonated very readily (e.g., by concentrated sulfuric acid at room temperature). These reactions generate heat. Phenols are also nitrated very rapidly, even by dilute nitric acid and can explode when heated. Many phenols form metal salts that may be detonated by mild shock.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

95-55-6, *o-isomer*

PAC-1: 2.9 milligram per cubic meter

PAC-2: 31 milligram per cubic meter

PAC-3: 190 milligram per cubic meter

DFG MAK: Danger of sensitization of the skin

591-27-5, *m-isomer*

PAC-1: 3 milligram per cubic meter

PAC-2: 33 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

Permissible Concentration in Water: Russia[43] has set MAC values in water used for domestic purposes. The value for *o*-aminophenol is 0.01 mg/L and for *p*-aminophenol is 0.05 mg/L.

Determination in Water: Toxic to aquatic organisms

Routes of Entry: Inhalation, ingestion, and skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Aminophenols can be absorbed through the skin, thereby increasing exposure. Can cause lung irritation. Poisonous if swallowed. These chemicals lower the blood's ability to carry oxygen (methemoglobinemia). This condition causes a bluish color to the skin and lips, headaches, dizziness; higher exposures can result in unconsciousness and death. Irritates eyes, skin and respiratory tract. Skin contact can cause burning sensation and rash. the *o*-isomer can affect the nervous system. *o*-Aminophenol has an oral LD_{50} for rats of 1300 mg/kg and *p*-aminophenol has produced LD_{50} values in rats of 375, 671, and 1270 mg/kg which are all of low acute toxicity. The oral LD_{50} in rats for *m*-aminophenol is 1000 mg/kg. May produce dermatitits, methemoglobinemia, bronchial asthma, and restlessness.

Long-Term Exposure: Prolonged or repeated contact can cause blood damage, skin disorders; liver, kidney, and brain damage. Aminophenols may cause mutations, and there is limited teratogenic evidence. Skin allergy or asthma may develop; future exposures, even in low doses can cause symptoms to occur.

Points of Attack: Blood, liver, kidneys, brain, skin, and lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Blood methemoglobin level. Evaluation by a qualified allergist. Any person who develops asthma from these aminophenols should avoid all future contact with them.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Aminophenols must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur.

Shipping: UN2512 Aminophenols (*o*-; *m*-; *p*-), Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Keep dust under control. Use a vacuum or wet method to reduce dust during clean-up. Do not sweep. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Aminophenols may burn, but do not readily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, CO_2, water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

California Proposition 65 Chemical[102]: Developmental/Reproductive toxin (female) 7/1/1987.

Hazard Alert: Poison, Possible neurotoxin, Combustible, Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; suspected reprotoxic hazard.

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

Hazard symbols, Risk & safety statements: Hazard symbol: T+; risk phrases: R28; R26/27/28; R61; R62; R63; safety phrases: S22; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Aminopterin is a white to yellow powder; commonly used as the dihydrate which forms clusters of yellow needles. Molecular weight = 440.46; freezing/melting point = 228−235°C; 260−265°C; vapor pressure = 2.3×10^{-19} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health-; flammability 1; reactivity 0. Soluble in water; solubility = 3.0 × 103 mg/L @ 25°C.

Potential Exposure: Aminopterin is used as a medicine (as a folic acid antagonist), rodenticide, and agricultural chemical.

Permissible Exposure Limits in Air

PAC Ver. 28, no values found in Ver. 29[138]

PAC-1: 2.3 milligram per cubic meter

PAC-2: 25 milligram per cubic meter

PAC-3: 150 milligram per cubic meter

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Acts as antimetabolite; antagonizes the utilization of folic acid by the body. GI effects. Highly toxic by ingestion. Has an LD_{low} = (oral-rat) 2.5 mg/kg.

Long-Term Exposure: A potential mutagen, and a questionable carcinogen. Listed as a developmental and reproductive toxicant by the state of California (Proposition 65). NIOSH has it listed as a suspected neurotoxin; liver and skin toxin. Bone marrow-chronic blood-forming system and other chronic effects.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Storage temperature: 2−8°C. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Do not create dust. Use a vacuum and water spray to reduce vapors. *Small wet spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator

Regulatory Authority and Advisory Information

Hazard Alert: Poison: High acute toxicity, Corrosive, Inhalation danger—inadequate warning properties; Human Data.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, Risk & safety statements: Hazard symbol: T + , Xi; risk phrases: R21; R23/24/25; R36/37/38; safety phrases: S26; S36/37/39; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 2-Aminopyridine is a flammable, colorless crystalline solid, or white leaflets or powder, or colorless liquid with a characteristic odor. Molecular weight = 91.13; freezing/melting point = 58°C; boiling point = 211°C; flash point = 68°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Highly soluble in water; solubility = 10−50 mg/mL @ 19°C.

Potential Exposure: 2-Aminopyridine is used in the manufacture of pharmaceuticals; especially antihistamines.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 ppm

Conversion factor: 1 ppm = 3.85 milligram per cubic meter

OSHA PEL: 0.5 ppm/2 milligram per cubic meter TWA

NIOSH REL: 0.5 ppm/2 milligram per cubic meter TWA

ACGIH TLV[1]: 0.5 ppm/2 milligram per cubic meter TWA

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 5 ppm (2 milligram per cubic meter), 1993; Austria: MAK 0.5 ppm (2 milligram per cubic meter), 1999; Belgium: TWA 0.5 ppm (2 milligram per cubic meter), 1993; Denmark: TWA 0.5 ppm (2 milligram per cubic meter), 1999; Finland: TWA 0.5 ppm (2 milligram per cubic meter); STEL 1.5 ppm (6 milligram per cubic meter), 1999; France: VME 0.5 ppm (2 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 2 milligram per cubic meter, 2003; the Philippines: TWA 0.5 ppm (2 milligram per cubic meter), 1993; Poland: MAC (TWA) 2 milligram per cubic meter, 1999; Switzerland: MAK-W 0.5 ppm (2 milligram per cubic meter), 1999; United Kingdom: TWA 0.5 ppm (2 milligram per cubic meter); STEL 2 ppm (7.8 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 ppm. Several states have set guidelines or standards for 2-aminopyridine in ambient air[61]: 0.5 ppm (2 milligram per cubic meter) TWA (California), 2 milligram per cubic meter (North Dakota), 3 milligram per cubic meter (Virginia), 4 milligram per cubic meter (Connecticut), 4.8 milligram per cubic meter (Nevada).

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 1.7 milligram per cubic meter

PAC-3: 10 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method (II-4) #S-158.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.22$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye, and skin contact (absorption through the skin).

Harmful Effects and Symptoms

Headaches, dizziness, excited state, nausea, flushed appearance; high blood pressure, respiratory distress, weakness, convulsions, stupor.

Short-Term Exposure: Skin contact contributes significantly to overall exposure. Irritates eyes, skin, and respiratory tract. May attack CNS. Inhalation or skin exposure can cause a fatal reaction that begins with a headache, dizziness, heaviness and weakness of the limbs, and may progress to convulsions; stupor; and coma. LD_{50} = (oral-rat) 0.2 g/kg.

Long-Term Exposure: May cause lung allergy.

Points of Attack: CNS; respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Interview for brain effects including recent memory loss; change in mood; concentration, headache, listless feeling; altered sleep patterns. Consider cerebellar, autonomic, and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 5 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere[52]; or store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2671 Aminopyridines, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use water spray to reduce dust or vapors. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Dike large spills. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with nitrogen oxides removal from effluent gas.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, Risk & safety statements: Hazard symbol: T + , N, Xn; risk phrases: R28; R23/24/25; R36/37/38; R50/53; safety phrases: S1; S22; S29; S36/37/39; S41; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]
Description: 4-Aminopyridine is white to tan or brown crystalline material. Odorless. Molecular weight = 94.12; specific gravity (H_2O:1) = 1.2607 @ 25.3°C; boiling point = 273°C; freezing/melting point = 155−158°C; flash point = 164°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Moderately soluble in water.
Potential Exposure: Used as a chemical intermediate in pharmaceuticals; as an agricultural chemical for field crops; and as a bird repellent and poison.
Incompatibilities: Sodium nitrite, strong oxidizers. Avoid contact with acid anhydrides, acid chlorides; and strong acids.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 1.8 milligram per cubic meter
PAC-2: 20 milligram per cubic meter
PAC-3: 40 milligram per cubic meter
Permissible Concentration in Water: No criteria set. Harmful to aquatic life in very low concentrations.
Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq 0.3$. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation, ingestion, skin absorption.
Harmful Effects and Symptoms
Short-Term Exposure: LD_{50} = (oral-rat) 21 mg/kg. May be fatal if swallowed or absorbed through the skin. Symptoms of exposure include rapid onset of disagreeable taste, immediate burning of throat; and abdominal discomfort; in addition, weakness, dizziness, disorientation, and seizures may occur. Delayed symptoms of oral ingestion include elevated liver enzymes, and respiratory arrest. Material may be fatal if inhaled, swallowed or absorbed through skin. Contact may cause burns to skin and eyes. Material affects neural transmission. In sufficient concentration, material may cause metabolic acidosis, respiratory arrest, and cardiac arrhythmias. The fatal dose to a 70 kg person is about 5 g.
Long-Term Exposure: High exposure or repeated exposure may cause liver damage.
Points of Attack: CNS; liver.
Medical Surveillance: Preemployment and regular physical examinations with emphasis on CNS. Liver function tests. Persons exposed to *strychnine* or other chemicals capable of causing seizures are probably at increased risk.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *For reference, the information for 2-Aminopiridine follows*: Up to *5 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100,

R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Avoid contact with acid anhydrides, acid chlorides; strong acids and strong oxidizers (such as halogens). Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2671 Aminopyridines, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce dust or vapors. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. *Dike large spills*. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with nitrogen oxides removal from effluent gas.

Hazard symbols, Risk & safety statements: Hazard symbol: Xn, N; risk phrases: R45; R48/22; R51/53; R62; R63; safety phrases: S2; S29/35; S36/37; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Amitrole is a colorless to off-white crystalline solid or white powder. Odorless when pure. Molecular weight = 84.1; specific gravity = 1.138 @ 20°C[72]; freezing/melting point = 147−159°C; vapor pressure = 8×10^{-6} mmHg; 4.41×10^{-7} mmHg @ 20°C[72]. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0. Soluble in water; solubility = Soluble in water; solubility = ≥ 100 mg/mL @ 17.5°C[72].

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this postemergence herbicide, which is now limited to noncrop applications as a herbicide and plant growth regulator. Some triazoles have been used as rubber components.

Incompatibilities: Dust may be explosive in air. Keep away from strong oxidizers; strong acids; light and heat (decomposes). Corrosive to iron, aluminum, and copper. Sublimes undecomposed at reduced pressure.

Permissible Exposure Limits in Air

IDLH = A potential human carcinogen[77]

OSHA PEL: None

NIOSH REL: 0.2 ppm TWA; suspected occupational carcinogen

ACGIH TLV[1]: 0.2 ppm TWA

PAC Ver. 29[138]

PAC-1: 0.6 milligram per cubic meter

PAC-2: 23 milligram per cubic meter

PAC-3: 220 milligram per cubic meter

DFG MAK: 0.2 ppm, inhalable fraction; Peak limitation Category II(8); Carcinogen Category 3B; Pregnancy Risk Group C

Australia: TWA 0.2 milligram per cubic meter, 1993; Austria: MAK 0.2 milligram per cubic meter, 1999; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.2 milligram per cubic meter, 1999; Finland: carcinogen, 1999; Switzerland: MAK-W 0.2 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.2 milligram per cubic meter, 2003; Argentina, Bulgaria, Colombia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans.

Determination in Air: NIOSH Analytical Method 0500; OSHA Method PV2006.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.65$. Unlikely to bioaccumulate in marine organisms.

Permissible Concentration in Water: No criteria set.

Determination in Water: Fish Tox = 12,422.37656000 ppb MATC (VERY LOW). Octanol−water coefficient: Log $K_{ow} \leq -0.6$. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Carcinogenicity is the primary observed effect. Amitrol is carcinogenic in mice and rats, producing thyroid and liver tumors following oral or subcutaneous administration. Railroad workers who were exposed to amitrole and other herbicides showed a slight (but statistically significant) excess of cancer when all sites were considered together. Because the workers were exposed to several different herbicides, however, no conclusions could be made regarding the carcinogenicity of amitrole alone.

Short-Term Exposure: Amitrol can be absorbed through the skin, thereby increasing exposure. May cause eye, skin and GI irritation and other effects. Toxic to the nervous and respiratory system and brain. Symptoms of exposure can include difficult breathing, muscle spasms, ataxia, anorexia, salivation, increased body temperature; weakness, exhaustion, dry skin, depression (thyroid function suppression).

Long-Term Exposure: May cause eye damage. A potential human carcinogen[77]. Hematological effects; Reproductive toxin[138]. Causes liver, thyroid, and pituitary cancer in animals. May damage the developing fetus. May cause liver, thyroid gland (possible goiter or underactive thyroid), and pituitary gland damage. Human Tox = 0.30973 ppb CHCL (Chronic Human Carcinogen Level) (EXTRA HIGH).

Points of Attack: Liver, thyroid, and pituitary gland, eyes, skin, liver carcinogen[138]

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. Before beginning employment and at regular times after that, the following is recommended: Physical examination of the thyroid and thyroid function tests (T_4, TSH, and T_3). If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Pituitary gland function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Contain and isolate spill. Product residues and sorbent media may be packaged in epoxy-lined drums. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Amitrol is resistant to hydrolysis and the action of oxidizing agents. Burning the compound with polyethylene is reported to result in >99% decomposition.

RTECS Number: TF0525000

UN/NA & ERG Number: (PIH) UN3018 (organophosphorus pesticide, liquid, toxic)/152

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade); *Theft hazard* 2.2 ($\geq$30.00% concentration)

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Neurotoxin (cumulative), Combustible, Agricultural chemical, drug.

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

CERCLA/SARA Section 304 RQ: 1 lb (0.454 kg)

Classified by EPA as a RUP

United States DOT 49CFR172.101, Inhalation Hazardous Chemical as organic phosphate, Substance ID: EDF-041

Hazard symbols, Risk & safety statements: Hazard symbol: T + ; risk phrases: R27/28; R33; R50/53; safety phrases: S1; S13; S28; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Amiton is a liquid organophosphate. Molecular weight = 269.38[72]; boiling point = 110°C @ 0.2 mmHg; vapor pressure = 0.01 mmHg @ 80°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 2; reactivity 1. Soluble in water.

Potential Exposure: Amiton is used as an acaricide and an insecticide; exposure may occur in manufacture and in application and use. VG has been used as a military nerve agent.

Incompatibilities: Contact with strong oxidizers may cause release of toxic phosphorus oxides. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.0099 milligram per cubic meter

PAC-2: 0.11 milligram per cubic meter

PAC-3: 0.65 milligram per cubic meter

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; GC/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Danger-poisonous; can be fatal if swallowed, inhaled, or absorbed through the skin or eyes. This material is highly toxic orally. It is a cholinesterase inhibitor. The LD_{50} = (oral-rat) 5.4 mg/kg. The toxic effects are similar to parathion. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and GI tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. this chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system; skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red-blood-cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 dibromide and TMB-4) have been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See entry on Parathion.

Respirator Selection: NIOSH: *(for Parathion) 0.5 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge (s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *2.5 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTOvHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material.

Spill Handling: *VG, when used as a weapon Note*: No Initial Isolation and Protective Action Distances have been assigned to amiton. This material is similar to parathion and may be considered a nerve agent.

Here, *for user reference*, is a sample of Initial Isolation and Protective Action Distances used for similar nerve agents:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate area of spill or leak. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Fire Extinguishing: Amiton is a combustible liquid. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. Small fires: dry chemical, carbon dioxide; water spray; or foam. *Large* *fires*: water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. All federal, state, and local environmental regulations must be observed. High-temperature incineration. Hydrolysis may also be used[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

CERCLA/SARA Section 304 RQ: 1 lb (0.454 kg)

Classified by EPA as a RUP

United States DOT 49CFR172.101 Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbol: T+, N; risk phrases R24; R28; R33; R50/53; safety phrases: S1/2; S28; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Amiton oxalate is a crystalline solid. Molecular weight = 359.39; freezing/melting point = 98−99°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 2; reactivity 1. Soluble in water.

Potential Exposure: A potential danger to those involved in manufacture and application of this insecticide.

Incompatibilities: Contact with strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, such as amiton oxalate, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.009 milligram per cubic meter

PAC-2: 0.099 milligram per cubic meter

PAC-3: 0.59 milligram per cubic meter

Determination in Water: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

Routes of Entry: Inhalation, dermal contact, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Amiton oxalate is a cholinesterase inhibitor. Symptoms include headache, giddiness, nervousness, blurred vision; weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, miosis, tearing, salivation and other excessive respiratory tract secretion; vomiting, cyanosis, uncontrollable muscle twitching followed by muscular weakness; convulsions, coma, loss of reflexes, and loss of muscular control. LD_{50} = (oral-rat) 3 mg/kg.

Points of Attack: See entry on “Parathion” as referred to under “Amiton.” Bear in mind that the oxalate is a solid whereas amiton is a high-boiling liquid.

Medical Surveillance: See entry on "Parathion" as referred to under "Amiton." Bear in mind that the oxalate is a solid whereas Amiton is a high-boiling liquid.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See entry on Parathion. Bear in mind that the oxalate is a solid whereas amiton is a high-boiling liquid.

Respirator Selection: NIOSH: (*for Parathion*) *0.5 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge (s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *2.5 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *10 milligram per cubic meter* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of phosphorus, nitrogen and carbon. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Stay upwind; keep out of low areas. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EC Number: 251-375-4 [*Annex I Index No.*: 612-086-00-2]

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, Class C, possible human carcinogen. California Proposition 65 (pending) suspected carcinogen[13]; Developmental/Reproductive toxin 3/3/1999.

Hazard Alert: Poison, Reproductive toxin: Suspected of causing genetic defects, Environmental hazard, Sensitization hazard, Agricultural chemical.

CERCLA/SARA 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, Risk & safety statements: Hazard symbol: Xn, N, Xi; risk phrases: R40; R22; R43; R48/22; R50/53; R62; safety phrases: S2; S22; S24; S29; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Amitraz forms colorless needle-like crystals. Liquid formulations may contain flammable organic solvents. Molecular weight = 293.45; freezing/melting point = 86−87°C; vapor pressure = 2.6×10^{-6} mmHg. Insoluble in water.

Potential Exposure: Those engaged in the manufacture, formulation and application of this insecticide and acaricide. A rebuttable presumption against registration for amitraz was issued on April 6, 1977 by United States Environmental Protection Agency on the basis of oncogenicity.

Incompatibilities: Keep away from strong oxidizers and strong acids. Acids may render this material unstable.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. Fish toxicity: 2.00272 ppb, MATC (Maximum Acceptable Toxicant Concentration) (HIGH)

Harmful Effects and Symptoms

Amitraz metabolizes to 2,4-dimethylaniline which is a potential human carcinogen. A mouse oncogenic bioassay was conducted by Boots Chemical Company and reported by EPA; the results of that study have been disputed. Acute oral LD_{50} for rats is 800 mg/kg; for mice is greater than 1600 mg/kg.

Short-Term Exposure: Poisonous if ingested or absorbed through the skin. Eye or skin contact can cause irritation. May affect the CNS causing dizziness and a lowering of consciousness. May cause skin sensitization and possible allergic reaction.

Long-Term Exposure: Possible skin allergy. May affect the liver and CNS. Human toxicity (long-term):1.75 ppb, Health advisory: (HIGH)

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. If skin or lung sensitization is suspected, consider evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area, away from fertilizers, seed, and other pesticides, flammable materials and sources of heat and flame. Do not reuse containers.

Shipping: UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. ***Spill Handling:*** Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line). Soil Adsorption Index (K_{oc}) = 1000 Estimate.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Stay upwind; keep out of low areas. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (anhydrous)

Description: Ammonia is a colorless, strongly alkaline, and extremely soluble gas with a pungent, suffocating odor. Molecular weight = 17.03. Specific gravity (H_2O:1) = 0.70; boiling point = −33.35°C; freezing/melting point = −77.7°C; vapor pressure = 760 mmHg @ −33.6°C; 2070 kPa @ 50°C; flash point = (flammable gas); autoignition temperature = 630°C. Explosive limits: LEL: 13%; UEL: 28%. Hazard identification (based on NFPA-704 M Rating System) (solutions >10% but NOT >50% NH_3): Health 3; flammability 1; reactivity 0. Anhydrous ammonia is a colorless, highly irritating gas at room temperature with a pungent, suffocating odor. Ammonia gas is lighter than air; hugs the ground when cool; and flammable at high concentrations and temperatures. Easily compressed, it forms a clear, colorless liquid under pressure. Floats and “boils” on water. Readily dissolves in water, forming ammonium hydroxide, an alkaline, corrosive solution. Poisonous, visible vapor cloud is produced.

Potential Exposure: Ammonia is used as a nitrogen source for many nitrogen-containing compounds. It is used in the production of ammonium sulfate and ammonium nitrate for fertilizers; and in the manufacture of nitric acid, soda; synthetic urea, synthetic fibers; dyes; and plastics. It is also utilized as a refrigerant and in the petroleum refining and chemical industries. It is used in the production of many drugs and pesticides. Other sources of occupational exposure include the silvering of mirrors, gluemaking, tanning of leather; and around nitriding furnaces. Ammonia is produced as a by-product in coal distillation and by the action of steam on calcium cyanamide, and from the decomposition of nitrogenous materials.

Incompatibilities: Violent reaction with strong oxidizers and acids. Shock-sensitive compounds may be formed with gold, halogens, mercury, mercury oxide, and silver oxide. Fire and explosions may be caused by trimethylammonium amide, 1-chloro-2,4-dinitrobenzene, *o*-chloronitrobenzene, platinum, trioxygen difluoride, selenium difluoride dioxide, boron halides, mercury, chlorine, iodine, bromine, hypochlorites, chlorine bleach, amides, organic anhydrides; isocyanates, vinyl acetate; alkylene oxides; epichlorohydrin, and aldehydes. Attacks some coatings, plastics, rubber, copper, brass, bronze, aluminum, steel, tin, zinc, and their alloys.

Permissible Exposure Limits in Air

NIOSH IDLH = 300 ppm

Odor threshold = 5.75 ppm

OSHA PEL: 50 ppm/35 milligram per cubic meter TWA

NIOSH REL: 25 ppm/18 milligram per cubic meter TWA; 35 ppm/27 milligram per cubic meter STEL

ACGIH TLV[1]: 25 ppm/17 milligram per cubic meter TWA; 35 ppm/24 milligram per cubic meter STEL

PAC ammonia* Ver. 29[138]

PAC-1: $\mathbf{30_A}$ ppm

PAC-2: $\mathbf{160_A}$ ppm

PAC-3: $\mathbf{1100_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: MAK: 20 ppm/14 milligram per cubic meter; Peak Limitation Category I(2); Pregnancy Risk Group: C (2006).

Arab Republic of Egypt: TWA 25 ppm (18 milligram per cubic meter), 1993; Australia: TWA 25 ppm (18 milligram per cubic meter); STEL 35 ppm, 1993; Austria: MAK 25 ppm (18 milligram per cubic meter), 1999; Belgium: TWA 25 ppm (17 milligram per cubic meter); STEL 35 ppm (24 milligram per cubic meter), 1993; Denmark: TWA 25 ppm (18 milligram per cubic meter), 1999; Finland: TWA 25 ppm (18 milligram per cubic meter); STEL 40 ppm (30 milligram per cubic meter), 1993; France: VME 25 ppm (18 milligram per cubic meter), VLE 50 ppm (36 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 14 milligram per cubic meter, 2003; India: TWA 25 ppm (18 milligram per cubic meter); STEL 35 ppm (27 milligram per cubic meter), 1993; Japan: 25 ppm (17 milligram per cubic meter), 1999; Norway: TWA 25 ppm (18 milligram per cubic meter), 1999; the Philippines: TWA 50 ppm (30 milligram per cubic meter), 1993; Poland: MAC (TWA) 20 milligram per cubic meter; MAC (STEL) 27 milligram per cubic meter, 1999; Russia: TWA 25 ppm; STEL 20 milligram per cubic meter, 1993; Sweden: NGV 25 ppm (18 milligram per cubic meter), TGV 50 ppm (35 milligram per cubic meter), 1999; Switzerland: MAK-W 25 ppm (18 milligram per cubic meter), KZG-W 50 ppm (36 milligram per cubic meter), 1999; Thailand: TWA 50 ppm (35 milligram per cubic meter), 1993; Turkey: TWA 25 ppm (35 milligram per cubic meter), 1993; United Kingdom: TWA 25 ppm (18 milligram per cubic meter); STEL 35 ppm (25 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 35 ppm. Several states have set airborne guidelines or standards for ammonia in ambient air[60]: 25 ppm (18 milligram per cubic meter) TWA and STEL of 35 ppm (27 milligram per cubic meter) (California), 0.024 milligram per cubic meter (Massachusetts), 0.042857 milligram per cubic meter (Kansas), 0.18−0.27 milligram per cubic meter (North Dakota), 0.25 milligram per cubic meter (Virginia), 0.36 milligram per cubic meter (Connecticut, Florida, New York, South Dakota), 0.429 milligram per cubic meter (Nevada, Wyoming), 2.7 milligram per cubic meter (North Carolina).

Determination in Air: Use NIOSH Analytical Method #6015, and #6016, OSHA Analytical Method ID-164; ID-188.

Permissible Concentration in Water: Russia[43] set a MAC of 2.0 mg/mL in water bodies used for domestic purposes and 0.05 mg/mL in water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion; skin and eye contact.

Harmful Effects and Symptoms

LC_{50} (inh/4 hours, mice) = 2115 ppm

Short-Term Exposure: Eye or skin contact with ammonia can cause irritation, burns, frostbite (anhydrous), and permanent damage. Irritates the respiratory tract causing coughing, wheezing and shortness of breath. Higher exposure can cause pulmonary edema, a medical emergency, that can be delayed for several hours and is life threatening. Exposure can cause headache, loss of sense of smell; nausea, and vomiting. *Inhalation*: Nose and throat irritation have been reported @ 72 ppm after 5 minutes exposure. Exposures of 500 ppm for 30 minutes have caused upper respiratory irritation, tearing, increased pulse rate and blood pressure. Death has been reported after an exposure to 10,000 ppm for an unknown duration. *Skin*: Solutions of 2% ammonia can cause burns and blisters after 15 minutes of exposure. These burns may be slow to heal. Anhydrous ammonia may cause skin to freeze. *Eyes*: Levels of 70 ppm (gas) have caused eye irritation. If not flushed with water immediately contact with eye may cause partial or complete blindness. *Ingestion*: Ammonia will cause pain if swallowed and burning of the throat and stomach. May cause vomiting. One teaspoon of 28% aqua ammonia may cause death.

Long-Term Exposure: Repeated exposure can cause chronic eye, nose, and throat irritation. Repeated lung irritation can result in bronchitis with coughing, shortness of breath; and phlegm. Levels of 170 ppm of ammonia vapor has caused mild changes in the spleens, kidneys and livers of guinea pigs.

Points of Attack: Skin, respiratory system; eyes.

Medical Surveillance: Preemployment physical examinations for workers in ammonia exposure areas should be directed toward significant changes in the skin, eyes, and respiratory system. Persons with corneal disease, glaucoma, or chronic respiratory diseases may suffer increased risk. Periodic examinations should include evaluation of skin, eyes, respiratory system; and pulmonary function test to compare with baselines established at preemployment examination. Consider chest X-ray following acute exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Prevent skin contact. **8 hours** (More than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber gloves, suits, boots; Teflon gloves, suits, boots; Viton gloves, suits; Responder suits, Trellchem HPS suits; Trychem 1000 suits; **4 hours** (At least 4 but $<$ 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): nitrile rubber gloves, suits, boots Appropriate clothing should be worn to prevent any possible skin contact with liquids of $>10\%$ content or reasonable probability of contact with liquids of $<10\%$ content. Wear eye protection to prevent any potential for eye contact with liquids of $>10\%$ NH_3 content. Employees should wash immediately when skin is wet or contaminated with liquids of $>10\%$ content. Remove nonimpervious clothing immediately if wet or contaminated with liquids containing $>10\%$ and promptly remove if liquid contains $<10\%$ NH_3 are involved. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas- or splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *250 ppm*: CcrS* (APF = 10) (any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern); or Sa* (APF = 10) (any supplied-air respirator). *300 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS* (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern); or CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

*Note**: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: PIH; check oxygen content prior to entering storage area. UN/NA1005 Nonflammable compressed gas, Poisonous gas, Corrosive material: (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code—White stripe (*strong solution >27% <31%*): Contact Hazard; not compatible with materials in solid white category. This gas is toxic and/or corrosive, nonflammable. Outside or detached storage is preferred in an area that is roofed, shaded with the cylinders stored off the ground on nonwooden floors, and away from radiant heat sources and all possible sources of ignition. If indoors or outdoors, store in a well-ventilated noncombustible location temperatures not to exceed 50°C. Automatic monitoring systems are also preferred. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Separate from other chemicals, particularly oxidizing gases, chlorine, bromine, iodine, and acids.

Shipping: Shipped in tank cars, tank trucks, barges, and steel cylinders. Labeling and restrictions vary with concentration: NA1005 Ammonia, anhydrous, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas, Domestic (U.S.), Inhalation Hazard (Special Provision 13). UN1005 Ammonia, anhydrous, Hazard Class: 2.3; Labels: 2.3-Poison Gas, 8-Corrosive material International, Inhalation Hazard Zone D. UN2672* Ammonia solutions, relative density between 0.880 and 0.957 @ 15°C in water, with >10 % but NOT > 35 % ammonia, Hazard class: 8; Labels: 8-Corrosive material. UN2073 Ammonia solution, relative density less than 0.880 @ 15°C in water, with > 35% but NOT > 50% ammonia, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas. **Note*: Also used for Ammonium hydroxide, CAS1336-21-6, Record A:0110.

Spill Handling:

Ammonia, anhydrous

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

UN1017 Chlorine

*Small spills (from a small package or a small leak from a large package)**

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.1/0.2

*Large spills (from a large package or from many small packages)**

First: Isolate in all directions (ft/m) 500/150

Then: Protect persons downwind (mi/km)

Day 0.5/0.8

Night 1.3/2.0

***Attention**: If dealing with a large spill from the following containers: (1) Rail tank car, (2) Highway tank truck or trailer, (3) Multiple ton cylinders or (4) Multiple small cylinders or single ton cylinder see the following: "ERG Table 3: Initial Isolation and Protective Action Distances for Different Quantities of Six Common Toxic-by-Inhalation Gases." This chart shows isolation protective distances for the transport containers listed above (numbers 1 through 4) and various wind conditions: Low wind (<6 mph); Moderate wind (6 to 12 mph); High wind (> 12 mph)

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. Stop the flow of gas it can be done safely. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and full protective clothing. If the leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair the leak or allow the cylinder to empty. For small liquid spills, neutralize with hydrochloric acid. Wipe or mop or use water aspirator. Drain into sewer with sufficient water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Firefighting gear (including SCBA) does not provide adequate protection. Thermal decomposition products may include oxides of nitrogen. This gas is under pressure; containers may rupture and explode when heated. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Move container from fire area if you can do it without risk. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flash back. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. *Do not put water on liquid ammonia; will increase evaporation. Small fires*: dry chemical or carbon dioxide. *Large fires*: water spray, fog or foam. Apply water gently to the surface. Do not get water inside container. From a secure explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure position. Isolate area until gas has dispersed.

Disposal Method Suggested: Dilute with water, neutralize with HCl and discharge to sewer. Recovery is an option to disposal which should be considered for paper manufacture, textile treating, fertilizer manufacture and chemical process wastes.

Ammonium Acetate A:0960

Formula: $C_2H_7NO_2$: CH_3COONH_4
Synonyms: Acetic acid, ammonium salt
CAS Registry Number: 631-61-8
HSDB Number: 556
RTECS Number: AF3675000
UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171
EC Number: 211-162-9

Regulatory Authority and Advisory Information

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg), 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%. Source of aqueous ammonia. NH_3 equivalent weight 22.09.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium acetate is a white crystalline solid. Acetic odor. Molecular weight = 77.08; specific gravity (H_2O:1) = 1.17 @ 20°C; boiling point = decomposes; freezing/melting point = 114°C. Heat of solution = -0.13×10^5 J/kg; Soluble in water.

Potential Exposure: Ammonium acetate is used as a chemical reagent, to make drugs; foam rubber; vinyl plastics; explosives, and to preserve foods. An environmental threat.

Incompatibilities: Combustible solid. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, sodium hypochlorite, potassium chlorate, sodium nitrite.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 3.8 milligram per cubic meter
PAC-2: 42 milligram per cubic meter
PAC-3: 250 milligram per cubic meter

Harmful Effects and Symptoms

Short-Term Exposure: Can irritate the eyes, skin and respiratory tract. Eye contact can cause burns and permanent damage. Inhalation can irritate the nose, throat, and lungs; high levels can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated exposures can cause lung irritation and the development of bronchitis with coughing, shortness of breath and phlegm.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wash thoroughly immediately after exposure to Ammonium Acetate.

Respirator Selection: Where there is the potential for exposure to ammonium acetate: SCBAF:Pd,Pp (APF =

10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from sodium hypochlorite, potassium chlorate and sodium nitrite, since violent reactions occur.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium Acetate may burn, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include ammonia, oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R23/25; R50/53; safety phrases: S29; S53; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ammonium arsenate a combustible, white powder or plate-like colorless crystal. Molecular weight = 176.03; freezing/melting point = (decomposes). Soluble in water.

Incompatibilities: Hydrogen gas forms highly toxic arsine gas on contact with inorganic arsenic.

Permissible Exposure Limits in Air
NIOSH IDLH = 5 mg[As]/m^3
OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled
NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level.
ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen
No PAC available.
DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/end-of-shift; Carcinogen Category 1
Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India: TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L[40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic*: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Skin contact can contribute to overall exposure. Irritates eyes, skin and respiratory tract. Eye contact may cause burns and permanent damage. Inhalation may irritate the nose and throat causing coughing and wheezing. Repeated exposures may cause an ulcer or hole in the cartilage dividing the inner nose and poor appetite; a metallic or garlic taste; nausea, vomiting, stomach pain and diarrhea.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Skin damage or problems with circulatory systems, and may have increased risk of cancer. May cause liver damage. Prolonged or repeated exposure may cause disturbed sleep; with a feeling of “pins and needles” and loss of coordination. While ammonium arsenate has not been identified as a carcinogen, arsenic, and certain arsenic compounds have been determined to be carcinogens. This chemical should be handled with extreme care.

Points of Attack: Liver, CNS; eyes, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function, nervous system; and skin tests. Urine tests for arsenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, *Inorganic Arsenic*.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Requirements for Respiratory Protection for Inorganic Arsenic Particulate Except for Those With Significant Vapor Pressure: $<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. $<$ or $= 20{,}000\ \mu g/m^3$ Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $> 20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting Any full-facepiece SCBA operated in positive-pressure mode.

* A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where ammonium arsenate is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN1546 Ammonium arsenate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium arsenate is combustible solid. Thermal decomposition products may include arsenic, ammonia, and oxides of nitrogen. Use dry chemical, carbon dioxide; water spray; or foam. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Ammonium Arsenate, Trenton, NJ (December 1998).

Ammonium Bicarbonate A:0980

Formula: CH_5NO_3; NH_4HCO_3

Synonyms: ABC-Trieb; Acid ammonium carbonate; Acid ammonium carbonate, monoammonium salt; Ammonium hydrogen carbonate; Bicarbonate d'ammonium (French); Bicarbonato amonico (Spanish); Bicarbonato de amonio (Spanish); Carbonic acid, monoammonium salt; Monoammonium carbonate

CAS Registry Number: 1066-33-7

HSDB Number: 491
RTECS Number: BO0860000
UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171
EC Number: 213-911-5
Regulatory Authority and Advisory Information
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Ammonium bicarbonate is a white crystalline solid with a faint ammonia odor. Molecular weight 79.07; specific gravity (H_2O:1) = 1.06; boiling point = decomposes; freezing/melting point = 107.5°C (if heated very rapidly; decomposition may start @ 35−60°C); heat of solution = 3.3 × 105 J/kg. Soluble in water; solubility = 17.4% @ 20°C.
Potential Exposure: It is used in leavening for some baked goods; in baking powders and fire extinguishers; to make dyes and pigments; in the manufacture of porous plastics; and as an expectorant.
Incompatibilities: Contact with strong caustics, such as potassium hydroxide or sodium hydroxide will cause the release of ammonia gas. Decomposes as temperature rises $> 35°C$.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 4.7 milligram per cubic meter
PAC-2: 52 milligram per cubic meter
PAC-3: 310 milligram per cubic meter
Harmful Effects and Symptoms
The dust can irritate skin, eyes and mucous membranes. Higher concentrations can cause temporary blindness, pulmonary edema and cyanosis. It can severely injure respiratory membranes with possible fatal results.
Short-Term Exposure: Irritates the eyes, skin and respiratory tract.
Long-Term Exposure: Prolonged or repeated exposure may cause lung damage.
Points of Attack: Lungs, skin, eyes.
Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute exposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).
Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from caustics (such as sodium hydroxide or potassium hydroxide), because ammonia gas is released.
Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.
Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or

federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium bicarbonate may burn, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include ammonia gas and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be buried in a chemical waste landfill. If neutralized ammonium bicarbonate is amenable to treatment at a municipal sewage treatment plant.

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 100 lb (45.4 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 29.86.

Hazard symbols, risk, & safety statements: Hazard symbol: T,C; risk phrases: R25; R34; safety phrases: S1/2; S22; S26; S37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium bifluoride. Molecular weight = 57.04; specific gravity (H_2O:1) = 1.5 @ 20°C; boiling point = 239.5°C; melting/freezing point = 125.6°C; heat of solution = 3.59×10^5 J/kg is a white crystalline compound that is commonly found in solution. Molecular weight = 57.04; boiling point = 239.5°C; melting/freezing point = 125.6°C; specific gravity (H_2O:1) = 1.5 @ 20°C; heat of solution = 3.59×10^5 J/kg. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Soluble in water.

Potential Exposure: It is used as a sterilizer, in dairy and brewery operations; in the ceramic, glass, and electroplating industries; as a laundry sour.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. In the presence of moisture corrodes concrete, metals, glass.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg [F]/m^3, 15 min. Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

PAC Ver. 29[138]

PAC-1: 11 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 750 milligram per cubic meter

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

[HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 milligram per cubic meter), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg[F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen.

Determination in Air: Fluorides (as F) may be collected on a filter and measured by an ion-specific electrode according to NIOSH Analytical Method 7902[18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: The dust irritates and burns the eyes, skin, nose, throat and lungs. Eye contact may cause permanent damage. Inhalation can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Between 1 teaspoonful and one ounce may be fatal to humans by ingestion. Ingestion will in any case cause irritation of the mouth and stomach and can cause vomiting, convulsions, collapse and acute toxic nephritis. If absorbed through the skin this chemical may cause added exposure.

Long-Term Exposure: May cause chronic lung irritation and kidney and liver damage. Bronchitis may develop. Chronic exposure may cause weight loss; nausea, vomiting, weakness, shortness of breath.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential. Intake of fluoride from natural sources in food or water should be known. In the case of exposure to fluoride dusts, periodic urinary fluoride excretion levels have been very useful in evaluating industrial exposures and environmental dietary sources.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter*: 95X*[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter*: Sa:Cf (APF = 25) *+ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter*:100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine) since highly poisonous hydrogen fluoride gas is released. Keep in plastic, rubber or paraffined containers (because it easily etches glass).

Shipping: UN1727 Ammonium hydrogendifluoride, solid, Hazard class: 8; Labels: 8-Corrosive material.

UN2817 Ammonium hydrogendifluoride, solution, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium bifluoride may burn, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include hydrogen fluoride gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be buried in a specially designated chemical landfill. Aqueous wastes may be reacted with an excess of lime followed by lagooning and either recovery or land disposal of the separated calcium fluoride.

Ammonium Bisulfite A:1000

Formula: $H_3N \cdot H_2O_3S$

Synonyms: Ammonium hydrogen sulfite; Ammonium monosulfite; Monoammonium sulfite; Sulfurous acid, monoammonium salt

CAS Registry Number: 10192-30-0

HSDB Number: 486

RTECS Number: WT3595000

UN/NA & ERG Number: UN2693 (bisulfites, inorganic, aqueous solution, n.o.s.)/154

EC Number: 233-469-7

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Strong reducing agent, Corrosive,

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) NH_3 Equivalent molecular weight: 17.18

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R32; R34; R41; safety phrases: S23; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium bisulfite is a white crystalline solid or colorless to yellow solution. Molecular weight = 99.1; specific gravity (H_2O:1) = 2.026; Melting/Freezing point = (decomposes) 150°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Soluble in water; solubility = 26.7%.

Potential Exposure: Used as a preservative, in drilling fluids, making industrial explosives, hair waving and bleaching agents; for making other chemicals. A source of sulfur in liquid fertilizers.

Incompatibilities: Sulfites react explosively on contact with oxidizers. Reacts with acids, acid fumes releasing sulfur dioxide. Reacts with water. Corrosive to metals.

Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 30 milligram per cubic meter
PAC-2: 330 milligram per cubic meter
PAC-3: 2000 milligram per cubic meter
DFG MAK: Sensitizing substances, as *sulfites*.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Ammonium bisulfite is highly corrosive. Eye and skin contact can cause severe irritation and burns with possible permanent damage. Inhalation can irritate the lungs, causing coughing and shortness of breath. Higher exposure can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long-Term Exposure: May cause lung damage.

Points of Attack: Lungs, skin, eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, acids, water, combustible materials.

Shipping: UN2693 Bisulfites, inorganic, aqueous solutions, Hazard class: 8; Labels: 8-Corrosive material

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate closed spaces before entering them. Absorb liquid with sand, vermiculite, earth, or similar absorbent material and place into containers for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium bisulfite is noncombustible. Thermal decomposition products may include ammonia, sulfur dioxide and oxides of nitrogen. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate. It may be possible to dispose of waste material at a municipal facility if treated, neutralized, and oxidized.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium carbamate is a colorless crystalline powder or white powder. Ammonia-like odor. The odor threshold is 5 ppm as NH_3 (detection) and 46.8 ppm as NH_3 (recognition). Molecular weight = 78.07; boiling point = 60°C; freezing/melting point = (sublimes) about 60°C; heat of combustion: (estimate) @ 25°C: −2612 Btu/lb; heat of solution: (endothermic) 86.9 Btu/lb. Highly soluble in water.

Potential Exposure: It is used as a fertilizer and ammoniating agent.

Incompatibilities: Strong bases, strong oxidizers. Keep away from heat (forms urea), moisture, and direct sunlight.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.23 milligram per cubic meter

PAC-2: 2.6 milligram per cubic meter

PAC-3: 15 milligram per cubic meter

Harmful Effects and Symptoms

Irritates skin, respiratory tract and mucous membranes on contact.

Short-Term Exposure: Exposure can irritate the eyes and skin, causing redness and tearing. Eye damage may occur. Inhalation can irritate the nose and lungs with coughing, and/or shortness of breath.

Long-Term Exposure: Repeated or prolonged exposure can cause lung irritation and the development of bronchitis.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Lung function testing. Eye examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, moisture, and direct sunlight. See also Incompatibilities.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.***Spill Handling:*** Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium carbonate is a colorless crystal or white lumpy powder with a strong ammonia odor. The odor specific gravity (gas) = 2.7; Threshold is <5 ppm as ammonia gas. Molecular weight = 96.09; specific gravity (H_2O:1) = 1.59 @ 20°C; freezing/melting point = (decomposes) 58°C, and volatilizes at about 60°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 1. Slightly soluble in water.

Potential Exposure: It is used in dyeing, tanning, medicines, fire extinguishers; to make casein glue; ammonia salts; and baking powders. A laboratory reagent.

Incompatibilities: Acids, acid salts; salts of iron and zinc, alkaloids, calomel and tartar emetic. Keep cool, below 38°C.

Contact with inorganic acids may form CO_2, heat, and dangerous spattering.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.31 milligram per cubic meter

PAC-2: 3.5 milligram per cubic meter

PAC-3: 21 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, eye, and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate eyes and nose. Ingestion may cause gastric irritation. Breathing Ammonium Carbonate can irritate the nose, throat and lungs, causing a cough and difficulty in breathing. Toxicity by Ingestion: LD_{50} = (rat) 2.15 g/kg.

Long-Term Exposure: May cause lung problems.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Fire Extinguishing: Thermal decomposition products may include oxides of carbon. This material may burn but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Slowly deposit in a large container of water. Add excess amounts of soda ash and let stand for 24 hours. Decant to another container, neutralize with hydrochloric acid, and drain with an excess of water. Ship to landfill.

Regulatory Authority and Advisory Information

Hazard Alert: Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) NH_3 Equivalent molecular weight: 31.84.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, Xi; risk phrases: R22; R36/37/38; R62; safety phrases: S2; S22 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium chloride is a white crystalline solid. Odorless. Molecular weight = 53.50; specific gravity (H_2O:1) = 1.518; boiling point = 520°C; freezing/melting point = 338°C (sublimes). Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 0; reactivity 0. Soluble in water; solubility = 37%.

Potential Exposure: Ammonium chloride is used as an industrial chemical, pharmaceutical, and veterinary drug; to make dry batteries; in galvanizing; as a soldering flux.

Incompatibilities: Acids, alkalis, and silver salts.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: (fume) 10 milligram per cubic meter TWA; 20 milligram per cubic meter STEL.

ACGIH TLV[1]: (fume) 10 milligram per cubic meter TWA; 20 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 20 milligram per cubic meter

PAC-2: 54 milligram per cubic meter

PAC-3: 330 milligram per cubic meter

Australia: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter (fume), 1993; Denmark: TWA 10 milligram per cubic meter, 1999; Russia: STEL 10 milligram per cubic meter (fume), 1993; United Kingdom: TWA 10 milligram per cubic meter (fume) STEL 20 milligram per cubic meter (fume), 2000; Belgium: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter (fume), 1993; France: VME 10 milligram per cubic meter (fume), 1999; Poland: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter (vapors and fumes), 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 20 milligram per cubic meter, fume.

Determination in Air: Collection on a filter and colorimetric analysis.

Permissible Concentration in Water: Russia[43] set a MAC of 1.2 mg/L in water for fishery purposes. May be toxic to aquatic organisms.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ammonium chloride is an eye, skin and respiratory system irritant with a low grade systemic toxicity by ingestion.

Points of Attack: Skin, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. Any barrier that will prevent contamination from the dry chemical. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for Exposures over *10 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, alkalis, and silver salts. Protect against physical damage[17].

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include ammonia, chlorine gas, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves addition of sodium hydroxide to liberate ammonia and form the soluble sodium salt. The liberated ammonia can be recovered and sold. After dilution to the permitted provisional limit, the sodium salt can be discharged into a stream or sewer[22].

Ammonium Chloroplatinate A:1040

Formula: $C_{16}H_8N_2Pt$; $(NH_4)_2PtC_{16}$

Synonyms: Ammonium platinic chloride; Diammonium hexachloroplatinate(2-); Diammonium hexachloroplatinate (VI); Platinate(2-), platinic ammonium chloride

CAS Registry Number: 16919-58-7

HSDB Number: 2069

RTECS Number: BP5425000

UN/NA & ERG Number: UN3288 (Toxic solid, inorganic, n.o.s.)/151

EC Number: 240-973-0 [*Annex I Index No.*: 078-008-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Unstable chemical (may be explosive), Sensitization hazard, Suspected of causing genetic defects.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Delisted from CERCLA/SARA EHS listing in 1988.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R25; R41; R42/43; R51; R62; safety phrases: S1/2; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Ammonium chloroplatinate is an orange-red crystalline cubic solid or yellow powder which decomposes when heated. Molecular weight = 443.5. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 1. Soluble in water; solubility = 0.7 g/100 mL @ 15°C.

Potential Exposure: It is used in photography, platinum plating and in the manufacture of platinum sponge.

Incompatibilities: This material is unstable and potentially explosive[193]. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 4 mg [Pt]/m^3
OSHA PEL: 0.002 mg[Pt]/m^3 TWA
NIOSH REL: 0.002 mg[Pt]/m^3 TWA
ACGIH TLV[1]: 1 0.002 mg[Pt]/m^3 TWA

DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates

Determination in Air: Use NIOSH II(7) Method #S-19 (soluble salts)

Routes of Entry: Inhalation, ingestion; skin and /or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Eye and skin irritation can cause irritation and burns. Inhalation can cause respiratory tract irritation, causing coughing and shortness of breath. First symptoms are pronounced irritation of the nose and upper respiratory passages, with sneezing, running of eyes, and coughing. Later, "asthmatic syndrome," with cough, tightness of chest, wheezing, and shortness of breath; develops. It is toxic by inhalation or ingestion. Toxic concentrations for inhalation are 0.9 μ/minute. LD_{50} = (oral-rat) 195 mg/kg.

Long-Term Exposure: Platinum salts can cause asthma-like allergy and skin allergy. Symptoms begin during exposure and grow worse with chronic exposure.

Points of Attack: Lungs, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. Like treatment for other platinum salts remove victim to fresh air and give oxygen. Nasal washing to remove salts is recommended. In case of skin or eye contact, irrigate with water immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration above 0.05 milligram per cubic meter*: Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or 0.1 milligram per cubic meter: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *4 milligram per cubic meter*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

*Causes eye irritation or damage; eye protection needed.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids and strong oxidizers.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium chloroplatinate may burn, but is hard to ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include ammonia, nitrogen oxides; chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Because of the high value of the metal, recovery is the economically indicated disposal method.

Form R *de minimis* concentration reporting level: Chromium(VI) compounds: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, O, N, Xi; risk phrases: R45; R8; R22; R34; R43; R49; R50/53; R62; R63; safety phrases: S17; S26; S29/35; S36/ 37/39; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ammonium chromate is a yellow crystalline compound which can be used in solution, which is yellow with an ammonia odor. Molecular weight = 152.07; specific gravity (H_2O:1) = 191 @ 12°C; boiling point = 180°C; heat of solution (endothermic @ 25°C) = 68.6 Btu/lb; freezing/ melting point = 185°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0, Oxidizer. Soluble in water.

Potential Exposure: It is used to inhibit corrosion and in dyeing, photography and many chemical reactions. Used as a fungicide and fire retardant.

Incompatibilities: A strong oxidizer and an explosive. Contact with combustible, organic and other readily oxidizable substances may cause fire and explosions. Hydrazine, other reducing agents. Corrosive to metals.

Permissible Exposure Limits in Air

NIOSH IDLH = 15 mg[Cr(VI)]/m^3

as chromium(VI) inorganic soluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued

7788-98-9

PAC Ver. 29[138]

PAC-1: 0.44 milligram per cubic meter

PAC-2: 7.7 milligram per cubic meter

PAC-3: 46 milligram per cubic meter

DFG MAK: Inhalable fraction; [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift

Russia has set a MAK value of 0.01 milligram per cubic meter for chromates and bichromates in the work-place[43].

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: The EPA[6] has designated chromium as a priority toxic pollutant. State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr(VI)]/L.

Determination in Water: Chromium(VI) may be determined by extraction and atomic absorption or calorimetry (using diphenylhydrazide).

Routes of Entry: Lungs, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact can cause severe damage with possible loss of vision. Breathing ammonium chromate can cause a sore or hole through the inner nose (septum), sometimes with bleeding, discharge or crusting. Irritation of nose, throat and bronchial tubes can also occur, with cough and/or wheezing. Skin contact can cause deep ulcers or an allergic skin rash.

Long-Term Exposure: Some water-soluble chromium[16] compounds are inferred noncarcinogens; the water-insoluble compounds are generally deemed to be carcinogens but the border line is not precise nor universally agreed to. Ammonium chromate is a hexavalent chromium compound which may be carcinogenic and should be handled with extreme caution. Breathing ammonium chromate can cause sores or hole in the septum dividing the inner nose, sometimes with bleeding, discharge, and/or formation of a crust. May cause skin and lung allergy and kidney damage.

Points of Attack: Blood, respiratory system; liver kidneys, eyes, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Blood gas analysis, CBC; chest X-ray, electrocardiogram, liver function tests; pulmonary Function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Also consider skin and nose examination, kidney function tests, evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. (as chromic acid and chromates) **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex coated suits; **4 hours** (At least 4 but $<$ 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; Viton gloves, suits Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. (1) Color code—Blue (carcinogen): Health Hazard/ Poison: Store in a secure poison location. (2) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and away from contact with easily oxidized or combustible materials; heat or any condition which could shock it. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43 A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium chromate explodes when heated. Thermal decomposition products may include ammonia and nitrogen oxides. Use water only. *Do not* use dry chemical, carbon dioxide; halon or foam extinguishers. Storage containers may explode and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Addition of a large volume of a reducing agent solution (hypo, bisulfite or ferrous salt, and acidify with 3 M sulfuric acid). When reduction is complete, flush to drain with large volumes of water.

Ammonium Citrate A:1060

Formula: $C_6H_{14}N_2O_7$; $NH_4COOCH_2C(OH)(COOH)CH_2COONH_4$

Synonyms: Ammonium citrate, dibasic; Citrato amonico dibasico (Spanish); Citric acid, ammonium salt; Citric acid, diammonium salt; Diammonium citrate; Diammonium hydrogen citrate; Dibasic ammonium citrate; 1,2,3-Propane tricarboxylic acid, 2-hydroxy-, ammonium salt

Ammcitrate; Ammonium monohydrogen citrate; Citrate d’ammonium, dibasique (French); Citrato de amonio, dibásico (Spanish); Microstop

CAS Registry Number: 7632-50-0; 3012-65-5 (dibasic); 3458-72-8 (tribaseic)

HSDB Number: 300 as diammonium citate

RTECS Number: GE7573000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 221-146-3

Regulatory Authority and Advisory Information

Hazard Alert: Combustible.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 15.06.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R36/37/38; R50; WGK (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)] safety phrases: S16; S26; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Ammonium citrate (various forms) is a white powdery material with a slight ammonia-like odor. Molecular weight: 226.19; 243.22 (tribasic); specific gravity (H_2O:1) = 1.48. Hazard identification (based on NFPA-704 M Rating System): Health 0; flammability 1; reactivity 0. Soluble in water.

Potential Exposure: It is used to make pharmaceuticals; rust-proofing compounds and plasticizers; as a food additive; stabilizing agent.

Incompatibilities: Contact with strong caustics causes the release of ammonia gas.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

7632-50-0; dibasic 3012-65-5; tribasic 3458-72-8

PAC-1: 1.1 milligram per cubic meter

PAC-2: 12 milligram per cubic meter

PAC-3: 72 milligram per cubic meter

Routes of Entry: Inhalation, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the eyes and may irritate the nose, throat and lungs. Contact may irritate the skin. Eye and skin irritant, moderate; Nervous system toxin-acute effects; Respiratory toxin-acute effects other than severe or moderate irritation[138].

Points of Attack: Eyes, lungs, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing and goggles. Wash thoroughly immediately after exposure to ammonium citrate.

Respirator Selection: *At any detectable concentration*: PaprTHie (APF = 50) (any NIOSH/MSHA or European Standard EN 149-approved air-purifying respirator with a tight-fitting full facepiece and a high-efficiency particulate filter); or SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from caustics (such as sodium hydroxide or potassium hydroxide) because ammonia gas is released.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium citrate may burn, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include ammonia gas and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be flushed to sewer with large volumes of water.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: E, T + , N, Xi; risk phrases: R45; R2; R6; R8; R21; R25; R26; R46; R34; R42/43; R48/23; R50/53; R60; R62; safety phrases: S17; S29; S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ammonium dichromate is a combustible, orange-red crystalline solid which is used in solution. Molecular weight = 252.06; specific gravity (H_2O:1) = 2.94; freezing/melting point = 170°C (see incompatibilities); autoignition temperature = 225°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 1 OX. Soluble in water; solubility = 36% @ 20°C.

Potential Exposure: It is used in dyeing, leather tanning and to make fireworks and chromic oxide; in lithography and photoengraving; in manufacture of special mordants and catalysts.

Incompatibilities: An unstable oxidizer; freezing/melting point = (decomposes below MP) 180°C; decomposition becomes self-sustaining and violent at about 225°C. Contact with combustible, organic or other easily oxidized materials, strong acids; hydrazine and other reducing agents; alcohols, sodium nitrite may cause fire and explosions.

Permissible Exposure Limits in Air

NIOSH IDLH = 15 mg[Cr(VI)]/m^3

as chromium(VI) inorganic soluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, tert-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See NIOSH Pocket Guide, Appendix A & C.

ACGIH TLV[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued

PAC Ver. 29[138]

PAC-1: 0.37 milligram per cubic meter

PAC-2: 6.3 milligram per cubic meter

PAC-3: 38 milligram per cubic meter

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift

Russia[43] has set a MAK value of 0.01 milligram per cubic meter for chromates and bichromates in work-place air.

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible concentration in Water: State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr (VI)]/L.

Determination in Water: Chromium(VI) may be determined by extraction and atomic absorption or colorimetry using diphenylhydrazole.

Routes of Entry: Ingestion, skin, and/or eye contact.

Short-Term Exposure: Should be handled as a carcinogen, with extreme caution. Ammonium dichromate can pass through the skin and may cause overexposure. Eye contact can cause severe damage with possible loss of vision.

Irritation of nose, throat, and bronchial tubes can also occur, with cough and/or wheezing. Skin contact can cause deep ulcers or an allergic skin rash. Skin sensitization in humans.

Long-Term Exposure: Ammonium dichromate is a hexavalent chromium compound which may be carcinogenic and should be handled with extreme caution. Breathing ammonium chromate can cause sores or hole in the septum dividing the inner nose, sometimes with bleeding, discharge, and/or formation of a crust. May cause skin and respiratory allergy and kidney damage.

Points of Attack: Blood, respiratory system; liver kidneys, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, CBC; chest X-ray, electrocardiogram, liver function tests; pulmonary Function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Also consider skin and nose examination, kidney function tests, evaluation by a qualified allergist. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. (as chromic acid and chromates) **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex coated suits; **4 hours** (At least 4 but $<$ 8 hours of resistance to breakthrough >0.1 $0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; Viton gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. (1) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and away from contact with easily oxidized or combustible materials; heat or any condition which could shock it. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43 A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1439 Ammonium dichromate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers.

Fire Extinguishing: Ammonium chromate is a combustible solid and explodes when heated. Thermal decomposition products may include ammonia and oxides of nitrogen and metal. Use water only. *Do not* use dry chemical, carbon dioxide; halon or foam extinguishers. Storage containers may explode and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Add a large volume of a reductant solution (hypo, bisulfite or ferrous salt and acidify with sulfuric acid). Neutralize when reduction is complete and flush to sewer with large volume of water.

Determination in Air: Fluoride aerosols may be measured by collection on a filter followed by fluoride ion measurement using an ion-specific electrode. Use NIOSH Analytical Method 7902.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, skin and /or eye contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the nose, throat and lungs. Contact can irritate or burn the skin and eyes. Higher exposures could cause pulmonary edema, a medical emergency that can be delayed for several hours. The symptoms of pulmonary edema are aggravated by physical effort. This can cause death.

Long-Term Exposure: With repeated exposure, some persons may notice poor appetite; nausea, constipation or diarrhea. Repeated overexposure to fluoride can cause brittle bones; stiff muscles and joints and eventual crippling fluorosis. This usually takes years to develop. High or repeated exposure may scar the lungs, causing shortness of breath and reduced lung function. These effects do not occur with prescribed fluoride levels in drinking water or dental use to prevent cavities.

Points of Attack: Skin, eyes, respiratory system; bones, muscles.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential. Urine fluoride level (should be less than 5 mg/L of urine).

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter*: 95XQ (APF = 10)*[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter*: Sa: Cf (APF = 25) * + (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter*: 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ammonium Fluoride must be stored to avoid contact with acids or alkalis, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Keep in plastic, rubber or paraffined containers (because it easily etches glass).

Shipping: UN2505 Ammonium fluoride, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium fluoride may burn, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include hydrogen fluoride gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazard symbols, risk, & safety statements: Hazard symbol: T, C (aq. solution); risk phrases: R26/27/28; R34; R35; R37; safety phrases: S1/2; S26; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ammonium hexafluorosilicate is a white crystalline powder. Odorless. Molecular weight: 178.18;

specific gravity (H_2O:1) = 1.02; boiling point = decomposes @ 100°C; melting/freezing point = decomposes @ 100°C; heat of solution = 85 Btu/lb; vapor pressure ≤ 0.075 mm. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0₩. Sinks and mixes with water; reaction forms highly corrosive hydrofluoric acid.

Potential Exposure: This material is used as a pesticide and miticide, wood preservative, soldering flux; light metal casting; and in the etching of glass.

Incompatibilities: Aqueous solution is highly corrosive. Contact with acids reacts to form hydrogen fluoride, which is a highly corrosive and forms a toxic gas. Corrosive to aluminum. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Ammonium fluorosilicate reacts with water [and moisture in air] to form hydrofluoric acid, a source of fluoride ions. Unlike other halide ions, the fluoride ion is highly reactive, acting as a weak base and participating in some unique reactions. In particular, fluorides react strongly with compounds containing calcium, magnesium, or silicon ions, which means that solutions containing soluble fluorides are corrosive to both living tissue and glass. Hydrofluoric acid can cause severe chemical burns and is one of the few materials that can etch glass. It is also a toxic gas in its anhydrous form[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

16919-19-0

PAC Ver. 29[138]

PAC-1: 12 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 780 milligram per cubic meter

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 milligram per cubic meter), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg[F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen.

Determination in Air: Fluorides may be measured by collection on a filter and measurement by ion-specific electrode according to NIOSH Analytical Method 7902[18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, eyes, and/or skin contact.

Harmful Effects and Symptoms

Inhalation of dust can cause pulmonary irritation and can be fatal in some cases. Ingestion may be fatal. Contact with dust causes irritation of eyes and irritation or ulceration of skin[136]

Short-Term Exposure: Inhalation may cause difficult breathing and burning of the mouth, throat and nose which may result in bleeding. These may be felt @ 7.5 milligram per cubic meter. Nausea, vomiting, profuse sweating and excess thirst may occur at higher levels. May cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. Skin contact may cause rash, itching and burning and ulceration of skin. Solutions of 1% strength may cause sores if not removed promptly. Eye contact may cause severe irritation. Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. A dose of 5−40 mg may cause nausea, diarrhea and vomiting. More severe symptoms of burning and painful abdomen, sores in mouth, throat and digestive tract; tremors, convulsions and shock will occur around a dose of 1 gram. Death may result by ingestion of 2−5 g. Also reported as 1 teaspoon to 1 ounce.

Long-Term Exposure: May cause chronic lung irritation and kidney and liver damage. Bronchitis may develop. Chronic exposure may cause weight loss; nausea, vomiting, weakness, shortness of breath. Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 milligram per cubic meter or higher. May cause mottling of teeth at this level.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential. Intake of fluoride from natural sources in food or water should be known. In the case of exposure to fluoride dusts, periodic urinary fluoride excretion levels have been very useful in evaluating industrial exposures and environmental dietary sources.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Use only with an effective and properly maintained exhaust ventilation or with a fully enclosed process. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter*: 95XQ (APF = 10)*[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter*: Sa:Cf (APF = 25) *+ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter*: 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine and fluorine) since highly poisonous hydrogen fluoride gas is released. Keep in plastic, rubber or paraffined containers (because it easily etches glass).

Shipping: UN2856 Fluorosilicates, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Treat with soda ash or slaked lime. Use an industrial vacuum cleaner to remove the spill. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn, but does not readily ignite. Thermal decomposition products may include hydrogen fluoride, silicon fluoride fumes and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. Water may be used but should be contained to prevent fluoride run-off.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ammonium Hydroxide is a colorless to milky-white solution of ammonia, with a strong, irritating odor. Molecular weight: 35.05; specific gravity (H_2O:1) = 0.9 @ 25°C; boiling point = 37.8°C (25% NH_3); freezing/melting point = −77°C; −58°C (25% NH_3); vapor pressure = 720 mmHg @ 27°C (30%NH_3); 115 mmHg @ 20°C (10% NH_3). Autoigniton temperature = 650 C. Explosive limits: LEL: 15%, UEL: 25%. Hazard identification (based on NFPA-704 M Rating System) (*strong solution*): Health 3; flammability 1; reactivity 2. Soluble in water.

Potential Exposure: It is used in detergents, stain removers, bleaches, dyes, fibers, and resins.

Incompatibilities: Solution is strongly alkaline. Violent reaction with strong oxidizers, acids (exothermic reaction with strong mineral acids). Shock-sensitive compounds may be formed with halogens, mercury oxide; silver oxide. Fire and explosions may be caused by contact with β-propiolactone, silver nitrate; ethyl alcoho; silver permanganate; trimethylammonium amide; 1-chloro-2,4-dinitrobenzene, *o*-chloronitrobenzene, platinum, trioxygen difluoride; selenium difluoride dioxide; boron halides; mercury, chlorine, iodine; bromine, hypochlorites, chlorine bleach; amides, organic anhydrides; isocyanates, vinyl acetate; alkylene oxides; epichlorohydrin; aldehydes. Attacks some coatings, plastics and rubber. Attacks copper, brass, bronze, aluminum, steel, zinc, and their alloys.

Determination in Air: Sampling by absorption in sulfuric acid followed by measurement by ion chromatography, conductivity. Use NIOSH Analytical Method #6015, #6016.

Permissible Concentration in Water: Russia[43] set a MAC of 2.0 mg/mL in water bodies used for domestic purposes and 0.05 mg/mL in water bodies used for fishery purposes.

Routes of Entry: Ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ammonium hydroxide is a corrosive chemical and can severely burn the skin and eyes, causing permanent damage. Exposure can severely irritate the nose, throat and lungs. Inhalation may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases.

Long-Term Exposure: Long-term exposure at low levels may cause chronic bronchitis. Repeated skin contact can cause dermatitis, dryness, itching, and redness.

Points of Attack: Lungs, skin, eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended for ammonia by NIOSH in criteria document #74-136 (Ammonia).

Respirator Selection:

NIOSH: *250 ppm*: CcrS* (APF = 10) (any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern); or Sa* (APF = 10) (any supplied-air respirator). *300 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS* (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern); or CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge (s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White stripe (*strong solution*): Contact Hazard; not compatible with materials in solid white category. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in temperatures below 25°C/77°F. Do not fill bottles completely. Store in tightly closed, strong glass, plastic or rubber-stoppered containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2672 Ammonia solutions, relative density between 0.880 and 0.957 at 15°C in water, with $>10\%$ but not $>35\%$ ammonia, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate closed spaces before entering them. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. If professional environmental engineering assistance is required, contact the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Fire Extinguishing: Thermal decomposition products may include ammonia and nitrogen oxides. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dilute with water, neutralize with HCl and discharge to sewer[22].

WGK[100] (German Aquatic Hazard Class): Vanadium and compounds: 3-Severe hazard to water, unless water solubility is <4 μg[V]/L.

Description: Ammonium metavanadate is a white or slightly yellow crystalline powder. It is an inorganic acidic salt. Molecular weight = 116.98; specific gravity (H_2O:1) = 2.33; freezing/melting point = 200°C (decomposes). Slightly soluble in water, with decomposition.

Potential Exposure: It is used in the metals industry to make alloys, chemical reactions, dyes, inks, varnishes, printing, medicines, and photography.

Incompatibilities: Moisture forms an acidic solution. React with bases and alkaline material: may generate heat and release flammable hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 35 mg[V]/m^3

OSHA PEL: 0.05 mg[V_sO_5]/m^3 TWA (*dust*):, respirable fraction; 0.1 mg[V_sO_5]/m^3 Ceiling Concentration, (fume)

NIOSH REL: 1.0 mg[V]/m^3 TWA
ACGIH TLV[1]: 0.05 mg[V_sO_5]/m^3 TWA, Not classifiable as a human carcinogen, (dust or fume)
PAC Ver. 29[138]
PAC-1: 0.01 milligram per cubic meter
PAC-2: 0.11 milligram per cubic meter
PAC-3: 80 milligram per cubic meter
DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Group 2 (2005) vanadium inorganic compounds

These levels are for air levels only. When skin contact also occurs, overexposure is possible even though air levels are less than the airborne permissible limits. For fume limits see "vanadium metal" (CAS 7440-62-2).

Determination in Air: Use NIOSH Method (vanadium): #7300, #7301; #7303 Elements, #7504.

Permissible Concentration in Water: State Drinking Water Guidelines: California: 50 μg[V]/L Arizona 7 μg[V]/L; Florida: 49 μg[V]/L; Minnesota: 50 μg[V]/L; Wisconsin: 30 μg[V]/L. Runoff from spills or fire control may cause water.

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, nose, and respiratory tract. Inhalation can cause coughing, wheezing and phlegm. Exposure may cause headache and a green coating on the tongue. Higher exposures may cause pneumonia and/or pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. The oral LD$_{50}$ for rats is 160 mg/kg.

Long-Term Exposure: Ammonium metavanadate may be a reproductive hazard. Repeated exposure may cause lung irritation and bronchitis.

Points of Attack: Eyes, skin, and lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider X-ray following acute overexposure. Regulatory exams that include lung function, X-ray, and skin tests are proposed in criteria document NIOSH 77-222.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 milligram per cubic meter*: 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators); or SA* (any supplied-air respirator). *1.25 milligram per cubic meter*: Sa:Cf * (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprHie* (APF = 25)* (any powered, air-purifying respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

* *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: UN2859 Ammonium metavanadate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include ammonia, vanadium oxides; and nitrogen oxides. Extinguish fire using an agent suitable for type of surrounding fire. Ammonium metavanadate itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium Molybdate A:1130

Formula: $H_8MoN_2O_4$; $(NH_4)_2MoO_4$

Synonyms: Ammonium paramolybdate; Diammonium molybdate; Molibdato amonico (Spanish); Molybdic acid, diammonium salt

CAS Registry Number: 13106-76-8

HSDB Number: 1802

RTECS Number: QA4900000

EC Number: 236-031-3

Regulatory Authority and Advisory Information

CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R36/37/38; safety phrases: S23; S26l S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium molybdate is a colorless, white or slightly greenish-yellow powder. Molecular weight + 196.038; specific gravity (H_2O:1) = 2.28. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Soluble in water.

Potential Exposure: It is used as an analytical reagent, in pigments and in the production of molybdenum metal and ceramics.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides; chemically active metals (such as potassium, sodium, magnesium and zinc) may cause a violent reaction.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 mg[Mo]/m^3

ACGIH TLV[1]: 0.5 mg[Mo]/m^3 TWA soluble compounds, confirmed animal carcinogen with unknown relevance to humans.

OSHA PEL: 5 mg[Mo]/m^3 TWA soluble compounds

PAC Ver. 29[138]

PAC-1: 3.1 milligram per cubic meter

PAC-2: 22 milligram per cubic meter

PAC-3: 130 milligram per cubic meter

DFG MAK: 5 mg[Mo]/m^3 TWA soluble compounds

Russia[43] set a MAC for molybdenum in work-place air @ 2.0 milligram per cubic meter for aerosol condensates and 4 milligram per cubic meter for soluble compounds in the form of dust.

Determination in Air: Molybdenum may be sampled by filter and measured by inductively coupled argon plasma atomic emission spectroscopy as described in NIOSH Analytical Method 7300 for metals[18].

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Symptoms of molybdenum poisoning includes stomach upset, diarrhea, coma; death from heart failure can occur. Exposure to high concentrations may cause irritation of the eyes, nose and throat. Very high exposure may cause kidney and liver damage.

Long-Term Exposure: May cause kidney and liver damage. Inhalation of dust can cause lung disease.

Points of Attack: Skin, lungs.

Medical Surveillance: Kidney, liver tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at this site of chemical release. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA (for soluble compounds of molybdenum) *25 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *50 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or if not present as a fume PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1000 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store to avoid possible contact with active metals.

Shipping: There are no known UN/DOT restrictions.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent for type of surrounding fire. Ammonium molybdate itself does not burn. Thermal decomposition products may include ammonia and nitrogen oxides. Use dry chemical appropriate for extinguishing metal fires. *Do not use* water. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 229-347-8
Regulatory Authority and Advisory Information
Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade) (explosive: with more than 0.2% combustible substances, including any organic substances calculated as carbon, to the exclusion of any other substance); *Theft hazard* 2000 (*33% concentration*) (fertilizer: solid, with nitrogen concentration of $\geq 23\%$ nitrogen).
Hazard Alert: Combustible, Environmental Hazard, Agricultural chemical.
United States National Primary Drinking Water Regulations: MCLG = 10 mg[N]/L; MCL = 10 mg/L
United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as nitrate compounds
Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)
CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 21.28 also reportable as a nitrate compound, water dissociable, (reportable only when in an aqueous solution), at the same reporting level (1.0%).
Canada, NPRI (solution only).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Ammonium nitrate is a white to gray to brown, beads, pellets, or flakes. Odorless. Molecular weight: 80.04; specific gravity (H_2O:1) = 1.73; boiling point = (decomposes below BP) 210°C; freezing/melting point = about 169°C with slow decomposition; the decomposition accelerates as it reaches boiling point and may become explosive. Hazard identification (based on NFPA-704 M Rating System): Health 0; flammability 0; reactivity 3, Oxidizer. Soluble in water.
Potential Exposure: Used in the manufacture of liquid and solid fertilizer compositions, industrial explosives and blasting agents from ammonium nitrate, matches; antibiotics; in the production of nitrous oxide.
Incompatibilities: A strong oxidizer. Reducing agents; combustible materials; organic materials; finely divided (powdered) metals may form explosive mixtures or cause fire and explosions. When contaminated with oil, charcoal or flammable liquids, can be considered an explosive which can be detonated by combustion or shock.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 6.7 milligram per cubic meter
PAC-2: 73 milligram per cubic meter
PAC-3: 440 milligram per cubic meter
Russia: MAC 0.3 milligram per cubic meter on a daily average basis in ambient air.
Permissible Concentration in Water: Russia[43] set a MAC of 0.5 mg/L in water bodies used for fishery purposes.
Routes of Entry: Inhalation, skin, and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: The potential for ammonia poisoning in the course of NH_4NO_3 and fertilizer manufacture is the chief toxic effect associated with ammonium nitrate. Exposure may irritate the skin, eyes, nose, throat and lungs. Overexposure can cause nausea and vomiting, headaches, weakness, faintness and collapse. Severe overexposure may lower the ability of the blood to carry oxygen. This can result in a bluish color to skin and lips, headaches, dizziness, collapse and even death.
Long-Term Exposure: Unknown at this time.
Points of Attack: Inhalation, skin.
Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Isolate ammonium nitrate from all other chemicals. UN0222 Explosive, Oxidizer. (Ammonium nitrate, with > 0.2% combustible substances) UN1942 & UN3375 Explosive, Strong oxidizer. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a well-ventilated area, away from sparks and flames preferably in a noncombustible location equipped with automatic sprinkler protection. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Keep well closed, dry, separated from materials and labeled "oxidizer." Storage of 500 tons or more should be avoided[35] or at least very carefully regulated. See NFPA 490, *Code for the Storage of Ammonium Nitrate*. See also OSHA Standard 1910.104 and NFPA 43 A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Ammonium nitrate with organic coating: UN0222 Ammonium nitrate, with > 0.2% combustible substances, including any organic substance calculated as carbon, to the exclusion of any other added substance, Hazard Class: 1D; Labels:1D-Explosive (with a mass explosion hazard); D-Substances or articles which may mass detonate (with blast and/or fragment hazard) when exposed to fire. Ammonium nitrate with NO organic coating: UN1942 Ammonium nitrate, with NOT > 0.2% of combustible substances, including any organic substance calculated as carbon, to the exclusion of any other added substance (also used for fertilizer), Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN3375 Ammonium nitrate emulsion or Ammonium nitrate suspension or Ammonium nitrate gel, intermediate for blasting explosives, Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN2072 Ammonium nitrate fertilizer, n.o.s., doesn't appear in the 49 CFR Hazmat Table, refer to UN1942, above). UN2071 Ammonium nitrate based fertilizer, Hazard class: 9; Labels: 9-Miscellaneous hazardous material. UN2426/140 Ammonium nitrate, liquid (hot concentrated solution), Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate and isolate the area of the spill and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Cover the spill with dry lime or soda ash and collect powdered material in the most convenient and safe manner and deposit in sealed containers. Flush area with water. Ventilate area after clean-up is complete. Keep ammonium nitrate out of confined space, such as a sewer, because of the potential for an explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Does not burn but supports combustion. May explode under confinement and high temperatures. Exercise extreme caution. Use flooding amounts of water. Thermal decomposition products may include nitrogen oxides and ammonia. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves addition of sodium hydroxide to liberate ammonia and form the soluble sodium salt. The liberated ammonia can be recovered and sold. After dilution to the permitted provisional limit, the sodium salt can be discharged into a stream or sewer[22].

Ammonium Oxalate A:1150

Formula: $C_2H_8N_2O_4$; $NH_4OOCCOONH_4$

Synonyms: Ethanedioic acid, diammonium salt; Oxalato amonico (Spanish)

CAS Registry Number: 1113-38-8 (hydrated salt 2:1); 5972-73-6 (monohydrate salt); 14258-49-2 (salt 2:1); 6009-70-7 (monohydrate)

HSDB Number: 1424

RTECS Number: RO2750000

UN/NA & ERG Number: UN1759 (Corrosive solids, n.o.s.)/154; UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 214-202-3

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Reducing agent, Corrosive, Irritant.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA)

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 27.45.

Hazard symbols, risk, & safety statements: Hazard symbol: C, Xn; risk phrases: R21/22; R34; R35; R36/37/38; R40; R42; R67; safety phrases: S1; S23; S24/25; S26; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium oxalate is an odorless, colorless crystalline material or powder. Molecular weight = 124.10; specific gravity (H_2O:1) = 1.48; freezing/melting point = (decomposes) 70°C. Hazard identification (based on NFPA-704 M Rating System/NJDH): Health 2; flammability 1; reactivity 0. Corrosive. Slightly soluble in water.

Potential Exposure: It is used in chemical analysis and to make blueprint paper, explosives; a rust-removal ingredient in metal polishes.

Incompatibilities: Ammonium oxalate is a reducing agent and also reacts as a base to neutralize acids and reacts with oxidizers generating carbon dioxide. Incompatible with oxidizers (chlorates, hypochlorite solutions, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Breathing ammonium oxalate can irritate the nose, throat and lungs. Harmful if swallowed or in contact with skin. Contact can irritate the skin. Overexposure may cause a kidney stone and kidney damage.

Long-Term Exposure: Repeated exposures may cause bronchitis, kidney stones, and kidney damage. Repeated contact may cause cracking of the skin and slow healing ulcers.

Points of Attack: Lungs, skin, kidneys.

Medical Surveillance: Lung function tests, Urinalysis, kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Gloves: Nitrile, natural rubber; Coveralls: Tyvek. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN1759 Corrosive solids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling:

UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation distance, fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium Oxalate may burn, but does not readily ignite. Thermal decomposition products may include ammonia fumes and oxides of nitrogen and carbon. Isolation distance, fire: 800 m/0.5 mi.(NJ). Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium Permanganate A:1170

Formula: H_4MnNO_4; NH_4MnO_4

Synonyms: Permanganato amonico (Spanish); Permanganic acid ammonium salt

CAS Registry Number: 13446-10-1

RTECS Number: SD6400000

UN/NA & ERG Number: UN3085 (oxidizing solid, corrosive, n.o.s.),/140; UN0473 (Substances, explosive, n.o.s.)/112

Regulatory Authority and Advisory Information

Hazard Alert: Explosive (when dry), Poison, Neurotoxic (cumulative) as Mn, Corrosive, Explosive.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112), as manganese compounds

Safe Drinking Water Act (47FR 9352): SMCL = 0.05 mg/L

EPA TSCA chemical inventory Section 8(b) as manganese

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%, manganese compounds, Form R Toxic Chemical Category Code: N450

Superfund/EPCRA 40CFR302.4, Appendix A, Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as manganese compounds, n.o.s.

Hazard symbols, risk, & safety statements: Hazard symbol: T, O; risk phrases: R8; safety phrases: S17; S41 (see Appendix 4)

Description: Ammonium permanganate is a violet-brown or dark purple crystalline (sugar-like or sand-like) solid. Molecular weight = 136.98; specific gravity (H_2O:1) = 2.21; freezing/melting point = 110°C. It explodes when heated to 60°C. Hazard identification (based on NFPA-704 M Rating System): Health 0; flammability 0; reactivity 3, OX. Soluble in water.

Potential Exposure: This material is used in bleaching and dyeing operations in the textile and leather industries.

Incompatibilities: Explosive; a strong oxidizing agent. Contact with reducing agents; fuels and other combustible materials; heat, or friction may cause a violent reaction. Ammonium permanganate, when dry, may explode from shock, friction or heating[68]. Incompatible with acetic acid, acetic anhydride, benzene, carbon disulfide, diethyl ether, ethyl alcohol, petroleum, combustibles, or organic matter.

Permissible Exposure Limits in Air

Ammonium permanganate

PAC Ver. 29[138]

PAC-1: 7.5 milligram per cubic meter

PAC-2: 12 milligram per cubic meter

PAC-3: 72 milligram per cubic meter

Manganese:

NIOSH IDLH = 500 mg[Mn]/m^3

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume)

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL

ACGIH TLV[1] 0.02 mg[Mn]/m^3, respirable fraction; 0.1 mg[Mn]/m^3, inhalable fraction; not classifiable as a human carcinogen.

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

Determination in Air: *Manganese*: Use NIOSH Analytical Method, Elements by ICP, #7300; #7301; #7303; #9102; Elements in blood or tissue, #8005; Metals in urine, #8310; OSHA Analytical Method, ID-125G or ID121.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50 μg[Mn]/L; State Drinking Water Standards: New York: 300 μg[Mn]/L; State Drinking Water Guidelines: California 500 μg[Mn]/L; Connecticut: 500 μg [Mn]/L; Maine: 500 μg[Mn]/L; Minnesota: 300 μg[Mn]/L; New Hampshire: 100 μg[Mn]/L. World Health Organization (WHO) limit: 400 μg(Mn)/L.

Routes of Entry: Inhalation, skin, and/or eye contact, ingestion.

Harmful Effects and Symptoms

Ammonium permanganate can affect you when breathed in. Exposure to ammonium permanganate can cause irritation of the eyes, nose, throat and lungs. Contact can irritate the skin and eyes.

Short-Term Exposure: Highly irritating to eyes, skin and respiratory tract.

Long-Term Exposure: Very irritating substances may cause lung effects and possible damage.

Points of Attack: Skin, eyes, nasal passages, throat and lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to Ammonium Permanganate, use a MSHA/NIOAH approved respirator equipped with particulate (dust/fume/mist) filters. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a powered-air purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ammonium Permanganate must be stored to avoid contact with heat, friction, organic and oxidizable material, fuels and combustibles, since violent reactions occur. Always store ammonium permanganate at temperatures below 60°C/140°F. Protect containers from shock as Ammonium Permanganate may explode. See OSHA Standard 1910.104 and NFPA 43 A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN0473 Substances, explosive, n.o.s., Hazard Class: 1.1 A; Labels:1.1A-Explosive (with a mass explosion hazard); A-Substances which are expected to mass detonate very soon after fire reaches them, Technical Name Required. UN3085 Oxidizing solid, corrosive, n.o.s., Hazard Class: 5.1; Labels: 5.1-Oxidizer, 8-Corrosive material. Technical Name Required.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m (150 ft) for liquids and at least 25 m/75 ft for solids. *Large spill*: Consider initial downwind evacuation for at least 100 m/330 ft. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Keep ammonium permanganate out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is highly reactive, heat sensitive and potentially explosive. Thermal decomposition products may include ammonia and oxides of nitrogen and metal. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number N450, must conform with USEPA regulations for storage, transportation, treatment and disposal of waste. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Dispose of contents and container to an approved waste disposal plant. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. All federal, state, and local environmental regulations must be observed. Do not discharge into drains or sewers.

Regulatory Authority and Advisory Information

Hazard Alert: Strong oxidizer, Sensitization hazard (skin, resp.).

United States National Primary Drinking Water Regulations: SMCL = 250 mg[SO_4^{2-}]/L as Sulfate

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 100 lb (45.4 kg)

EPCRA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 14.93.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: O, Xn, Xi; risk phrases: R8; R22; R36/37/38; R42/43; safety phrases: S2; S17; S22; S24; S26; S37; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium persulfate is a colorless or white crystalline solid. Molecular weight = 228.19; freezing/melting point = (decomposes) 120°C; specific gravity (H_2O:1) = 1.982 @ 20°C; heat of decomposition = 120°C; heat of solution = 1.8×10^5 J/kg. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 0; reactivity 1, Oxidizer, ₩. Decomposes in water.

Potential Exposure: It is used as a bleaching agent, in photographic chemicals, and to make dyes. It is also used as an ingredient of polymerization catalysts.

Incompatibilities: Decomposes in water and moist air, forming oxygen gas. A strong oxidizer; reacts with reducing agents; organic and combustible materials. Incompatible with heat, sodium peroxide (produces a friction-, heat-, and water-sensitive explosive); aluminum powder.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 22 milligram per cubic meter

PAC-3: 130 milligram per cubic meter

ACGIH TLV[1]: 0.1 milligram per cubic meter TWA *as persulfates*

DFG MAK: Danger of sensitization of the airways and skin.

United Kingdom: TWA 1 mg(S_2O_8), 2000; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the skin, eyes, nose, throat and lungs. Exposure may cause an allergy-like reaction, with eye tearing, nose congestion; asthma-like wheezing and difficulty in breathing. Life-threatening shock may result. The oral LD_{50} for rats is 820 mg/kg[9].

Long-Term Exposure: May cause skin or respiratory allergies.

Points of Attack: Eye, lungs, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended; effects may be delayed.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing and goggles. Wash thoroughly immediately after exposure to Ammonium persulfate.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ammonium persulfate must be stored to avoid contact with combustibles (such as wood, paper, and oil), sodium peroxide, aluminum and water, since violent reactions occur. Store in tightly closed containers in a cool, dry and well-ventilated area. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1444 Ammonium persulfate, Hazard Class: 5.1; Labels: 5.1-Oxidizer

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Wash area down with water.

Fire Extinguishing: Ammonium persulfate is a strong oxidizing agent that can cause combustible materials, such as wood, paper, and oil to ignite. Heat above 120°C forms oxygen and sulfur dioxide. In addition, other Thermal decomposition products may include ammonia and oxides of nitrogen. Use dry chemical, CO_2 or water spray extinguishers.

Disposal Method Suggested: May be treated with large volumes of water, neutralized and flushed to sewer[22]. This applies to small quantities only.

Ammonium Phosphate A:1190

Formula: $H_9N_2O_4P$; $(NH_4)_2HPO_4$
Synonyms: Ammonium orthophosphate, dibasic; Ammonium orthophosphate, monohydrogen; Ammonium phosphate, dibasic; Ammonium phosphate, hydrogen; Diammonium orthophosphate; Diammonium orthophosphate, hydrogen; Diammonium phosphate; Diammonium phosphate, hydrogen; Diammonium phosphate, monohydrogen; Dibasic ammonium phosphate; Secondary ammonium phosphate
CAS Registry Number: 7722-76-1 (monobasic); 7783-28-0 (dibasic)
HSDB Number: 301
RTECS Number: TB9375000
UN/NA & ERG Number: Not listed
EC Number: 231-987-8
Regulatory Authority and Advisory Information
CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 25.79.
Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn; risk phrases: R8; R20/21/22; R36/37/38; safety phrases: S26; 36/37/39; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Ammonium phosphate is a white crystalline or powdery substance. Molecular weight: 132.06 (dibasic); 115.03 (monobasic); specific gravity (H_2O:1) = 1.803 @ 20°C (dibasic/monobasic); boiling point = 100°C (decomposes); melting/freezing point = dibasic decomposes below melting point @ 102°C; 190°C (monobasic); heat of solution = 42 Btu/lb. Hazard identification (based on NFPA-704 M Rating System): (*dibasic*). Health 1; flammability 0; reactivity 0; (*monobasic*) Health 1; flammability 0; reactivity 1. Highly soluble in water.
Potential Exposure: Used in fireproofing of textiles; wood and paper; in soldering flux; as a fertilizer; a buffer; in baking powder and food additives.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with air causes this chemical to produce anhydrous ammonia fumes.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
7783-28-0
PAC-1: 20 milligram per cubic meter
PAC-2: 220 milligram per cubic meter
PAC-3: 1300 milligram per cubic meter
7722-76-1
PAC-1: 17 milligram per cubic meter
PAC-2: 190 milligram per cubic meter
PAC-3: 1100 milligram per cubic meter
Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Monobasic is a mild eye and skin irritant. Short term exposure to dibasic can cause moderate skin and eye irritation. Ammonia fumes can cause eye irritation $>$ 70 ppm. Dibasic is a lung irritant which can range from moderate to severe, depending on exposure. In closed spaces, inhalation of ammonia fumes may cause nose and throat irritation (70 ppm, 5 minutes). Levels of 500 ppm for 30 minutes may cause irritation to throat and lungs. High levels may cause asphyxiation and/or result in accumulation of fluid in the lung and suffocation. Ammonia poisoning upon ingestion is characterized by sagging of facial muscles, tremors, anxiety, difficulty in controlling muscles; stupor and coma. There is only a slight chance of this happening from ingestion of ammonium phosphates, except in persons with impaired liver function. Large doses may cause calcium imbalance and an increased flow of urine.
Points of Attack: Liver, skin, eyes.
Medical Surveillance: Liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Seek medical attention, if necessary. Give large quantities of water or milk. *Inhalation*: Move to fresh air. Give oxygen or artificial respiration if required. Seek medical attention, if necessary.
Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Use a dust mask if necessary. A SCBA may be necessary if ammonia fumes are present.
Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly sealed containers in a cool location away from oxidizers, bases.
Shipping: There are no DOT/UN listed requirements.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate closed spaces before entering them. Absorb liquid with sand, vermiculite, earth, or similar absorbent material and place into containers for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not flammable. Thermal decomposition products may include ammonia, phosphorus oxides; and nitrogen oxides. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be flushed to sewer with huge volumes of water.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents

RCRA Land Ban Waste Restrictions

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 10 lb (4.54 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: E, Xi; risk phrases: R1; R2; R8; R9; R11; R42/43; R51; safety phrases: S1; S1; S3; S4; S15; S16; S21; S33; S41; (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ammonium picrate is a bright yellow crystalline solid, which turns red if contaminated. Molecular weight: 246.14; specific gravity (H_2O:1) = 1.72; freezing/melting point = decomposes on heating; explodes @ 423°C. Slightly soluble in water. A high explosive *when dry*, and flammable when wet. Hazard identification (Based on NFPA Rating System): Health 3; flammability 3; reactivity 3, Oxidizer.

Potential Exposure: Used in explosives, fireworks and rocket propellants.

Incompatibilities: *Explosive when dry*. A powerful oxidizer that reacts violently with reducing agents. Dangerous when heated or shocked.

Keep away from metals, sodium nitrite, perchlorates, peroxides, permanganates, and any form of shock.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Routes of Entry: Inhalation of dust, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ammonium picrate can pass through the skin. This chemical can irritate the eyes and skin, and is an allergen. Ingestion can cause a bitter taste, nausea, diarrhea, vomiting, abdominal pain; skin eruptions; stupor and possible death. Breathing high levels can damage the kidneys, liver, and red blood cells. Urine may become reddish, scant or even stop; there may be drowsiness, coma, and even death.

Long-Term Exposure: Repeated exposure can cause the skin and eyes to turn yellow, skin allergy; liver, kidney and blood cell damage. A sensitizer; may cause allergies.

Points of Attack: Eyes, skin, respiratory system; kidneys, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. CBC. Liver function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to ammonium picrate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. UN0004 EXPLOSIVE. UN1310 Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Incompatible with strong oxidizers, strong bases. Contact with air causes substance to give off corrosive anhydrous ammonia fumes. Outside, detached storage is recommended. Store to avoid heat, shock or the presence of reducing materials. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1310 Ammonium picrate, wetted with not < 10% water, by mass, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN0004 Ammonium picrate, dry or wetted with <10 % water, by mass, Hazard Class: 1.1D; Labels: 1.1D-Explosives (with a mass explosion hazard); D-Substances or articles which may mass detonate (with blast and/or fragment hazard) when exposed to fire.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Flood area with water. *Keep Material Wet. Do not dry sweep*. Keep ammonium picrate out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. If necessary, seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Fire Extinguishing: Use extreme care as ammonium picrate will explode when heated or shocked, especially when dry. *May explode and propel fragments 1600 m (1 mi) or more if fire reaches cargo*. This chemical is a flammable solid. Thermal decomposition products may include ammonia and oxides of nitrogen and carbon. Use flooding quantities of water, applied from a distance. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full

facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. May be poured onto soda ash, packaged in paper and burned. May also be mixed with flammable solvent and sprayed into an incinerator equipped with afterburner and scrubber[24].

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium sulfamate is a white to yellow crystalline solid. Molecular weight: 114.12; specific gravity (H_2O:1) = 1.767; freezing/melting point = 131°C (with decomposition); boiling point = 160°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 2. Very soluble in water.

Potential Exposure: Ammonium sulfamate is used as a herbicide and in compositions for retarding flame in textiles and paper products; a softener for paper, cotton textiles.

Incompatibilities: Strong oxidizers, potassium, potassium chlorate, sodium nitrite, metal chlorates, and hot acid solutions. Elevated temperatures cause a highly exothermic reaction with water.

Permissible Exposure Limits in Air

NIOSH IDLH = 1500 milligram per cubic meter

OSHA PEL: 10 milligram per cubic meter, total dust/5 milligram per cubic meter, respirable fraction TWA

NIOSH REL: 10 milligram per cubic meter, total dust/5 milligram per cubic meter, respirable fraction TWA

ACGIH TLV[1]: 10 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 98 milligram per cubic meter

PAC-3: 5000 milligram per cubic meter

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 10 milligram per cubic meter, 1993; Austria: MAK 15 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter, 1993; Denmark: TWA 10 milligram per cubic meter, 1999; Finland: TWA 10 milligram per cubic meter, STEL 20 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; Norway: TWA 10 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Russia: STEL 10 milligram per cubic meter, 1993; Switzerland: MAK-week 10 milligram per cubic meter, 1999; Turkey: TWA 15 milligram per cubic meter, 1993; United Kingdom LTEL 10 milligram per cubic meter, STEL 20 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 milligram per cubic meter.

Determination in Air: Collection on a filter followed by gravimetric analysis. Use NIOSH Analytical Method #S348.

Permissible Concentration in Water: The No-Observed-Adverse-Effect-Level (NOAEL) is 250 mg/kg/day according to the EPA Health advisory: cited below. From this a Health advisory: of 21.4 mg/L of water was derived for a 10-kg child on a 1-day, 10-day or longer term basis. An acceptable daily intake has been determined to be 0.214 mg/kg/day and a lifetime Health advisory: for a 70 kg adult is 1.5 mg/L.

Determination in Water: There is no standard method for determining ammonium sulfamate in water. There is, however, a method for detection in foods which is a colorimetric method based on liberation of SO_4, reduction to H_2S which is measured after treatment with zinc, *p*-aminodimethylaniline and ferric chloride to give methylene blue.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This material is moderately toxic by ingestion and may cause GI disease. High levels may irritate the eyes, skin and respiratory tract, nausea and vomiting. The oral LD_{50} for rat is 3900 mg/kg.

Long-Term Exposure: Unknown at this time.

Medical Surveillance: Nothing special indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *100 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *250 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or if not present as a fume PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *500 milligram per cubic meter*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 1500 milligram per cubic meter: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area away from Oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); water, potassium, potassium chlorate, sodium nitrite, metal chlorates and hot acid solutions.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: ammonium sulfamate may burn, but does not readily ignite. Use dry chemical, CO_2, or foam extinguishers.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dilute with water, make neutral with acid or base and flush into sewer with more water.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C, N; risk phrases: R11; R17; R31; R34; R51; safety phrases: S16; S21; S26; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ammonium sulfide is a yellow crystalline (sugar or sand-like) material, commonly found in liquid solution, which is flammable. Solution has an odor of rotten eggs. Molecular weight: 51.11; 68.14 (solution); boiling point = 104°C (solution); freezing/melting point = (decomposes). Flash point = 72°C; explosive limits (solution) LEL: 40,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 2. Soluble in water.

Potential Exposure: It is used in photographic developers, synthetic flavors, coloring metals (i.e., to apply patina to bronze); and to make textiles.

Incompatibilities: Vapor form explosive mixture with air Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Evolves poisonous ammonia on contact with strong bases. Contact with acid or acid fumes releases hydrogen sulfide. Keep away from moisture[101].

Permissible Exposure Limits in Air

12135-76-1 *(solution)*
PAC Ver. 29[138]
PAC-1: 1 ppm
PAC-2: 54 ppm
PAC-3: 100 ppm

Determination in Water: Toxic to aquatic organisms.

Routes of Entry: Ingestion, skin absorption, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Ammonium sulfide can be absorbed through the skin, thereby increasing exposure. This substance is a corrosive chemical and contact can irritate and burn the eyes and skin. Exposure can irritate the nose, throat and lungs, causing a cough and difficulty in breathing. Very high levels could cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Very high levels could cause you to feel dizzy, lightheaded, and cause you to pass out.

Long-Term Exposure: Repeated exposure can cause lung irritation and bronchitis.

Points of Attack: Lungs, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing and goggles. Wash thoroughly immediately after exposure to ammonium sulfide and at the end of the work-shift.

Respirator Selection: *Where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (3) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store to avoid contact with acids and acid fumes, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from moisture. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2923 Corrosive solids, toxic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous material, Technical Name Required. UN2683 Ammonium sulfide solution, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials, 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Add ferric chloride solution to spilled material. Stir and add Soda Ash. Sweep solid material up and deposit in sealed containers. Keep ammonium sulfide out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium sulfide solution is a Flammable Liquid. Thermal decomposition products may include flammable hydrogen sulfide and ammonia. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add to a large volume of ferric chloride solution with stirring. Neutralize with soda ash. Flush to drain with water.

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Ammonium sulfite is a colorless to yellow crystalline (sand-like or sugar-like) solid, normally sold or used in a 40% solution. Molecular weight = 116.13; 99.1 (bisulfite); specific gravity (H_2O:1) = 2.03 (bisulfite, solid); 1.40 (72% aqueous solution); freezing/melting point = 150°C (sublimes); heat of solution = (endothermic) = 1.01×10^5 J/kg (For dilute solution 1 mol/0.300 mol water, which is equal to 1.833 lb/volume lb of water); vapor pressure = 395 mmHg @ 20°C. Soluble in water.

Potential Exposure: Ammonium sulfite is used in medicines, metal lubricants; explosives, photography, hair wave solutions; and to make other chemicals. It is also used as a preservative, and for treating agricultural grain.

Incompatibilities: A strong reducing agent. Reacts violently with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

10196-04-0; 10192-30-0 (bisulfite)

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Ammonium sulfite can affect you when breathed in; exposure can irritate the nose, throat, bronchial tubes, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Affects the CNS.

Long-Term Exposure: Ammonium sulfite may cause an asthma-like allergy. Future exposures could then cause asthma attacks with cough, shortness of breath and wheezing. Very severe (anaphylactic) reactions could also occur, and could be fatal. Bisulfite is a respiratory sensitizer.

Points of Attack: Skin, eyes, respiratory system, CNS; kidney (bisulfite).

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposure, the following are recommended: lung function tests; seek prompt medical attention if symptoms are suspected.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over ammonium sulfite, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. Where there is potential exists for high exposures to ammonium sulfite, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Yellow Stripe (strong reducing agent): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ammonium sulfite must be stored in tightly closed containers in a cool, well-ventilated place to avoid contact with oxidizers and acids as flammable hydrogen sulfide gas is produced.

Shipping: UN2693 Bisulfites, inorganic, aqueous solutions, n.o.s., Hazard class: 8; Labels: 8-Corrosive material. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium sulfite may burn, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include ammonia and oxides of sulfur and nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. May be buried in a chemical waste landfill in accordance with federal, state, and local statutes; or, if oxidized and neutralized, it may be sent to a municipal sewage treatment plant for biological treatment Incineration.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible.

Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 27.45.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to waters.

Description: Ammonium tartrate is a colorless crystalline or white granular solid. Molecular weight = 184.18; specific gravity (H_2O:1) = 1.63 @ 25°C; 1.601 (diammonium salt). Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0. Soluble in water.

Potential Exposure: Ammonium tartrate is used in the textile industry and in medicine.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong oxidizers, especially potassium chlorate, sodium nitrite may cause violent reactions.

Permissible Exposure Limits in Air
PAC Ver. 29[138]
14307-43-8
PAC-1: 30 milligram per cubic meter
PAC-2: 330 milligram per cubic meter
PAC-3: 2000 milligram per cubic meter
3164-29-2, diammonium salt
PAC-1: 0.8 milligram per cubic meter
PAC-2: 8.8 milligram per cubic meter
PAC-3: 53 milligram per cubic meter

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: A corrosive. Contact can irritate the eyes and skin, and cause permanent damage. May irritate the nose, throat and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. The symptoms of pulmonary edema are aggravated by physical effort. This can cause death.

Long-Term Exposure: Unknown at this time. However, corrosive substances may cause lung effects and damage.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from potassium chloride and sodium nitrite.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include ammonia and oxides of nitrogen and carbon. Ammonium tartrate may burn, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. May be buried in a chemical waste landfill in accordance with federal, state, and local statutes; or, if oxidized and neutralized, it may be sent to a municipal sewage treatment plant for biological treatment.

RTECS Number: TP1840000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 237-499-1 [*Annex I Index No*.: 078-002-00-6]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Organometallic; Strong reducing agent, Sensitization hazard.

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 100 lb (45.4 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 11.98.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R25; R38; R41; R43; safety phrases: S2; S22; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Ammonium tetrachloroplatinate is a dark ruby-red crystalline solid. Molecular weight = 372.96; specific gravity (H_2O:1) = 2.93; freezing/melting point = 140–150°C. Soluble in water.

Potential Exposure: This material is used in photography.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 4 mg [Pt]/m^3

OSHA PEL: 0.002 mg[Pt]/m^3 TWA

NIOSH REL: 0.002 mg[Pt]/m^3 TWA

ACGIH TLV[1]: 1 0.002 mg[Pt]/m^3 TWA

No PAC available.

DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates.

Determination in Air: Use NIOSH II(7) Method #S-19 (soluble salts)

Routes of Entry: Inhalation of vapor or dust, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ammonium tetrachloroplatinate can affect you when breathed in. Ammonium Tetrachloroplatinate may irritate the eyes, nose and throat, high exposures can cause irritability and even seizures ("fits").

Long-Term Exposure: Skin and air passage sensitizer; severe allergy can develop to ammonium tetrachloroplatinate. Symptoms may include asthma (with cough, wheezing and/or shortness of breath), runny nose and/or skin rash, sometimes with hives. If allergy develops, even small future exposure can trigger significant symptoms. Some persons exposed to this type of chemical have developed lung scarring.

Points of Attack: Eyes, skin, nose, throat.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. These may be normal if person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: chest X-ray every three years should be considered if above tests are not normal. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 0.002 milligram per cubic meter, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. It is a skin and inhalation sensitizer; the Color code—Blue may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids; strong bases.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, ammonia and oxides of nitrogen and metal. Use dry chemical, CO_2, water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium Thiocyanate A:1260

Formula: CH_4N_2S; NH_4SCN

Synonyms: Ammonium isothiocyanate; Ammonium rhodanate; Ammonium rhodanide; Ammonium sulfocyanate; Ammonium sulfocyanide; Ammonium thiocyanate liquor; Carbo-Tech ammonium thiocyanate; Degussa ammonium thiocyanate; Rhodanid; Thiocyanic acid, ammonium salt; Tiocianato amonico (Spanish)

CAS Registry Number: 1762-95-4

HSDB Number: 701

RTECS Number: XK7875000

UN/NA & ERG Number: UN2672 (ammonia solutions)/154; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171; UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 217-175-6 [*Annex I Index No.*: 616-004-00-3; 615-030-00-5]

Regulatory Authority and Advisory Information Note: Contains no cyanide and therefore has low acute toxicity[101].

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P030

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 22.37. Form R *de minimis* concentration reporting level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, Xi, C; risk phrases: R20.21/22; R32; R36/37/38; R52/53; safety phrases: S13; S26; 36/37; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium thiocyanate is a colorless solid which absorbs moisture, becoming liquid, known as the "liquor." Molecular weight: 76.12; specific gravity (H_2O:1) = 1.305; boiling point = (decomposes) 115°C[136]; freezing/melting point = (decomposes) 170°C[136]; vapor pressure = × 10^{-X} mmHg @ 25°C; heat of solution = 3.1×10^5 J/kg. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 1. Freely soluble in water.

Potential Exposure: It has many uses in making matches, fabric processing; metals processing; chemical manufacturing, electroplating; zinc coating; liquid rocket propellents, fabric dyeing, polymerization catalyst, in photography. Used as a laboratory chemical. May be used as an agricultural chemical: herbicides, weed killers, defoliants.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Acts as an acid; incompatible with lead nitrate, chlorates, nitric acid, acid, acid fumes. In the presence of moisture, this chemical is corrosive to brass, copper, iron. *Ammonium thiocyanate liquor* can release ammonia vapors if mixed with a chemical base or with an acid. Violent or explosive reactions have occurred when thiocyanates are mixed with oxidizing agents [such as chlorates (potassium chlorate), nitrates, nitric acid, and peroxides]. Nitric acid violently oxidized a thiocyanate solution [Bretherick 1979 p. 121]. An explosion of guanidine nitrate demolished an autoclave built to withstand 50 atmospheres, in which it was being made from ammonium thiocyanate and lead nitrate [C. Angew. Chem. 49:23 1936][101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.3 milligram per cubic meter

PAC-2: 25 milligram per cubic meter

PAC-3: 150 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method #7904; #6010, cyanides.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = -2.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Skin and/or eyes; may be absorbed through unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: *Note*: Contains no cyanide and therefore has low acute toxicity[101]. Contact with dust irritates the eyes and cause burns to the eyes and skin. This chemical can be absorbed through the skin, and significantly to overall exposure; prolonged contact may produce various skin eruptions, nausea, dizziness, cramps, and mild to severe disturbance of the nervous system. Ingestion causes dizziness, cramps, nervous disturbances. Inhalation of material may be harmful. Contact may cause burns to skin and eyes. Inhalation of Asbestos dust may have a damaging effect on the lungs. Fire may produce irritating, corrosive and/or toxic gases. Some liquids produce vapors that may cause dizziness or suffocation.

Long-Term Exposure: Repeated exposure may cause nausea, loss of appetite; runny nose; abdominal problems, loss of weight, weakness, and skin rashes. Prolonged exposure may cause thyroid gland problems, blood cell damage, nervous system damage with personality and mood changes.

Points of Attack: Thyroid, nervous system; blood cells.

Medical Surveillance: Thyroid function tests, CBC.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nonabsorbent material are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as cyanides): Up to *25 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ammonium Thiocyanate must be stored to avoid contact with potassium chlorate and lead nitrate, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture, acid, acid fumes; or chlorine because toxic fumes are released. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2672 Ammonia solutions, relative density between 0.880 and 0.957 at 15°C in water, with $>$ 10 % but not $>$ 35 % ammonia, Hazard class: 8; Labels: 8-Corrosive material. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use vacuum to reduce dust during clean up. *Do not dry sweep*. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium Thiocyanate may burn, but does not readily ignite. Thermal decomposition products may include ammonia, hydrogen cyanide, hydrogen sulfide, and nitrogen oxides. Use dry chemical, CO_2, water spray; or foam extinguishers. Runoff from fire control may cause pollution. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Slowly add to large container of water. Stir in slight excess of soda ash. Decant or siphon liquid from sludge, neutralize with HCl and flush to sewer. Sludge may be landfilled.

Ammonium Thiosulfate A:1270

Formula: $H_8N_2O_3S_2$

Synonyms: Ammonium hyposulfite; Amthio; Diammonium thiosulfate; Hypo; Thiosulfuric acid, diammonium salt; Tiosulfato amonico (Spanish)

CAS Registry Number: 7783-18-8

HSDB Number: 2688

RTECS Number: XN6465000

UN/NA & ERG Number: UN3077 (solid)/177

EC Number: 231-982-0

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: SMCL = 250 mg[SO_4^{-2}]/L as Sulfate

CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 22.98.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R33; R36/37/38; safety phrases: S26; S37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ammonium thiosulfate is a white crystalline solid with an ammonia odor. Molecular weight: 148.22; specific gravity (H_2O:1) = 1.679; freezing/melting point = 150°C [decomposes $<$50°C (solution); $>$100°C (anhydrous crystals)]. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 0; reactivity 0. Highly soluble in water.

Potential Exposure: Used as an agricultural chemical and fungicide, metal lubricant; in cleaning metals; in photographic chemicals, making other chemicals. A laboratory reagent.

Incompatibilities: Contact with sodium chlorate may cause a violent reaction. Corrodes brass, copper, and copper-based metals.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 12 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 790 milligram per cubic meter

Routes of Entry: Dermal contact., inhalation, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate eyes, skin and respiratory tract. Respiratory irritant-acute, severe, or moderate but not mild. Acute effects: CNS, brain, respiratory system, kidneys. Hematological effects-acute, unspecified[138].

Long-Term Exposure: May affect organs and body systems listed above, as having acute problems.

Points of Attack: CNS, brain, respiratory system, blood.

Medical Surveillance: Consider the points of attack.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, acids, water, or combustible materials.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate closed spaces before entering them. Absorb liquid with sand, vermiculite, earth, or similar absorbent material and place into containers for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium thiosulfate may burn, but does not readily ignite. Thermal decomposition products may include ammonia, hydrogen sulfide, sulfur oxides; and nitrogen oxides. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate. It may be possible to dispose of waste material at a municipal facility if treated, neutralized and oxidized.

Ancymidol A:1275

Formula: $C_{15}H_{16}N_2O_2$
Synonyms: A-REST; α-Cyclopropyl-α-(4-methoxyphenyl)-5-pyrimidinemethanol-; α-Cyclopropyl-4-methoxy-α-(pyrimidin-5-yl)benzyl alcohol; 5-Pyrimidinemethanol, α-cyclopropyl-α-(4-methoxyphenyl); QUEL; Reducymol; Sepro; EL 531; Thritone
CAS Registry Number: 12771-68-5; 51025-96-8
RTECS Number: UV9280000
UN/NA & ERG Number: None listed
EC Number: 235-814-7
Regulatory Authority and Advisory Information
Hazard Alert: Combustible, Agricultural chemical.
Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R22; R25; R61; safety phrases: S13; S22; S36/37/39; S45; S53 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): Not found.
Description: Ancymidol is a white to buff colored crystalline or granular solid. Slightly aromatic odor. Molecular weight = 256.3; freezing/melting point = 111−112°C; vapor pressure = 2.0×10^{-7} mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 0; reactivity 0. Soluble in water; solubility = 645 ppm (approx).
Potential Exposure: Ancymidol is a plant growth regulator registered for treating container-grown herbaceous plants, ornamental woody shrubs, and bedding plants grown in greenhouses and other plant bedding areas for primarily commercial production. Growth regulator used on plants such as chrysanthemums, certain lilies, and poinsettias effects produced by ancymidol are the result of inhibition of gibberellin biosynthesis. It produces a more compact growth form by suppressing elongation.
Incompatibilities: Dust may form explosive mixture with air. Ancymidol may react vigorously with oxidizing agents. Mixtures with concentrated hydrogen peroxide or strong mineral acids (e.g., nitric, sulfuric, perchloric) may cause explosions. Mixtures with hypochlorous acid, lead perchlorate, chlorine, bleaches, including sodium hypochlorite; mixed water/carbon tetrachloride solution; trichloroisocyanuric acid form methyl hypochlorite, which can be explosive, especially when exposed to sunlight or heat. May react with metallic aluminum at high temperature. Flow or agitation of substance may generate electrostatic charges due to low conductivity; ground all equipment containing this material. May attacks some plastics, rubber, and coatings.
Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.
Determination in Water: Fish toxicity (threshold)[77]: Very low—19952.6231500 ppb, MATC (Maximum Acceptable Toxicant Concentration)
Routes of Entry: Inhalation, ingestion, skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: May irritate the eyes, skin and respiratory system. Harmful if swallowed. May be absorbed through the skin. LD_{50} (oral, rat) = 4500 mg/kg
First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.
Storage: Color code—Green: General storage may be used. Keep container tightly closes and store @ 2 to 8°C. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, acids, water, or combustible materials.
Shipping: None listed
Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Not combustible. Thermal decomposition products may include oxides of nitrogen and carbon. Use water spray, alcohol-resistant foam, dry chemical, or carbon dioxide. Wear SCBA for firefighting if necessary.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed.

Amphetamine A:1280

Formula: $C_9H_{13}N$; $C_6H_5CH_2CH(NH_2)CH_3$

Synonyms: Actedron; Adipan; Allodene; DL-Amphetamine; Anfetamina (Spanish); Anorexide; Benzedrine; Deoxynorephedrine; racemic-Desoxynorephedrine; DL-Benzedrine; DL-α-Methylbenzeneethaneamine; DL-1-Phenyl-2-aminopropane; Elastonon; Isoamycin; Isomyn; Mecodrin; α-Methylbenzeneethaneamine; Norephedrane; Novydrine; Ortedrine; Phenedrine; 1-Phenyl isopropyl amine; Profamina; Propisamine; Psychedrine; Raphetamine; Simpatedrin; Sympamine; Sympatedrine; Weckamine

CAS Registry Number: 300-62-9; 60-13-9 (sulfate); 300-42-5 (methamphetamine hydrochloride) *Note*: There are various other "amphetamines" listed in the literature, however this CAS (300-62-9) is specifically regulated by EPA. RTECS lists this CAS as "Benzedrine."

HSDB Number: 3287

RTECS Number: SH9450000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 206-096-2

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable, Suspected of causing genetic defects, Suspected reprotoxic hazard, Drug, Primary irritant (w/o allergic reaction) also listed for methamphetamine hydrochloride.

Banned or Severely Restricted (UN) (U.S.)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

SUPERFUND/CERCLA 40CFR302.4 RQ: 1 lb (0.454 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; risk phrases: R10; R23/24/25; R27/28; R36/37/38 (for 300-62-9); R39; R50/53; R62; R63; safety phrases: S7; S13; S16; S36/37; S28; S45 (see Appendix 4).

Description: Amphetamine is a mobile liquid with an amine odor. Molecular weight = 135.23; specific gravity (H_2O:1) = 0.93; boiling point = 200−203°C; flash point = 26.7°C[101]. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0. Slightly soluble in water.

Potential Exposure: Amphetamine is used as a pharmaceutical. It is a CNS stimulant.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 27; No values found in Ver. 29[138]

PAC-1: 1.8 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 20 milligram per cubic meter

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure include dry mouth, metallic taste; loss of appetite; nausea, vomiting, diarrhea, abdominal cramps; headache, chilliness, flushing or pallor; palpitation, restlessness, dizziness, tremor, hyperactive reflexes; talkativeness, tenseness, irritability, weakness, insomnia, fever, confusion. With large doses, irregular heartbeat; pain and difficulty in urination. Convulsions, coma, circulatory collapse. This chemical is classified as extremely hazardous. Probable lethal dose in humans is 5−50 mg/kg or 7 drops to 1 teaspoon for a 70 kg (150 lb) person. Symptoms of exposure to methamphetamine hydrochloride (aka "speed") include elevation of blood pressure, tachycardia, palpitation, psychotic episodes (rare), dizziness, dysphoria, overstimulation, euphoria, insomnia, tremor, restlessness, headache, exacerbation of motor and phonic tics, Tourette's syndrome, diarrhea, constipation, dryness of the mouth, unpleasant taste, other GI disturbances, urticaria, impotence, changes in libido and suppression of growth in children. Other symptoms include metallic taste, anorexia, difficulty in micturition, mydriasis, agitation, skin rashes and abdominal pain. Exposure can cause increased awareness, lessening of fatigue, exhilaration, sweating, flushing or pallor, dehydration, purposeless motions, bradycardia, extrasystoles, heart block, tachypnea, anxiety, paranoid and hostile behavior, and delirium. Large doses may also cause fever or chilliness, talkativeness, disorientation and aggressive behavior. Other symptoms from large doses include acts of self-destruction and mania[101].

Long-Term Exposure: Habit forming drug which affects the CNS. Chronic symptoms for methamphetamine hydrochloride (aka "speed") include severe dermatoses, marked insomnia, irritability, hyperactivity, personality changes, and psychosis. Other chronic symptoms include aplastic anemia, pancytopenia, gynecomastia, and angiitis. Exposure to large doses may cause hyperreflexia, rapid respiration, confusion, assualtiveness, hallucinations, panic states, hyperpyrexia, rhabdomyolysis, fatigue and mental depression following CNS stimulation, arrhythmias, hypertension or hypotension, circulatory collapse, nausea, vomiting, convulsions, coma and death[101].

Points of Attack: CNS.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim* *ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place[52].

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquid in dry sand, vermiculite or other absorbent material. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

United States Environmental Protection Agency, C*hemical Hazard Information Profile*: Amphetamine, Washington, DC, Chemical Emergency Preparedness Program (November 30, 1987).

Ampicillin A:1290

Formula: $C_{16}H_{19}N_3O_4S$

Synonyms: Acillin; Adobacillin; Alpen; Amblosin; Amcill; Amfipen; Aminobenzyl penicillin; D-(−)-α-Aminobenzylpenicillin; D-(−)-α-Aminopenicillin; 6-[d(−)-α-Aminophenylacetamido]penicillanic acid 6; 6-(2-Amino-2-phenylacetamindo)-3,-3-dimethyl-7-oxo-4-thia-1-azabicyclo(3.2.0) heptane-2-carboxylic acid; (Aminophenylmethyl)-penicillin; Amipenix S; Amperil; Ampi-Bol; D-(−)-Ampicillin; D-Ampicillin; Ampicillin A; Ampicillin acid; Ampicillin anhydrate; Ampicillin (USDA); Ampicin; Ampikel; Ampimed; Ampipenin; Amplisom; Amplital; Ampy-penyl; Austrapen; AY-6108; Binotal; Bonapicillin; Britacil; BRL; BRL 1341; Copharcilin; Cymbi; Divercillin; Doktacillin; Grampenil; Guicitrina; Guicitrine; Lifeampil; Marisilan; NSC-528986; Nuvapen; Omnipen; P-50; Penbristol; Penbritin; Penbritin pediatric; Penbritin syrup; Penbrock penicline; Pentrex; Pfizerpen A; Polycillin; Ponecil; Principen; Qidamp; Ro-Ampen; Semicillin; SK-Ampicillin; Synpenin; Tokiocillin; Tolomol; Totacillin; Totalciclina; Totapen; Ultrabion; Ultrabron; Viccillin; Viccillin S; Vicillin; WY-5103

CAS Registry Number: 69-53-4 (anhydrous); 7177-48-2 (trihydrate)

HSDB Number: 3009

RTECS Number: XH8350000; HS8425000 (trihydrate)

EC Number: 200-709-7

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: There is inadequate evidence for the carcinogenicity of ampicillin in humans. There is limited evidence for the carcinogenicity in experimental animals. Overall evaluation: Ampicillin is not classifiable as to its carcinogenicity to humans, Group 3.

Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Drug.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R36/37/38; R42/43; R62; R63; safety phrases: S22; S36; S36/37; S41 (see Appendix 4).

Description: Ampicillin in anhydrous form occurs as crystals. Molecular weight = 349.44; freezing/melting point = 199-202°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): (*anhydrous*) Health 1; flammability 0; reactivity 0; (*trihydrate*) Health 2; flammability 0; reactivity 0. Slightly soluble in water.

Potential Exposure: Used as an antibiotic.

Incompatibilities: May be incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Russia[43]: MAC 0.1 milligram per cubic meter in workplace air, ampicillin.

Harmful Effects and Symptoms

Short-Term Exposure: Ampicillin can affect you when breathed in. Exposure can cause skin rash. This may or may not be an allergic reaction, but if hives are present, allergy is likely. Exposure to high levels can cause upset stomach and diarrhea. The LD_{50} for rat is 10 g/kg and for mouse is 28 mg/kg[9]. Ampicillin can cause hypersensitivity reactions in allergic persons.

Long-Term Exposure: Exposure may cause allergy to develop, often accompanied with hives. Once allergy develops, even low future exposures can cause an allergic reaction. Persons having an allergy to penicillin may be more likely to develop an allergic reaction to ampicillin. Exposure can lead to a rare, but sometimes fatal reaction (aplastic anemia) in which blood cell count drops very low. Ampicillin can cause a liver-damaging reaction. Since ampicillin kills many normal germs, new resistant strains can grow after repeated exposure, resulting in a “yeast” or other types of infection.

Points of Attack: Liver, blood cells, skin.

Medical Surveillance: Liver function tests; CBC. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly at the end of the work-shift. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of Ampicillin to potentially exposed workers.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and moisture.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Ampicillin itself does not burn. Thermal decomposition products may include sulfur oxides and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (*n*-; *o*-)

Description: All isomers of amyl acetate are highly flammable, colorless to yellow, watery liquids. The *n*-and *iso*-isomers have a persistent, fruity, banana-like or pear-like odor. The *sec*-isomer has a mild fruity odor. Molecular weight of isomers = 130.21. Hazard identification (based on NFPA-704 M Rating System): (*sec-isomer*) Health 2; flammability 3; reactivity 0.

n-isomer: Boiling point = 146 @ 760 mmHg; specific gravity (H_2O:1) = 0.876 @ 20°C; melting/freezing point = −78.5°C; liquid surface tension = 0.012 N/m @ 30°C; liquid water interfacial tension = (estimate) 0.05 N/m @ 17°C; relative vapor density (air = 1) = 4.5; ratio of specific heats of vapor (gas) = 1.1; latent heat of vaporization = 3.1×10^5 J/kg; heat of combustion = -310.8×10^5 J/kg; vapor pressure = 0.93 kPa @ 20; flash point = 32°C; autoignition temperature = 360°C. explosive limits: LEL: 1.0%; UEL: 7.5%; *sec*-isomer: Boiling point = 121°C; melting/freezing point = −148°C; critical temperature = 326°C; critical pressure = 411.6 psia = 28.0 atm = 2.83 MN/m^2; specific gravity (H_2O:1) = 0.861−0.866 @ 20°C; liquid surface tension = 28.9 dyn/cm = 0.0289 N/m @ 20°C; liquid water interfacial tension = (estimate) 0.0441 N/m @ 20°C; relative vapor density (air = 1) = 4.5; ratio of specific heats of vapor (gas) = (estimate) $>$ 1−1.1 @ 20°C; latent heat of vaporization = (estimate) = 3.0×10^5 J/kg; heat of combustion = −14.402 Btu/lb = −8000 cal/g = -334.9×10^5 J/kg; vapor pressure = 7 mmHg @ 20; flash point = 32°C; explosive limits: LEL: 1.1%; UEL: 7.0%.

tert-isomer: Boiling point = 125°C; flash point = 26°C; explosive limits: LEL: 1.0%; UEL: 7.5%

Potential Exposure: (*n*-isomer): Primary irritant (w/o allergic reaction), (*sec*-isomer) Human Data. Amyl acetates are used as industrial solvents and in the manufacturing and dry-cleaning industry; making artificial fruit-flavoring agents; cements, coated papers, lacquers; in medications as an inflammatory agent; pet repellents, insecticides and miticide. Many other uses.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrates. May soften certain plastics.

Permissible Exposure Limits in Air

n-and sec-amyl acetates

NIOSH IDLH = 1000 ppm

Odor threshold = 0.0075−7.3 ppm. *(n-)*; odor threshold = 0.002 ppm. *(sec-) Note*: The range of accepted *odor threshold values* is quite broad and caution should be used in relying on odor alone as a warning of potentially hazardous exposure.

Odor threshold = 0.08−0.0006 in water. *Note*: The range of accepted *Odor Threshold values* is quite broad and caution should be used in relying on odor alone as a warning of potentially hazardous exposure.

ACGIH TLV[1]: 50 ppm/266 milligram per cubic meter TWA; 100 ppm/532 milligram per cubic meter STEL
DFG MAK: 50 ppm/270 milligram per cubic meter TWA; Peak Limitation Category I(1). Pregnancy Risk Group C.

Determination in Air: Use NIOSH Analytical Method #1450 Esters I, #2549 Volatile Organic Compounds[18] (screening).

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.18$ (*n*-isomer); 2.26 (*sec-isomer*). Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye, and skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Amyl acetates can be absorbed through the skin, thereby increasing exposure. Irritates the eyes, causing burning sensation. Inhalation can irritate the respiratory tract, causing cough and wheezing. Higher exposure can cause headache, drowsiness, weakness, and loss of consciousness.

Long-Term Exposure: (*n*-) May cause liver damage. (*sec*-) May cause slight changes in the nervous system (brain wave changes). Prolonged or repeated skin contact to amyl acetates can cause irritation, dryness and cracking. Although all of these chemicals have not been adequately tested, many similar petroleum-based chemicals can cause brain or other nerve damage. Effects may include reduced memory and concentration, personality changes; such as withdrawal and irritability; fatigue, sleep disturbances; reduced coordination; and/or effects on autonomic nerves, and/or nerves to the arms and legs with weakness and sensation of "pins and needles." See also DFG MAK, above, for Pregnancy Risk Groups.

Points of Attack: Eyes, skin and respiratory system; CNS.

Medical Surveillance: Liver function tests. Positive and borderline individuals showing brain effects, changes in memory, concentration, mood and sleeping patterns, as well as headaches and fatigue should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *n*-Amyl acetate (CAS: 628-63-7): Prevent skin contact. **8 hours** (More than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Barricade coated suits; Responder suits; **4 hours** (At least 4 but $<$ 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Polyvinyl alcohol gloves; Teflon gloves, suits, boots. Employees should wash promptly when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Wear solvent-resistant protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear solvent-resistant, splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (for *n*-, *sec*-, and *iso*-isomers): *1000 ppm*: CcrFOv* (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister); or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister; PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or Sa* (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv (APF = 500) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection. There are no specific respirator specs for *tert*-amyl acetate.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where amyl acetates may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area, preferably a detached shed. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Avoid contact. Stay upwind. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Establish forced ventilation to keep levels below explosive limit. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals are flammable liquids. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. (*n*-, *sec*-, and *iso-primary- and secondary*-isomers listed).

European/International Regulations (*all isomers except tert-*): Hazard symbol: Xn; risk phrases: R10; R20; R37; safety phrases: S2; S41; S46; (*tert*-; *75-85-4*): Hazard symbol: F, Xn; risk phrases: R11; R20; R36/R37/38; safety phrases: S2; S21; S41; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]—*and sec-isomers*, mixed isomers.

Description: Amyl alcohols (pentanols) have eight isomers. All are flammable, colorless liquids, except the isomer 2,2-dimethyl-1-propanol, which is a crystalline solid. Odors* are described as "acetone-like" and "similar to fuel oil."

n-isomer, CAS 71-41-0: Molecular weight = 88.17; boiling point = 137.9°C; melting/freezing point = −78.8°C; critical temperature = 313°C; specific gravity (H_2O:1) = 0.818 @ 15°C; liquid surface tension = 0.02560 N/m @ 20°C; liquid water interfacial tension = 0.005 N/m @ 20°C; relative vapor density (air = 1): 3.04; ratio of specific heats of vapor (gas): 1.06; latent heat of vaporization = 5.049×10^5 J/kg; heat of combustion = -376.8×10^5 J/kg; electrical conductivity = 2.6×10^7 pS/m; vapor density (air = 1) = 3.0; vapor pressure = 2.29 mmHg @ 20°C. Explosive limits: LEL: 1.2%; 12.000 ppm; UEL: 10.0% @ 100°C. Hazard identification (based on NFPA-704M Rating System): Health 1; flammability 3; reactivity 0.

sec-isomer CAS 6032-29-7: Molecular weight = 88.17; boiling point = 118°C; melting/freezing point = −78.8°C; flash point = 34°C; autoignition temperature = 343°C. Explosive limits: LEL: 1.2%; UEL: 9.0. Hazard identification (based on NFPA-704M Rating System): Health 1; flammability 3; reactivity 1, Oxidizer. Slightly soluble in water; solubility = 13.5 g/100 mL.

tert-isomer CAS 75-85-4: Boiling point = 102°C; melting/freezing point = −8°C; flash point = 19°C; autoignition temperature = 436°C; explosive limits: LEL: 1.2%; UEL: 9. Hazard identification (based on NFPA-704M Rating System): Health 1; flammability 3; reactivity 0. Moderate solubility in water.

iso-primary-isomer CAS: 123-51-3: Molecular weight = 88.17; boiling point = 132°C; melting/freezing point: −117°C; critical temperature: 307°C; specific gravity (H_2O:1) = 0.82 @ 20°C; liquid surface tension = 0.0238 N/m @ 20°C; liquid water interfacial tension = 0.005 N/m @ 18°C; relative vapor density (air = 1) = 3.04; ratio of specific heats of vapor (gas) = (est.) 1.062; latent heat of vaporization = 5.016×10^5 J/kg; heat of combustion = -376.8×10^5 J/kg; heat of solution = -1.33×10^5 J/kg; vapor pressure = 28 mmHg @ 20°C; threshold limit = 0.012−10 ppm; flash point = 43°C (cc); 55°C (oc); autoignition temperature = 350°C; explosive limits: LEL: 1.2%; UEL: 9% @ 100°C. Hazard identification (based on NFPA-704M Rating System): Health 1; flammability 2; reactivity 0. Soluble in water; solubility = 2%. Threshold limit = 0.028−0.072 ppm.

iso-secondary-isomer CAS: 6032-29-7: Boiling point = 113-119°C; melting/freezing point = −50°C; specific gravity (H_2O:1) = 0.812; flash point = 35°C; autoignition temperature = 343°C; explosive limits: LEL: 1.2%; UEL: 9%.

Hazard identification (based on NFPA-704M Rating System): Health 1; flammability 2; reactivity 0.

**Note*: The range of accepted odor threshold values is quite broad and caution should be used in relying on odor alone as a warning of potentially hazardous exposure.

Amyl alcohols are obtained from fused oil which forms during the fermentation of grain, potatoes, or beets for ethyl alcohol. The fusel oil is a mixture of amyl alcohol isomers, and the composition is determined somewhat by the sugar source. Slight to moderate solubility in water.

Potential Exposure: (*n*-isomer); Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), (*iso-, primary*): Possible risk of forming tumors, Primary irritant (w/o allergic reaction), (*sec*-, *active primary*-, and other isomers) Primary irritant (w/o allergic reaction). Used as a solvent in organic synthesis and synthetic flavoring, pharmaceuticals, corrosion inhibitors; making plastics and other chemicals; as a flotation agent. The (*n*-isomer) is used in preparation of oil additives, plasticizers, synthetic lubricants, and as a solvent.

Incompatibilities: Forms an explosive mixture with air. Contact with strong oxidizers and hydrogen trisulfide may cause fire and explosions. Incompatible with strong acids. Violent reaction with alkaline earth metals forming hydrogen, a flammable gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm (*isoamyl alcohol, primary-, and sec-*)

Determination in Air: Use NIOSH Analytical Method #1402, #1405.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol–water coefficient: Log K_{ow} = 1.34 (*n*-); 1.42 (*sec*-); 1.15 (*iso-, primary*-); 1.35 (*iso-, secondary*-); 0.9 (*tert*-). Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin contact; ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Passes through the skin; contact contributes significantly to overall exposure. Skin contact can cause skin irritation. Inhalation can irritate the eyes and respiratory system, causing headache, nausea, and vomiting. High exposure can cause dizziness, lightheadedness, confusion, and unconsciousness. Very high exposure can cause death.

Long-Term Exposure: Can cause liver damage and blood effects.

Points of Attack: Eyes, skin, respiratory system; CNS.

Medical Surveillance: Regular medical checkups are recommended, depending on degree of exposure.

First Aid: Skin contact contributes significantly to overall exposure. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. ACGIH and safety equipment suppliers/manufacturers recommend polyvinyl alcohol, polyvinyl chloride, Neoprene, butyl rubber; and nitrile rubber, Neoprene + styrene-butadiene rubber (SBR), polyurethane, SBR, and SBR/Neoprene as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *500 ppm*: Sa:Cf (APF = 25)[£] (any supplied-air respirator operated in a continuous-flow mode); CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; PaprOv[£] [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece);

or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv(any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister); or SCBAE (any appropriate escape-type, SCBA).

*Note**: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where amyl alcohols may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers; strong acids and hydrogen trifluoride; since violent reactions occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2811 Pentanols, Hazard Class: 3; Labels: 3-Flammable liquid. UN1987 Alcohols, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use alcohol or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Amyl Nitrate A:1320

Formula: $C_5H_{11}NO_3$; $C_5H_{11}ONO_2$

Synonyms: *n*-Amyl nitrate; Diesel ignition improver; Nitrate d'amyle (French); Nitrato de amilo (Spanish); Nitric acid, pentyl ester

CAS Registry Number: 1002-16-0

RTECS Number: QV0600000

UN/NA & ERG Number: UN1112/140

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: MCLG = 10 mg[N]/L; MCL = 10 mg/L as nitrates.

Hazard Alert: Flammable, Oxidizing agent, Temperature sensitive (Possible explosive as temp. rises)

Hazard symbols, risk, & safety statements: Hazard symbol: F + , O; risk phrases: R9; R12; safety phrases: S13; S16; S26; S27; S41 (see Appendix 4)

Description: Amyl nitrate is a flammable, colorless liquid. Ethereal odor. Molecular weight = 133.15; specific gravity (H_2O:1) = 1.0 @ 20°C; boiling point = 145°C; 153−157°C; melting/freezing point = −123°C; flash point = 48.9°C (oc). Hazard identification (based on NFPA-704M Rating System): Health 2; flammability 2; reactivity 0, Oxidizer. Floats on water; insoluble.

Potential Exposure: Highly flammable, Amyl nitrate is used as an ignition additive in diesel fuels.

Incompatibilities: A strong oxidizer. Violent reaction with many compounds, including reducing agents; chemically active metals; combustible materials, strong acids, alkaline earth sulfides, aluminum carbides, aluminum, amines, calcium sulfide, carbides, chlorine trifluoride, glycerin, hydrides, hydrochloric acid, hydrogen peroxide, hydrogen sulfide, hydroxylamine, magnesium, metal powders, metal sulfides, molybdenum, phenylhydrazine, phosphorous red/friction, phosphorous trichloride, silicon, sulfides, sulfur, sulfur dioxide, sulfur/friction, sulfuric acid, tungsten, hydrogen trisulfide. Temperature sensitive; may explode as temperature rises.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.5 ppm

PAC-2: 16 ppm

PAC-3: 98 ppm

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes and skin. Breathing amyl nitrate vapor can cause headaches, dizziness, weakness, and nausea. Higher levels can cause convulsions and death. Exposure can interfere with the ability of the blood to carry oxygen, causing headaches, weakness and a Blue color to the skin and lips.

Long-Term Exposure: Repeated exposure may cause anemia. After repeated exposure tolerance develops. If exposure stops suddenly, chest pain and heart attack could occur.

Points of Attack: Blood cells.

Medical Surveillance: Blood tests for methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, flames and other combustible materials, such as wood, paper or oil. Outside or detached storage is preferred. Before entering confined space where amyl nitrate may be present, check to make sure that an explosive concentration does not exist. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1112 Amyl nitrate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate site of spill or leak. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep Amyl Nitrate out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include Oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with scrubber to remove nitrogen oxides in effluent gases.

Amyl Nitrites A:1330

Formula: C5H11NO2

Synonyms: *n-isomer*: 1-Nitropentane

iso-isomer: Nitrous Acid, 3-methylbutyl ester; Isoamyl nitrite; Isopentyl alcohol nitrite; 3-Methylbutanol nitrite; 3-Methylbutyl nitrite; Nitropentane; Nitrous acid, pentyl ester; Pentyl nitrite

CAS Registry Number: 463-04-7 (*n*-); 110-46-3 (*iso*-)

HSDB Number: 606

RTECS Number: RA1140000 (*n*-); NT0187500 (*iso*-)

UN/NA & ERG Number: UN1113/129; UN1993 (flammable liquids, n.o.s.)/128 (*iso*-)

EC Number: 207-332-7 [*Annex I* Index No.: 007-020-00-9] (*n*-); 203-770-8 [*Annex I* Index No.: 007-020-00-9] (*iso*-)

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Suspected reprotoxic hazard

European/International Regulations (*n-and iso-isomers*): Hazard symbol: (*n- & iso-isomers*) F + , Xn; risk phrases: R11; R20/22; R63; safety phrases: S2; S16; S24; S41; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Amyl nitrites are flammable, yellowish liquid with a penetrating, fruity odor. Molecular weight = 117.17; boiling point = 104°C; 99.2°C (*iso*-); specific gravity (H_2O:1) = 0.8758 @ 20°C; 0.883 @ 20°C (*iso*-); liquid surface tension = (estimate) 0.020 N/m @ 20°C; liquid water interfacial tension = (estimate) 0.040 N/m @ 20°C; relative vapor density (air = 1) = 4; ratio of specific heats of vapor (gas) = 1.0709; latent heat of vaporization = 4.94×10^5 J/kg; heat of combustion = -290×10^5 J/kg; vapor pressure = (est.) 27 mmHg; 3.48 kPa @ 20°C; flash point = 3°C (*n*-); 3°C (*iso*-); autoignition temperature = 209−210°C. Hazard identification (based on NFPA-704M Rating System): Health 1; flammability −; reactivity 2. Floats on water; very slightly soluble; decomposes.

Potential Exposure: Amyl nitrite is used to make pharmaceuticals; perfumes, diazonium compounds, and other chemicals.

Incompatibilities: Vapors may form explosive mixture with air. Slowly decomposes in light, heat, and on contact with water. A strong oxidizer. Contact with reducing agents and easily oxidizable materials may cause fire and explosions. Reported to be an explosion hazard when exposed to air and light. Keep away from alcohols, antipyrine, alkaline materials; alkaline carbonates; potassium iodide; bromides, and ferrous salts. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

110-46-3 (iso-)

PAC Ver. 29[138]

PAC-1: 0.48 ppm

PAC-2: 5.3 ppm

PAC-3: 32 ppm

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Amyl nitrite can be absorbed through the skin, thereby increasing exposure. Contact can irritate the eyes and skin. A skin allergy can develop. Chronic overexposure can cause blood cell damage and anemia. Exposure can rapidly cause flushing, headaches, dizziness, sharp drop in blood pressure; fast pulse rate; confusion; a Blue color to lips and fingernails and possible fainting and shock.

Long-Term Exposure: Chronic overexposure can cause anemia and red blood cell damage. Repeated exposure causes tolerance to develop. If exposure stops suddenly, chest pain and heart attack could occur. May cause skin allergy to develop. Infants below the age of six months who drink water containing nitrite in excess of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.

Points of Attack: Blood, skin.

Medical Surveillance: Blood methemoglobin level, CBC, evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where amyl nitrite may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator[52]. Protect from exposure to light. Keep under an inert atmosphere. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep amyl nitrite out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with scrubber to remove nitrogen oxides from the combustion gases.

Amyl Trichlorosilane A:1340

Formula: $C_5H_{11}SiCl_3$

Synonyms: Amiltriclorosilano (Spanish); Pentyltrichlorosilane; Pentylsilicon trichloride; Silane, trichloropentyl-; Trichloroamylsilane; Trichloropentylsilane

CAS Registry Number: 107-72-2

HSDB Number: 887

RTECS Number: VV4725000

UN/NA & ERG Number: UN1728/155

EC Number: 203-515-0

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Flammable, Corrosive, Violently reactive with water.

Listed in the TSCA inventory.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C; risk phrases: R10; R14; R23/24; R34; safety phrases: S1; S16; S26; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Amyl trichlorosilane is a colorless to yellowish liquid with a sharp acrid odor (like hydrochloric acid). Molecular weight = 205.63; specific gravity (H_2O:1) = 1.137 @ 25°C; boiling point = 168°C; liquid surface tension = (estimate) 0.020 N/m @ 20°C; relative vapor density (air = 1) = 7.1; latent heat of vaporization = 2.02×10^5 J/kg; heat of combustion = -154×10^5 J/kg; heat of solution: 4.0×10^5 J/kg; flash point = 30°C. NFPA 704M Hazard Identification (based on NFPA-704M Rating System): Health 3; flammability 2; reactivity 2₩. Reacts violently with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: It is used to make silicones.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam releasing heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.6_A}$ ppm

PAC-2: $\mathbf{7.3_A}$ ppm

PAC-3: $\mathbf{33_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Harmful Effects and Symptoms

Short-Term Exposure: A corrosive chemical that can cause severe eye and skin burns. Exposure can irritate the eyes, nose and throat. Higher levels can irritate the lungs, causing coughing and/or shortness of breath; still higher exposures can cause pulmonary edema, a medical emergency which can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. The oral LD_{50} for rat is 2,340 mg/kg.

Long-Term Exposure: Similar corrosive chemicals cause lung damage; bronchitis may develop.

Points of Attack: Lungs, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider lung X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Acid gas*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1728 Amyltrichlorosilane, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep amyl trichlorosilane out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.2/1.9

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phosgene and hydrogen chloride. *Do not use water or foam.* Use dry chemical, carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Aniline is a clear, colorless, oily liquid that darkens on exposure to light; with a characteristic amine-like odor. Molecular weight = 93.14; 129.60 (hydrochloride); boiling point = 184.2°C; 245°C (hydrochloride); melting/freezing point = −6°C; specific gravity (H_2O:1) = 1.022; 1.2 (hydrochloride) @ 20°C; liquid surface tension = (estimate) 0.020 N/m @ 20°C; liquid water interfacial tension = (estimate) 0.0058 N/m @ 20°C; Liquid surface tension: = 0.0455 N/m @ 20°C; critical pressure = 5.31 MN/m^2; relative vapor density (air = 1) = 4; ratio of specific heats of vapor (gas) = 1.0709; electrical conductivity = 2.4×10^6 pS/m; latent heat of vaporization = 4.61×10^5 J/kg; heat of combustion = -348.3×10^5 J/kg; vapor pressure = 0.6 mmHg @ 20; <0.076 mmHg (hydrochloride); flash point = 70°C; 193°C (hydrochloride); NFPA 704M Hazard Identification (based on NFPA-704M Rating System): Health 3; flammability 2; reactivity 0. Explosive Limits: LEL: 1.3%; UEL: 11%. Slightly soluble in water; solubility = 3.4 g/100 mL @ 20°C; the hydrochloride is more soluble ≥ 100 g/100 mL. *Note*: This chemical's odor generally provides inadequate warning of exceeded exposure limits.

Potential Exposure: Aniline is widely used as an intermediate in the synthesis of dyestuffs. It is also used in the manufacture of rubber accelerators and antioxidants, pharmaceuticals, marking inks; tetryl, optical whitening agents; photographic developers; resins, varnishes, perfumes, shoe polishes, and many organic chemicals.

Incompatibilities: May form explosive mixture with air. Unless inhibited (usually methanol), aniline is readily able to polymerize. Fires and explosions may result from contact with halogens, strong acids; oxidizers, strong base organic anhydrides; acetic anhydride, isocyanates, aldehydes, sodium peroxide. Strong reaction with toluene diisocyanate. Reacts with alkali metals and alkali earth metals. Attacks some plastics, rubber and coatings; copper and copper alloys.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Odor threshold = 0.58−10 ppm.

Aniline and homologues.

Conversion factor: 1 ppm = 3.81 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/19 milligram per cubic meter TWA [skin]

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 2 ppm/7.6 milligram per cubic meter TWA [skin]; Confirmed animal carcinogen; BEI: 50 mg/L total *p*-aminophenol in urine at end-of-shift

PAC* Ver. 29[138]

aniline

PAC-1: $\mathbf{8_A}$ ppm

PAC-2: $\mathbf{12_A}$ ppm

PAC-3: $\mathbf{20_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 2 ppm/7.7 milligram per cubic meter [skin] danger of skin sensitization; Peak Limitation Category II (2); Carcinogen Category 4; Pregnancy Risk Group C; BAT: 1 mg/L urine/end-of-shift

Arab Republic of Egypt: TWA 2 ppm (10 milligram per cubic meter) [skin], 1993; Australia: TWA 2 ppm (10 milligram per cubic meter) [skin], 1993; Austria: MAK 2 ppm (8 milligram per cubic meter) [skin], suspected carcinogen, 1999; Belgium: TWA 2 ppm (7.6 milligram per cubic meter) [skin], 1993; Denmark: TWA 1 ppm (4 milligram per cubic meter) [skin], 1999; Finland: TWA 2 ppm (7.6 milligram per cubic meter), STEL 4 ppm [skin], carcinogen, 1993; France: VME 2 ppm (10 milligram per cubic meter) [skin], carcinogen, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter [skin], 2003; India: TWA 0.2 milligram per cubic meter [skin], 1993; Japan: 1 ppm (3.8 milligram per cubic meter) [skin], 1993;

Norway: TWA 1 ppm (4 milligram per cubic meter), 1999; the Philippines: TWA 5 ppm (19 milligram per cubic meter) [skin], 1993; Poland: MAC (time-weighted average) 5 milligram per cubic meter; MAC (STEL) 20 milligram per cubic meter, 1999; Russia: TWA 1 ppm, STEL 0.1 milligram per cubic meter [skin], 1993; Sweden: NGV 1 ppm (4 milligram per cubic meter), KTV 2 ppm (8 milligram per cubic meter) [skin], 1999; Switzerland: MAK-week 2 ppm (8 milligram per cubic meter), KZG-week 10 ppm (40 milligram per cubic meter) [skin], 1999; Turkey: TWA 5 ppm (19 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 1 ppm (4 milligram per cubic meter) [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Mexico: TWA 10 milligram per cubic meter; STEL 5 ppm (20 milligram per cubic meter). Russia[43] set a MAC of 0.05 m/mg^3 in residential air on a momentary basis and 0.03 milligram per cubic meter in residential air on an average daily basis. The California standard for work-place air is 2 ppm (7.6 milligram per cubic meter) TWA. Several states have set guidelines or standards for aniline in ambient air[60]: 0.4 milligram per cubic meter (New York), 1.4 μ/m^3 (Massachusetts), 3.0 μ/m^3 (Rhode Island), 23.81 μ/m^3 (Kansas), 50 μ/m^3 (South Carolina), 100 μ/m^3 (North Dakota), 160 μ/m^3 (Virginia), 200 μ/m^3 (Connecticut), 238 μ/m^3 (Nevada), 1000 μ/m^3 (North Carolina).

Determination in Air: Silica adsorption, workup in *n*-propanol, followed by GC. Use NIOSH Analytical Method 2002 for aromatic amines[18].

Permissible Concentration in Water: No criteria set but EPA[32] has suggested an ambient limit in water of 262 μ/mL based on health effects. Russia[43] set a MAC of 0.1 mg/L in water for domestic purposes and 0.0001 mg/L in water for fishery purposes.

Routes of Entry: Inhalation of vapors, percutaneous absorption of liquid and vapor, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Skin contact contributes significantly to overall exposure. Direct contact with liquid aniline can cause skin burns, eye irritation and possible permanent damage. Inhalation can cause irritation of the respiratory tract with wheezing and coughing. High levels can interfere with the blood's ability to carry oxygen. Higher levels can cause difficult breathing; collapse and death. Symptoms of exposure include grayish Blue skin, headache, nausea, sometimes vomiting; dryness of throat; confusion, vertigo, lack of muscle coordination; ringing in the ears; weakness, disorientation, lethargy, drowsiness and coma. Urinary signs include painful urinating, blood in the urine; the presence of hemoglobin in the urine; and diminished amounts of urine. Aniline is classified as very toxic. Probable oral lethal dose in humans is 50−500 mg/kg for a 150-lb person. The approximate minimum lethal dose for a 150-lb human is 10 g. Serious poisoning may result from ingestion of 0.25 mL.

Long-Term Exposure: Chronic exposure can cause anemia, anorexia, weight loss; and skin lesions. Chronic effects may be due to acute damage to the brain, heart, and kidneys. Loss of appetite; dizziness, insomnia, tremors, malignant bladder growths; liver damage; and jaundice. Anemia has been reported. Has been linked to bladder cancer according to a NIOSH study. Signs and symptoms include: blood in the urine, other changes in the appearance of the urine; changes in urinary habits; lumps in the groin and lower abdomen; and pain in the lower abdomen or back. Aniline can cross the placental barrier. Because fetal hemoglobin is more easily oxidized to methemoglobin than is adult hemoglobin and is less easily reduced back to normal hemoglobin, methemoglobin theoretically may be at higher levels in fetuses than in exposed mothers.

Points of Attack: Blood, cardiovascular system, liver, kidneys.

Medical Surveillance: Preplacement and periodic physical examinations should be performed on all employees working in aniline exposure areas. These should include a work history to elicit information on all past exposures to aniline, other aromatic amines; and nitro compounds known to cause chemical cyanosis; the clinical history of any occurrence of chemical cyanosis; a personal history to elicit alcohol drinking habits; and general physical examination with particular reference to the cardiovascular system. Persons with impaired cardiovascular status may be at greater risk from the consequences of chemical cyanosis. A preplacement CBC and methemoglobin estimation should be performed as baseline levels, also follow-up studies including periodic blood counts and hematocrit. People at special risk include individuals with glucose-6-phosphate-dehydrogenase deficiency and those with liver and kidney disorders; blood diseases, or a history of alcoholism. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Aniline, the simplest aromatic amine, is a prototypical inducer of methemoglobinemia and impaired oxygen transport to tissues. Chemical protective clothing is recommended because aniline vapor and liquid can be dermally absorbed and may contribute to systemic toxicity. Prevent skin contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): butyl rubber gloves, suits, boots; Polyvinyl alcohol gloves; 4H and Silver Shield gloves; Barricade coated suits; Responder suits, Trellchem HPS suits; **4 hours** (At least 4 but $<$ 8 hours of resistance to breakthrough $>0.1\ \mu m > g/cm^2/min$): Teflon gloves, suits, boots; Viton gloves, suits, Saranex coated suits. In areas of vapor concentration, the use of respirators alone is not sufficient; skin protection by protective clothing should be provided even though there is no skin contact with liquid aniline. Personal hygiene practices including prompt removal of clothing which has absorbed aniline, thorough showering after work and before changing to street clothes and clean working clothes daily are essential. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit.

NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where aniline may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, dry, dark, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Where this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1547 Aniline, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN1548 Aniline hydrochloride, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Stay upwind; keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Wear positive-pressure breathing apparatus and special protective clothing. Remove all ignition sources: no flares, smoking or flames in hazard area. Do not touch material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with vermiculite, dry sand; earth, or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Fight fire from maximum distance. Dike fire control water for later disposal and do not scatter material. If a leak or spill has not ignited, use water spray to control vapors. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant

(≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with provision for nitrogen oxides removal from flue gases by scrubber, catalytic or thermal device[22].

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water (*m-isomer*); 3-Severe hazard to water (*o-isomer*); 2-Hazard to water (*p-isomer*)

Description: Anisidine exists as *ortho*-, *meta*-, and *para*-isomers. They have characteristic amine (fishy) odors.

o-isomer: A colorless to pink liquid. Solid below 5°C. Molecular weight = 123.17; boiling point = 224°C; melting/freezing point = 5°C; vapor pressure ≤ 0.1 mmHg @ 20°C; flash point = 118°C (oc); autoignition temperature = 415°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. Practically insoluble in water; solubility = 1.5%.

m-isomer: Pale yellow liquid. Molecular weight = 123.2; boiling point = 251°C; freezing/melting point = 57.2°C; vapor pressure = 0.006 mmHg @ 20°C.

p-isomer: Reddish-brown solid. Molecular weight = 123.2; boiling point = 243°C; freezing/melting point = 57.2°C; vapor pressure = 0.4 mmHg @ 20°C; flash point = 122°C; autoignition temperature = 515°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Insoluble in water.

Potential Exposure: Anisidines are used in the manufacture of azo dyes; pharmaceuticals; textile-processing chemicals

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine,

bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some coatings and some forms of plastic and rubber.

Permissible Exposure Limits in Air

o- & p-isomers

NIOSH IDLH = 50 milligram per cubic meter

OSHA PEL: 0.5 milligram per cubic meter TWA [skin]

NIOSH REL: 0.5 milligram per cubic meter TWA [skin] Potential occupational carcinogen. Reduce exposures to the lowest feasible concentration.

ACGIH TLV[1]: 0.1ppm/0.5 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans; BEI established.

PAC Ver. 29[138]

90-04-0 (o-isomer); 104-94-9 (*p-isomer*)

PAC-1: 1.5 milligram per cubic meter

PAC-2: 8.3 milligram per cubic meter

PAC-3: 50 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 3B

Australia: TWA 0.1 ppm (0.5 milligram per cubic meter) [skin], 1993; Austria: MAK 0.1 ppm (0.5 milligram per cubic meter) [skin], 1993; Belgium: TWA 0.1 ppm (0.5 milligram per cubic meter) [skin], 1993; Denmark: TWA 0.1 ppm (0.5 milligram per cubic meter) [skin], 1999; Finland: TWA 0.5 milligram per cubic meter, STEL 1.5 milligram per cubic meter [skin], carcinogen, 1993; France: VME 0.1 ppm (0.5 milligram per cubic meter) [skin], carcinogen, 1999; India: TWA 0.1 ppm (0.5 milligram per cubic meter) [skin], 1993; Japan: [skin], 2B carcinogen, 1999; Norway: TWA 0.1 ppm (0.5 milligram per cubic meter), 1999; the Philippines: TWA 0.5 milligram per cubic meter [skin], 1993; Poland: MAC (time-weighted average) 0.5 milligram per cubic meter; MAC (STEL) 1 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter [skin], 1993; Switzerland: MAK-week 0.1 ppm (0.5 milligram per cubic meter), KZG-week 0.2 ppm (1 milligram per cubic meter) [skin], 1999; United Kingdom: TWA 0.1 ppm (0.51 milligram per cubic meter), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans.

104-94-9 (p-isomer)

OSHA PEL: 0.5 milligram per cubic meter TWA

NIOSH REL: 0.5 milligram per cubic meter TWA

ACGIH TLV[1]: 0.1 ppm TWA [skin]; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 8.3 milligram per cubic meter

PAC-3: 50 milligram per cubic meter

DFG MAK: [skin]; DFG Carcinogen Category 3B

Australia: TWA 0.1 ppm (0.5 milligram per cubic meter) [skin], 1993; Austria: MAK 0.1 ppm (0.5 milligram per cubic meter) [skin], 1999; Belgium: TWA 0.1 ppm (0.5 milligram per cubic meter) [skin], 1993; Denmark: TWA 0.1 ppm (0.5 milligram per cubic meter) [skin], 1999; Finland: TWA 0.5 milligram per cubic meter, STEL 1.5 milligram per cubic meter [skin], carcinogen, 1993; France: VME 0.1 ppm (0.5 milligram per cubic meter) [skin], 1999; India: TWA 0.1 ppm (0.5 milligram per cubic meter) [skin], 1993; Japan: [skin], 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter [skin], 2003; the Philippines: TWA 0.5 milligram per cubic meter [skin], 1993; Poland: MAC (time-weighted average) 0.5 milligram per cubic meter; MAC (STEL) 1 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter [skin], 1993; Switzerland: MAK-week 0.1 ppm (0.5 milligram per cubic meter), KZG-week 0.2 ppm (1 milligram per cubic meter) [skin], 1999; United Kingdom: TWA 0.1 ppm (0.53 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for anisidines in ambient air[60]: 0.02−1.0 μ/m^3 (Rhode Island), 5.0 μ/m^3 (Connecticut and North Dakota), 8.0 μ/m^3 (Virginia), 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 2514, anisidine[18].

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq 1$ (*o*-isomer); 1.18 (*m*-isomer); <1 (*p*-isomer). Unlikely to bioaccumulate in marine organisms. A listed United States DOT marine pollutant that may persist in the environment.

Routes of Entry: Inhalation, ingestion, skin, eye, mucous membrane absorption.

Harmful Effects and Symptoms

Short-Term Exposure: These chemicals can be absorbed through the skin, eyes, or mucous membranes; thereby increasing exposure. Contact with anisidines can irritate the eyes, skin and respiratory tract; can cause a burning sensation and skin rash. Inhalation of *p*-anisidine can cause shortness of breath and coughing. Exposure can interfere with the blood's ability to carry hemoglobin (methemaglobinemia). This can cause headache, dizziness, cyanosis of the skin and lips. Higher levels can cause difficult breathing; collapse and death.

Long-Term Exposure: *o*-anisidine is a probable carcinogen in humans (IARC: Group 2B, limited human evidence). Related aromatic amines are carcinogens, and *p*-anisidine may be carcinogenic as well. Repeated exposure to these isomers may cause anemia, skin allergy, lung irritation and bronchitis; nerve and kidney damage.

Points of Attack: Blood, kidneys, liver, cardiovascular system; CNS.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. *o-anisidine*: evaluation by a qualified allergist, test for blood hemoglobin, CBC and reticulocyte count. Consider nerve conduction studies. *p-Anisidine*: lung function tests, evaluation by a qualified allergist, kidney function tests, CBC, methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof (*o*-anisidine) or dust-proof (*p*-anisidine) chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 500) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dark, well-ventilated area. Protect against sunlight and strong oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2431 Anisidines, Hazard Class: 6.1; Labels: 6.1-Poisonous materials

Spill Handling: *Liquid*: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Cover with sand and soda ash (9:1). After mixing, collect material in the most convenient and safe manner and deposit in sealed containers. Keep *o*-anisidine out of confined spaces, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. *Solid*: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in combustible solvent (alcohols, benzene, etc.) and spray solution into furnace equipped with afterburner and scrubber, or burn spill residue on sand and soda ash absorbent in a furnace.

Anisole A:1370

Formula: C_7H_8O; $C_6H_5OCH_3$

Synonyms: Anisol (Spanish); Benzene, methoxy; Ether, methyl phenyl; Methoxybenzene; Methyl phenyl ether; Metil fenil eter (Spanish); Phenyl methyl ether

CAS Registry Number: 100-66-3

HSDB Number: 44

RTECS Number: BZ8050000

UN/NA & ERG Number: UN2222/128

EC Number: 202-876-1

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn, Xi; risk phrases: R10; R20/21/22; R36/37/38; R52/53; R61; R63; safety phrases: S16; S24/25; S26; 37/39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Anisole is a colorless to yellowish liquid with an agreeable, aromatic, spicy-sweet odor. Molecular weight = 108.15; specific gravity (H_2O:1) = 1.7; boiling point = 154°C; freezing/melting point = −37.3°C; vapor pressure = 3.1 mmHg @ 25; flash point = 51.6°C (oc); explosive limits: LEL: 3400 ppm; autoignition temperature = 475°C. Hazard identification (based on NFPA-704M Rating System): Health 1; flammability 2; reactivity 0. Insoluble in water.

Potential Exposure: Anisole is used as a solvent; a flavoring, vermicide, making perfumes; and in organic synthesis.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 0.1 ppm TWA (A4) [skin]

PAC Ver. 29[138]

PAC-1: 1.6 milligram per cubic meter

PAC-2: 18 milligram per cubic meter

PAC-3: 110 milligram per cubic meter

Permissible Concentration in Water: Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment. Russia[43] set a MAC of 0.05 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, absorbed through the skin, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: A skin irritant since it degreases the skin; prolonged skin contact can cause drying and cracking. It irritates the eyes and respiratory tract if exposure occurs[57]. Exposure can cause dizziness, lightheadedness, and unconsciousness. It is moderately toxic by ingestion[44]. The oral LD_{50} for rat is 3700 mg/kg and for mouse is 2800 mg/kg[9].

Long-Term Exposure: Skin problems, dryness, cracking.

Points of Attack: Eyes, skin, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-

approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where anisole may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated, fireproof area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2222 Anisole, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate spill or leak area. Absorb spilled liquid in sand or inert absorbent and put in sealed containers and remove for disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Anthracene A:1380

Formula: $C_{14}H_{10}$

Synonyms: Anthracen (German); Anthracene oil; Anthracene PAC; Anthracin; Antraceno (Spanish); Green oil; *p*-Naphthalene; Paranaphthalene; Sterilite hop defoliant; Tetra olive N2G

CAS Registry Number: 120-12-7; 90640-80-5 (anthracene oil)

HSDB Number: 702; 1178 as naphthenic acids

RTECS Number: CA9350000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 204-371-1

Regulatory Authority and Advisory Information

Carcinogenicty: Anthracene has not been identified as a carcinogen. Handle with caution as several related PAHs are known carcinogens. NIOSH has recommended that coal tar pitch volatiles, including PAHs be treated as potential human carcinogen.

California Proposition 65 Chemical[102]: (*coke oven emissions*) Cancer 2/27/1987.

Hazard Alert: Poison, Combustible, Lacrimator, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Banned or Severely Restricted (UN) (in cosmetic products in the EU)[35]

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as naphthalenes

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 307(a)(1) Toxic pollutant designated, pursuant to of the and is subject to effluent limitations as PAHs.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed
RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.059; Nonwastewater (mg/kg), 3.4
RCRA 40CFR264, Appendix 9; Ground Water Monitoring List: Suggested methods (PQL μg/L): 8100 (200); 8270 (10)
Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 5000 lb (2270 kg), 40CFR 372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; NPRI.
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N, F, T, Xi; risk phrases: R45; R11; R23/24/25; R36/37/38; R39; R51/53; R62; R65; R66; R67; safety phrases: S9; S16; S24/25; S26; S29; S36/37; S45; S60; S61; S62 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Anthracene is colorless, to pale yellow crystalline solid with a bluish fluorescence. PAHs are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Molecular weight = 178.23; specific gravity (H_2O:1) = 1.28; boiling point = 340°C; freezing/melting point = 215.76−216.5°C; vapor pressure = 0.99 mmHg @ 145°C; flash point = 121°C; autoignition temperature = 540°C. Explosive limits: LEL: 0.6%[17]. NFPA 704M Hazard Identification (based on NFPA-704M Rating System): Health 0; flammability 1; reactivity 0. Insoluble in water.

Potential Exposure: It is used as an intermediate in dye stuffs (alizarin), insecticides, and wood preservatives; making synthetic fibers, anthraquinone, and other chemicals. May be present in coke oven emissions, diesel fuel, and coal tar pitch volitiles.

Incompatibilities: Finely dispersed powder may form explosive mixture in air. Contact with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, chromic acid/or calcium hypochlorite.

Permissible Exposure Limits in Air
NIOSH IDLH = 80 milligram per cubic meter coal tar pitch volatiles
PAC Ver. 29[138]
120-12-7
PAC-1: 48 milligram per cubic meter
PAC-2: 530 milligram per cubic meter
PAC-3: 3200 milligram per cubic meter
No occupational limits have been established for anthracene. However this chemical may be present as *coke oven emissions* and *coal tar pitch volatiles*.
OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.
NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens
ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen
DFG MAK: Carcinogen Category 1
See also entry for coal tar pitch volatiles.

Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; NIOSH Analytical Method #5515, PAHs by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms, therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/L, respectively.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \geq$ 4.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Anthracene can affect you when breathed in. Once inside your body, anthracene appears to target the skin, blood, stomach and intestines and the lymph system. Exposure to high doses of anthracene for a short time can cause damage to the skin. It can cause burning, itching and edema, a buildup of fluid in tissues. Humans exposed to anthracene experienced headaches, nausea, loss of appetite, inflammation or swelling of the stomach and intestines. In addition, their reaction time slowed and they felt weak. Skin contact can cause irritation or a skin allergy which is greatly aggravated by sunlight on contaminated skin. Breathing irritates the nose, throat and bronchial tubes. Eye contact or "fume" exposure can cause irritation and burns.

Long-Term Exposure: Repeated skin contact can cause thickening, pigment changes and growths. Anthracene may cause mutations. Handle with extreme caution. The carcinogenic status of anthracene is a bit confusing: Animal negative[9] compares with ACGIH[1] and DFG[3] categorization of coal tar volatiles as proven carcinogens. The

DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies.

Points of Attack: Skin, lungs/respiratory system; bladder, liver, blood, kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Evaluation by a qualified allergist. NIOSH lists the following tests: CBC; chest X-ray; pulmonary function tests: Forced Vital Capacity; Forced Expiratory Volume (1 second); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria[2].

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. *Antidotes and Special Procedures*: Sun screens for ultraviolet light may help prevent skin allergic reactions. These may need frequent reapplications if you are sweating. Ultraviolet-screening sunglasses can help with eye allergic reactions. Consult your doctor or pharmacist in selecting these.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Anthracene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine and fluorine), chromic acid and calcium hypochlorite, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Anthracene is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Irritating and noxious gases, including oxides of carbon. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration[22].

EC Number: 201-549-0

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human evidence: inadequate; animal evidence: sufficient, *possibly carcinogenic to humans*, Group 2B, 2007; NTP concluded that anthraquinone caused cancer of the kidney and urinary bladder in male and female rats and of the liver in female rats. Handle with caution as several related polynuclear aromatic hydrocarbons (PAHs) are known carcinogens. NIOSH has recommended that PAHs be treated as potential human carcinogen.

California Proposition 65 Chemical[102]: Cancer 9/28/2007.

Hazard Alert: Poison, Combustible, Agricultural Chemical, Suspected of causing genetic defects, Possible risk of forming tumors; Possible sensitization hazard (skin).

TSCA 40CFR704.30; 40CFR716.120(a) List of substances; 40CFR712.30(m); 40CFR799.500 Testing Requirements. Export notification required by §12(b)

Hazard symbols, risk, & safety statements: Hazard symbol: T + , Xi; Risk phrases: R45; R27/28; R43; R62; Safety phrases: S13; S28; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Anthraquinone is a combustible, light yellow to green crystalline solid. Molecular weight = 208.23; specific gravity (H_2O:1) = 1.44; boiling point = 376.89°C; melting/freezing point = 286°C (sublimes); flash point = 185°C (cc). NFPA 704M Hazard Identification (based on NFPA-704M Rating System): Health 2; flammability 1; reactivity 0. Very slightly soluble in water; solubility ≤ 13 mg/L @ 22°C.

Potential Exposure: Anthraquinone is an important starting material for vat dye manufacture. Also used in making organics; and used as a bird repellent in seeds.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 12 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 790 milligram per cubic meter

Russia[43]: MAC 5 milligram per cubic meter work-place air.

Determination in Air: NIOSH Analytical Method #5013, Dyes

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \geq 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Through the skin, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Can be absorbed through the skin, thereby increasing exposure. Eye or skin contact can cause irritation. An allergen, may cause skin irritation and sensitization. Severe poisoning may cause seizures and coma.

Long-Term Exposure: May cause skin allergy, with itching and rash. It may be mutagenic.

Points of Attack: Skin, lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Antimony is a silvery-white, lustrous, hard, brittle metal; scale-like crystals, or dark gray lustrous powder. Molecular weight = 121.76; specific gravity (H_2O:1) = 6.68 @ 25°C; boiling point = 1635°C; freezing/melting point = 630.63°C. Hazard identification (based on NFPA-704 M Rating System): [powder]. Health 2; flammability 2; reactivity 0. Insoluble in water and organic solvents.

Potential Exposure: Exposure to antimony may occur during mining, smelting or refining; alloy and abrasive manufacture; and typesetting in printing. Antimony is widely used in the production of alloys, imparting increased hardness, mechanical strength, corrosion resistance, and a low coefficient of friction. Some of the important alloys are Babbitt, pewter, white metal, Britannia metal and bearing metal (which are used in bearing shells), printing-type, metal, storage battery plates, cable sheathing, solder, ornamental castings, and ammunition. Pure antimony compounds are used as abrasives, pigments, flame-proofing compounds, plasticizers, and catalysts in organic synthesis; they are also used in the manufacture of tartar emetic, paints, lacquers, glass, pottery, enamels, glazes, pharmaceuticals, pyrotechnics, matches, and explosives. In addition, they are used in dyeing, for blueing steel; and in coloring aluminum pewter; and zinc. A highly toxic gas, stibine, may be released from the metal under certain conditions.

Incompatibilities: Pyrophoric. Finely dispersed powder may form explosive mixture in air. Strong oxidizers; strong acids [especially halogenated acids], produce a violent reaction, and deadly stibine gas (antimony hydride). Heat forms stibine gas. Mixtures with nitrates or halogenated compounds may cause combustion. Forms an explosive mixture with chloric and perchloric acid. *Note*: Stibine is formed when antimony is exposed to nascent (freshly formed) hydrogen[77].

Permissible Exposure Limits in Air

Arab Republic of Egypt: TWA 0.5 milligram per cubic meter, 1993; Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: MAK 0.5 milligram per cubic meter, 1999; Belgium: TWA 0.5 milligram per cubic meter, 1993; Denmark: TWA 0.5 milligram per cubic meter, 1999; Finland: TWA 0.5 milligram per cubic meter, 1993; France: VME 0.5 milligram per cubic meter, 1999; the

Netherlands: MAC-TGG 0.5 mg[Sb]/m^3; MAC-TGG 0.5 milligram per cubic meter, 2003; Japan: 0.1 milligram per cubic meter, 2B carcinogen, 1999; Norway: TWA 0.5 mg[Sb]/m^3, 1999; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (time-weighted average) 0.5 milligram per cubic meter; MAC (STEL) 1.5 milligram per cubic meter, 1999; Russia: TWA 0.2 milligram per cubic meter, STEL 0.5 milligram per cubic meter, 1993; Sweden: NGV 0.5 milligram per cubic meter, 1999; Switzerland: MAK-week 0.5 milligram per cubic meter, 1999; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Nations: TWA 0.5 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 mg [Sb]/m^3. Several states have set guidelines or standards for antimony in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 1.19 μ/m^3 (Kansas) to 1.2 μ/m^3 (Pennsylvania) to 5 μ/m^3 (North Dakota) to 8.0 μ/m^3 (Virginia) to 10 μ/m^3 (Connecticut) to 12 μ/m^3 (Nevada) to 40 μ/m^3 (Rhode Island).

Determination in Air: OSHA Analytical Methods ID-125G, ID121. See also NIOSH Analytical Method #8005 (elements in blood and tissue).

Permissible Concentration in Water: Safe Drinking Water Act, MCL, treatment technique; MCL, 0.006 mg/L; MCLG, 0.006 mg/L; Regulated Chemical (47FR9352).

Determination in Water: Digestion followed by atomic absorption. See EPA Methods 204.1 and 204.2.

Routes of Entry: Inhalation of dust or fume, skin, and/or eye contact.

Harmful Effects and Symptoms

Antimony and its compounds are generally regarded as primary skin irritants. Lesions generally appear on exposed, moist areas of the body, but rarely on the face. The dust and fumes are also irritants to the eyes, nose, and throat, and may be associated with gingivitis, anemia, and ulceration of the nasal septum and larynx. Antimony trioxide causes a dermatitis known as "antimony spots." This form of dermatitis results in intense itching followed by skin eruptions. A diffuse erythema may occur, but usually the early lesions are small erythematous papules. They may enlarge, however, and become pustular. Lesions occur in hot weather and are due to dust accumulating on exposed areas that are moist due to sweating. No evidence of eczematous reaction is present, nor an allergic mechanism. *Systemic*: Systemic intoxication is uncommon from occupational exposure. However, miners of antimony may encounter dust containing free silica; cases of pneumoconiosis in miners have been termed "silico-antimoniosis." Antimony pneumoconiosis, per se, appears to be a benign process. Antimony metal dust and fumes are absorbed from the lungs into the blood stream. Principal organs attacked include certain enzyme systems (protein and carbohydrate metabolism), heart, lungs; and the mucous membrane of the respiratory tract. Symptoms of acute oral poisoning include violent irritation of the nose, mouth, stomach, and intestines, vomiting, bloody stools, slow shallow respiration, pulmonary congestion, coma, and sometimes death due to circulatory or respiratory failure. Chronic oral poisoning presents symptoms of dry throat, nausea, headache, sleeplessness, loss of appetite; and dizziness. Liver and kidney degenerative changes are late manifestations. Antimony compounds are generally less toxic than antimony. Antimony trisulfide, however, has been reported to cause myocardial changes in humans and experimental animals. Antimony trichloride and pentachloride are highly toxic and can irritate and corrode the skin. Antimony fluoride is extremely toxic; particularly to pulmonary tissue and skin.

Short-Term Exposure: Eye and skin contact can cause irritation and itchy skin rash. Inhalation can cause respiratory tract irritation with wheezing, and shortness of breath. Exposure can cause headache, nausea, abdominal pain; and loss of sleep. Antimony poisoning can be delayed from one half to 2 hours following ingestion. Symptoms include nausea, vomiting, dehydration and thirst; difficulty in swallowing; rapid pulse; cyanosis, watery stool and cramps; collapse and shock. See also above.

Long-Term Exposure: Repeated exposure can cause ulcers and sores of the nose to develop, damage to the kidneys, liver, and heart, lung effects (abnormal chest X-ray). See also above. Antimony may cause an increase in blood cholesterol; a decrease in blood sugar. Decreases longevity, alters blood levels of glucose and cholesterol in laboratory animals exposed at high levels over their lifetime.

Points of Attack: Respiratory system, cardiovascular system, skin, eyes and lungs. Decreases longevity, alters blood levels of glucose and cholesterol in laboratory animals exposed at high levels over their lifetime[182].

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including antimony. Although BAS is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: A combination of protective clothing, barrier creams, gloves, and personal hygiene will protect the skin. Prevent skin contact. Any barrier that will prevent contamination from the dry chemical. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide washing facilities, emergency showers and eyewash. Eating should not be permitted in exposed areas.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, halogens, strong acids; and heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Contact with acids forms deadly stibine gas. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist.

Shipping: UN2871 Antimony powder, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Antimony dust can present a moderate hazard when exposed to flame. SCBA may be required when antimony is exposed to extreme temperatures in a fire. Use dry chemical appropriate for metal fires, water spray, fog or standard foam extinguishers. Toxic fumes are produced in fire, including deadly stibine gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and recycling is an option to disposal which should be considered for scrap antimony and spent catalysts containing antimony. Dissolve spilled material in minimum amount of concentrated HCl. Add water, until white precipitate appears. Then acidify to dissolve again. Saturate with H_2S. Filter, wash and dry the precipitate and return to supplier[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Description: Antimony lactate is a noncombustible, tan solid. Molecular weight = 388.98. Soluble in water. Antimony lactate may be contaminated with arsenic or other toxic substances.

Potential Exposure: Antimony lactate is used in fabric dyeing.

Incompatibilities: Contact with strong oxidizers (chlorates, permanganates, peroxides and nitrates) may cause a violent reaction. Contact with acids can produce deadly stibine gas.

Permissible Exposure Limits in Air

Inorganic [Sb]

NIOSH IDLH = 50 mg[Sb]/m^3

ACGIH TLV[1]: 0.5 mg[Sb]/m^3 TWA

OSHA PEL: 0.5 mg[Sb]/m^3 TWA

NIOSH REL: 0.5 mg[Sb]/m^3 TWA

No PAC available.

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006)

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia[43] set a MAC of 0.3 milligram per cubic meter in work-place air.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Antimony lactate can affect you when breathed and by passing through skin. Exposure can irritate the eyes, nose, throat and skin. Very high levels could cause Antimony poisoning, with symptoms of nausea headaches, abdominal pain; trouble breathing and death. See also antimony [7440-36-0]. Antimony lactate may be contaminated with arsenic or other toxic substances.

Long-Term Exposure: Repeated exposure can cause abnormal chest X-ray and damage the heart and liver. Prolonged or repeated skin contact can cause sores and ulcers. Antimony may cause an increase in blood cholesterol; a decrease in blood sugar.

Points of Attack: Skin, lungs, heart, liver.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. EKG, liver function tests; urine tests for antimony. Also test for arsenic if contamination is suspected. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72-216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly immediately after exposure and at the end of the work-shift. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of this antimony compound to potentially exposed workers.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, acids, and oxidizers.

Shipping: UN1550 Antimony lactate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony lactate itself does not burn. Thermal decomposition products may include deadly stibine gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 231-601-8 [*Annex I Index No.*: 051-002-00-3]

Regulatory Authority and Advisory Information

Banned or Severely Restricted (New Zealand)[13] (Many countries, especially in food) (UN)[35]

Clean Air Act, 42USC7412; Title I, Part A, §112 Hazardous Pollutants

Clean Water Act: 40CFR401.15 Section 307, Toxic Pollutants; Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

Safe Drinking Water Act, MCL, treatment technique; MCL, 0.006 mg[Sb]/L; MCLG, 0.006 mg[Sb]/L; Regulated Chemical (47FR9352) as Antimony, SMCL = 250 mg[Cl-]/L as Chloride.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed (as antimony compounds, n.o.s.)

SUPERFUND/CERCLA 40CFR302.4, Appendix A, RQ: 1000 lb (454 kg); 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; NPRI as antimony compounds.

Hazard symbols, risk, & safety statements: Hazard symbol: C, N; risk phrases: R34-R51/53; safety phrases: S1/2; S26; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Antimony pentachloride is a noncombustible, colorless to reddish-yellow oily liquid with an offensive odor. Molecular weight = 299.05; boiling point = 77°C (decomposes); freezing/melting point = 3°C; specific gravity (H_2O:1) = 2.354 @ 20°C; liquid surface tension (est.) = 0.015 N/m @ 20°C; latent heat of vaporization = 1.60×10^5 J/kg; heat of solution = -4.925×10^5 J/kg; vapor pressure = 0.84 mmHg @ 20°C. Hazard identification (based on NFPA-704M Rating System): (*solid or liquid*). Health 3; flammability 0; reactivity 1. Decomposes on contact with water.

Potential Exposure: It is used in dyeing, coloring metals and in many organic chemical reactions as a catalyst.

Incompatibilities: Decomposes on contact with heat, acids, alkalis, ammonia, water or other forms of moisture producing fumes of hydrogen chloride and antimony. Decomposes above 77°C forming chlorine and antimony trichloride. Attacks many metals in the presence of moisture forming explosive hydrogen gas. Reacts with air forming corrosive vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Sb]/m^3

ACGIH TLV[1]: 0.5 mg[Sb]/m^3 TWA

OSHA PEL: 0.5 mg[Sb]/m^3 TWA

NIOSH REL: 0.5 mg[Sb]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 3.7 milligram per cubic meter

PAC-2: 33 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006)

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia[43] set a MAC of 0.3 milligram per cubic meter in work-place air.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Routes of Entry: skin absorption; inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Antimony pentachloride is a corrosive chemical; can affect you when breathed in and by passing through your skin. Exposure can cause sore throat, rash, poor appetite; abdominal pain; loss of sleep; and irritate the lungs. Higher levels can cause pulmonary edema, a medical emergency that can be delayed for several hours; irregular heartbeat which can cause death. High or repeated exposure may damage the liver, kidneys, and the heart muscle. If used near acid, a deadly stibine gas can be formed. Antimony may contain arsenic. It is a corrosive chemical. Contact can burn the skin or eyes. The oral LD_{50} for rat is 1115 mg/kg[9].

Long-Term Exposure: Repeated contact can cause ulcers or sores in the nose, kidney, liver, and heart damage. Antimony may cause an increase in blood cholesterol; a decrease in blood sugar.

Points of Attack: Kidneys, liver, heart, respiratory system.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. EKG, liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72-216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Antimony pentachloride must be stored to avoid contact with organic or combustible materials (such as wood, paper and oil), since violent reactions occur. See incompatibilities. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture and heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1730 (liquid) Antimony pentachloride, liquid, Hazard class: 8; Labels: 8-Corrosive material. UN1731 (solution) Antimony pentachloride, solutions, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate the area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony Pentachloride itself does not burn. Thermal decomposition products may include chlorine and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Encapsulate and transfer to an approve landfill. If chemically treated and neutralized, the chemical is amenable to biological treatment at municipal sewage treatment plant. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T + , C, N, Xn; risk phrases: R20; R22; R27/28; R29; R34; R51/53; safety phrases: S1; S13; S22; S26; S27; S28; S29/35; S36/37/39; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: Antimony pentafluoride is a noncombustible, oily, colorless liquid with a pungent odor. Molecular weight = 216.7; specific gravity (H_2O:1) = 2.340 @ 30°C; boiling point = 143°C; melting/freezing point = 8.3°C; liquid surface tension = (estimate) 0.020 N/m @ 20°C; latent heat of vaporization = (estimate) 1.8×10^5 J/kg; vapor pressure = 1.33 kPa @ 25°C. Hazard identification (based on NFPA-704M Rating System): Health 4; flammability 0; reactivity 1₩. Soluble in water. Dangerously reactive with water; violent, forming hydrogen fluoride.
Potential Exposure: It is used as a catalyst in chemical reactions or as a source of fluorine (fluorinating reagent) in fluorination reactions.
Incompatibilities: Water and other forms of moisture releases hydrofluoric acid, combustible organic and siliceous materials, phosphorus, and phosphate materials. Attacks glass, ceramic, lead, and metals, including copper in the presence of moisture. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Antimony pentafluoride, if confined and wet may cause explosion. Antimony pentafluoride appears to have oxidizing properties; may cause fire in contact with combustible or organic materials. May react with metals, including lead, releasing flammable hydrogen gas.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water

Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg [Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Severe health hazard. May be fatal if inhaled or absorbed through the skin. The compound is corrosive and irritating to eyes, skin, and lungs. Contact with eyes or skin causes severe burns. Ingestion causes vomiting and severe burns of mouth and throat. Overexposure by any route can cause bloody stools; slow pulse; low blood pressure; coma, convulsions, and cardiac arrest. The probable oral lethal dose of 5−50 mg/kg or between 7 drops and a teaspoonful for a 150-pound person (antimony salts).

Long-Term Exposure: Can damage the kidneys, liver, and heart. Repeated exposure may affect the lungs and cause an abnormal chest X-ray to develop. Antimony may cause an increase in blood cholesterol; a decrease in blood sugar.

Points of Attack: Eyes, skin, respiratory system; cardiovascular system, liver, lungs, kidney, heart.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. EKG, liver and kidney function tests. Consider lung function tests and chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

NIOSH: *(fluorides) 12.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *25* milligram per cubic meter: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter*: Sa:Cf (APF = 25)* + (any supplied-air respirator operated in a continuous-flow mode); or P* + *if not present as a fume* (any powered, air-purifying respirator with a dust and mist filter). *125 milligram per cubic meter*: HieF^{+} (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: HieF^+ (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent. Exposure to 500 milligram per cubic meter (IDLH) is immediately dangerous to life and health.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Antimony pentafluoride must be stored to avoid contact with phosphorus, phosphates, siliceous, and combustible or organic materials; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture and heat. Outside or detached storage is preferred.

Shipping: UN1732 Antimony pentafluoride, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials.

Spill Handling: UN1732 Antimony pentafluoride, when spilled in water.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.3/0.4

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 2.6/4.1

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. For *large spills* dike far ahead. Absorb spills with noncombustible absorbent material, such as vermiculite, dry sand; earth, etc., and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride, fumes of fluoride and oxides of metal. Approach fire from upwind; avoid hazardous vapors and toxic decomposition products. Do not use water or foam on fire or on adjacent fires; extinguish with dry chemicals or carbon dioxide. Water spray may be used to reduce vapors. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Safe Drinking Water Act, MCL, treatment technique; MCL, 0.006 mg/L; MCLG, 0.006 mg/L; Regulated Chemical (47FR9352)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

EPCRA Section 313: Includes any unique chemical substance that contains antimony as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; NPRI (as antimony compounds).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Antimony potassium tartrate is an odorless, colorless, crystalline material or white powder with a sweetish, metallic taste. Molecular weight = 667.87; specific gravity (H_2O:1) = 2.6. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Soluble in water; solution is slightly acidic.

Potential Exposure: It is used in medicine; textile and leather dyeing; as an insecticide.

Incompatibilities: Solution will react with alkaline materials.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Sb]/m^3

ACGIH TLV[1]: 0.5 mg[Sb]/m^3 TWA

OSHA PEL: 0.5 mg[Sb]/m^3 TWA

NIOSH REL: 0.5 mg[Sb]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 4.1 milligram per cubic meter

PAC-2: 37 milligram per cubic meter

PAC-3: 220 milligram per cubic meter

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006)

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia MAC value[43] is 0.3 milligram per cubic meter.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Routes of Entry: Skin absorption; inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Antimony potassium tartrate can affect you when breathed in and by passing through your skin. Eye and skin contact can cause irritation and skin rash. Exposure can cause poor appetite; abdominal pain; nausea, headaches, sore throat; and irritation of air passages, with cough. Higher levels can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure may make the heart beat irregularly or stop. High or repeated exposure may damage the liver or heart muscle.

Long-Term Exposure: Prolonged or repeated contact can cause ulcers or sores in the nose, kidney, liver, and heart damage. Antimony may cause an increase in blood cholesterol; a decrease in blood sugar.

Points of Attack: Skin, eyes, respiratory system; cardiovascular system, kidneys, liver.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. EKG. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72-216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: UN1549 Antimony potassium tartrate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony potassium tartrate itself does not burn. Thermal decomposition products may include potassium oxide and antimony. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Antimony tribromide is a nonflammable, colorless to yellow crystalline solid dissolved in hydrobromic acid. Molecular weight = 361.51. Boiling point = 288°C @ 749 mmHg; freezing/melting point = 96.6°C; specific gravity (H_2O:1) = 4.148 @ 23°C; critical temperature = 904.5°C; critical pressure = 5.67 MN/m^2; heat of vaporization = 53.2 kJ/mol @ 560°C; vapor pressure ≤ 0.075 mmHg @ 23°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 1 ₩. Soluble in water; slow reaction, releasing antimony trioxide and hydrogen bromide.

Potential Exposure: Antimony tribromide is used to make antimony salts; in dyeing, and analytical chemistry.

Incompatibilities: Contact with water reacts, liberating antimony trioxide and hydrogen bromide. Dry trioxide material may explode if heated air. Heat forms toxic bromides. Antimony tribromide attacks various metals.

Permissible Exposure Limits in Air antimony trioxide and hydrogen bromide.

NIOSH IDLH = 50 mg[Sb]/m^3

ACGIH TLV[1]: 0.5 mg[Sb]/m^3 TWA

OSHA PEL: 0.5 mg[Sb]/m^3 TWA

NIOSH REL: 0.5 mg[Sb]/m^3 TWA

No PACavailable.

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006)

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia MAC value[43] is 0.3 milligram per cubic meter.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Harmful Effects and Symptoms

Short-Term Exposure: Antimony tribromide can affect you when breathed and by passing though skin. Exposure can cause sore throat; skin rash; poor appetite; irritation of the air passages with cough. Higher exposures can cause pulmonary edema, a medical emergency, which can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. This chemical can cause irregular heartbeat; this can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High or repeated exposure may damage the liver and the heart muscle. Antimony tribromide is a corrosive chemical and contact can burn the skin and eyes, with burns and possible permanent damage. If used near acid, a deadly stibine gas can be released.

Long-Term Exposure: Antimony may cause an increase in blood cholesterol; a decrease in blood sugar. Repeated exposure can cause liver, heart muscle damage; headaches; loss of appetite; dry throat and sleep disturbance. Corrosive substances, such as antimony tribromide have the potential for causing lung damage.

Points of Attack: Skin, eyes, respiratory system; cardiovascular system.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. EKG, liver function tests; urine tests for antimony. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72-216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50* milligram per cubic meter: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Antimony Tribromide must be stored to avoid contact with potassium, sodium, and bases (such as sodium hydroxide, potassium hydroxide and ammonium hydroxide), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture and heat.

Shipping: UN3141 Antimony compounds, inorganic, liquid, n.o.s, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include corrosive hydrogen bromide and oxides of metal. Extinguish fire using an agent suitable for type of surrounding fire. Antimony tribromide itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Encapsulate and bury at an approved chemical landfill. Unacceptable for disposal at sewage treatment plants. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Antimony trichloride is a noncombustible, clear, colorless, crystalline solid. Acrid, pungent odor. Molecular weight = 228.10; boiling point = 223.3°C; freezing/melting point = 73°C; specific gravity (H_2O:1) = 3.14 @ 20°C; heat of solution = -1.6×10^5 J/kg; heat of fusion = 13.3 cal/g; vapor pressure = 0.119 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 2. Soluble in water; solubility = 10%[d]; reaction.

Potential Exposure: It is used to make antimony salts and drugs; to fireproof textiles; and as a catalyst in many organic reactions; as a reagent for chloral, aromatic hydrocarbons, vitamin A, and for drug identification.

Incompatibilities: Decomposes in water, forming hydrochloric acid and antimony oxychloride. Reacts violently with strong bases; ammonia, alkali metals; aluminum, potassium, sodium. Forms explosive mixture with perchloric acid when hot. Reacts with air forming hydrochloric acid. Attacks metals in the presence of moisture, forming explosive hydrogen gas.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Determination in Water: Toxic to aquatic organisms.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Antimony trichloride can affect you when inhaled. Exposure can cause sore throat; skin rash; poor appetite; and irritation of the air passages, with cough. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Higher exposures can also cause irregular heartbeat; This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High or repeated exposure may damage the liver and the heart muscle. Antimony trichloride is a corrosive chemical and contact can burn the skin and eyes, with possible permanent damage. If used near acid, a deadly gas (stibine) can be released. The oral LD_{50} for rat is 525 mg/kg[9].

Long-Term Exposure: Antimony may cause an increase in blood cholesterol; a decrease in blood sugar. May cause mutations. May damage the developing fetus. Repeated exposure can cause liver, heart muscle damage; headaches; loss of appetite; dry throat and sleep disturbance. Corrosive substances, such as antimony trichloride have the potential for causing lung damage.

Points of Attack: Cardiovascular system, reproductive system, liver, heart, and lungs.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. EKG, liver function tests; urine test for antimony, lung function tests including chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72-216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers under nitrogen in a cool, well-ventilated area away from water or moisture, heat and incompatible substances, such as strong bases; aluminum, potassium, and sodium.

Shipping: UN1733 Antimony trichloride, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Antimony trichloride itself does not burn. Thermal decomposition products may include hydrogen chloride oxides of metal (antimony). Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: S23/24/25; R51/53; R62; safety phrases: S1/2; S7; S26; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Antimony trifluoride is a noncombustible, odorless, white to gray crystalline solid. Molecular weight = 178.75; specific gravity (H_2O:1) = 4.38 @ 21°C (solid); boiling point = 376°C; freezing/melting point = 292°C; vapor pressure = 3 mmHg @ 17°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Soluble in water.

Potential Exposure: It is used in dyeing; to make porcelain and pottery; and as a fluorinating agent.

Incompatibilities: Hot perchloric acid.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Sb]/m^3

OSHA PEL: 0.5 mg[Sb]/m^3 TWA

NIOSH REL: 0.5 mg[Sb]/m^3 TWA

ACGIH TLV[1]: 0.5 mg[Sb]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 2.2 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 120 milligram per cubic meter

DFG MAK: Carcinogen Category 2; Germ Cell, Mutagenic, Category 3B (2006)

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia MAC value[43] is 0.3 milligram per cubic meter.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects. Fluoride ion: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Harmful Effects and Symptoms

Short-Term Exposure: Antimony trifluoride can affect you when breathed in and by passing through your skin. Exposure can cause sore throat; skin rash; poor appetite; and irritate the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Antimony trifluoride can cause irregular heartbeat; this can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High or repeated exposure may damage the liver and the heart muscle. Antimony Trifluoride is a corrosive chemical and contact can burn the skin and eyes, causing damage. If used near acid, a deadly gas (Stibine) can be released. The oral LD_{50} for mouse is 804 mg/kg[9].

Long-Term Exposure: Antimony may cause an increase in blood cholesterol; a decrease in blood sugar. Repeated contact can cause ulcers and sores of the nose. Can damage the kidneys, liver, and heart. Repeated exposure may affect the lungs and cause an abnormal chest X-ray to develop.

Points of Attack: Eyes, skin, respiratory system; cardiovascular system.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. EKG, liver and kidney function tests. Consider lung function tests and chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72-216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

NIOSH: *(fluorides) 12.5* milligram per cubic meter: Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter*: Sa:Cf (APF = 25)* + (any supplied-air respirator operated in a continuous-flow mode); or* + *if not present as a fume* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter*: HieF$^+$ (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 250 milligram per cubic meter: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: HieF$^+$ (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Notes: *Substance reported to cause eye irritation or damage; may require eye protection. $^+$May need acid gas sorbent. Exposure to 500 milligram per cubic meter (IDLH) is immediately dangerous to life and health.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: UN1549 Antimony compounds, inorganic, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony Trifluoride itself does not burn. Thermal decomposition products may include fluorides and antimony. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*antimony(III) oxide*).

Description: Antimony trioxide is a noncombustible, odorless, white crystalline powder. Molecular weight = 291.52; specific gravity (H_2O:1) = 5.2 @ 25°C (solid); boiling point = (sublimes) 1550°C @ 760 mmHg; freezing/melting point = 655°C; heat of fusion = 46.3 cal/g; vapor pressure = 1 mmHg @ 574°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Practically insoluble in water; solubility = 1.4×10^{-4} g/100 mL @ 30°C.

Potential Exposure: It is used in flame-proofing, pigments and ceramics, to stain iron and copper; to decolorize glass; industrial chemical, dye, pigment, and printing ink.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, halogenated acids, chlorinated rubber, bromine trifluoride. Reduction with hydrogen forms toxic antimony hydride.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[Sb]/m^3 TWA

NIOSH REL: 0.5 mg[Sb]/m^3 TWA

ACGIH TLV[1]: 0.5 mg[Sb]/m^3 TWA; Suspected Human Carcinogen; (production) keep worker exposure to a minimum.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Harmful Effects and Symptoms

Short-Term Exposure: Antimony trioxide can affect you when breathed in. Exposure can cause sore throat, rash, poor appetite; and irritation of the airways, with cough. High or repeated exposure may damage the liver and the heart muscle. If used near acid, a deadly stibine gas can be released.

Long-Term Exposure: Antimony may cause an increase in blood cholesterol; a decrease in blood sugar. There is an association between antimony trioxide in smelting processes and increased lung cancer. There is some evidence that this chemical nay damage the developing fetus and cause miscarriage. Can damage the kidneys, liver, and heart. Repeated exposure may affect the lungs and cause an abnormal chest X-ray to develop.

Points of Attack: Eyes, skin, respiratory system; cardiovascular system, kidneys, liver, reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Antimony can be measured in the urine, feces, and blood[76]. CBC, urine test for antimony, EKG, liver and kidney function tests. Consider lung function tests and chest X-ray. Depending on the degree of exposure, periodic medical checkups are advisable.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72-216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, strong oxidizers; acids. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1549 Antimony compounds, inorganic, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use any agent suitable for surrounding fires. Thermal decomposition products may include toxic Sb fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Antimycin A A:1490

Formula: $C_{28}H_4N_2O_9$ (Antimycin A); $C_{28}H_{40}N_2O_9$ (Antimycin A1); $C_{26}H_{36}N_2O_9$ (Antimycin A3); $C_{25}H_{34}N_2O_9$ (Antimycin A_4)

Synonyms: Antimicina A (Spanish); Antimycin A; Antipiricullin; Dihyrosamidin; Fintrol; Isovaleric acid 8-ester with 3-formamido-*N*-(7-hexyl-8-hydroxy-4,9-dimethyl-2,6-dioxo-1,5-dioxonan-3-yl)salicylamide isovaleric acid 8 ester; Virosin

CAS Registry Number: 1397-94-0 (A-); 11118-72-2 (Antimycin/Fintrol); 518-75-2 (Antimycin/Citrinin); 642-15-9 (A_1-Dimidin); 522-70-3 (A_3-); 27220-59-3 (A_4-) *Note*: Both A_1 CAS Numbers are found in RTECS, with the same chemical formula, although EPA regulates only CAS number 1397-94-0 (Antimycin A-)

HSDB Number: 6417 (A-)

RTECS Number: CD0350000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 208-257-2 (CAS 518-75-2)

Regulatory Authority and Advisory Information

518-75-2 *(Antimycin/Citrinin)*

IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg)[72]

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (*Antimycin A-*)

Description: Antimycin ($A_3C_{26}H_{36}N_2O_9$) and (Antimycin A_1) $C_{28}H_{40}N_2O_9$ are crystalline solids. Molecular weight = 512.8 (A); 520.64 (A_3-); 506.6 (A_4-); freezing/melting point = 170–175°C; 149–150°C (A1); 174–175°C (A_3). They are complex 9-membered (2 oxygens and 7 carbons) ring derivatives with complex side chains. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Practically insoluble in water.

Potential Exposure: Specific uses for antimycin A were not found, however, antimycin A_1, and antimycin A_3 are reported to be antibiotic substances produced by streptomyces for use as a fungicide, possible insecticide and miticide. Registered as a pesticide in the U.S.

Permissible Exposure Limits in Air

1397-94-0, Antimycin A

PAC Ver. 29[138]

PAC-1: 0.16 milligram per cubic meter

PAC-2: 1.8 milligram per cubic meter

PAC-3: 5.5 milligram per cubic meter

Routes of Entry: Ingestion, intramuscular.

Harmful Effects and Symptoms

Short-Term Exposure: Subcutaneous, intravenous, and intraperitoneal route poisons. Moderately toxic by ingestion and intramuscular routes. The oral LD_{50} for rat is 28 mg/kg[9].

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. (Nonspecific–Pesticide, solid, n.o.s.). Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: (Nonspecific, Pesticide, solid, n.o.s.). *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987. United States Environmental Protection Agency Gene-Tox Program, Positive: SHE-clonal assay; Inconclusive: Carcinogenicity-mouse/rat.

Hazard Alert: Exposure can be lethal, Combustible Agricultural chemical, Possible risk of forming tumors, Suspected of causing genetic defects.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P072

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

CERCLA/SARA Section 304 RQ: 100 lb (45.4 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. (as 1-naphthyl thiourea).

Hazard symbols, risk, & safety statements: Hazard symbol: T + ; risk phrases: R40; R51/53; R62; safety phrases: S23; S25; S28; S36/37; S40; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: ANTU is a noncombustible, white crystalline solid or gray powder. Odorless. Molecular weight = 202.29; boiling point = (decomposes) 457°C; freezing/melting point = 198°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 1; reactivity 0. Slightly soluble in water.

Potential Exposure: ANTU or its formulations are used as a rodenticide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, silver nitrate.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 milligram per cubic meter

OSHA PEL: 0.3 milligram per cubic meter TWA

NIOSH REL: 0.3 milligram per cubic meter TWA

ACGIH TLV[1]: 0.03 milligram per cubic meter TWA [skin]; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 0.91 milligram per cubic meter

PAC-2: 10 milligram per cubic meter

PAC-3: 100 milligram per cubic meter

DFG MAK: 0.3 milligram per cubic meter inhalable aerosol; Peak Limitations Category 11(2)

Australia: TWA 0.3 milligram per cubic meter, 1993; Austria: MAK 0.3 milligram per cubic meter, 1999; Belgium: TWA 0.3 milligram per cubic meter, 1993; Denmark: TWA 0.3 milligram per cubic meter, 1999; Finland: TWA 0.3 milligram per cubic meter, STEL 0.9 milligram per cubic meter, 1999; France: VME 0.3 milligram per cubic meter, carcinogen, 1999; the Netherlands: MAC-TGG 0.3 milligram per cubic meter, 2003; the Philippines: TWA 0.3 milligram per cubic meter, 1993; Switzerland: MAK-week 0.3 milligram per cubic meter, KZG-week 1.5 milligram per cubic meter, 1999; Turkey: TWA 0.3 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea. New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for ANTU in ambient air[60] ranging from 3 μ/m^3 (North Dakota) to 5 μ/m^3 (Virginia) to 6 μ/m^3 (Connecticut) to 7 μ/m^3 (Nevada).

Determination in Air: Collection on a filter and analysis by gas−liquid chromatography. Use NIOSH Analytical Method 5276.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.66$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion and skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous. Symptoms include seizures, and dermal irritation. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Ingestion may cause vomiting, shortness of breath; and bluish discoloration of the skin. ANTU is moderately toxic: probable oral lethal dose (human) 0.5−5 mg/kg, or between 1 ounce and 1 pint (or 1 lb) for 150 lb person. The LD_{50} for oral rat is 6 mg/kg[9]. Chronic sublethal exposure may cause antithyroid activity. Can produce hyperglycemia of three times normal in 3 hours.

Long-Term Exposure: May cause chronic dermatitis; increased production of white blood cells. A suspected carcinogen and a possible mutagen.

Group ***Points of Attack:*** Respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. People with chronic respiratory disease or liver disease may be especially at risk. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute overexposure. Evaluation by a dermatologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *3 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *7.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *15 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *100 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in unknown* *concentration or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and silver nitrate. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1651 Naphthylthiourea, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Avoid inhalation and skin contact; wear proper respiratory protection and protective clothing. Do not touch spilled material, stay upwind, keep out of low areas. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: ANTU may burn but will not ignite readily. Extinguish with dry chemical, carbon dioxide; water spray, fog, or foam. Thermal decomposition products may include nitrogen and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in a furnace equipped with an alkaline scrubber[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: None found

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human No Sufficient Data; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1987
California Proposition 65 Chemical[102]: Cancer 7/1/1987
California Proposition 65 Developmental/Reproductive toxin 3/3/99.
Hazard Alert: Poison, Reproductive toxin, Agricultural chemical.
Hazardous Waste Constituent (EPA/RCRA)[5].
Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xn, N; risk phrases: R45; R11; R36/37/38; R40; R48/20; R50; R62; R63; safety phrases: S7; S16; S23; S24/25; S29/35; S36/37/39; S45; S53 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)].

Description: Aramite is a heavy, dark-amber liquid. Molecular weight = 334.89; boiling point = 175°C @ 0.1 mmHg; freezing/melting point = −32°C; vapor pressure = 9 mmHg @ 25°C. Practically insoluble in water.

Potential Exposure: Aramite is an organochlorine miticide and antimicrobial agent. Aramite is regulated by EPA under the Federal Insecticide, Fungicide, and Rodenticide Act and the Resource Conservation and Recovery Act. The significant regulatory action was a voluntary cancellation of the active ingredient registration by the sole producer in 1975.

Incompatibilities: Incompatible with alkaline material, such as lime or Bordeaux mixture (slaked lime and copper sulfate solution).

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices. A limit on Aramite in ambient air has been set in Pennsylvania[60] @ 18.07 μ/m^3.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This material is slightly toxic (LD$_{50}$ value for rats is 3900 mg/kg) but it is carcinogenic to animals.

Long-Term Exposure: Aramite is carcinogenic in the rat and dog following its oral administration. It produced liver tumors in the rat and carcinomas of the gall bladder and biliary ducts in the dog. Aramite was tested in two strains of mice by the oral route and produced a significant increase of hepatomas in males of one strain.

Points of Attack: See above.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalis, nitrates and heat. This material may be thermally unstable (Verschueren). Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2902 Pesticides, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include chlorine and sulfur oxide. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Acid or alkaline hydrolysis followed by flushing to sewer.

Argon A:1510

Formula: Ar

Synonyms: Argon-40; Argon, cryogenic; Liquid argon; R-740

CAS Registry Number: 7440-37-1

HSDB Number:7902

RTECS Number: CF2300000

UN/NA & ERG Number: UN1006 (compressed gas)/121; UN1951 [argon, refrigerated liquid (cryogenic liquid)]/120

EC Number: 231-147-0

Regulatory Authority and Advisory Information

Hazard Alert: Frostbite/Cryogenic burn hazard, Asphyxiation hazard[1], Contains gas under pressure; may explode if heated.

Hazard symbols, risk, & safety statements: Hazard symbol: Risk phrases: R5; R21; safety phrases: S9; S33; 38 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: With the symbol A, argon is a nonflammable gas; one of the elements in the inert gas category. It is colorless. Molecular weight = 39.95; boiling point = −186°C; freezing/melting point = −192°C; vapor density (air = 1) = 1.66. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 0; reactivity 0. Slightly soluble in water; solubility = 3.5% @ 20°C.

Potential Exposure: Argon is used in metal fabrication and steel making; as an inert gas shield in arc welding; as an inert atmosphere in electric lamps; as a blanketing agent in metals refining (especially titanium and zirconium).

Permissible Exposure Limits in Air

An asphyxiant at less than 18% oxygen by volume.

OSHA: (shipyards and construction) simple asphyxiant, inert gas, and vapor

ACGIH: simple asphyxiant with no specified numerical TLV. The limiting factor is the available oxygen.

PAC Ver. 29[138]

PAC-1: 65,000 ppm

PAC-2: 230,000 ppm

PAC-3: 400,000 ppm

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: asphyxiant, 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Simple asphyxiant.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[Fl]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation and possibly skin contact with liquid argon.

Harmful Effects and Symptoms

Short-Term Exposure: The gas is a simple asphyxiant as noted above. Contact with the liquid can cause frostbite. High levels or concentrations in the air can replace oxygen, resulting in headache, unconsciousness, or death.

First Aid: If contact with liquid argon occurs, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with warm water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Where exposure to cold equipment, vapors, or liquids may occur, employees should be equipped with special clothing designed to prevent the freezing of body tissues. Avoid skin contact with liquid argon. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear splash-proof chemical goggles where exposure to liquid argon can occur.

Respirator Selection: Exposure to argon is dangerous because it can cause a deficiency of oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Storage areas should be well-ventilated. Protect vessels which contain argon from physical damage. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1006 Argon, compressed, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop flow of gas. If sources of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air and allow cylinder to empty. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Argon is nonflammable and indeed can act as an extinguishing agent itself. Therefore, use extinguishing agents suited for surrounding fires. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Vent to atmosphere. Return refillable compressed gas cylinders to supplier.

Aristolochic Acid and Salts A:1515

Formula: $C_{17}H_{11}NO_7$ (A-salt); $C_{16}H_9NO_6$ (B-salt); $C_{16}H_9NO_7$ (C-salt)

Synonyms: (A-): Aristolochic acid A; Aristolochic acid-I; Aristolochin; Birthwort; 8-Methoxy-6-nitrophenanthol(3,4-d)1,3-dioxole-5-carboxylic acid; 3,4-Methylenedioxy-8-methoxy-10-nitro-1-phenanthrenecarboxylic acid; NSC-50413; Phenanthro(3,4-d)-1,3-dioxole-5-carboxylic acid, 8-methoxy-6-nitro-; Tardolyt; TR 1736; (B-): Aristolochic acid II; Aristolochic acid B; B-Aristolochic acid; Phenanthro(3,4-d)-1,3-dioxole-5-carboxylic acid, 6-nitro-; (C-): Aristolochic acid C; Aristolochic acid IIIa;10-Hydroxy-6-nitrophenanthro(3,4-d)-1,3-dioxole-5-carboxylic acid; 10-Hydroxy-6-nitronaphtho(2,1-g)(1,3)benzodioxole-5-carboxylic acid; 6-Nitro-10-hydroxyphenanthro[3,4-*d*]-1,3-dioxole-5-carboxylic acid

CAS Registry Number: 313-67-7 (A-); (alt.) 61117-05-3 (A-); 475-80-9 (B-); 4849-90-5 (C-)

HSDB Number: 7179 (A-)

RTECS Number: CF3325000 (A-); SF8281600 (B-)

UN/NA & ERG Number: UN1544 (alkaloid, solid, n.o.s.)/151

EC Number: 206-238-3; 202-499-6

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *probably carcinogenic to humans*, Group 2A, 2002.

California Proposition 65 Chemical[102]: Cancer 7/9/2004

Hazard Alert: Poison, (A-) Possible risk of forming tumors, Suspected of causing genetic defects; (B-), Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R45; R22; R25; R34; R40; R51/53; R61; R62; safety phrases: S7; S22; S35; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Shiny brown leaflets or a yellow or white powder. Molecular weight = 341.27 (A-); 311.26 (B-); 327.247 (C-); boiling point = 658°C; freezing/melting point = 260−265°C (A-); 287-292°C (C-); flash point = 352°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Low solubility in water.

Potential Exposure: Aristolochic acids are alkaloids used primarily as a chemical intermediate for pharmaceuticals, lab chemicals, herbal extract, drug.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Ingestion, inhalation, skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic, may be fatal if inhaled, swallowed or absorbed through skin. Avoid any skin contact. Effects of contact or inhalation may be delayed. LD_{50} = (oral-rat) <200 mg/kg. LD_{Lo} = (i.v.-man) 3 mg/kg (Bethesda)

Long-Term Exposure: May cause tumors and affect the unborn fetus. Pregnant women should avoid contact.

Points of Attack: Reproductive sysem.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method* if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed.

Personal Protective Methods: Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations *only*; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: Wear positive-pressure SCBA (SCBA). *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry place or a refrigerator. Protect from exposure to light, and keep away from mineral acids and oxidizers.

Shipping: UN1544 Alkaloids, solid, n.o.s. or Alkaloid salts, solid, n.o.s. poisonous, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. PG III.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Keep unauthorized personnel away. Stay upwind. Keep out of low areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers for disposal.

Fire Extinguishing: Noncombustible material. Thermal decomposition products in fire include toxic oxides of nitrogen and carbon. Containers may explode when heated.

Runoff may pollute waterways. If tank, rail car or tank truck is involved in a fire, isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small Fire*: Use dry chemical, CO_2 or water spray. *Large Fire*: Water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Elemental arsenic, as, occurs to a limited extent in nature as a steel-gray, amorphous metalloid. Molecular weight = 74.9216; boiling point = 613°C (sublimes); freezing/melting point = 814°C @ 36 atm; 817°C @ 28 atm; critical temperature = 803°C; critical pressure = 34.6 MN/m^2; specific gravity (H_2O:1) = 5.727 @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0; (*arsenic compounds*) Health 4; flammability 0; reactivity 0. Insoluble in water. Arsenic in this entry includes the element and any of its inorganic compounds *excluding* arsine. Arsenic trioxide (As_2O_3), the principal form in which the element is used, is frequently designated as arsenic, white arsenic, or arsenous oxide. Arsenic is present as an impurity in many other metal ores and is generally produced as arsenic trioxide as a by-product in the smelting of these ores, particularly copper. Most other arsenic compounds are produced from the trioxide.

Potential Exposure: Arsenic compounds have a variety of uses. Arsenic and its compounds are used as an alloy additive, in electronic devices; in veterinary medicines; in agriculture as insecticides, herbicides, larvicides, and pesticides. Some arsenic compounds are used in pigment production; the manufacture of glass as a bronzing or decolorizing agent; the manufacture of opal glass and enamels, textile printing; tanning, taxidermy, antifouling paints; to control sludge formation in lubricating oils. Metallic arsenic is used as an alloying agent for heavy metals; and in solders, medicines, herbicides. EPA has estimated that more than 6 million people living within 12 mi of major sources of copper, zinc, and lead smelters-may be exposed to 10 times the average United States atmospheric levels of arsenic. The agency says that 40,000 people living near some copper smelters may be exposed to 100 times the national atmospheric average.

Incompatibilities: Incompatible with strong acids; strong oxidizers; peroxides, bromine azide, bromine pentafluoride, bromine trifluoride; cesium acetylene carbide, chromium trioxide; nitrogen trichloride, silver nitrate. Can react vigorously with strong oxidizers (chlorine, dichromate, permanganate). Forms highly toxic fumes on contact with acids or active metals (iron, aluminum, zinc). Hydrogen gas can react with inorganic arsenic to form highly toxic arsine gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 mg[As]/m^3

Arsenic and inorganic compounds

OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA

Arsenic, inorganic, and organic compounds

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 17 milligram per cubic meter

PAC-3: 100 milligram per cubic meter

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India: TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L

EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L[40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic*: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58].

Determination in Water: See OSHA Analytical Method ID-105 for arsenic. The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry.

Routes of Entry: Inhalation, through the skin, and ingestion of dust and fumes.

Harmful Effects and Symptoms

Local: Trivalent arsenic compounds are corrosive to the skin. Brief contact has no effect, but prolonged contact results in a local hyperemia and later vesicular or pustular eruption. The moist mucous membranes are most sensitive to the irritant action. Conjunctiva, moist and macerated areas of the skin, eyelids, the angles of the ears, nose, mouth, and respiratory mucosa are also vulnerable to the irritant effects. The wrists are common sites of dermatitis, as are the genitalia if personal hygiene is poor. Perforations of the nasal septum may occur. Arsenic trioxide and pentoxide are capable of producing skin sensitization and contact dermatitis. Arsenic is also capable of producing keratoses, especially of the palms and soles. Arsenic has been cited as a cause of skin cancer, but the incidence is low. *Systemic*: The acute toxic effects of arsenic are generally seen following ingestion of inorganic arsenical compounds. This rarely occurs in an industrial setting. Symptoms develop within 1/2 to 4 hours following ingestion and are usually characterized by constriction of the throat followed by dysphagia, epigastric pain, vomiting, and watery diarrhea. Blood may appear in vomitus and stools. If the amount ingested is sufficiently high, shock may develop due to severe fluid loss, and death may ensue in 24 hours. If the acute effects are survived, exfoliative dermatitis and peripheral neuritis may develop. Cases of acute arsenical poisoning due to inhalation are exceedingly rare in industry. When it does occur, respiratory tract symptoms—cough, chest pain; dyspnea-giddiness, headache, and extreme general weakness precede GI symptoms. The acute toxic symptoms of trivalent arsenical poisoning are due to severe inflammation of the mucous membranes and greatly increased permeability of the blood capillaries. Chronic arsenical poisoning due to ingestion is rare and generally confined to patients taking prescribed medications. However, it can be a concomitant of inhaled inorganic arsenic from swallowed sputum and improper eating habits. Symptoms are weight loss; nausea and diarrhea alternating with constipation, pigmentation and eruption of the skin, loss of hair, and peripheral neuritis. Chronic hepatitis and cirrhosis have been described. Polyneuritis may be the salient feature, but more frequently there are numbness and paresthesias of "glove and sticking" distribution. The skin lesions are usually melanotic and keratotic and may occasionally take the form of an intradermal cancer of the squamous cell type, but without infiltrative properties. Horizontal white lines (striations) on the fingernails and toenails are commonly seen in chronic arsenical poisoning and are considered to be a diagnostic accompaniment of arsenical polyneuritis. Inhalation of inorganic arsenic compounds is the most common cause of chronic poisoning in the industrial situation. This condition is divided into three phases based on signs and symptoms. *First Phase*: The worker complains of weakness, loss of appetite; some nausea, occasional vomiting, a sense of heaviness in the stomach, and some diarrhea. *Second Phase*: The worker complains of conjunctivitis, and a catarrhal state of the mucous membranes of the nose, larynx, and respiratory passages. Coryza, hoarseness, and mild tracheobronchitis may occur. Perforation of the nasal septum is common, and is probably the most typical lesion of the upper respiratory tract in occupational exposure to arsenical dust. Skin lesions, eczematoid and allergic in type, are common. *Third Phase*: The worker complains of symptoms of peripheral neuritis, initially of hands and feet, which is essentially sensory. In more severe cases, motor paralyses occur; the first muscles affected are usually the toe extensors and the peronei. In only the most severe cases will paralysis of flexor muscles of the feet or of the extensor muscles of hands occur. Liver damage from chronic arsenical poisoning is still debated, and as yet the question is unanswered. In cases of chronic and acute arsenical poisoning, toxic effects to the myocardium have been reported based on EKG changes. These finding, however, are now largely discounted and the EKG changes are ascribed to electrolyte disturbances concomitant with arsenicalism. Inhalation of arsenic trioxide and other inorganic arsenical dusts does not give rise to radiological evidence of pneumoconiosis. Arsenic does have a depressant effect upon the bone marrow, with disturbances of both erythropoiesis and myelopoiesis. Evidence is now available incriminating arsenic compounds as a cause of lung cancer as well as skin cancer. Skin cancer in humans is causally associated with exposure to inorganic arsenic compounds in drugs, drinking water and the occupational environment. The risk of lung cancer was increased 4—12 times in certain smelter workers who inhaled high levels of arsenic trioxide. However, the influence of other constituents of the working environment cannot be excluded in these studies. Case reports have suggested an association between exposure to arsenic compounds and blood dyscrasias and liver tumors.

Short-Term Exposure: Skin contact can cause irritation, itching, burning sensation; and rash. Eye contact can cause irritation and burns. Inhalation can cause irritation of the respiratory tract. High exposure can cause poor appetite; nausea, vomiting and muscle cramps. High exposure can cause nerve damage with numbness, "pins and needles" sensation; weakness of the arms and legs.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Arsenic is a carcinogen; causes skin, lung, and lymphatic cancer, possible reproductive hazard (a teratogen in animals). Can cause an ulcer of the "bone" dividing the inner nose. It can cause hoarseness, sore eyes, nerve damage; thickening of the skin with patch areas of darkening and loss of pigment; liver damage and stomach problems. Small doses can accumulate in the body. Causes acute and chronic toxicity, liver and kidney damage; decreases blood hemoglobin. A carcinogen[182].

Points of Attack: Liver, kidneys, skin, lungs, lymphatic system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before first exposure and every 6–12 months thereafter, OSHA 1910.1018 requires employers to provide (for persons exposed to 0.005 milligram per cubic meter of arsenic); a medical history and exam which shall include: chest X-ray, exam of the nose, skin, and nails, sputum cytology examination, test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work-day. Levels should not be greater than 100 μg/g creatinine in the urine. Exam of the nervous system. After suspected overexposure, repeat these tests and consider CBC and liver function tests. Also examine skin periodically for abnormal growths. Skin cancer from arsenic can easily be cured when detected early. Employees have a legal right to testing information under OSHA 1910.20.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). Oral *penicillamine (not penicillin)* has been used as a follow up treatment; or, used instead of BAL for milder poisoning, with mixed success. Side effects may occur with such treatment and it is never a substitute for controlling exposure. Treatment can only be done under strict medical care.

Personal Protective Methods: Workers should be trained in personal hygiene and sanitation, the use of PPE, and early recognition of symptoms of absorption, skin contact irritation, and sensitivity. With the exception of arsine and arsenic trichloride, the compounds of arsenic do not have odor or warning qualities. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear dust-proof chemical goggles and face shield when working with powder or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic*."

Respirator Selection:

Requirements for Respiratory Protection for Inorganic Arsenic Particulate Except for Those With Significant Vapor Pressure: $<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. $<$ or $= 20{,}000\ \mu g/m^3$ Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $> 20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting any full-facepiece SCBA operated in positive-pressure mode.

*A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

Requirements for Respiratory Protection for Inorganic Arsenicals*With Significant Vapor Pressure*

$<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask* air-purifying respirator equipped with high-efficiency filter** and acid gas cartridge; or (2) any half-mask* supplied-air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Front- or back-mounted gas mask equipped with high-efficiency filter** and acid gas canister; (2) any full-facepiece supplied-air respirator; or (3) any full-facepiece SCBA. < or = 10,000 μg/m^3 half-mask* supplied-air respirator operated in positive-pressure mode. < or = 20,000 μg/m^3 supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. >20,000 μg/m^3, unknown concentrations, or firefighting: Any full-facepiece SCBA operated in positive-pressure mode. * Half-mask respirators shall not be used for protection against arsenic trichloride, as it is rapidly absorbed through the skin. ** A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher. *Note*: Workers should be permitted to leave the work area every 2 hours to wash their faces and obtain clean respirators.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Arsenic must be stored in a cool, dry place away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1558 Arsenic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills*: take up with sand or other noncombustible absorbent material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Note*: see Initial isolation and protective action distances for organoarsenic compound, solid or liquid (e.g., UN3280).

Fire Extinguishing: Arsenic metal is noncombustible; however, arsenic dust can be flammable when exposed to heat or flame. Thermal decomposition products may include arsine and oxides of metal. Use dry chemical, CO_2, water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Elemental arsenic wastes should be placed in long-term storage or returned to suppliers or manufacturers for reprocessing. Arsenic pentaselenide-wastes should be placed in long-term storage or returned to suppliers or manufacturers for reprocessing. Arsenic trichloride: hydrolyze to arsenic trioxide utilizing scrubbers for hydrogen chloride abatement. The trioxide may then be placed in long-term storage. Arsenic trioxide: long-term storage in large shiftproof and weatherproof silos. This compound may also be dissolved, precipitated as the sulfide and returned to the suppliers. Arsenic-containing sewage may be decontaminated by pyrolusite treatment[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, O (liquid); risk phrases: R45; R8; R17; R23/25; R28; R40; R53; safety phrases: S1/2; S17; S25; S29; S36/37; S45, S60, S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Arsenic acid is an odorless, noncombustible, white semitransparent crystalline material or in a commercial grade that is a pale yellow syrup-like liquid. Molecular weight = 141.95; specific gravity (H_2O:1) = 2.2 @ 20°C; boiling point = (loses water) 160°C; melting/freezing point = 36°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 0; reactivity 0. It converts to As_2O_5 (arsenic pentoxide) when heated above 300°C. See also arsenic pentoxide.
Potential Exposure: It is used as a wood treatment, drying agent, soil sterilant and to make other arsenates. It has been used as a cotton defoliant.
Incompatibilities: Incompatible with sulfuric acid, caustics, ammonia, amines, isocyanates, alkylene oxides; oxidizers, epichlorohydrin, vinyl acetate; amides. Avoid contact with chemically active metals. Corrodes brass, mild steel and galvanized steel. Contact with acids or acid mists releases deadly arsine gas. The solution is weakly acidic and a weak oxidizing agent. Reacts with alkalis to generate some heat and precipitate arsenates[101].
Permissible Exposure Limits in Air
NIOSH IDLH = 5 mg[As]/m^3
arsenic, and inorganic compounds
OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level
ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.
7778-39-4
PAC Ver. 29[138]
PAC-1: 2.9 milligram per cubic meter
PAC-2: 32 milligram per cubic meter
PAC-3: 190 milligram per cubic meter
DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L[40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic*: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Skin contact can cause irritation, itching, burning sensation; and rash. Eye contact can cause irritation and burns. Inhalation can cause irritation of the respiratory tract. High exposure can cause poor appetite; nausea, vomiting and muscle cramps. High exposure can cause nerve damage with numbness, "pins and needles" sensation; weakness of the arms and legs. The oral LD_{50} for rat is 48 mg/kg[9]. Ingestion of 130 mg of arsenic may be fatal to humans. Smaller doses may become fatal since arsenic accumulates in the body.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Arsenic acid is a mutagen that may cause changes to genetic material and an animal teratogen. Can cause an ulcer of the "bone" dividing the inner nose. It can cause disturbed sleep; thickening of the skin with patch areas of darkening and loss of pigment, or the development of white lines in the nails.

Points of Attack: Liver, kidneys, skin, lungs, nervous system; lymphatic system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Examination of the nose, skin, eyes, nails, and nervous system. Test for urine arsenic. At NIOSH recommended exposure limits, urine arsenic should not be greater than 50−100 μg/L of urine. See also entry for "Arsenic."

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to physician*: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. A regulated, marked area should be established where arsenic acid is handled, used, or stored. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full facepiece respiratory. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic*."

Respirator Selection: **Requirements for Respiratory Protection for Inorganic Arsenic Particulate** ***Except for Those With Significant Vapor Pressure:*** $<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) any half-mask supplied air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. $<$ or $= 20{,}000\ \mu g/m^3$ supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $>20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting any full-facepiece SCBA operated in positive-pressure mode.

* A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Arsenic acid must be stored to avoid contact with heat and chemically active metals (such as potassium, sodium, magnesium and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1554 (solid) or UN1553 (liquid) Arsenic acid, liquid or solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Neutralize spilled material with crushed limestone, soda ash or lime. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area and wash spill site after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Arsenic acid itself does not burn. Thermal decomposition products may include arsine and oxides of arsenic. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a minimum of concentrated hydrochloric acid. Dilute with water until white precipitate forms. Add HCl to dissolve. Saturate with H_2S; filter and wash precipitate and return to supplier. Alternatively, precipitate with heavy metals, such as lime or ferric hydroxide in lieu of H_2S[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T + , O, N; risk phrases: R45; R8; R23/25; R50/53; R61; R62; R63; safety phrases: S17; S29/35; S53; S41; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Arsenic pentoxide is an odorless white lumpy solid or powder and nonflammable. It may be shipped as a concentrated water solution. Molecular weight = 229.84; specific gravity (H_2O:1) = 4.32 @ 25°C; 5.73[77]; boiling point = 499.8°C; freezing/melting point = (decomposes) 315°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 0; reactivity 0. Highly soluble in water; solubility = 66 gm/100 mL.
Potential Exposure: Arsenic pentoxide is used in production of metal arsenates; as an herbicide, defoliant on cotton; as a chemical intermediate; as an ingredient in wood preservatives; and in glass. Other possible uses are as an insecticide and soil sterilant.
Incompatibilities: Decomposes above 315°C, forming oxygen and arsenic trioxide fumes. Arsenic pentoxide is an oxidizer; reacts violently with bromine pentafluoride and reducing agents. The solution in water is a weak acid. Incompatible with acids, strong alkalis; halogens, rubidium carbide, zinc. Corrosive to metals in the presence of moisture. Contact with acids or acid mists releases deadly arsine gas.
Permissible Exposure Limits in Air
NIOSH IDLH = 5 mg[As]/m^3
Arsenic and inorganic compounds
OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.
NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level
ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.
PAC Ver. 29[138]
PAC-1: 0.73 milligram per cubic meter
PAC-2: 8 milligram per cubic meter
PAC-3: 150 milligram per cubic meter
DFG TRK: DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg [As]/L in urine/end-of-shift; Carcinogen Category 1
Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India:

TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07–0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L[40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic*: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]. Octanol–water coefficient: Log K_{ow} = (estimated) <0.7. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: It is irritating to eyes, nose, and respiratory system. This chemical can be absorbed through the skin, thereby increasing exposure. Skin contact can cause irritation, burning, itching, and a rash. Symptoms usually appear ½ to 1 hour after ingestion, but may be delayed. Symptoms include a sweetish, metallic taste and garlicky odor of breath; difficulty in swallowing; abdominal pain; vomiting and diarrhea; dehydration; feeble heart beat; dizziness and headache; and eventually coma, sometimes convulsions, general paralysis, and death. The oral LD$_{50}$ for rat is 8 mg/kg[9]. This material is extremely toxic; the probable oral lethal dose for humans is 5–50 mg/kg, or between 7 drops and 1 teaspoonful for a 150-lb person.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Arsenic pentoxide is a carcinogen in humans. It has been shown to cause skin cancer. May damage the male reproductive glands. Chronic exposure may cause nerve damage to the extremities, alter cellular composition of the blood, and cause structural changes in blood components. Repeated exposure can cause an ulcer in the "bone" dividing the inner nose. Long-term skin contact can cause thickened skin and pigmentation changes. Some persons develop white lines in the finger nails.

Points of Attack: Liver, kidneys, skin, respiratory system; lymphatic system. Reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before first exposure and every 6–12 months thereafter, a medical history and exam are recommended, including: exam of the nose, skin eyes, nails and nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work-day). Levels should not be greater than 100 μg/ g of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage.

Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods:

General information: First responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE)*: select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APR or PAPR are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, *Inorganic Arsenic*. Protective Gloves: Wear Norton chemical protective glove set, Wear chemical goggles; wear a mask/respirator in open areas.

Respirator Selection: **Requirements for Respiratory Protection for Inorganic Arsenic Particulate** ***Except for Those With Significant Vapor Pressure:*** < or = 100 μg/m^3 (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. < or = 500 μg/m^3 (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. < or = 10,000 μg/m^3 (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. < or = 20,000 μg/m^3 Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. >20,000 μg/m^3, unknown concentrations, or firefighting Any full-facepiece SCBA operated in positive-pressure mode.

* A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry, well-ventilated area away from metals, acids and other incompatible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1559 Arsenic pentoxide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material. Neutralize spilled material with crushed limestone, soda ash or lime. Absorb small liquid spills with sand or other noncombustible absorbent material and place into containers for later disposal. For *large spills*, dike far ahead of spill for later disposal. Ventilate area and wash spill site after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: As_2O_5 may burn but does not readily ignite. Thermal decomposition products may include arsenic trioxide fumes. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a minimum of concentrated hydrochloric acid. Dilute with water until white precipitate forms. Add HCl to dissolve. Saturate with H_2S; filter and wash precipitate and return to supplier. Alternatively, precipitate with heavy metals, such as lime or ferric hydroxide in lieu of H_2S[22]. If needed, seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line). Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T + , N; risk phrases: R45; R28; R32; R34; R45; R50/53; R61; R62; R63; safety phrases: S29; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Arsenic trioxide is a noncombustible, odorless, white powder or colorless crystalline solid. Molecular weight = 197.84; boiling point = 460−465°C; freezing/melting point = 312°C (sublimes @ 193°C). Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Slightly soluble in water.

Potential Exposure: Arsenic trioxide, a primary raw material for other arsenic compounds, is used in manufacture of pesticides, glass, industrial chemicals, and drugs. It is an intermediate for insecticides, herbicides and fungicides. The material is used as a wood and tanning preservative and a decoloring and refining agent in glass manufacture. It is also used in pharmaceuticals and in the purification of synthetic gas.

Incompatibilities: Sodium chlorate; sodium hydroxide, sulfuric acid; fluorine; chlorine trifluoride; chromic oxide; aluminum chloride; phosphorus pentoxide; hydrogen fluoride; oxygen difluoride; tannic acid; infusion cinchona and other vegetable astringent infusions and decoctions; iron in solution. Contact with acids or acid mists releases deadly arsine gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 mg[As]/m^3

Arsenic and inorganic compounds

OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

PAC* Ver. 2.9

PAC-1: 0.27 milligram per cubic meter

PAC-2: **3.0**$_{\mathbf{A}}$ milligram per cubic meter

PAC-3: **9.1**$_{\mathbf{A}}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Australia: carcinogen, 1993; Austria: carcinogen, 1999; Belgium: carcinogen, 1993; Denmark: TWA 0.05 mg(As)/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, carcinogen, 1999; Japan carcinogen, 1999; Norway: TWA 0.01 mg(As)/m^3, 1999; the Philippines: TWA 0.1 milligram per cubic meter, carcinogen, 1993; Poland: TWA 0.01 mg(As)/m^3, 1999; Sweden: TWA 0.03 mg(As)/m^3, carcinogen, 1999; Switzerland: MAK-week 0.1 mg(As)/m^3, carcinogen, 1999; United Kingdom: TWA 0.1 mg(As)/m^3, carcinogen, SEP2000; United Kingdom: TWA 0.1 mg(Se)/m^3, SEP2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed human carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L[40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic*: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58].

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Skin contact can cause burning, itching, and rash. Inhalation can cause respiratory irritation. Eye contact can cause irritation and possible permanent damage. High exposures can cause an abnormal EKG. Symptoms of acute poisoning may take from ½ hour to several hours after ingestion to appear. They may include: sweetish metallic taste; garlicky odor of breath and feces; constriction in throat and difficulty in swallowing; burning and colicky pains in esophagus, stomach and bowel; vomiting and profuse painful diarrhea (stools are watery initially, later becoming bloody); dehydration with intense thirst and muscular cramps; bluing of skin; feeble pulse and cold extremities; vertigo, frontal headache; stupor, delirium and mania (these symptoms may occur without concurrent or preceding gastric symptoms); fainting, coma, convulsions, general paralysis; and then possible death. This material is considered super toxic; probable oral lethal dose (human) is less than 5 mg/kg, i.e., a taste (less than 7 drops) for a 70 kg (150 lb) person. Material causes acute GI and CNS symptoms.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Arsenic trioxide is a human carcinogen; causes skin and liver cancer. Renal and hepatic damage have been observed. Chronic exposure to material has led to nasal septum perforation, dermatological symptoms (lesions, necrosis, etc.) and an increase in the incidence of lung and lymphatic cancers. Appreciable exposure to respiratory irritant promoters, such as metal oxide fumes elicits a carcinogenic response from arsenic trioxide. Repeated or high exposure can cause nerve damage with "pins and needles" sensation; burning, numbness, and weakness in the extremities. Exposure can cause skin allergy to develop.

Points of Attack: Skin, liver, kidneys, lungs, lymphatic system.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. Before first exposure and every 6−12 months thereafter, a medical history and exam are recommended, including: exam of the nose, skin eyes, nails and nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work-day). Levels should not be greater than 100 μg/g of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with large amounts of soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. A regulated, marked area should be established where arsenic trioxide is handled, used, or stored. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full facepiece respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wash thoroughly immediately after exposure to Arsenic Trioxide and at the end of the work-shift. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic*."

Respirator Selection: **Requirements for Respiratory Protection for Inorganic Arsenic Particulate** ***Except for Those With Significant Vapor Pressure:*** < or = 100 μg/m^3 (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. < or = 500 μg/m^3 (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. < or = 10,000 μg/m^3 (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2)

Half-mask supplied-air respirators operated in positive-pressure mode. < or = 20,000 μg/m^3 Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. > 20,000 μg/m^3, unknown concentrations, or firefighting Any full-facepiece SCBA operated in positive-pressure mode.

* A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage Store in tightly closed containers in a cool, dry well-ventilated area away from contact with incompatible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1561 Arsenic trioxide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Wear full protective clothing including gloves and eye protection. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include arsine and oxides of arsenic metal. Avoid breathing dusts and fumes from burning materials. Keep upwind. Wear SCBA. Extinguish fire using agent suitable for type of surrounding fire (material itself does not burn or burns with difficulty). Use water in flooding quantities as fog. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in a minimum of concentrated hydrochloric acid. Dilute with water until white precipitate forms. Add HCl to dissolve. Saturate with H_2S; filter and wash precipitate and return to supplier. Alternatively, precipitate with heavy metals, such as lime or ferric hydroxide in lieu of H_2S[22]. If needed, seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), NPRI (arsenic compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R10; R16; R23/25; R32; R50/53; safety phrases: S20/21; S28; S29; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water [lit.].

Description: Arsenic trisulfide is a noncombustible, odorless, yellow or orange powder or red needles (changes to a different "red" form @ 170°C). Molecular weight = 246.04; specific gravity (H_2O:1) = 3.43 @ 20°C; boiling point = 707°C; freezing/melting point = 300−327°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0. Insoluble in water.

Potential Exposure: Arsenic trisulfide is used in the manufacture of glass, oil cloth, linoleum, electrical semiconductors, fireworks and used as a pigment.

Incompatibilities: A strong reducing agent; avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and potassium nitrate mixed with sulfur, since violent reactions occur. Water contact forms hydrogen sulfide. Incompatible with acids, halogens. Contact with acids or acid mists releases deadly arsine gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 mg[As]/m^3

Arsenic and inorganic compounds

OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

No PAC available.

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3 A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/ L[40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic*: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58].

Routes of Entry: Inhalation of dust, skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Arsenic trisulfide can affect you when breathed in and may enter the body thought the skin. Arsenic trisulfide is a carcinogen; handle with extreme caution. Contact can cause burning, itching, thickened skin; rash and color changes. Exposure can irritate the nose and throat; and may cause an ulcer or hole in the inner nose. High or repeated exposures can cause disturbed sleep; "pins and needles," numbness and weakness of arms and legs. High or repeated exposure can cause poor appetite; nausea, vomiting, diarrhea and death.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Arsenic trisulfide is a carcinogen in humans; it has been shown to cause skin, liver and lung cancer. It may be a teratogen, causing reproductive damage, such as reduced fertility and interference with the menstrual cycle. May cause liver damage and lower the red blood cell count. Repeated skin contact can cause thickened skin and pigmentation changes. Some persons develop white lines on the fingernails. High or repeated exposure can cause nerve damage with burning, "pins and needles" sensation and weakness of the extremities.

Points of Attack: Skin, respiratory system; nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, the following are recommended: exam of the nose, skin, eyes, nails and nervous system. CBC. Examination of the nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work-day). At NIOSH recommended exposure levels, urine arsenic should not be greater than 50−100 μg/L of urine. After suspected overexposure, repeat these tests. Also examine your skin periodically for abnormal growths. Skin cancer from arsenic is easily cured with early detection.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Avoid skin contact with arsenic trisulfide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operations. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Eye protection is included in the recommended respiratory protection. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic*."

Respirator Selection: **Requirements for Respiratory Protection for Inorganic Arsenic Particulate** ***Except for Those With Significant Vapor Pressure:*** $<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. $<$ or $= 20{,}000\ \mu g/m^3$ Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $> 20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting Any full-facepiece SCBA operated in positive-pressure mode.

* A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Avoid contact with the incompatible materials cited above. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1557 Arsenic compounds, solid, n.o.s. inorganic, including arsenates, n.o.s.; arsenites, n.o.s.; arsenic sulfides, n.o.s.; and organic compounds of arsenic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Keep water and acids away from spilled Arsenic Trisulfide. Collect powdered materials using a vacuum equipped with a high efficiency particulate filter (do not use a standard shop vacuum) or wet cleaning methods and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Arsenic trisulfide may burn, but does not readily ignite. Use dry chemical, CO_2, water spray; or foam extinguishers. Thermal decomposition products may include hydrogen sulfide, arsine, sulfur oxides and arsenic fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada: Priority Substance List & Restricted Substances/Ocean Dumping FORBIDDEN (CEPA), NPRI (arsenic compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[191,192]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T; N; risk phrases: R45; R20/21/22; R27/28; R46; R50/53; R61; R63; safety phrases: S1; S13; S22; S29/35; S36/37/39; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Arsenous trichloride is a noncombustible, colorless or pale yellow oily, fuming liquid. The odor is described as pungent and acrid. Molecular weight = 181.27; specific gravity (H_2O:1) = 2.156 @ 25°C; boiling point = 130.2°C; freezing/melting point = −16°C; vapor pressure = 8.4 mmHg @ 23.5°C; Latent heat of vaporization = 49.06 cal/g; heat of solution = (estimate) -0.42×10^5 J/kg. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0₩. Decomposes in water, forming hydrogen chloride.

Potential Exposure: Arsenic chloride is used in the ceramics industry; in the synthesis of chlorine-containing arsenicals; as a chemical intermediate for arsenic insecticides, pharmaceuticals; and has been used in chemical warfare agents.

Incompatibilities: Contact with sodium, potassium, or powdered aluminum may cause a violent reaction. It is decomposed in water, forming arsenic hydroxide and hydrogen chloride. Exposure to light forms toxic gas. Violent reaction with anhydrous ammonia, strong acids; strong oxidizers and halogens. Incompatible with alkali metals; active metals, such as arsenic, iron, aluminum, zinc. Corrodes metals in the presence of moisture and forms flammable and explosive hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 mg[As]/m^3

Arsenic and inorganic compounds

OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

7784-34-1

PAC Ver. 29[138]

PAC-1: 0.91 ppm

PAC-2: 10 ppm

PAC-3: 240 ppm

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India: TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L[40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic*: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Eye contact can cause burns, possibly causing permanent damage. Exposure to vapors causes spasm of eyelids, tearing, pain, and reddening. Exposure above the occupational exposure limits can cause death. In acute exposures, it is extremely toxic and caustic, owing not only to the poisonous nature of arsenic, but also to the release of hydrochloric acid in the presence of water. Exposure to the skin causes local irritation and blisters. Inhalation or ingestion causes hemorrhagic gastroenteritis resulting in loss of fluids and electrolytes, collapse, shock and death. The fatal human dose is 70−180 mg depending on the weight of the victim. Symptoms usually appear one-half to one hour after ingestion. Symptoms include a sweetish metallic taste; garlicky odor on the breath and stools; constriction in throat; difficulty in swallowing; abdominal pain; vomiting, diarrhea, bluing of the skin; weak pulse; dizziness, headaches, coma, and convulsions.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Chronic poisoning can lead to peripheral disturbed sleep; skin conditions; liver damage. Arsenic and certain arsenic compounds have been implicated in the induction of skin and lung cancer. Based on several related arsenic compounds, arsenic trichloride may be a mutagen and teratogen.

Points of Attack: Liver, kidneys, skin, lungs, reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before first exposure and every 6–12 months thereafter, a medical history and exam are recommended, including: exam of the nose, skin eyes, nails and nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work-day). Levels should not be greater than 100 μg/g of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. A regulated, marked area should be established where arsenous trichloride is handled, used, or stored. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full facepiece respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic*."

Respirator Selection: **Requirements for Respiratory Protection for Inorganic Arsenicals*With Significant Vapor Pressure:*** < or = 100 μg/m^3 (micrograms per cubic meter) (1) Half-mask* air-purifying respirator equipped with high-efficiency filter** and acid gas cartridge; or (2) Any half-mask* supplied-air respirator. < or = 500 μg/m^3 (1) Front- or back-mounted gas mask equipped with high-efficiency filter** and acid gas canister; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. < or = 10,000 μg/m^3 Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 20,000 μg/m^3 Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. > 20,000 μg/m^3, unknown concentrations, or firefighting: Any full-facepiece SCBA operated in positive-pressure mode. * Half-mask respirators shall not be used for protection against arsenic trichloride, as it is rapidly absorbed through the skin. ** A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Arsenous trichloride, AsCl3, should be stored in tightly closed containers in a cool, well-ventilated area away from heat, water and any possible contact with active metals or other incompatible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1560 Arsenic trichloride, Hazard class 6.1; Labels: 6.1-Poison Inhalation Hazard, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.6/0.9
Night 1.0/1.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch-spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into sealed containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Arsenous trichloride is not flammable so agents must be used which are suitable for surrounding fire. Thermal decomposition products may include hydrogen chloride, arsine, chlorine and oxides of metal (arsenic). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in a minimum of concentrated hydrochloric acid. Dilute with water until white precipitate forms. Add HCl to dissolve. Saturate with H_2S; filter and wash precipitate and return to supplier. Alternatively, precipitate with heavy metals, such as lime or ferric hydroxide in lieu of H_2S[22]. If needed, seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line). In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T + , F + , N; risk phrases: R45; R2; R3; R5; R12; R20/21/22; R26; R27/28; R46; R48/20; R50/53; R61; R62; safety phrases: S1; S9; S13; S16; S22; S28; S33; S36/37/39; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Arsine (SA) is an extremely flammable and poisonous, colorless, liquefied compressed gas. Slight garlic-like odor. SA is nonirritating, produces no immediate symptoms, and odor is not an adequate indicator of arsine's (SA) presence, so persons exposed to hazardous levels may be unaware of its presence. The established PEL is 10 times lower than the concentration at which people begin to smell SA (odor threshold of 0.5 ppm and above)[77]. Molecular weight = 77.95. Specific gravity (H_2O:1) = 3.19; boiling point = −63°C; freezing/melting point = −117.2°C; Relative vapor density (air = 1) = 2.69; vapor pressure = 14.9 atm @ 21.1°C; >760 mmHg @ 20°C[77]; flash point = flammable gas. Explosive Limits: LEL: 5.1%; 5100 ppm; UEL: 78%. NFPA 704M Hazard Identification (based on NFPA-704M Rating System): Health 4; flammability 4; reactivity 2. Decomposes @ 300°C. Solubility in water = 20% @ 20°C.

Potential Exposure: Arsine is used in making electronic, semiconductor components; in organic syntheses; and in making lead-acid storage batteries. Arsine may be generated by side reactions or unexpectedly; e.g., it may be generated in metal pickling operations; metal drossing operations; or when inorganic arsenic compounds contact sources of nascent hydrogen. It has been known to occur as an impurity in acetylene. Most occupational exposure occurs in chemical, smelting, and refining industries. It has been used as a poison gas. Cases of exposure have come from workers dealing with zinc, tin, cadmium, galvanized coated aluminum; and silicon and steel metals. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. SA is used as a military poison gas (blood agent). It forms cyanide in the body.

Incompatibilities: Arsine forms explosive mixture with air. SA reacts with strong oxidizers, nitric acid, causing an explosion hazard. Thermally unstable; shock, friction, and concussion sensitive; can explosively decompose. Can explode on contact with warm, dry air. Violent reaction with acids, halogens, mixtures of potassium and ammonia. Decomposes to metallic arsenic (fumes) on exposure to light, moisture or upon decomposition from heat or ignition.

Permissible Exposure Limits in Air

NIOSH IDLH = 3 ppm

odor threshold ≤ 1.0 ppm. The odor is an *unreliable* indicator.

Conversion factor: 1 ppm = 3.19 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.05 ppm/0.2 milligram per cubic meter TWA

NIOSH REL: 0.002 milligram per cubic meter [15 min.] Ceiling level, See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.005 ppm/0.01 milligram per cubic meter TWA

Emergency Response Planning Guidelines (DOE)

ERPG-1: Inappropriate

ERPG-2: 0.5 ppm

ERPG-3: 1.5 ppm

Arab Republic of Egypt: TWA 0.05 ppm (0.2 milligram per cubic meter), 1993; Australia: TWA 0.05 ppm (0.2 milligram per cubic meter), 1993; Austria: MAK 0.05 ppm (0.2 milligram per cubic meter), 1999; Denmark: TWA 0.01 ppm (0.03 milligram per cubic meter), 1999; France: VME 0.05 ppm (0.2 milligram per cubic meter), VLE 0.2 ppm (0.8 milligram per cubic meter), 1999; Hungary: TWA 0.05 milligram per cubic meter, STEL 0.1 milligram per cubic meter [skin], 1993; Japan: 0.01 ppm (0.032 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.2 milligram per cubic meter, 2003; Norway: TWA 0.003 ppm (0.01 milligram per cubic meter), 1999; the Philippines: TWA 0.05 ppm (0.5 milligram per cubic meter), 1993; Poland: MAC (time-weighted average) 0.2 milligram per cubic meter; MAC (STEL) 0.6 milligram per cubic meter, 1999; Russia: TWA 0.05 ppm, STEL 0.1 milligram per cubic meter, 1993; Sweden: NGV 0.02 ppm (0.05 milligram per cubic meter), 1999; Switzerland: MAK-week 0.05 ppm (0.16 milligram per cubic meter), KZG-week 0.25 ppm, 1999; Thailand: TWA 0.05 ppm (0.2 milligram per cubic meter), 1993; Turkey: TWA 0.05 ppm (0.2 milligram per cubic meter), 1993; United Kingdom: TWA 0.05 ppm (0.16 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South

Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.05 ppm. Several states have set guidelines or standards for arsine in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 1.0 μ/m^3 (Connecticut) to 2.0 μ/m^3 (Florida and North Dakota) to 3.3. μ/m^3 (Virginia) to 5.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 6001, OSHA Analytical Method ID-105, ID-125G.

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons. Federal Drinking Water Guidelines: EPA 10 μg/L; State Drinking Water Guidelines: Arizona 10 μg/L; Connecticut 10 μg/L. Toxic pollutant designated pursuant to section 307 (a) (1) of the Clean Water Act and is subject to effluent limitations (arsenic and inorganic and organic arsenic) [40 CFR 401.15 (7/1/1987)]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: See OSHA Analytical Method ID-105 for arsenic. The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. Octanol−water coefficient: Log K_{ow} = (estimated) 0.68. Unlikely to bioaccumulate in marine organisms. Very toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Routes of Entry: Inhalation of gas, ingestion, skin contact.

Harmful Effects and Symptoms

Arsine is an extremely toxic gas that can be fatal if inhaled in sufficient quantities. Acute poisoning is marked by a triad of main effects caused by massive intravascular homolysis of the circulating red cells. Early effects may occur within an hour or two and are commonly characterized by general malaise, apprehension, giddiness, headache, shivering, thirst; and abdominal pain with vomiting. In severe acute cases the vomitus may be blood stained and diarrhea ensues as with inorganic arsenical poisoning. Pulmonary edema has occurred in severe acute poisoning. Invariably, the first sign observed in arsine poisoning is hemoglobinuria, appearing with discoloration of the urine up to port wine hue (first to the triad). Jaundice (second of triad) sets in on the second or third day and may be intense, coloring the entire body surface a deep bronze hue. Coincident with these effects is a severe hemolytic-type anemia. Severe renal damage may occur with oliguria or complete suppression of urinary function (third of triad), leading to uremia and death. Severe hepatic damage may also occur, along with cardiac damage and EKG changes. Where death does not occur, recovery is prolonged. In cases where the amount of inhaled arsine is insufficient to produce acute effects, or where small quantities are inhaled over prolonged periods, the hemoglobin liberated by the destruction of red cells may be degraded by the reticuloendothelial system and the iron moiety taken up by the liver, without producing permanent damage. Some hemoglobin may be excreted unchanged by the kidneys. The only symptoms noted may be general tiredness; pallor, breathlessness on exertion; and palpitations as would be expected with severe secondary anemia.

Short-Term Exposure: Inhaling arsine can irritate the lungs, causing shortness of breath and coughing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High exposure can cause hemolysis (destruction of red blood cells), causing anemia with headache, weakness, nausea, vomiting and abdominal pain. Acute kidney failure may follow; this can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High concentrations of arsine gas will cause damage to the eyes; however, many experts agree that before this occurs systemic effects can be expected. Skin or eye contact with compressed gas can cause frostbite.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Arsine is carcinogenic to humans. Also, it should be treated as a teratogen. Repeated exposure may damage the nerves, causing weakness, "pins and needles" sensation; weakness in the limbs with loss of coordination. May cause kidney, liver, and heart damage.

Points of Attack: Blood, kidneys, liver, lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: liver function tests; pulmonary function tests; reticulocyte count; urine (chemical/metabolite), hemoglobin; urinalysis (routine); white blood cell count/differential. In preemployment physical examinations, special attention should be given to past or present kidney disease, liver disease, and anemia. Periodic physical examinations should include tests to determine arsenic levels in the blood and urine, CBC with reticulocyte count, kidney and liver function tests; urine hemoglobin, examination of the nervous system; and chest X-ray (following acute exposure). Since arsine gas is a by-product of certain production processes, workers should be trained to recognize the symptoms of exposure and to use appropriate PPE.

First Aid: If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform artificial respiration. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. *Dimercaprol* treatment is indicated and blood transfusions may be necessary. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. Seek medical attention immediately. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Decontamination: Since arsine is a gas, you don't have to decontaminate victims or yourself. If you don't have the equipment and training, don't enter the hot zone to rescue and treat victims. And, be aware that arsine may be trapped in the victim's clothing.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APR or PAPR are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, *Inorganic Arsenic*. Protective Gloves: Wear Norton chemical protective glove set, Wear chemical goggles; wear a mask/respirator in open areas.

Respirator Selection: **Requirements for Respiratory Protection for Inorganic Arsenicals *With Significant Vapor Pressure*** $<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask* air-purifying respirator equipped with high-efficiency filter** and acid gas cartridge; or (2) Any half-mask* supplied-air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Front- or back-mounted gas mask equipped with high-efficiency filter** and acid gas canister; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ Half-mask* supplied-air respirator operated in positive-pressure mode. $<$ or $= 20{,}000\ \mu g/m^3$ Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $> 20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting: Any full-facepiece SCBA operated in positive-pressure mode.

* Half-mask respirators shall not be used for protection against arsenic trichloride, as it is rapidly absorbed through the skin.

** A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note*: *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and away from radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Arsine must be stored to avoid contact with incompatible materials including oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), since violent reactions occur. Outside, detached storage is preferred. Arsine decomposes and deposits Arsenic on exposure to light and moisture. Sources of ignition, such as smoking and open flames, are prohibited where arsine is handled, used, or stored. Metal containers involving the transfer of arsine should be grounded and bonded. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association. The storage area for flammable toxic gases should have electrical equipment conforming to Article 500 of the National Electrical Code.

Shipping: UN2188 Arsine, Hazard class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

Arsine (for SA see below)

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.6/0.9
Night 2.5/4.1

Large Spills (from a large package or from many small packages)

First: Isolate in all directions(ft/m) 3000/1000
Then: Protect persons downwind (mi/km)
Day 3.6/5.8
Night 7.0 + /11.0 + *

* + means distance can be larger in certain atmospheric conditions.

SA, when used as a weapon

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 1250/400

Then: Protect persons downwind (mi/km)

Day 1.2/1.9

Night 3.6/5.8

Large Spills (from a large package or from many small packages)

First: Isolate in all directions(ft/m) 3000/1000

Then: Protect persons downwind (mi/km)

Day 5.6/9.0

Night 7.0 + /11.0 + *

* + means distance can be larger in certain atmospheric conditions.

No flares, smoking, or flames in area. Use water spray to reduce vapors. Isolate area until arsine gas has dispersed. Stay upwind; keep out of low areas. Ventilate area of leak to disperse the gas if it can be done without placing personnel at risk. Wear positive-pressure breathing apparatus and full protective clothing. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stop the flow of gas if it can be done safely, with undue risk. If the source of the leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Use large amounts of water to disperse vapors; contain runoff. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This gas is under pressure; containers may rupture and explode when heated. Containers may rocket. In case of fire, *do not put out the fire*. Arsine is so bad that the fire is safer than the unburned arsine. If you can shut off the flow of gas don't do anything else—let the fire burn out. Thermal decomposition products may include arsenic and nitrogen oxides. In the unlikely situation where there is a tank of arsine adjacent to a fire, cool the tank with large amounts of water, but first evacuate the area—if the tank ruptures from heating, arsine could kill. Again, arsine gives off toxic gases in a fire or when heated, but these are not as bad as the arsine itself. You can use a water spray to "knock down" the toxic gases coming from an arsine fire. This chemical is a highly flammable gas. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Approach fire from upwind. Fight fire from protected location or maximum possible distance. Let small fires burn out, if possible. Use water spray or foam extinguishers. For massive fire in cargo area use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Cool containers that are exposed to flames with water from the side until well after fire is out. See isolation distances above if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Arsine may be disposed of by controlled burning. When possible, cylinders should be sealed and returned to suppliers[22]. Seek guidance from regulatory agencies as to proper disposal. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Description: White or greenish (chrysotile), Blue (crocidolite), or gray-green (amosite) fibrous, odorless solids; freezing/melting point = 600°C (Decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Insoluble in water. Asbestos is a generic term that applies to a number of naturally occurring, hydrated mineral silicates incombustible in air and separable into filaments. The most widely used in industry in the United States is chrysotile, a fibrous form of serpentine. Other types include amosite, crocidolite, tremolite, anthophyllite, and actinolite.

Potential Exposure: Most asbestos is used in the construction industry. Much of it is firmly bonded, i.e., the asbestos is "locked in" in such products as floor tiles, asbestos cements, and roofing felts, and shingles; while the remaining 8% is friable or in powder forms present in insulation materials, asbestos cement powders, and acoustical products. As expected, these latter materials generate more airborne fibers than the firmly bonded products. The asbestos used in nonconstruction industries is utilized in such products as textiles; friction material including brake linings and clutch facings; paper, paints, plastics, roof coatings; floor tiles, and miscellaneous other products. Significant quantities of asbestos fibers appear in rivers and streams draining from areas where asbestos-rock outcroppings are found. Some of these outcroppings are being mined. Asbestos fibers have been found in a number of drinking water supplies, but the health implications of ingesting asbestos are not fully documented. Emissions of asbestos fibers into water and air are known to result from mining and processing of some minerals. Exposure to asbestos fibers may occur throughout urban environments perhaps resulting from asbestos from brake linings and the flaking of sprayed asbestos insulation material. In recent years, much effort has been put into removal of asbestos insulation, particularly from schools and other public buildings where worn or exposed asbestos causes public exposure.

Incompatibilities: None

Permissible Exposure Limits in Air

OSHA PEL: 0.1 asbestos fiber (> 5 μm long)/cc; 1f/cc/30 minutes excursion; carcinogen. [0.1 fiber (longer than 5 μm and having a length-to-diameter ratio of at least 3 to 1) per cubic centimeter of air (0.1 fiber/cm^3), as determined by the membrane filter method at approximately 400X magnification with phase contrast illumination. No worker should be exposed in excess of 1 fiber/cm^3 (excursion limit) as averaged over a sampling period of 30 minutes; Cancer and Lung Disease Hazard]

NIOSH REL: 0.1f/cc (fibers > 5 μm long)/400L; carcinogen. [NIOSH considers asbestos to be a potential occupational carcinogen and recommends that exposures be reduced to the lowest feasible concentration. For asbestos fibers >5 μm in length: 1×10^5 fibers/m^3/0.1 fiber/cm^3 as determined by a 400-liter air sample collected over 100 minutes (see NIOSH Analytical Method #7400)]

ACGIH TLV[1]: (all forms) 0.1f/cc TWA; Confirmed Human Carcinogen

European OEL: 0.1 asbestos fibers/cc (2003)
PAC Ver. 29[138]
asbestos (includes amosite 12172-73-5; ascarite 81133-20-2; chrysotile 1332-21-4)
PAC-1: 0.05 milligram per cubic meter
PAC-2: 0.55 milligram per cubic meter
PAC-3: 3.3 milligram per cubic meter
DFG MAK: Carcinogen Category 1, Confirmed Human carcinogen, (2004)
Austria: carcinogen, 1999; France: VME 0.3 fiber/ml, carcinogen, 1999; Norway: TWA 0.1 fiber/cm^3, 1999; Switzerland: MAK-week 0.25 fiber/ml, carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. Several states have set guidelines or standards for asbestos in ambient air[60] ranging from zero (Massachusetts, Nevada, North Carolina, North Dakota, South Carolina) to 0.001 μ/m^3 (Connecticut) to 0.005 μ/m^3 (Pennsylvania) to 0.005 μ/m^3 (Nevada) to 2.0 μ/m^3 (Virginia) to 5.0 μ/m^3 (New York).

Determination in Air: NIOSH Analytical Method #9002, asbestos (bulk) by PLM, #7402, by PCM #7402, by TEM (Transmission Electron Microscopy), OSHA Analytical Methods ID-160, asbestos in Air, and ID-191, Polarized Light Microscopy of asbestos. NIOSH Analytical Method #9000, asbestos, chrysotile by XRD

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): 40CFR141.62, MCL, 7 million fibers/l (longer than 10 μm); 40CFR141.51, MCLG, 7 million fibers/l ($>$ 10 μm); 47FR9352 regulated chemical; 40CFR141.23, inorganic chemical sampling and analytical requirements; 40CFR141.32, public notification requirements To protect freshwater and saltwater aquatic life: no criteria have been established due to insufficient data. *To protect human health*: preferably zero. A lifetime cancer risk of 1 in 100,000 corresponds to concentrations of 300,000 fibers/L[6].

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: There is no known acute health effects. Persons who develop serious and fatal diseases later in life may feel fine at the time of exposure.

Long-Term Exposure: Asbestosis (chronic exposure): dyspnea (breathing difficulty), interstitial fibrosis; restricted pulmonary function; finger clubbing; irritation of eyes; (Potential occupational carcinogen). Available studies provided conclusive evidence that exposure to asbestos fibers causes cancer and asbestosis in humans. Lung cancers and asbestosis have occurred following exposure to chrysotile, crocidolite, amosite, and anthophyllite. Mesotheliomas, lung and GI cancers have been shown to be excessive in occupationally exposed persons, while mesotheliomas have developed also in individuals living in the neighborhood of asbestos factories and near crocidolite deposits; and in persons living with asbestos workers. Asbestosis has been identified among persons living near anthophyllite deposits. Likewise, all commercial forms of asbestos are carcinogenic in rats, producing lung carcinomas and mesotheliomas following their inhalation; and mesotheliomas after intrapleural (i.p.) injection. Mesotheliomas and lung cancers were induced following even 1 day's exposure by inhalation. The size and shape of the fibers are important factors; fibers less than 0.5 μm in diameter are most active in producing tumors. Other fibers of a similar size including glass fibers can also produce mesotheliomas following intrapleural or i.p. injection. There are data that show that the lower the exposure, the lower the risk of developing cancer. Excessive cancer risks have been demonstrated at all fiber concentrations studied to date. Evaluation of all available human data provides no evidence for a threshold or for a "safe" level of asbestos exposure.

Points of Attack: Respiratory system, eyes, lungs [cancer site].

Medical Surveillance: OSHA mandates the following: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); radiography; sputum cytology; tuberculin skin test. Medical surveillance is required, except where a variance from the medical requirements of this proposed standard have been granted, for all workers who are exposed to asbestos as part of their work environment. For the purposes of this requirement the term "exposed to asbestos" will be interpreted as referring to TWA exposures above 1 fiber/c or peak exposures above 5 fibers/c. The major objective of such surveillance will be to ensure proper medical management of individuals who show evidence of reaction to past dust exposures, either due to excessive exposures or unusual susceptibility. Medical management may range from recommendations as to job placement, improved work practices, cessation of smoking, to specific therapy for asbestos-related disease or its complications. Medical surveillance cannot be a guide to adequacy of current controls when environmental data and medical examinations only cover recent work experience because of the prolonged latent period required for the development of asbestosis and neoplasms. Required components of a medical surveillance program include periodic measurements of pulmonary function [forced vital capacity (FVC) and forced expiratory volume for one second (FEV_1)], and periodic chest roentgenograms (postero-anterior 14 × 17 inches). Additional medical requirement components include a history to describe smoking habits and details on past exposures to asbestos and other dusts and to determine presence or absence of pulmonary, cardiovascular, and GI symptoms, and a physical examination, with special attention to pulmonary rales, clubbing of fingers and other signs related to cardiopulmonary systems. Chest roentgenograms and pulmonary function tests should be performed at least every two years on all employees exposed to asbestos. Such tests should be made annually on individuals: (1) who have a history of 10 or more years of employment involving exposure to asbestos or (2) who show roentgenographic findings (such as small opacities, pleural plaques, pleural thickening or pleural calcification) which suggest or indicate pneumoconiosis or other reactions to asbestos or (3) who have changes in pulmonary function which indicate restrictive or obstructive lung disease. Preplacement medical examinations and medical examinations on the termination of employment of asbestos-exposed workers are also required.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water.

Personal Protective Methods: Prevent skin contact; Any barrier that will prevent contamination from the fiber. Use of respirators can be decided on the basis of TWA or peak concentration. When the limits of exposure to asbestos dust cannot be met by limiting the concentration in the workplace, the employer must utilize a program of respiratory protection and furnishing of protective clothing to protect every worker exposed. *Protective Clothing*: (1) The employer shall provide each employee subject to exposure in a variance area with coveralls or similar full body protective clothing and hat, which shall be worn during the working hours in areas where there is exposure to asbestos dust. Nondisposable clothing should be placed in plastic bags for laundering or decontamination. (2) The employer shall provide for maintenance and laundering of the solid protective clothing, which shall be stored, transported and disposed of in sealed nonreusable containers marked "Asbestos-Contaminated Clothing" in easy-to-read letters. (3) Protective clothing shall be vacuumed before removal. Clothes shall not be cleaned by blowing dust from the clothing or shaking. (4) If laundering is to be done by a private contractor, the employer shall inform the contractor of the potentially harmful effects of exposure to asbestos dust and of safe practices required in the laundering of the asbestos-soiled work clothes. (5) Resin-impregnated paper or similar protective clothing can be substituted for fabric-type of clothing. (6) It is recommended that in tightly contaminated operations (such as insulation and textiles) provisions be made for separate change rooms.

Respirator Selection: $<$ or $= 1 f/cm^3$: (fibers per cubic centimeter) ($10 \times$ PEL): Half-mask air-purifying respirator other than a disposable respirator, equipped with high-efficiency filters*. $<$ or $= 5 f/cm^3$ ($50 \times$ PEL): Full-facepiece air-purifying respirator equipped with high-efficiency filters*. $<$ or $= 10 f/cm^3$ ($100 \times$ PEL) Any powered air-purifying respirator equipped with high-efficiency filters* or any supplied-air respirator operated in continuous-flow mode. $<$ or $= 100 f/cm^3$ ($1{,}000 \times$ PEL): Full-facepiece supplied air respirator operated in pressure-demand mode. $> 100 f/cm^3$ ($1{,}000 \times$ PEL), or unknown concentrations Full-facepiece supplied-air respirator operated in pressure-demand mode, equipped with an auxiliary positive-pressure SCBA.

* A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with asbestos workers must be, by law, trained in its proper handling and storage. Asbestos should be stored wet with special surfactants and water. Keep asbestos in closed, impermeable, sealed containers. Protect against physical damage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2212 Blue asbestos (Crocidolite) or Brown asbestos (amosite, mysorite), Hazard class: 9; Labels: 9-Miscellaneous hazardous material. UN2590 White asbestos (chrysotile, actinolite, anthophyllite, tremolite), Hazard class: 9; Labels: 9-Miscellaneous hazardous material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Proper procedures for repair or removal of the material must be followed by trained personnel. Strict hygiene is required; keep dust under control. Wearing protective equipment, use a wet mop or special high efficiency HEPA vacuum to clean area. Do not use common shop vacuum cleaner. *Note*: Avoid blowing, sweeping or dry brushing, and dry mopping; all of which may raise dust levels. Do not shovel. For storing asbestos wastes, use heavy-gauge impervious plastic bags. For final disposal contact your local environmental authority. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Asbestos itself does not burn. Care should be taken to contain asbestos materials disturbed in a fire. Becomes powder-like and loses its hazardous properties when heated above 1,200°C. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Asbestos may be recovered from waste asbestos slurries as an alternative to disposal. Landfilling is an option[22] for disposal if carefully controlled.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 2B (*extracts of steam and air refined*); Group 3 *(steam refined, cracking residue, and air-refined*) 1987; NTP: Carcinogenesis studies; selected, October 2000; NIOSH has recommended that coal tar pitch volatiles, including PAHs be treated as potential human carcinogen.

California Proposition 65 Chemical[102]: (*if present as coke oven emissions*) Cancer 2/27/1987.

Hazard Alert: Combustible, Possible risk of forming tumors, Suspected reprotoxic hazard.

EPCRA Section 313 Form R *de minimus* concentration reporting level: 0.1%. Form R Toxic Chemical Category Code: N590 as PACs.

Hazard symbols, risk, & safety statements: Hazard symbol: risk phrases: R40; R61; safety phrases: S41; (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Asphalt fumes are flammable when hot and may contain hydrogen sulfide and human carcinogen, such as benzo(*a*)pyrene and dibenz(*a*,*h*)anthracene. Fumes generated during the production or application of asphalt (a dark-brown to black cement-like substance manufactured by the vacuum distillation of crude petroleum oil). Molecular weight = variable 1000 to 2600; specific gravity (H_2O:1) = 1.0 to 1.8 (no temperature given); boiling point ≥ 300°C; freezing/melting point = 55−175°C; flash point ≤ 10−225°C (as a general rule, the more liquid the type of asphalt, the lower the flashpoint; cutback <10°C; typical asphalt 225°C); Autoignition ≥ 400°C. Hazard identification (based on NFPA-704 M Rating System) (typical asphalt): Health 0; flammability 1; reactivity 0. However, *asphalt cutback* has a flammability rating of 3. Insoluble in water. Hazard identification (based on NFPA-704 M Rating System): *roofer's flux and straight run residue*: Health 0; flammability 1; reactivity 0.

Asphalt fumes have been defined by NIOSH as the nimbose effusion of small, solid particles created by condensation from the vapor state after volatilization of asphalt. In additional to particles, a cloud of fume may contain materials still in the vapor state. The major constituent groups of asphalt are asphaltenes, resins, and oils made up of saturated and unsaturated hydrocarbons. The asphaltenes have molecular weights in the range of 1000−2600, those of the resins fall in the range of 370−500, and those of the oils is the range of 290−630. Asphalt has often been confused with tar because the two are similar in appearance and have sometimes been used interchangeably as construction materials. Tars are, however, produced by destructive distillation of coal, oil or wood, whereas asphalt is a residue from fractional distillation or crude oil. The amounts of benzo(*a*)pyrene found in fumes collected from two different plants that prepared hot mix asphalt ranged from 3 to 22 ng/m^3; this is approximately 0.03% of the amount in coke oven emissions and 0.01% of that emitted from coal-burning home furnaces.

Potential Exposure: Occupational exposure to asphalt fumes can occur during the transport, storage, production, handling, or use of asphalt. The composition of the asphalt that is produced is dependent on the refining process applied to the crude oil, the source of the crude oil and the penetration grade (viscosity) and other physical characteristics of the asphalt required by the consumer. The process for production of asphalt is essentially a closed-system distillation. Refinery workers are therefore potentially exposed to the fumes during loading of the asphalt for transport from the refinery during routine maintenance, such as leaning of the asphalt storage tanks, or during accidental spills. Most asphalt is used out of doors, in paving and roofing. The workers' exposure to the fumes is dependent on environmental conditions, work practices, and other factors. These exposures are stated to be generally intermittent and at low concentrations. Workers are potentially exposed also to skin and eye contacts with hot, cut-back, or emulsified asphalts. Spray application of cut-back, or emulsified asphalts may involve respiratory exposure also.

Incompatibilities: Asphalt and bitumen dust may form explosive mixture with air. *Note*: Asphalt becomes molten at about 93°C. Asphalt burns readily when heated or ignited in the presence of air or oxygen. May be incompatible with strong oxidizing agents like nitric acid. Charring may occur followed by ignition. If heated sufficiently or ignited in the presence of air, oxygen or strong oxidizing agents, can burn exothermically. May be ignited by strong oxidizing agents. Mostly unreactive in other settings. Not affected by aqueous solutions of acids, alkalis, most oxidizing agents, and most reducing agents[101].

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 milligram per cubic meter 15-minute Ceiling concentration; NIOSH considers asphalt fumes to be a potential occupational carcinogen and recommends that exposures be reduced to the lowest feasible concentration. See Pocket guide, Appendix A.

ACGIH TLV[1]: 0.5 milligram per cubic meter not to be exceeded at any time; not classifiable as a human carcinogen [asphalt (bitumen) fume (8052-42-)] *as benzene-soluble aerosol*; BEI issued (1999)

Asphalt (bitumen) and petroleum asphalt

PAC Ver 29

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2, *as bitumen, vapor and aerosol*

Arab Republic of Egypt: TWA 5 milligram per cubic meter, 1993; Australia: TWA 5 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter, 1993; Norway: TWA 5 milligram per cubic meter, 1999; Poland: TWA 5 milligram per cubic meter (fume), STEL 15 milligram per cubic meter (fume), 1999; United Kingdom LTEL 5 milligram per cubic meter, STEL 10 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Not classifiable as a human carcinogen

Occupational exposure to asphalt fumes is defined as exposure in the work-place at a concentration of one-half or more of the recommended occupational exposure limit. If exposure to other chemicals also occurs, as is the case when asphalt is mixed with a solvent, emulsified, or used concurrently with other materials, such as tar or pitch, provisions of any applicable standard for the other chemicals shall also be followed. Occupational exposure to asphalt fumes shall be controlled so that employees are not exposed to the airborne particulates at a concentration greater than 5 milligram per cubic meter (measured as total particulates) of air, determined during any 15-minute period (NIOSH Ceiling Concentration). Several states have set guidelines or standards for asphalt fumes in ambient air[60]: 50 μ/m^3 (North Dakota), 80 μ/m^3 (Virginia), 100 μ/m^3 (Connecticut), 119 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 5042 "Benzene-soluble fraction and total particulate (asphalt fume)." The total particulate portion of this method is based on NIOSH Analytical Method 0500. Other methods applicable to asphalt fume are NIOSH Analytical Method #5800, PACs, and NIOSH Analytical Method #2550, Benzothiazole in Asphalt Fume.

Routes of Entry: Inhalation of dusts and fumes. Skin exposure can cause thermal burns from hot asphalt.

Harmful Effects and Symptoms

Short-Term Exposure: The principal adverse effects on health from exposure to asphalt fumes are irritation of the serous membranes of the conjunctivae and the mucous membranes of the respiratory tract. Hot asphalt can cause burns of the skin; and release vapors that irritate the eyes, throat, and possible bronchial tubes and lungs.

Long-Term Exposure: In animals, there is evidence that asphalt left on the skin for long periods of time may result in local carcinomas, but there have been no reports of such effects of human skin that can be attributed to asphalt alone.

Points of Attack: Skin, respiratory system. Cancer site in animals: skin tumors. Reproductive system

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Lung function tests, Details of recommended preplacement and periodic physical examinations and record keeping have been set forth by NIOSH in the Criteria Document cited below. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Employees shall wear appropriate protective clothing, including gloves, suits, boots; face shields (8-inch minimum), or other clothing as needed, to prevent eye and/or skin contact with asphalt. NIOSH recommends thermally insulated gloves if working with hot asphalt, long sleeve shirts, long cuffless trousers, and metal-toed shoes. All protective clothing should be clean and available each day, and put on prior to the work-shift.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). Engineering controls shall be used when needed to keep concentrations of asphalt fumes below the recommended exposure limit. The only conditions under which compliance with the recommended exposure limit may be achieved by the use of respirators are: (1) During the time required to install or test the necessary engineering controls. (2) For operations, such as nonroutine maintenance or repair activities, causing brief exposure at concentrations above the environmental limit. (3) During emergencies when concentrations of asphalt fumes may exceed the environmental limit. When a respirator is permitted above, it shall be selected from a list of respirators approved by NIOSH. See the Criteria Document cited below.

Storage: Color code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Asphalt is normally shipped solid in steel drums. Fumes are encountered only in asphalt melting operations. Wherever lighter or liquid forms of asphalt are used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1999 Tars, liquid including road oils and cutback bitumens, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Spilled asphalt is allowed to cool and solidify whereupon it is recovered, melted and used if clean. Ventilate area of spill or leak. Absorb liquid asphalt with sand or other noncombustible absorbent material and place in containers for disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: The lighter, more liquid forms are flammable (especially cutback). The heavier, more solid forms may give off flammable gas when heated. Thermal decomposition products may include hydrogen sulfide. For heavy forms of asphalt, use dry chemical, carbon dioxide; or foam extinguishers. For light forms, use dry chemical, fog, or water mist. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Asphalt solids may be landfilled[22].

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, N, Xi; risk phrases R43; R48/22; R50/53; R62; R63; safety phrases: S2; S29; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Atrazine is a white, odorless, crystalline solid or powder which is often mixed with a flammable liquid. Molecular weight = 215.72; boiling point = decomposes; freezing/melting point = 175-177°C; specific gravity (H_2O:1) = 1.19; vapor pressure = 2.9×10^{-7}. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 0; reactivity 0. Slightly soluble in water; solubility 0.003%.

Potential Exposure: Atrazine is an herbicide and plant growth regulator used for season-long weed control in corn, sorghum, and certain other crops. Banned for use as a pesticide in the EU. US annual use > 75 millon pounds.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA; not classifiable as a human carcinogen

No PAC available.

DFG MAK: 2 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(8) (2004)

Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 2 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 0.2 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Switzerland: MAK-week 2 milligram per cubic meter, 1999; United Kingdom LTEL 10 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards[60] for atrazine in ambient air ranging from 50 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: Use OSHA versatile sampler-2; Reagent; GC/Electron capture detection; NIOSH #5602.

Permissible Concentration in Water: A maximum level (MCL and MCGL) in drinking water of 0.003 mg/L has been set by EPA[62]. The Canadian Drinking Water IMAC is 0.06 mg/L. A suggested no-adverse-effect-level in drinking water has been calculated by NAS/NRC as 0.15 mg/L. An acceptable daily intake (ADI) of 0.0215 mg/kg/day has been calculated for atrazine[46]. A limit of 0.5 mg/L of atrazine has been specified by Russia[43] in water bodies used for domestic purposes. Also, several states have set guidelines for atrazine in drinking water[61] ranging from 0.093 μg/L (Massachusetts) to 15 μg/L (California) to 25 μg/L (New York) to 43 μg/L (Maine) to 150 μg/L (Kansas).

Determination in Water: Analysis of atrazine is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen-phosphorus containing pesticides in water samples. In this method, approximately 1:1 sample is extracted with methylene chloride. The extract is concentrated, and the compounds are separated using capillary column GC. Measurement is made using a nitrogen phosphorus detector. The method detection limit has not been determined for this compound, but it is estimated that the detection limits for the method analytes are in the range of 0.1−2 μg/L. Fish Tox: 88.31816000 ppb MATC (INTERMEDIATE). Octanol−water coefficient: Log $K_{ow} = 2.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Atrazine is possibly carcinogenic to humans (IARC: 2B). There is inadequate evidence to confirm carcinogenicity of atrazine in humans. However, there is the increased risk for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects of atrazine on the hypothalamic pituitary gonadal axis.

Short-Term Exposure: Contact may cause skin and severe eye irritation.

Long-Term Exposure: Atrazine may be a carcinogen in humans since it has been shown to cause mammary and uterine cancers in animals. There is limited evidence that atrazine may damage the developing fetus. Atrazine may cause skin allergy. Human Tox: 3.00000 ppb (HIGH). Human Tox Type: MCL

Points of Attack: Eyes, skin, respiratory system; CNS; liver.

Medical Surveillance: Evaluation by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof (for liquid) or dust-proof (for powders or dust) chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Should be stored in tightly closed containers away from strong acids.

Shipping: UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Collect spilled dry material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Absorb liquid containing atrazine in vermiculite, dry sand; earth, or similar material. Treatment technologies which will remove atrazine from water include activated carbon adsorption, ion exchange, reverse osmosis, ozone oxidation and ultraviolet irradiation. Conventional treatment methods have been found to be ineffective for the removal of atrazine from drinking water. Limited data suggest that aeration would not be effective in atrazine removal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index $K_{oc} = 100$.

Fire Extinguishing: Extinguish fire using an agent suitable for the type of surrounding fire; atrazine itself does not burn. Thermal decomposition products may include hydrogen chloride and nitrogen oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Atrazine is hydrolyzed by either acid or base[22]. The hydroxy compounds are generally herbicidally inactive, but their complete environmental effects are uncertain. However, the method appears suitable for limited use and quantities of triazine. Atrazine underwent >99% decomposition when burned in a polyethylene bag, and combustion with a hydrocarbon fuel would appear to be a generally suitable method for small quantities. Combustion of larger quantities would probably require the use of a caustic wet scrubber to remove nitrogen oxides and HCl from the product gases[22].

California Proposition 65 Chemical[102]: Cancer 7/1/1987

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Possible risk of forming tumors.

Banned or Severely Restricted (Italy, Sweden) (UN)[13]

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U014 (as C.I. Solvent Yellow 34)

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A, RQ: 100 lb (45.4 kg)

CERCLA/SARA 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*492-80-8 and salts*): Hazard symbol: Xn, N; Risk phrases: R45; R22; R36; R40; R51/53; R62; Safety phrases: S2; S36/37; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)].

Description: Auramine is a yellow crystalline powder or flaky material. Molecular weight = 267.4; freezing/melting point = 136°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0; (*hydrochloride*) Health 3; flammability 0; reactivity 0. Insoluble in water.

Potential Exposure: Auramine is used industrially as a dye or dye intermediate for coloring textiles; paper, and leather. Also used as an antiseptic (a powerful antiseptic in ear and nose surgery, and treatment of gonorrhea) and fungicide. Human exposure to auramine occurs principally through skin absorption or inhalation of vapors. Low-level dermal exposure to the consumer may occur but would be limited to any migration of auramine from fabric, leather, or paper goods.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air
PAC Ver. 29[138]
2465-27-2, hydrochloride
PAC-1: 0.81 milligram per cubic meter
PAC-2: 8.9 milligram per cubic meter
PAC-3: 53 milligram per cubic meter
technical grade and hydrochloride
DFG MAK: [skin] Carcinogen Category 2
No numerical occupational exposure limits (OELs) have been established. However auramine may be a carcinogen; there may be no safe level of exposure. This chemical can be absorbed through the skin, thereby increasing the potential for exposure. Zero in New York, North Dakota[60] in ambient air.

Determination in Air: NIOSH Analytical Method #5013, Dyes

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes, and may cause damage. Skin absorption may result in dermatitis and burns, nausea and vomiting. May cause tumors. May be mutagenic.

Long-Term Exposure: Commercial auramine is carcinogenic in mice and rats after oral administration, producing liver tumors; after subcutaneous injection in rats, producing local sarcomas. The manufacture of auramine (which also involves exposure to other chemicals) has been shown in one study to be causally associated with an increase in bladder cancer. The actual carcinogenic compound(s) has not been specified precisely.

Points of Attack: Liver, bladder.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Monthly urinalysis. Physical exam every 6 months focused on bladder.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with auramine all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Cover with sand and soda ash. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Use water, carbon dioxide; powdered agents or alcohol foam on auramine fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incinerate in furnace with afterburner and scrubber[24].

Azacitidine A:1623

Formula: $C_8H_{12}N_4O5$

Synonyms: 5-AC; 4-Amino-1-β-D-ribofuranosyl-1,3,5-triazin-2(1*h*)-one; 4-Amino-1-β-D-ribofuranosyl-D-triazin-2(1*h*)-one; 4-Amino-1-β-D-ribofuranosyl-*S*-triazin-2(1*h*)-one; Antibiotic U-18496; 5′-Azacytidine; 5-Azacytidine; 5 AZC; 5-AZCR; Ladakamycin; MTase inhibitor; Mylosar; NCI-C01569; NSC 102816; NSC 103627; S-Triazin-2(1*H*)-one, 4-amino-1-β-D-ribofuranosyl-; 1,3,5-Triazin-2(1*H*)-one, 4-amino-1-β-D-ribofuranosyl-; U 18496; Vidaza

CAS Registry Number: 320-67-2

HSDB Number: 6879

RTECS Number: XZ3017500

UN/NA & ERG Number: UN3249 (medicine, solid, toxic, n.o.s.)/151

EC Number: 206-280-2

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: probably carcinogenic to humans, *probably carcinogenic to humans*, Group 2A.

California Proposition 65 Chemical[102]: Cancer 1/1/1992

Hazard Alert: Poison, Azicitidine is a regulated prescription drug and subject to labeling and other requirements. Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R45; R34; R36/37/38; R41; R50/53; R61; R62; R63; safety phrases: S1/2; S20/21; S28; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: White crystalline solid or powder. Molecular weight = 244.2; freezing/melting point = 228-230°C; vapor pressure = 4×10^{-12} mmHg @ 25°C. Low solubility in water; solubility ≤ 100 g/L @ 25°C.

Potential Exposure: A growth inhibitor (DNA methyltransferase inhibitor). A cytotoxic agent and chemotherapeutic agent used to treat *angina pectoris*, an ischemic heart disease symptom. Occupational exposure to azacitidine could occur among health professionals and support staff (including custodians) by dermal contact, inhalation, or accidental ingestion during drug preparation or administration or cleanup of medical waste, including disposal of excretions from treated patients (Zimmerman *et al*. 1981, NIOSH 2004). The National Occupational Exposure Survey (conducted from 1981 to 1983) estimated that 1069 health-services workers, including 698 women, potentially were exposed to azacitidine[77]. Azacitidine may be produced synthetically or isolated from the bacterium *Streptoverticillium ladakanus* [IARC 1990].

Incompatibilities: Azacitidine is Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with alkali metals, nitrides, and strong reducing agents such as hydrides may form flammable and/or toxic gases. May react with anhydrides forming acids and esters, generating noticeable heat, and also with oxoacids and carboxylic acids to form esters plus water, but the heat of reaction in the latter case typically is low. Keep away from isocyanates and epoxides; may initiate their polymerization. Azacitidine is sensitive to light and oxidation and unstable in solution. It undergoes hydrolysis in aqueous buffers.

Permissible Exposure Limits in Air: No standards or PAC available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -3.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Dermal contact, inhalation, or accidental ingestion during drug preparation The primary route of human exposure to azacitidine is intravenous or intramuscular injection in patients receiving anticancer therapy.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure via intravenous route include nausea, vomiting, diarrhea, reduction in white cell count, leukopenia and agranulocytosis. Other symptoms via intravenous route include dose-related leukemia, thrombocytopenia, myelosuppression, GI upset, alterations in hepatic function tests, fatal hepatic coma, myalgia, rhabdomyolysis, rash, stomatitis, fever, hypotension and reversible renal impairment. Symptoms of exposure to this type of compound include anorexia, local irritant effects, allergic reactions including pruritus and erythema, headache, malaise, weakness, anaphylaxis, vesicant or irritant effect on skin and mucous membranes, thrombophlebitis, anemia, bleeding, immunosuppressant effect, mouth ulcers, esophagitis, abdominal pain, hemorrhage, perforation of the stomach, alopecia, delayed wound healing, amenorrhea, inhibition of spermatogenesis, gynecomastia, hyperuricemia, acute renal failure due to uric acid nephropathy, hyperphosphatemia, disturbances of electrolyte balance, pigmentation of the skin and nails, jaundice and abnormal liver function tests [NCI].

Long-Term Exposure: May cause tumors. Suspected of causing genetic defects. May cause cancer.

Medical Surveillance: This chemical is a known or suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: *Eyes*: First check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20 to 30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: *Immediately* flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, *immediately* call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation*: *Immediately* leave the contaminated area; take deep breaths of fresh air. IMMEDIATELY call a physician and be prepared to transport the victim to a hospital even if no symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA (SCBA) should be used; if not available, use a level of protection greater than or equal to that advised under Protective Clothing. INGESTION: *Do not induce vomiting*. If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and *immediately* call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. *Do not induce vomiting*. Immediately transport the victim to a hospital.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). Where the neat test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with a combination filter cartridge, i.e. organic vapor/acid gas/HEPA (specific for organic vapors, HCl, acid gas, SO_2 and a high efficiency particulate filter)[193].

Storage: Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked and cool, ventilated area. Protect this chemical from exposure to light. Keep the container tightly closed under an inert atmosphere, and store under refrigerated temperatures[193].

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: If you spill this chemical, you should dampen the solid spill material with water, then transfer the dampened material to a suitable container. Use absorbent paper dampened with water to pick up any remaining material. Seal your contaminated clothing and the absorbent paper in a vapor-tight plastic bag for eventual disposal. Wash all contaminated surfaces with a soap and water solution. Do not reenter the contaminated area until the Safety Officer (or other responsible person) has verified that the area has been properly cleaned[72].

Fire Extinguishing: Thermal decomposition oxides of nitrogen carbon. Fires involving this material can be controlled with a dry chemical, carbon dioxide or Halon extinguisher. A water spray may also be used[193].

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Azadirachtin A:1624

Formula: $C_{35}H_{44}O_{16}$

Synonyms: AZATIN-O; Dimethyl (2aR,3S,4S,4aR,5S,7aS,8S,10R,10aS,10bR)-10-acetoxy-3,5-dihydroxy-4-[(1aR,S,3aS,6aS,7S,7aS)-6a-hydroxy-7a-methyl-3a,6a,7,7a-tetrahydro-2,7-methanofuro[2,3-b]oxireno[e]oxepin-1a(2*H*)-yl]-4-methyl-8-[[(2E)-2-methylbut-2-enoyl]oxy}octahydro-1*H*-naphtho[1,8a-c:4,5-b′c′]difuran-5,10a(8*H*)-dicarboxylate Dimethyl (2aR,3S,4S,R,S,7aS,8S,10R,10aS,10bR)-10-(acetyloxy)-3,5-dihydroxy-4-[(1S,2S,6S,8S,9R,11S)-2-hydroxy-11-methyl-5,7,10-trioxatetracyclo[6.3.1.02,6.09,11]dodec-3-en-9-yl]-4-methyl-8-[[(2E)-2-methylbut-2-enoyl]oxy] octahydro-1*H*-furo[3′,4′:4,4a]naphtho[1,8-bc]furan-5,10a (8*H*)-dicarboxylate; EPA Reg. No. 70051-9-59807

CAS Registry Number: 11141-17-6 (A-); 95507-03-2 (B-); 118855-02-0 (F-); 134788-15-1 (H-); 134788-16-2 (I-)

HSDB Number: 7372

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Sensitization hazard (skin); Agricultural chemical.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn; risk phrases: R22; R36/37; R43; R50/53; safety phrases: S1; S24/25; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Off-white, yellowish powder or dark brown emulsifiable concentrate. Molecular weight = 720.7 (A-); 662 (B-); freezing/melting point = 159°C; flash point ≥ 100°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 2; reactivity 0. Insoluble in water. Carrier solvents used in commercial formulations may change physical and toxicological properties.

Potential Exposure: Biological tetranortriterpinoid insecticide; insect growth regulator. A natural product extracted from seeds of the Neem tree (*Azadirachta indica*).

Incompatibilities: Powder or liquid may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, reducing agents and metals, acid chlorides, alkalis, alkali metals, high heat, including sunlight.

Permissible Exposure Limits in Air:

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Skin, eyes, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Eye and skin contact may cause mild to severe irritation or other temporary injury. Toxic if swallowed. LD_{50} = (oral-rat) 5 g/kg; LD_{50} = (dermal-rat) >2 g/kg

Long-Term Exposure: Constant exposure may cause skin sensitization.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: Eyes: First check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20 to 30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: Immediately flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, immediately call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation*: Immediately leave the contaminated area; take deep breaths of fresh air. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician and be prepared to transport the victim to a hospital. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA (SCBA) should be used; if not available, use a level of protection greater than or equal to that advised under Protective Clothing. *Ingestion*: *Do Not induce vomiting*. If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and immediately call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. Do Not induce vomiting. Immediately transport the victim to a hospital.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where risk assessment shows air-purifying respirators are appropriate, use a full-face respirator type (N100) United States or Type P3 (EN-143) respirators as backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Storage: Keep locked up in a cool, dark place or refrigerator. Safe Storage of Pesticides: Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72].

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. All equipment used to handle this material must be grounded. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. Wear positive-pressure, SCBA (SCBA). Wear chemical protective clothing which is specifically recommended by the manufacturer. Structural firefighter's protective clothing provides only limited protection. *Release, no fire*. Prevent dust cloud. Small spill: Cover with sand or other noncombustible material and place in a container for later disposal. Cover powder spills with plastic sheet or tarp to minimize spreading and protect from wind, rain, or spray. Large spill: Stop the release if it can be done safely from a distance. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use large amounts of water well away from release to disperse vapors—contain runoff. Ventilate confined area if it can be done without placing personnel at risk.

Fire Extinguishing: Liquid may be flammable. *Small fire*: Use dry chemical, CO_2, water spray, or polymer foam. *Large fire*: Use water spray, fog, or regular foam. Do not scatter spilled material with high pressure water streams. Dike fire-control water for later disposal. IF material is not leaking, cool exposed containers with large quantities of water from unattended equipment until fire is well out, or remove intact containers if it can be done safely. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Waste product may be disposed of onsite (open dumping may be prohibited) or at an approved waste disposal facility. All federal, state, and local environmental regulations must be observed.

Azathioprine A:1630

Formula: $C_9H_7N_2O_2S$

Synonyms: Azanin azatioprin; Azothioprine; BW 57-322; Ccucol; Imuran; Imurek; Imurel; 6-(1′-Methyl-4′-nitro-5′-imidazolyl)-mercaptopurine; Methylnitroimidazolylmercaptopurine; 6-(1-Methyl-*p*-nitro-5-imidazolyl)-thiopurine; 6-(1-Methyl-4-nitroimidazol-5-ylthio)purine; 6-(Methyl-*p*-nitro-5-imidazolyl)-thiopurine; 6-[(1-Methyl-4-nitro-1*H*-imidazol-5-yl)thio]-1*H*-purine; 6-[(1-Methyl-4-nitroimidazol-5-yl)thio]purine; NCI-C03474; NSC-39084; Rorasul

CAS Registry Number: 446-86-6

HSDB Number: 7084

RTECS Number: UO8925000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 207-175-4

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen; IARC: Human

Sufficient Evidence, 1980; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1998

California Proposition 65 Chemical[102]: Cancer; Developmental/Reproductive toxin.

Hazard Alert: Poison, Immunosuppressant, Antineoplastic, Antirheumatic drug; Reproductive toxin.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn; risk phrases: R45; R20/21/22; R36/37/38; R61; R62; safety phrases: S22; S26; S36/37; S41; S45; S53 (see Appendix 4).

Description: Azathioprine is a complex heterocyclic compound which forms pale yellow crystals. Molecular weight = 277.3; freezing/melting point = 243−244°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0.

Potential Exposure: Azathioprine is an immunosuppressive agent, generally used in combination with a corticosteroid to prevent rejection following renal homotransplantations. It also is used following transplantation of other organs. Other uses of azathioprine include the treatment of a variety of presumed autoimmune diseases, including rheumatoid arthritis; ankylosing spondylitis; systemic lupus erythematosus; dermatonyositis, periarteritis nodosa, scleroderma, refractory thombocytopenic purpura; autoimmune hemolytic anemia; chronic active liver disease; regional enteritis; ulcerative colitis; various autoimmune diseases of the eye; acute and chronic glomerulonephritis; the nephritic syndrome; Wegener's granulomatosis; and multiple sclerosis.

Incompatibilities: Incompatible with reducing agents, such as hydrides (may cause the release of explosive gases), oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids (violent exothermic reaction), strong bases.

Permissible Exposure Limits in Air

No standards or PAC available.

Permissible Concentration in Water: Octanol−water coefficient: Log $K_{ow} = 0.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Human exposure to azathioprine occurs because of its widespread use, since the 1970s, to prevent rejection following organ transplantation and to treat a variety of autoimmune diseases. Azathioprine is readily absorbed from the gut and is known to cross the human placenta.

Harmful Effects and Symptoms

There is sufficient evidence that azathioprine is carcinogenic in humans. Two large prospective studies of kidney transplant patients (receiving azathioprine and prednisone almost routinely) showed that these patients experienced increased incidences of nonHodgkin's lymphomas, cancer of the skin, hepatobiliary carcinoma and other tumors. Patients treated with azathioprine, but not transplant recipients, showed an increased incidence of the same cancers as patients with transplants, but to a lesser extent. Mice receiving azathioprine by intraperitoneal, subcutaneous or intramuscular injection had suggestive evidence of induced lymph system neoplasms. Rats given azathioprine orally had suggestive evidence of induced ear cancers. Results of the animal studies provide limited evidence of carcinogenicity. Among reported symptoms of azathioprine exposure are bone-marrow depression, especially leukopenia[52]; toxic hepatitis and jaundice, stomatitis, dermatitis, hair loss; fever; anorexia, vomiting and diarrhea. It is a developmental toxicant and suspected toxicant of the following systems: cardiovascular or blood-, respiratory, GI, liver, kidney, musculo-skeletal, respiratory.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere[52]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Remove all ignition sources. Dampen spilled material with toluene to avoid airborne dust. Seal the accumulated wastes in vapor-tight plastic bags for eventual disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include nitrogen and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Azobenzene A:1660

Formula: $C_{12}H_{10}N_2$; $C_6H_5N=NC_6H_5$

Synonyms: Azobenzide; Azobenzol; Azobisbenzene; Azodibenzene; Azodibenzeneazofume; Benzeneazobenzene; Diazobenzene; 1,2-Diphenyldiazene; Diphenyldiazene; Diphenyldiimide; NCI-C02926

CAS Registry Number: 103-33-3

HSDB Number: 1513

RTECS Number: CN1400000

UN/NA & ERG Number: UN2811 (Toxic solids, organic, n.o.s.)/154

EC Number: 203-102-5 [*Annex I Index No.*: 611-001-00-6]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Limited Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Bioassay (feed); clear evidence: rat; no evidence: mouse; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

California Proposition 65 Chemical[102]: Cancer 1/1/1990

Hazard Alert: Poison, Combustible, Chemically unstable, Possible risk of forming tumors, Suspected of causing genetic defects, Explosion hazard, Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R20/22; R48/22; R68; R50/53; R62 safety phrases: S29; S53; S41; S46; S60; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Azobenzene is a combustible, orange-red crystalline solid. Molecular weight = 182.2; boiling point = 293°C (decomposes); freezing/melting point = 68°C; vapor pressure = 7.6×10^{-5}. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0. Insoluble in water.

Potential Exposure: An azo compound. Those engaged in azobenzene use in dye, rubber, chemical, and pesticide manufacturing.

Incompatibilities: Azo compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides. This chemical is sensitive to prolonged exposure to heat. This chemical is incompatible with strong oxidizing agents[101].

Permissible Exposure Limits in Air

No standards or PAC available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \geq 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Azobenzene irritates the eyes, skin and respiratory tract. In serious cases there is a risk of unconsciousness and death. The consumption of alcohol may exacerbate toxic effects. The oral LD_{50} for rat is 1000 mg/kg.

Long-Term Exposure: A potential carcinogen. Can affect the blood and cause liver disorders.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests. CBC.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store under an inert atmosphere in a freezer or refrigerator. Protect from air and light[52]. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Transfer to vapor-tight plastic bags for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS Number: UG0800000
UN/NA & ERG Number: UN3234/150 (P)
EC Number: 201-132-3 [*Annex I Index No.*: 608-019-00-1]
Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable solid, Polymerization hazard.

United States Environmental Protection Agency TSCA Section 8(e) Risk Notification, 8EHQ-0892-8909.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Harmful to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & safety statements: Hazard symbol: E, Xn, N; risk phrases: R2; R11; R19; R20/22; R52/53; safety phrases: S2; S39; S41; S47; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Azobisisobutylonitrile is a white crystalline compound. Molecular weight = 164.23; specific gravity (H_2O:1) = 1.11 @ 25°C; boiling point = decomposes; freezing/melting point = (decomposes) 99–103°C; Autoignition temperature = 63°C. NFPA 704M Hazard Identification (based on NFPA-704M Rating System): Health 3; flammability 3; reactivity 3. Insoluble in water.

Potential Exposure: Azobisisobutylonitrile is both a nitrile and azo compound. Used as a polymerization initiator, free radical generator (or initiator); as a catalyst in vinyl polymerizations; as a blowing agent for elastomers and plastics.

Incompatibilities: Flammable; dust may form explosive mixture with air. Unstable and easily oxidized material; keep away from oxidizers, strong acids. Keep at temperature not $\geq 30°C$ (this may vary by manufacturer). Risk of explosion from heat, shock, friction. Warming causes production of tetramethylsuccinonitrile and cyanide fumes. Keep away from acetone and other ketones, alcohols, lithium, aluminum, aldehydes, and hydrocarbons, such as heptane. Azo compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides. This chemical is sensitive to prolonged exposure to heat. This chemical is incompatible with strong oxidizing agents[101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 4.1 milligram per cubic meter
PAC-2: 45 milligram per cubic meter
PAC-3: 130 milligram per cubic meter
NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.

Determination in Air: NIOSH Analytical Method #7904 (Cyanides). See also NIOSH Criteria Document 212 *Nitriles*

Permissible Concentration in Water: No criteria set. May be harmful to aquatic organisms.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 1.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Azodiisobutyronitrile can affect you by passing through your skin. Contact can cause irritation to the eyes and skin. Inhalation can irritate the nose and throat, causing wheezing and coughing. High exposure can cause dizziness, vomiting, abdominal pain; flushing, headache, shortness of breath; and coma. Convulsions and death may follow.

Long-Term Exposure: Azodiisobutyronitrile may cause liver and kidney damage. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Respiratory system, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood cyanide level. Liver and kidney function tests. Consider thyroid evaluation and CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note*: Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1-2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Where there is potential exists for exposures to azodiisobutyronitrile, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

NIOSH (*as cyanides*): *25 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Azodiisobutyronitrile must be stored to avoid contact with acetone, lithium, aluminum hydride, and water, since violent reactions occur. Azodiisobutyronitrile is self-reactive and will explode at elevated temperatures. It should be stored under nitrogen, dry ice or ice. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3234 Self-reactive solid type C, temperature controlled materials, Hazard Class: 4.1; Labels: 4.1-Flammable solid, Technical Name Required.

Spill Handling:

Nitriles

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not sweep or raise dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Do not use water or wet method*. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Azodiisobutyronitrile may self-ignite at elevated temperatures. Use dry chemical, CO_2, water spray; or foam extinguishers. Use water spray to keep fire-exposed containers cool. Thermal decomposition products may include oxides of nitrogen, tetramethylsuccinonitrile, and cyanide fumes. Containers may explode in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Azoxystrobin A:1680

Formula: $C_{22}H_{17}N_3O_5$

Synonyms: Amistar fungicide; (αE)-2-[[6-(2-Cyanophenoxy)-4-pyrimidinyl]oxy]-α-(methoxymethylene) benzeneacetic acid methyl ester; Heritage Fungicide; ICIA5504; Methyl (E)-2-[2-(6-(2-cyanophenoxy)pyrimidin-4-yloxy)phenyl]-3-methoxyacrylate

CAS Registry Number: 131860-33-8

HSDB Number: 7017

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3082/177

EC Number: 607-256-00-8

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, Not Likely to be Carcinogenic to Humans

Hazard Alert: Poison, Combustible, Agricultural chemical, Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & safety statements: Hazard symbol: T, N; risk phrases: R23; R50/53; safety phrases: S22; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: White to beige crystalline solid or powder. Molecular weight = 403.4; specific gravity = 1.33; freezing/melting point = 116°C[72]; vapor pressure = 3 to 8.25×10^{-13} mmHg @ 20°C; Henry's Law constant = 7×10^{-14} atm m^3/mol @ 25°C (est)[72]; hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 2; reactivity 0. Soluble in water; solubility = 6−10 mg/L @ 20°C. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: A β-methyoxyacrylate, Strobilurin is an agricultural fungicide.

Incompatibilities: Combustible; dust may form explosive with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

2 milligram per cubic meter TWA (recommended by Syngenta, makers of Amistar fungicide)

Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq 2.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, absorption through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Slightly to moderately toxic by ingestion, inhalation and skin absorption. May cause skin, eye and respiratory system irritation. LD_{50} = (oral-rat) >2 g/kg; LD_{50} = (dermal-rat) >5 g/kg.

Long-Term Exposure: Possible mutagen; in vitro test were positive for the induction of chromosomal aberrations in human lymphocytes assay[72]. May cause DNA damage. May cause liver damage.

Points of Attack: Liver and possibly the reproductive system.

Medical Surveillance: In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear positive-pressure, SCBA (SCBA). Wear chemical protective clothing which is specifically recommended by the manufacturer. Structural firefighter's protective clothing provides only limited protection.

Respirator Selection: Where there is potential exists for exposure to azoxystrobin, use respirators and components tested and approved under appropriate government standards: NIOSH/MSHA or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous flow mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place away from oxidizers. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Cover with plastic sheet to prevent spreading and to protect it from wind, rain or spray. Absorb or cover with *dry* sand, sand or other noncombustible material and transfer to containers clean up spill promptly. Don't wash it away. Instead, sprinkle the spill with sawdust, vermiculite, or kitty litter. Sweep it into a plastic garbage bag, and dispose of it as directed on the pesticide product label[72]. Stop the release if it can be done safely from a distance. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use large amounts of water well away from release to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. If in a building, evacuate the building and confine vapors by closing doors and shutting down HVAC system.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of nitrogen and carbon. Small fire: Use dry chemical, CO_2, or water spray. Large fire: Use *dry* chemical, CO_2, alcohol-resistant foam, or water spray. Keep exposures cool to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not allow water to get inside containers.* If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Recycle any unused portion of the material for its approved use or return it to the manufacturer or supplier. Dispose of contents and container to an approved waste disposal plant. Use a licensed professional waste disposal service to dispose of this material. Ultimate disposal of the chemical, product, and waste containers must consider: the material's impact on air quality; potential migration in soil or water; effects on animal and plant life; and conformance with public health, local, state, and federal health and environmental regulations. Never reuse or recycle used product containers unless the recycling program specifically accepts pesticide containers and you follow the program's instructions for preparing the empty containers for collection

B

Bacitracin B:0050

Formula: $C_{66}H_{103}N_{17}O_{16}S$
Synonyms: Ayfivin; Baciguent; Baci-Jel; Baciliquin; Bacitek ointment; Fortracin; Parentracin; Penitracin; Topitracin; Zutracin
CAS Registry Number: 1405-87-4
HSDB Number: 6418
RTECS Number: CP0175000
UN/NA & ERG Number: UN3249 (medicine, solid, toxic, n.o.s.)/151
EC Number: 215-786-2
Regulatory Authority and Advisory Information
Hazard Alert: Poison, Combustible, Sensitization hazard.
Listed on the TSCA inventory.
List of Acutely Toxic Chemicals, Chemical Emergency Preparedness Program (EPA) and formerly on CERCLA/SARA 40CFR302, Table 302.4 Extremely Hazardous Substances List. *Removed from listing in 1988*
Listed on Canada's DSL List.
Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R20/21/22; R43; safety phrases: S22; 36/37/39; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)].
Description: Bacitracin is a white to light tan powder which is odorless or having a slight odor and very bitter taste. Molecular weight = 1422.69; freezing/melting point: 221−224°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0. Highly soluble in water.
Potential Exposure: Bacitracin is used as an ingredient in antibiotic ointments to treat or prevent topical or eye infections. Commercial Bacitracin is a mixture of at least 9 bacitracins. Also used as a feed and drinking water additive for animals; as a food additive for human consumption.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.
Permissible Exposure Limits in Air
No standards or Protective Action Criteria (PAC) available.
Routes of Entry: Skin contact, inhalation, ingestion.
Harmful Effects and Symptoms
This data has been questioned, however, and it has been stated that as a result of a mathematical miscalculation, bacitracin was wrongly included on a list of hazardous chemicals drafted several years ago by the National Institute of Occupational Safety and Health. The mistake was remedied in 1988 when the substance was removed from the EHS list as noted above.
Short-Term Exposure: Bacitracin may be absorbed through the skin, thereby increasing exposure. May cause eye and/or skin irritation. Hypersensitivity reactions may result from application of this compound to the skin, but this may not be common. Ingestion may cause gastrointestinal upset with nausea, vomiting and diarrhea. LD_{50} = (oral-mouse) 25 mg/kg (highly toxic).
Long-Term Exposure: May cause liver damage. Exposure may cause hypersensitivity; allergic reaction to bacitracin through inhalations, ingestion and dermal contact.
Points of Attack: Liver, skin.
Medical Surveillance: Evaluation by a qualified allergist. Kidney function tests.
First Aid: In case of large-scale exposure, the directions for medicines (nonspecific, n.o.s.) would be applied as follows: Move victim to fresh air; call emergency medical care. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 minutes. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.
Storage: Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked and cool, ventilated area.
Shipping: UN 3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur and carbon. Use dry chemical, carbon dioxide; water spray; or polymer foam extinguishers. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Save fire control water for later disposal, do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00002-8

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.

agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses (SCBAs) that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.
