(*Carlsberg*) Sweden: TWA 1 glycine unit/m^3, ceiling 3 glycine units/m^3, 1999; United Kingdom: LTEL 0.00006 milligram per cubic meter; STEL 0.00006 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.00006 milligram per cubic meter. Several states have set guidelines or standards for *subtilis*ins in ambient air[60] ranging from zero (North Dakota); to 0.1 μ/m^3 (Nevada); to 1000.0 μ/m^3 (Virginia).

Determination in Air: No method available.

Routes of Entry: Inhalation of dust.

Harmful Effects and Symptoms

Short-Term Exposure: *Subtilis*ins can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Exposure can cause runny nose; congestion, sore throat; sweating, headache, chest pain; flu-like symptoms; cough, breathlessness, wheezing. Prolonged exposure may lead to chronic lung damage.

Long-Term Exposure: *Subtilis*ins may cause respiratory sensitization and enzyme asthma. Future exposures can cause asthma attacks with shortness of breath; wheezing, cough, and/or chest tightness. Contact can irritate the skin, especially in sweaty areas. Prolonged exposure may lead to chronic lung damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 0.00006 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator with a high efficiency particulate filter. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a powered-air purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed.

Where there is potential for high exposures exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include harmful and irritating gases. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS Number: EZ5075000

UN/NA & ERG Number: UN2771 (solid)/151; UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 202-388-9 [*Annex I Index No.:* 006-038-00-4]

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1983; NCI: Carcinogenesis Studies (feed); clear evidence: rat, mouse, 1978

California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: Poison, Possible thyroid effects, Combustible, Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R22; R50/53; safety phrases: S29/35; S53; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Sulfallate is an amber liquid. Molecular weight = 223.80; boiling point = 128−130°C under 1.0 mm pressure; flash point = 88°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: A dithiocarbamate. The major use for sulfallate in the United States is as a preemergent selective herbicide to control certain annual grasses and broadleaf weeds around vegetable and fruit crops. Sulfallate has also been used for weed control among shrubbery and ornamental plants. Some dithiocarbamates have been used as rubber components.

Incompatibilities: Dithiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of dithiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine.Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of dithiocarbamate with aldehydes, nitrides, and hydrides. Dithiocarbamate are incompatible with acids, peroxides, and acid halides.

Permissible Exposure Limits in Air

DFG MAK: Danger of skin sensitization (dithiocarbamates used as rubber components).

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. High exposure may cause fatigue, sleepiness, headache, dizziness, upset stomach; severe rash and personality changes; muscle weakness and collapse may result. LD_{50}(oral-rat) = 850 mg/kg (slightly toxic).

Long-Term Exposure: Thyroid effects. Repeated or prolonged skin contact may cause rash from irritation. A probable carcinogen in humans. Repeated exposure may cause kidney damage. Sulfallate, a chlorinated dithiocarbamate, administered in the feed, was carcinogenic to Osborne-Mendel rats and to B6C3F1 mice, inducing mammary gland tumors in females of both species, tumors of the fore stomach in male rats; and lung tumors in male mice.

Points of Attack: Skin, eyes, kidneys, plasma and thyroid function (possible goiter). Cancer site in animals: stomach, lungs.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others[52]. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or in a cool, dry regulated area. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2771 Dithiocarbamate and Thiocarbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include nitrogen oxides; sulfur oxides; and chlorine. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be decomposed by strong oxidizing agent. Large amounts should be incinerated in a unit with effluent gas scrubbing[22].

EC Number: 204-783-1 [*Annex I Index No.:* 016-031-00-8]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R36/37; safety phrases: S2; S25; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sulfolane is a colorless oily liquid. Molecular weight = 120.18; specific gravity (H_2O:1) = 1.26 @ 20°C Boiling point = 285°C; freezing/melting point = 27°C; flash point = 176°C. Explosive limits: LEL = 67,000 ppm, UEL: unknown; Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Soluble in water.

Potential Exposure: Sulfolane is used primarily as a process solvent for extraction of aromatics and for purification of acid gases. Used as a curing agent for epoxy resins, in medicine ash an antibacterial; fractionation of wood tars, tall oil, and other fatty acids; a component of hydraulic fluid; in textile finishing.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with nitronium tetrafluoroborate(1-) is potentially explosive.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 4.1 milligram per cubic meter

PAC-2: 45 milligram per cubic meter

PAC-3: 400 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritating to the eyes. Lethality data indicate that sulfolane is not highly acutely toxic. Oral LD

50 values in the rat range 1846−2500 mg/kg. Symptoms of neurotoxicity have been observed in rats, dogs, and monkeys; after ingestion, injection, inhalation or dermal application of sulfolane. These effects include convulsions, hyperactivity, tremors and ataxia. Other effects of acute exposure to sulfolane include alterations in stomach, intestines, lungs and liver following ingestion; and lung and liver inflammation following inhalation.

Long-Term Exposure: Sulfolane is neither a dermal sensitizer nor irritant in the guinea pig, but it does cause eye injuries in rabbits. Subchronic inhalation exposure to sulfolane has resulted in a reduction in the white blood cell count in rats and monkeys. No information was found on the carcinogenicity or teratogenicity of sulfolane. The compound was not found to be mutagenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3334 Aviation regulated liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material. Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R27/28; R33; R50/53; R62; safety phrases: S1/2; S23; S28; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sulfotep is a yellow mobile liquid. Garlic-like odor. Molecular weight = 322.34; specific gravity (H_2O:1) = 1.20 @ 25°C; boiling point = (decomposes) 131−135°C @ 2 mmHg; vapor pressure = 0.0002 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 1. Practically insoluble in water; solubility = 0.0007%. A pesticide that may be absorbed on a solid carrier or mixed in a more flammable liquid which will change the physical properties listed here.

Potential Exposure: Sulfotep is used in greenhouse fumigant formulations for control of aphids, spider mites; thrips, whiteflies, etc.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Hydrolyzes very slowly in aqueous solution. Attacks some forms of plastic, rubber and coating. Corrosive to iron.

Permissible Exposure Limits in Air

NIOSH IDLH = 10 milligram per cubic meter

Conversion factor: 1 ppm = 13.18 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.2 milligram per cubic meter TWA [skin]

NIOSH REL: 0.2 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.2 milligram per cubic meter, measured as inhalable fraction and vapor TWA [skin] not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 0.32 milligram per cubic meter

PAC-2: 3.5 milligram per cubic meter

PAC-3: 35 milligram per cubic meter

DFG MAK: 0.0075 ppm/0.1 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C

EEC OEL: 0.1 milligram per cubic meter [skin]

Australia: TWA 0.2 milligram per cubic meter [skin], 1993; Austria: MAK 0.015 ppm (0.2 milligram per cubic meter) [skin], 1999; Belgium: TWA 0.2 milligram per cubic meter [skin], 1993; Denmark: TWA 0.015 ppm (0.2 milligram per cubic meter) [skin], 1999; France: VME 0.2 milligram per cubic meter [skin], 1999; Norway: TWA 0.015 ppm (0.2 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter [skin], 2003; Switzerland: MAK-W 0.015 ppm (0.2 milligram per cubic meter) [skin], 1999; Turkey: TWA 0.2 milligram per cubic meter [skin], 1993; United Kingdom: TWA 0.2 milligram per cubic meter [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Several states have set guidelines or standards for sulfotep in ambient air ranging from 3.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (Connecticut); to 5.0 μ/m^3 (Nevada); to 20.0 μ/m^3 (North Dakota).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = \sim 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. Can cause rapid, fatal, poisoning. Contact may cause eye pain, blurred vision. May affect the nervous system. Symptoms of exposure include: lacrimation (discharge of tears); rhinorrhea (discharge of thin nasal mucous); headache, cyanosis, anorexia, nausea, vomiting, diarrhea, localized sweating; weakness, twitching, paralysis, Cheyne−Stokes respiration; convulsions, low blood pressure; cardiac irregular/irregularities; respiratory failure and death. Super toxic;

probable oral lethal dose in humans is less than 5 mg/kg, or a taste (less than seven drops) for a 70 kg (150 lb) person. It is a cholinesterase inhibitor. Material is similar to parathion in symptomatology, including nausea followed by vomiting; abdominal cramps; diarrhea, excessive salivation; headache, giddiness, dizziness, weakness, tightness in chest; blurring of vision; tearing, slurring of speech; confusion, troubled breathing; convulsions, coma and even death.

Long-Term Exposure: A cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. Repeated exposure may cause personality changes of depression, anxiety, or irritability.

Points of Attack: Eyes, skin, respiratory system; CNS; cardiovascular system, blood cholinesterase.

Medical Surveillance: NIOSH lists the following tests: Blood serum; cholinesterase, red blood cells/count. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above test as soon as possible and get an exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Keep under medical observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator). *Up to 5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 10 milligram per cubic meter:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and moisture. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1704 (Sulfotep) Tetraethyl dithiopyrophosphate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sulfotep may burn, but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Thermal decomposition products may include oxides of phosphorus and sulfur, and phosphoric acid mist. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Incineration with added flammable solvent in furnace equipped with afterburner and alkaline scrubber[22].

RTECS Number: WS4250000

UN/NA & ERG Number: UN1350 (solid)/133; UN2448 (molten)/155

EC Number: 231-722-6 [*Annex I Index No.:* 016-094-00-1]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Primary irritant (w/o allergic reaction).

FDA-over the counter and proprietary drug

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R38; safety phrases: S2; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonwater polluting agent (*metal*); 1-Low hazard to water. (*colloidal*).

Description: Sulfur is a yellow crystalline solid or powder. Often transported in the molten state. Molecular weight = 32.06; 256.5 (S_8); boiling point = 445°C; freezing/melting point = 113−120°C (amorphous); 115°C (β-sulfur); 107°C (r-sulfur); flash point = 207°C; 160°C (cc); autoignition temperature 232°C. Explosive limits: LEL = 35% (1400 g/m^3). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Insoluble in water.

Potential Exposure: Widely used in manufacture of sulfuric acid; carbon bisulfide; drugs, fungicides, gunpowder, wood pulp; rubber, and other products.

Incompatibilities: Combustible solid. Liquid forms sulfur dioxide with air. Violent reaction with strong oxidizers, halogen compounds; phosphorus, sodium, tin, uranium, metal carbides and other compounds. Forms explosive, shock-sensitive or pyrophoric mixtures with ammonia, ammonium nitrate; bromates, calcium carbide; charcoal, chlorates, hydrocarbons, iodates, iron. Attacks steel when moist.

Permissible Exposure Limits in Air

PAC Ver. 28, no value in Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Russia set a MAC for work-place air of 6.0 milligram per cubic meter of elemental sulfur.

Determination in Air: Filter; Acid; ICP; NIOSH Analytical Method (IV) #7300, Elements.

Permissible Concentration in Water: Mexico[35] set a MAC of 0.5 mg/L of sulfides in estuaries.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Sulfur can affect you when breathed in. Irritates the eyes, skin and respiratory tract. Exposure can cause inflammation of the nose and irritate the lungs.

Long-Term Exposure: Repeated exposures may cause chronic bronchitis to develop with cough, phlegm, and/or shortness of breath. Contact can irritate the skin and may cause a skin allergy. Repeated exposure to sulfur dust may cause permanent eye damage (clouding of the eye lens and chronic irritation).

Points of Attack: Skin, respiratory tract.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. Eye examination. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to sulfur, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store solid sulfur in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); chemically active metals (such as potassium, sodium lithium and zinc); charcoal, phosphorus, metal nitrates (such as potassium nitrate) and metal halogenates (such as zinc bromate). Molten sulfur must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); chemically active metals (such as potassium, sodium, lithium and zinc) and metal carbides (such as calcium carbide), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where sulfur is used, handled or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1350 Sulfur, Hazard Class: 4.1; Labels: 4.1-Flammable solid (International). NA1350 Sulfur, Hazard class: 9; Labels: 9-Miscellaneous hazardous material (Domestic). UN2448 Sulfur, molten, Hazard Class: 4.1; Labels: 4.1-Flammable solid (International). NA 2448 Sulfur, molten Hazard class: 9; Labels: 9-Miscellaneous hazardous material (Domestic).

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sulfur is a combustible solid. Use dry chemical, water spray; or foam extinguishers. Fire may restart after it has been extinguished. Dust or vapor (from molten sulfur) forms explosive mixture with air. Thermal decomposition products may include sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Salvage for reprocessing or dump to landfill.

EC Number: 233-036-2 [*Annex I Index No.:* 016-012-00-4]
Regulatory Authority and Advisory Information
Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).
Hazard Alert: Poison inhalation hazard, Combustible, Environmental hazard.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)
United States DOT 49CFR172.101, Inhalation Hazardous Chemical
United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R14; R20; R25; R29; R35; R50; safety phrases: S1/2; S26; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Sulfur chloride is a fuming, oily liquid with a yellowish-red to amber color and a suffocating odor. It has an added hazard since it oxidizes and hydrolyzes to sulfur dioxide and hydrogen chloride. Molecular weight = 135.02; specific gravity (H_2O:1) = 1.7 @ 16°C; boiling point = 138°C; freezing/melting point = −77°C; vapor pressure = 10 mmHg @ 28°C; flash point = 118°C (cc)[17]. Autoignition temperature = 234°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 1₩. Reacts with water (decomposes).
Potential Exposure: Sulfur chloride finds use as a chlorinating agent, catalyst, and as an intermediate in the manufacture of organic chemicals; carbon tetrachloride; sulfur dyes; insecticides, synthetic rubber; and pharmaceuticals. Exposure may also occur during the extraction of gold, purification of sugar juice; finishing and dyeing textiles; processing vegetable oils; hardening wood; and vulcanization of rubber. Has been used as a military poison.
Incompatibilities: Decomposes violently in water, forming hydrochloric acid, sulfur dioxide; sulfur, sulfite, thiosulfate, and hydrogen sulfide. Reacts with oxidizers, strong bases; peroxides, phosphorus oxides; organics, antimony, antimony sulfide; arsenic sulfide; mercury oxide; tin, alkenes, terpenes, unsaturated glycerides; chromyl chloride; methyl sulfoxide; dimethylformamide, acetone, and other compounds; causing fire and explosion hazard. Corrosive to many metals in presence of water. Attacks some plastics, rubber and coatings.
Permissible Exposure Limits in Air
NIOSH IDLH = 5 ppm
Conversion factor 1 ppm = 5.52 milligram per cubic meter
OSHA PEL: 1 ppm/6 milligram per cubic meter TWA
NIOSH REL: 1 ppm/6 milligram per cubic meter Ceiling Concentration
ACGIH TLV[1]: 1 ppm/5.5 milligram per cubic meter Ceiling Concentration
PAC* Ver. 29[138]
PAC-1: $\mathbf{0.53}_{\mathbf{A}}$ ppm
PAC-2: $\mathbf{6.4}_{\mathbf{A}}$ ppm
PAC-3: $\mathbf{15}_{\mathbf{A}}$ ppm
*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.
Australia: TWA 1 ppm (6 milligram per cubic meter), 1993; Austria: MAK 1 ppm (6 milligram per cubic meter), 1999; Belgium: STEL 1 ppm (5.5 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (6 milligram per cubic meter), 1999; Finland: TWA 1 ppm (6 milligram per cubic meter); STEL 2 ppm (12 milligram per cubic meter) [skin], 1999; Hungary: STEL 5 milligram per cubic meter, 1993; Japan: 1 ppm (5.5 milligram per cubic meter), 1999; the Netherlands: MAC 6 milligram per cubic meter, 2003; Norway: TWA 1 ppm (6 milligram per cubic meter), 1999; the Philippines: TWA 6 milligram per cubic meter, 1993; Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 15 milligram per cubic meter, 1999; Russia: STEL 1 ppm (0.3 milligram per cubic meter) [skin], 1993; Switzerland: MAK-W 1 ppm (6 milligram per cubic meter), KZG-W 2 ppm (12 milligram per cubic meter), 1999; United Kingdom: STEL 1 ppm (5.6 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 1 ppm.
Several states have set guidelines or standards for sulfur monochloride in ambient air[60] ranging from 50.0 μ/m^3 (Virginia); to 60.0 μ/m^3 (North Dakota); to 120.0 μ/m^3 (Connecticut); to 143.0 μ/m^3 (Nevada).

Determination in Air: No method available.
Determination in Water: Violent reaction.
Routes of Entry: Inhalation of vapor, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: A lacrimator and corrosive. Fumes can cause severe irritation to eyes, skin, and mucous membranes of the upper respiratory tract. Contact can cause severe irritation, burns and permanent eye damage. Corrosive on ingestion. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause headache, nausea, and dizziness. Although this compound is capable of producing severe pulmonary irritation, few serious cases of industrial exposure have been reported. This may be due to the pronounced irritant effects of sulfur chloride which serve as an immediate warning signal when concentration of the gas approaches a hazardous
Long-Term Exposure: May cause lung damage; bronchitis may develop. Repeated exposure can cause drying and cracking of the skin.
Points of Attack: Respiratory system, skin, eyes, lungs.
Medical Surveillance: Preemployment and periodic examinations should give special emphasis to the skin, eyes, and respiratory system. Pulmonary function tests may be useful. Lung function tests. Consider chest X-ray following acute overexposure. Exposures may also include sulfur dioxide and hydrochloric acid. See also these compounds.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *5 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.
Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Keep containers well closed and upright, away from heat. Do not allow water to get into container as this material reacts violently with water when in a closed vessel. Provisions should be made for washing down spills with large quantities of water. Vapor-tight electrical equipment is recommended to reduce corrosion. Separate from oxidizing materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.
Shipping: UN1828 Sulfur chlorides, Hazard class: 8; Labels: 8-Corrosive material, Potential Inhalation Hazard (Special Provision 5)

Spill Handling:
Sulfur chlorides
Initial isolation and protective action distances
Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).
Small spills (From a small package or a small leak from a large package)
When spilled on land
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.5/0.8
Night 0.8/1.3
When spilled in water
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.8/1.3
Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Avoid contact with liquid and vapor. Keep people away. Wear goggles, SCBA, and rubber overclothing (including gloves). Stop discharge if possible to do so without harm. Call fire department. Isolate and remove discharged material. Notify local health and pollution control agencies. Remove all ignition sources. Ventilate area of spill or leak. The aqueous solution is a strong acid that can be neutralized with lime or soda ash. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride; hydrogen sulfide; sulfur oxides. *Do not use water*. Use chemical extinguishers. Decomposes on contact with water to produce heat and toxic and corrosive fumes. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Wearing protective equipment, spray carefully onto sodium ash/slaked lime mixture. Then spray with water, dilute, neutralize and flush to drain.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R5; R21; R23; R34; R62; R63; safety phrases: S1/2; S9; S26; S33; S36/37/39; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sulfur dioxide is a noncombustible colorless gas at ambient temperatures with a characteristic, strong, suffocating odor. The Odor Threshold is 1.1ppm. Shipped as a liquefied compressed gas. Molecular weight = 64.06; specific gravity (H_2O:1) = 2.6 @ 20°C; boiling point = −10°C; freezing/melting point = −76°C; relative vapor density (air = 1) = 2.26. Vapor pressure = 3.2 atm; 750 mmHg @ 10.3°C;. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Soluble in water; solubility = 10%.

Potential Exposure: Sulfur dioxide is used in the manufacture of sodium sulfite, sulfuric acid; sulfuryl chloride; thionyl chloride; organic sulfonates; disinfectants, fumigants, glass, wine, ice, industrial and edible protein; and vapor pressure thermometers. It is also used in the bleaching of beet sugar, flour, fruit, gelatin, glue, grain, oil, straw, textiles, wicker ware; wood pulp; and wool; in the tanning of leather; in brewing and preserving; and in the refrigeration industry. Exposure may also occur in various other industrial processes as it is a by-product of ore smelting, coal and fuel oil combustion; paper manufacturing and petroleum refining.

Incompatibilities: Reacts with water to form sulfurous acid, a medium-strong acid. Reacts violently with ammonia, acrolein, acetylene; alkali metals; such as sodium, potassium, magnesium, and zinc; chlorine, ethylene oxide; amines, butadiene. Attacks many metals including aluminum, iron, steel, brass, copper, nickel; especially in presence of water or steam. Incompatible with halogens. Attacks plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 2.62 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/13 milligram per cubic meter

NIOSH REL: 2 ppm/5 milligram per cubic meter TWA; 5 ppm/13 milligram per cubic meter STEL

ACGIH TLV[1]: 0.25 ppm/0.65 milligram per cubic meter STEL; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: $\mathbf{0.20_A}$ ppm

PAC-2: $\mathbf{0.75_A}$ ppm

PAC-3: $\mathbf{30_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 0.5 ppm/1.3 milligram per cubic meter TWA; Peak Limitation Category I(1); a momentary Ceiling Concentration value of 1 mL/m^3/2.7 milligram per cubic meter should not be exceeded; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 5 ppm (13 milligram per cubic meter), 1993; Australia: TWA 2 ppm (5 milligram per cubic meter); STEL 5 ppm, 1993; Austria: MAK 2 ppm (5 milligram per cubic meter), 1999; Belgium: TWA 2 ppm (5.2 milligram per cubic meter); STEL 5 ppm (13 milligram per cubic meter), 1993; Denmark: TWA 2 ppm (5 milligram per cubic meter), 1999; Finland: TWA 2 ppm (5 milligram per cubic meter); STEL 5 ppm (13 milligram per cubic meter), 1999; France: VME 2 ppm (5 milligram per cubic meter), VLE 5 ppm (10 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Japan: 1999; Norway: TWA 2 ppm (5 milligram per cubic meter), 1999; the Philippines: TWA 5 ppm (13 milligram per cubic meter), 1993; Poland: MAC (TWA) 2 milligram per cubic meter; MAC (STEL) 5 milligram per cubic meter, 1999; Russia: STEL 10 milligram per cubic meter [skin], 1993; Sweden: NGV 2 ppm (5 milligram per cubic meter), TKV 5 ppm (13 milligram per cubic meter), 1999; Switzerland: MAK-W 2 ppm (5 milligram per cubic meter), KZG-W 4 ppm (10 milligram per cubic meter), 1999; Thailand: TWA 5 ppm (13 milligram per cubic meter), 1993; Turkey: TWA 5 ppm (13 milligram per cubic meter), 1993; United Kingdom: TWA 2 ppm (5.3 milligram per cubic meter); STEL 5 ppm (13 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH TLV: STEL 5 ppm. Russia[43] set a MAC for ambient air in residential areas of 0.5 milligram per cubic meter on a momentary basis and 0.05 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for sulfur dioxide in ambient air[60] ranging from 1.2 μ/m^3 (Tennessee); to 80.0−1300.0 μ/m^3 (Arizona); to 119.0 μ/m^3 (Nevada); to 1300.0 μ/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #6004, Sulfur dioxide; OSHA Analytical Methods ID-200, ID-104 (for impinger).

Routes of Entry: Inhalation of gas; direct contact of gas or liquid phase on skin and mucous membranes.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Causes irritation of the eyes, nose, throat. Nose and throat irritation may be let @ 6−12 ppm. Between 10−50 ppm for 5−15 minutes, runny nose (rhinorrhea); difficult breathing; coughing and choking; reflex bronchoconstriction may occur. Levels of 50−100 ppm may only be tolerated for 30−60 minutes, and 400 ppm and above may immediately cause swelling and accumulation of fluid in throat and lungs (pulmonary edema), breathing stoppage; pneumonia, and death. Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* Levels of 1% (10,000 ppm) may be irritating to moist skin. Liquid may cause frostbite and chemical burns. *Eyes:* Irritation may occur @ 20 ppm and above. Liquid may cause frostbite, and permanent damage leading to blindness. *Ingestion:* Liquid may cause frostbite and chemical burns to mouth.

Long-Term Exposure: Repeated or prolonged inhalation exposure may cause asthma. May cause chronic irritation of the eyes and respiratory tract; loss of the sense of smell; burning and dryness. Stomach problems may also occur. May cause permanent lung damage. Repeated exposure to 10 ppm may cause irritation to throat and lungs and an increased occurrence of nosebleeds. There is limited animal evidence that sulfur dioxide causes lung cancer in animals. There is limited evidence that sulfur dioxide may damage the developing fetus. *Note:* Persons with asthma, subnormal pulmonary function, or cardiovascular disease are at greater risk. Sulfur dioxide may irritate the eyes and respiratory tract. Signs and symptoms of acute exposure to sulfur dioxide may be severe and include coughing, choking, dyspnea (shortness of breath), sneezing, wheezing, and chest discomfort. Upper airway edema (swelling) or obstruction, bronchoconstriction, pneumonia, pulmonary edema; and respiratory paralysis may occur. Fatigue may be noted. Gastrointestinal effects may include nausea, vomiting, and abdominal pain. Cyanosis (blue tint to skin and mucous membranes) may be noted following exposure to sulfur dioxide. It may cause death or permanent injury after very short exposure to small quantities. 1000 ppm causes death in from 10 minutes to several hours by respiratory depression.

Points of Attack: Respiratory system, skin, eyes.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, ECG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; white blood cell count/differential. Preplacement and periodic medical examinations should be concerned especially with the skin, eyes and respiratory tract. Lung function tests. Examination of the eyes, nose, and throat. Consider chest X-ray following acute overexposure. Pulmonary function should be evaluated, as well as smoking habits, and exposure to other pulmonary irritants.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *20 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *100 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode) *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poisonous and corrosive gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Keep temperature <54°C/130°F, protect containers from damage. Outdoor, ventilated, fireproof storage preferred. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1079 Sulfur dioxide, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone C. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.7/2.7

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 3000/1000
Then: Protect persons downwind (mi/km)
Day 3.5/5.5
Night 7.0 + /11.0 + *

* + means distance can be larger in certain atmospheric conditions.

****Attention:*** If dealing with a large spill from the following containers: (1) Rail tank car, (2) Highway tank truck or trailer, (3) Multiple ton cylinders or (4) Multiple small cylinders or single ton cylinder see the following: "ERG Table 3: Initial Isolation and Protective Action Distances for Different Quantities of Six Common Toxic-by-Inhalation Gases." This chart shows isolation protective distances for the transport containers listed above (numbers 1 through 4) and various wind conditions: Low wind (<6 mph); Moderate wind (6 to 12 mph); High wind (> 12 mph).

Rail tank car (isolate, all directions) 3000 ft; **Day:** (Lo)7 + mi./(Med) 7 + mi./(Hi) 4.4 mi.; **Night:** (Lo)7 + mi./(Med) 7 + mi./(Hi) 6.1 mi.

Highway tank truck or trailer (isolate, all directions) 3000 ft; **Day:** (Lo)7 + mi./(Med) 3.6 mi./(Hi) 3.1 mi.; **Night:** (Lo)7 + mi./(Med) 5 mi./(Hi) 3.8 mi.

Multiple ton cylinders (isolate, all directions) 1500 ft; **Day:** (Lo)3.2 mi./(Med) 1.5 mi./(Hi) 1.1 mi.; **Night:** (Lo) 4.7 mi./(Med) 2.5 mi./(Hi) 1.7 mi.

Multiple small cylinders or single ton cylinder (isolate, all directions) 600 ft; **Day:** (Lo)1.9 mi./(Med) 0.9 mi./(Hi) 0.7 mi.; **Night:** (Lo) 3.5 mi./(Med) 1.5 mi./(Hi) 0.9 mi.

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable. Extinguish fires with dry chemical, carbon dioxide; water spry, fog or foam. Wear SCBA and full protective clothing. Move container from fire area. Stay away from ends of tanks. Cool containers that are exposed to flames with water from the side until well after the fire is out. Isolate area until gas has dispersed. Keep unnecessary people away. Containers may explode in heat of fire, or they may rupture and release irritating toxic sulfur dioxide. Sulfur dioxide has explosive properties when it comes in contact with sodium hydride; potassium chlorate at elevated temperatures; ethanol; ether; at very cool temperatures (−15°C); fluorine; chlorine trifluoride and chlorates. It will react with water or steam to produce toxic and corrosive fumes. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Pass into soda ash solution, then add calcium hypochlorite; neutralize and flush to sewer with water (A-38).

Regulatory Authority and Advisory Information

Hazard Alert: Suffocation/asphyxiation hazard, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg[F]/L, as Fluoride.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R5; R21; R37; safety phrases: S9; S33; S38; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Sulfur hexafluoride is a colorless, odorless gas. Shipped as a liquefied compressed gas. Molecular weight = 146.06; specific gravity (H_2O:1) = 1.7 @ 20°C; boiling point = (sublimes) − 64°C; freezing/melting point = (sublimes) − 51°C; relative vapor density (air = 1): 5.11; vapor pressure = 21.5 atm. Condenses directly to a solid upon cooling. Practically insoluble in water; solubility = 0.003% @ 25°C.

Potential Exposure: May contain highly toxic sulfur pentafluoride as an impurity. SF6 is used in various electric power applications as a gaseous dielectric or insulator. The most extensive use is in high-voltage transformers. SF6 is also used in waveguides, linear particle accelerators; Van de Graaff generators; chemically pumped continuous-wave lasers; transmission lines; and power distribution substations. Nonelectrical applications include use as a protective atmosphere for casting of magnesium alloys and use as a leak detector or in tracing moving air masses. Several sources note that vitreous substitution of SF6 in owl monkeys results in a greater ocular vascular permeability than that caused by saline. This implies that SF_6 could have an important use in retinal surgery.

Incompatibilities: May contain impurities that cause it to hydrolyze on contact with water, forming corrosive and toxic hydrogen fluoride. Vigorous reaction with disilane.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 5.98 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: 1000 ppm/6000 milligram per cubic meter TWA
NIOSH REL: 1000 ppm/6000 milligram per cubic meter TWA
ACGIH TLV[1]: 1000 ppm/5970 milligram per cubic meter TWA
PAC Ver. 29[138]
PAC-1: 3000 ppm
PAC-2: 33,000 ppm
PAC-3: 200E + 05 ppm
DFG MAK: 1000 ppm/6100 milligram per cubic meter TWA; Peak Limitation Category II(8); Pregnancy Risk Group D
Australia: TWA 1000 ppm (6000 milligram per cubic meter), 1993; Austria: MAK 1000 ppm (6000 milligram per cubic meter), 1999; Belgium: TWA 1000 ppm (5970 milligram per cubic meter), 1993; Denmark: TWA 1000 ppm (6000 milligram per cubic meter), 1999; Finland: TWA 1000 ppm (6000 milligram per cubic meter); STEL 1250 ppm (7500 milligram per cubic meter), 1999; France: VME 1000 ppm (6000 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 6000 milligram per cubic meter, 2003; the Philippines: TWA 1000 ppm (6000 milligram per cubic meter), 1993; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 5000 milligram per cubic meter, 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1000 ppm (6000 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (6000 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (6070 milligram per cubic meter); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1000 ppm. Several states have set guidelines or standards for sulfur hexafluoride in ambient air[60] ranging from 60.0 milligram per cubic meter (North Dakota); to 100.0 milligram per cubic meter (Virginia); to 120.0 milligram per cubic meter (Connecticut); to 142.857 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6602.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.68$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with the liquid may cause frostbite. Symptoms of exposure include asphyxia; increase(d) breathing rate; pulse rate; slight muscle incoordination; emotional upset; fatigue, nausea, vomiting. SF_6 is considered to be physiologically inert in the pure state. In high concentrations. However, pure SF_6 can act as a simple asphyxiant by displacing the necessary oxygen. Ordinarily, however, SF_6 does not exist in the pure state. It contains variable quantities of sulfur fluorides. In the presence of water, these sulfur fluorides can hydrolyze to yield hydrogen fluoride (HF) and oxygluoride compounds, such as sulfuryl fluoride (SO_2F_2) and thionyl fluoride (SOF_2). These compounds have much more toxic health effects. Sulfur hexafluoride may also be contaminated with more toxic sulfur compounds, such as S_2F_{10}.

Long-Term Exposure: Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability, and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite; diarrhea or constipation. Nosebleeds and sinus problems can also occur.

Points of Attack: Respiratory system, skeleton

Medical Surveillance: Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure.

First Aid: *Eye:* If eye tissue is frozen, seek medical attention immediately; if tissue is not frozen, immediately and thoroughly flush the eyes with large amounts of water for at least 15 minutes, occasionally lifting the lower and upper eyelids. If irritation, pain, swelling, lacrimation, or photophobia persist, get medical attention as soon as possible. *Skin:* If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water. Breathing: If a person breathes large amounts of this chemical, move the exposed person to fresh air at once. If breathing has stopped, perform mouth-to-mouth resuscitation. Keep the affected person warm and at rest. Get medical attention as soon as possible[190].

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *(fluorides) 12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PAPRDM^{*+} *if not present as a fume* (any powered, air-purifying respirator with a dust and mist filter). *125 milligram per cubic meter:* HieF^{+} (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF^{+} (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* *Substance reported to cause eye irritation or damage; may require eye protection. $^{+}$May need acid gas sorbent.

Storage: Check oxygen content prior to entering storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Outdoor, ventilated, fireproof storage preferred. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1080 Sulfur hexafluoride, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area for at least 100 m/330 ft in all directions. *Large spill*: Consider initial downwind evacuation for at least 500 m/1/3 mi. If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable gas. Thermal decomposition products may include hydrogen fluoride and oxides of sulfur. If tank, rail car or tank truck is involved in a fire, *isolate* for 800 m/0.5 mi. in all directions; also, consider initial evacuation for 800 m/0.5 mi. in all directions[31]. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Seal unused cylinders and return to suppliers.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sulfuric acid is a colorless to dark brown, odorless, oily liquid which is commercially sold @ 93% to 98% H_2SO_4, the remainder being water. Molecular weight = 98.08; specific gravity (H_2O:1) = 1.8 @ 25°C; boiling point = (decomposes) 340°C; freezing/melting point = 10.6°C; vapor pressure = 0.001 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 2₩. Fuming sulfuric acid (oleum) gives off free SO_2. Soluble in water; violent reaction.

Potential Exposure: Used as a chemical feedstock in the manufacture of acetic acid, hydrochloric acid; citric acid; phosphoric acid; aluminum sulfate; ammonium sulfate; barium sulfate; copper sulfate; phenol, superphosphates, titanium dioxide; as well as synthetic fertilizers, nitrate explosives; artificial fibers; dyes, pharmaceuticals, detergents, glue, paint, and paper. It finds use as a dehydrating agent for esters and ethers due to its high affinity for water; as an electrolyte in storage batteries; for the hydrolysis of cellulose to obtain glucose; in the refining of mineral and vegetable oil; and in the leather industry. Other uses include fur and food processing; carbonization of wool fabrics; gas drying; uranium extraction from pitchblende; and laboratory analysis. Sulfuric acid is among the highest-volume produced chemical in the United States.

Incompatibilities: A strong acid and oxidizer. Reacts violently with water with dangerous spattering and evolution of heat. Reacts violently with combustible and reducing materials; bases, organic materials; chlorates, carbides, picrates, fulminates, water, powdered metals. Corrosive to most common metals forming explosive hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 15 milligram per cubic meter

OSHA PEL: 1 milligram per cubic meter TWA

NIOSH REL: 1 milligram per cubic meter TWA

ACGIH TLV[1]: 0.2 milligram per cubic meter (measured as thoracic fraction of the aerosol) TWA; Suspected Human Carcinogen; H_2SO_4 contained in strong inorganic acid mists

PAC* Ver. 29[138]

includes oleum

PAC-1: **0.20**$_{\mathbf{A}}$ milligram per cubic meter

PAC-2: **8.7**$_{\mathbf{A}}$ milligram per cubic meter

PAC-3: **160**$_{\mathbf{A}}$ milligram per cubic meter

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 0.1 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category I(1), a momentary Ceiling value of 0.2 milligram per cubic meter should not be exceeded; Carcinogen Category 4; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 1 milligram per cubic meter, 1993; Australia: TWA 1 milligram per cubic meter, 1993; Austria: MAK 1 milligram per cubic meter, 1999; Belgium: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1993; Denmark: TWA 1 milligram per cubic meter, 1999; Finland: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter [skin], 1999; France: VME 1 milligram per cubic meter, VLE 3 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Japan: 1 milligram per cubic meter, 1999; Norway: TWA 1 milligram per cubic meter, 1999; Poland: MAC (TWA) 1 milligram per cubic meter; MAC (STEL) 3 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter [skin], 1993; Sweden: NGV 1 milligram per cubic meter, TKV 3 milligram per cubic meter, 1999; Switzerland: MAK-W 1 milligram per cubic meter, KZG-W 2 milligram per cubic meter, 1999; Thailand: TWA 1 milligram per cubic meter, 1993; Turkey: TWA 1 milligram per cubic meter, 1993; United Kingdom: TWA 1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 3 milligram per cubic meter. Several states have set guidelines or standards for sulfuric acid in ambient air[60] ranging from 2.381 μ/m^3 (Kansas); to 10.0 μ/m^3 (South Carolina); to 14.0 μ/m^3 (Massachusetts); to 16.0 μ/m^3 (Virginia); to 12.0−100.0 μ/m^3 (North Carolina); to 20.0 μ/m^3 (Connecticut); to 24.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7903, Inorganic Acids; OSHA Analytical Method ID-113.

Permissible Concentration in Water: A guideline of 250 μg/L of sulfate has been recommended for drinking water by the EEC[35] and the state of Kansas[61].

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May cause irritation of nose and throat at levels of 5 milligram per cubic meter. Swelling of the throat and lungs and inflammation of the bronchial membranes may occur at levels of 12−35 milligram per cubic meter. A few drops in the lung air passages may be fatal. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* May cause severe irritation, burns and ulceration. *Eyes:* May cause severe irritation, damage to the cornea and blindness. *Ingestion:* May cause damage to teeth, burning of the mouth, throat, and stomach; nausea, vomiting of blood and eroded tissue; holes in the stomach and intestines, shock and kidney damage. Death may occur from as little as 1 oz. Signs and symptoms of acute ingestion of sulfuric acid may be severe and include salivation, intense thirst; difficulty in swallowing; pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of sulfuric acid. Acute inhalation exposure may result in sneezing, hoarseness, choking, laryngitis, dyspnea (shortness of breath); respiratory tract irritation; and chest pain. Bleeding of nose and gums, ulceration of the nasal and oral mucosa; pulmonary edema; chronic bronchitis; and pneumonia may also occur. If the eyes have come in contact with sulfuric acid, irritation, pain, swelling, corneal erosion; and blindness may result. Dermal exposure may result in severe burns, pain, and dermatitis (red, inflamed skin).

Long-Term Exposure: Can cause chronic runny nose; tearing of the eyes; nose bleeding; and stomach upset. Risk of tooth erosion and pitting from repeated or prolonged exposure to the aerosol. Lungs may be affected by repeated or prolonged exposure to the aerosol; bronchitis may develop. Exposure to amounts greater than 3.0 milligram per cubic meter may cause all of the above symptoms in greater severity.

Points of Attack: Eyes, skin, respiratory system; teeth.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 second). For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. Exam of the teeth. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene, Teflon, Saranex, Neoprene/natural rubber, Viton are among the recommended protective materials for *sulfuric acid solution of more than 70%.* All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. for engineering controls see NIOSH Criteria Document #74-128, *Exposure to Sulfuric Acid.*

Respirator Selection: *Up to 15 milligram per cubic meter:* Sa:Cf (APF = 25)$^{\pounds}$ (any supplied-air respirator operated in a continuous-flow mode); or PaprAgHie (APF = 25) (APF = 25)$^{\pounds}$ (any powered, air-purifying respirator with acid gas cartridge(s) in combination with a high-efficiency particulate filter); or CcrFAg100 (APF = 50) [Any chemical cartridge respirator with a full facepiece and acid gas cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF; PDPP (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF:PD,PP:ASCUBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Check oxygen content prior to entering storage area. **(1)** Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. (2) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Sulfuric acid must be stored to avoid contact with water, chlorates, chromates, carbides, fulminates, nitrates, picrates, and powdered metals; since violent reactions occur. Store in tightly closed containers in a cool, dry well-ventilated area away from sunlight and in an area with an acid resistant cement floor. Sources of ignition, such as smoking and open flames are prohibited where sulfuric acid is used, handled, or stored in a manner that could create a potential fire or explosion hazard. always add acid to water, never the reverse. Sulfuric acid is extremely corrosive; handle with care and use proper equipment and practices. Wherever sulfuric acid is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Contact of sulfuric acid with metal drums may cause the release of flammable, explosive hydrogen gas; therefore, storage drums should be coated with acid resistant material.

Shipping: UN1830 Sulfuric acid with >51% acid or sulfuric acid with not >51% acid, Hazard class: 8; Labels: 8-Corrosive material. UN1831 Sulfuric acid, fuming with 30% or more free sulfur trioxide and Sulfuric acid, fuming, with <30% free sulfur trioxide, Hazard class: 8; Labels: 8-Corrosive material. UN1832 Sulfuric acid, spent, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Sulfuric acid, fuming;***Sulfuric acid, fuming, with not less than 30% free Sulfur trioxide***

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1250/400
Then: Protect persons downwind (mi/km)
Day 1.8/2.9
Night 3.5/5.6

Extremely hazardous to health; areas may be entered with extreme care. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. No skin surface should be exposed. Keep all sources of ignition away from containers because explosive mixtures of hydrogen may be produced during storage. Ventilate area of spill or leak. *Small spills:* cover area with sodium bicarbonate or soda ash/slaked lime. Shovel neutralized residues into containers for disposal, or (if not available) cover area with sand or earth and shovel into disposal containers. Other neutralizing agents are calcinated dolomite; calcium oxide and hydroxide; sodium carbonate. Place sulfuric acid absorbed in vermiculite in sealed containers. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Notify proper authorities in case of water pollution. Do not touch spilled material. Use water spray to reduce vapor; do not get water inside container. Dike for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include sulfur oxides are produced in fire or on contact with water. Contact with metal releases flammable and explosive hydrogen gas. Use carbon dioxide or dry chemical. Use water on combustibles burning in vicinity of this material, but use extreme care as water applied directly to this acid results in generation of heat and causes splattering. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add slowly to solution of soda ash and slaked lime with stirring; flush to drain with large volumes of water. Recovery and reuse of spent sulfuric acid may be a viable alternative to disposal, and processes are available.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Strong oxidizer, Highly toxic gas, Corrosive, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 250 lb (114 kg)

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R5; R21; R26/27/28; 34; R41; safety phrases: S1/2; S9; S26; S33; S36/37/39; S38; S41; S45 (see Appendix 4).

Description: Sulfur pentafluoride is a colorless liquid or gas (above 29°C). Odor like sulfur dioxide. Noncombustible liquid and nonflammable gas. Molecular weight = 254.12; specific gravity (H_2O:1) = 2.1 @ 0°C Boiling point = 26.7°C; freezing/melting point = −53°C; vapor pressure = mmHg 561 @ 25°C; relative vapor density (air = 1) = 8.77. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: Sulfur pentafluoride is encountered as a by-product in the manufacture of sulfur hexafluoride, which is made by the direct fluorination of sulfur or sulfur dioxide.

Incompatibilities: Violent reaction with many compounds, including reducing agents; chemically active metals; combustible materials, strong acids, alkaline earth sulfides, aluminum carbides, aluminum, amines, calcium sulfide, carbides, chlorine trifluoride, glycerin, hydrides, hydrochloric acid, hydrogen peroxide, hydrogen sulfide, hydroxylamine, magnesium, metal powders, metal sulfides, molybdenum, phenylhydrazine, phosphorous red/friction, phosphorous trichloride, silicon, sulfides, sulfur, sulfur dioxide, sulfur/friction, sulfuric acid, tungsten, hydrogen trisulfide. Fluorides form explosive and toxic gases on contact with strong acids and acid fumes. Reacts with strong caustics. Decomposed in temperatures above 400°C forming toxic and corrosive fumes of sulfur oxides and sulfur fluorides; as this chemical decomposes, it acts as both a strong oxidizer and a fluorinating agent.

Permissible Exposure Limits in Air

NIOSH IDLH = 1 ppm

Conversion factor: 1 ppm = 10.39 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.025 ppm/0.25 milligram per cubic meter TWA

ACGIH TLV[1]: 0.01 ppm/0.10 milligram per cubic meter Ceiling Concentration

PAC Ver. 29[138]
PAC-1: 9.10E-04 ppm
PAC-2: 0.01 ppm
PAC-3: 1 ppm
DFG MAK: No numerical value established. Data may be available.
Australia: TWA 0.01 ppm (0.1 milligram per cubic meter), 1993; Austria: MAK 0.025 ppm (0.25 milligram per cubic meter), 1999; Belgium: STEL 0.01 ppm (0.1 milligram per cubic meter), 1993; Denmark: TWA 0.01 ppm (0.1 milligram per cubic meter), 1999; Finland: TWA 0.025 ppm, STEL 0.075 ppm [skin], 1999; Norway: TWA 0.01 ppm (0.1 milligram per cubic meter), 1999; the Philippines: TWA 0.025 ppm (0.25 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 0.01 ppm (0.1 milligram per cubic meter), KZG-W 0.02 ppm (0.2 milligram per cubic meter), 1999; Turkey: TWA 0.025 ppm (0.25 milligram per cubic meter), 1993; United Kingdom: TWA 0.025 ppm (0.26 milligram per cubic meter), STEL 0.075 ppm, 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.01 ppm. Several states have set guidelines or standards for sulfur pentafluoride in ambient air[60] ranging from 0.8 μ/m^3 (Virginia); to 1.0 μ/m^3 (North Dakota); to 5.0 μ/m^3 (Connecticut); to 6.0 μ/m^3 (Nevada).

Determination in Air: Gaseous fluorides collected by impinger using caustic; particulates by filter. Analysis is by ion-specific electrode per NIOSH Analytical Method 7902[18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic when inhaled. Irritates the eyes, skin, and respiratory tract. Fluorides can irritate and may damage the eyes. Skin contact can cause irritation, rash or burning sensation. High repeated exposure can cause nausea, vomiting, loss of appetite; and bone and teeth changes. Extremely high levels could be fatal. Breathing can irritate the nose and throat, and cause nausea, headaches and nosebleeds. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Very high exposure can cause fluoride poisoning with stomach pain; weakness, convulsions, collapse and death. These effects do not occur at the level of fluorides used in water for preventing cavities in teeth. In animals: pulmonary edema, hemorrhage.

Long-Term Exposure: Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability and mottling of the teeth. May cause lung and kidney damage.

Points of Attack: Respiratory system; CNS.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; ECG; pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; white blood cell count/differential. Also consider kidney function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 0.1 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 ppm:* SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 1 ppm:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Fluorides must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. Fluorides form explosive gases on contact with nitric acid. Store in tightly closed containers in a cool, well-ventilated area away from water. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3287 Toxic liquids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Toxic liquids, inorganic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.2/1.9

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.8/2.9
Night 4.0/6.6

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable gas. Decomposed in temperatures above 400°C. Thermal decomposition products may include sulfur oxides and sulfur fluorides; as this chemical decomposes, it acts as a strong oxidizer which can increase the intensity of a fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]
Description: Sulfur tetrafluoride is a colorless gas with an odor like sulfur dioxide. Shipped as a liquefied compressed gas. Molecular weight = 108.06; specific gravity (H_2O:1) = 10.5 @ 21°C; 1.95 @ −78°C; boiling point = −38°C; freezing/melting point = −121°C; relative vapor density (air = 1) = 3.78; vapor pressure = 10.5 atm @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 2. ₩ Highly soluble. Reacts violently, with water forming toxic and corrosive hydrofluoric acid and thionyl fluoride.
Potential Exposure: Sulfur tetrafluoride is used as a selective fluorinating agent in making water-repellent and oil-repellent materials and lubricity improvers. It is also used as a pesticide intermediate.
Incompatibilities: Keep away from moisture, concentrated sulfuric acid, dioxygen difluoride. Reacts vigorously with water, alcohols and acids releasing toxic fluoride, sulfur oxide fumes and forming a corrosive acid solution. Readily hydrolyzed by moisture, forming hydrofluoric acid, thionyl fluoride. Attacks glass, ceramic, concrete.
Permissible Exposure Limits in Air
NIOSH IDLH = Not determined.
Conversion factor: 1 ppm = 4.42 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 0.1 ppm/0.4 milligram per cubic meter Ceiling Concentration
ACGIH TLV[1]: 0.1 ppm/0.44 milligram per cubic meter Ceiling Concentration
PAC Ver. 29[138]
PAC-1: 0.091 ppm
PAC-2: 0.1 ppm
PAC-3: 0.82 ppm
Australia: TWA 0.1 ppm (0.4 milligram per cubic meter), 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Belgium: STEL 0.1 ppm (0.44 milligram per cubic meter), 1993; Denmark: TWA 0.1 ppm (0.4 milligram per cubic meter), 1999; Finland: TWA 0.1 ppm (0.4 milligram per cubic meter), STEL 0.3 ppm [skin], 1999; Norway: TWA 0.1 ppm (0.4 milligram per cubic meter), 1999; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 2 mg[HF]/m^3, 1999; the Netherlands: MAC 0.4 milligram per cubic meter, 2003; United Kingdom: TWA 0.1 ppm (0.45 milligram per cubic meter), STEL 0.3 ppm (1.3 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH TLV: Ceiling Concentration 0.1 ppm. Several states have set guidelines or standards for sulfur tetrafluoride in ambient air[60] ranging from 3.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (North Dakota); to 8.0 μ/m^3 (Connecticut); to 10.0 μ/m^3 (Nevada).
Determination in Air: Bubbler; NaOH; Ion-specific electrode; OSHA Analytical Method. #ID11.
Permissible Concentration in Water: No criteria set. (SF_4 reacts violently with water to give SO_2 and HF). Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.
Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Exposure can severely irritate the nose, throat, and lungs. May cause skin burns (from SF_4 releasing hydrofluoric acid on exposure to moisture). High

levels can cause a build-up of fluid in the lungs (pulmonary edema) with cough and shortness of breath. This can lead to death. Contact with liquid may cause frostbite. Sulfur tetrafluoride is about as toxic as phosgene. It is a strong irritant. The toxic effects are attributed largely to fluorine which is released upon hydrolysis. In animals: dyspnea (breathing difficulty), weakness, rhinorrhea (discharge of thin nasal mucous).

Long-Term Exposure: May cause lung damage. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability and mottling of the teeth. May cause kidney damage.

Points of Attack: Eyes, skin, respiratory system, bones, teeth.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function testing. Urine test for fluoride level (should not be above 4 mg/L). If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *fluorides: 12.5 milligram per cubic meter*: Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter*: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PAPRDM^{*+} *if not present as a fume* (any powered, air-purifying respirator with a dust and mist filter). *125 milligram per cubic meter:* HieF$^+$ (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF$^+$ (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Sulfur tetrafluoride must be stored to avoid contact with water, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam or acids to avoid the production of toxic fumes. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2418 Sulfur tetrafluoride, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. Forbidden to be transported by any aircraft or by rail tank car.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.6/2.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 2000/200
Then: Protect persons downwind (mi/km)
Day 2.2/3.6
Night 5.9/9.5

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include sulfur dioxide and hydrogen fluoride may be released in fire. This chemical is a nonflammable gas but containers may rupture and explode when exposed to heat. *Do not use water*. For small fires use dry chemical or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sulfur trioxide is a crystalline solid which has 3 forms: *alpha-, beta*-, and *gamma*-; and can also exist as a gas or liquid. Molecular weight = 80.06; boiling point = 45°C (all forms); freezing/melting point = 17°C (*gamma*-); 32.5°C (*beta*-); 62°C (*alpha*-); vapor pressure = 433 mmHg @ 250°C. An explosive increase in vapor pressure occurs when the *alpha*-form melts. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 2. ₩. Reacts with water forming hydrosulfuric acid.

Potential Exposure: Sulfur trioxide is used as a sulfating and sulfonating agent for detergent, lubricating oil additives, and other organic compounds; in solar energy collectors. It is also used as an intermediate in sulfuric acid manufacture and in making explosives.

Incompatibilities: Combustible and Corrosive. A strong oxidizer. Reacts violently with water, steam or moisture, releasing corrosive hydrosulfuric acid. Violent reactions occur on contact with strong bases; strong acids, chemically active metals; reducing agents; finely divided metal; cyanides, nitrates, picrates, fulminates, chlorates, sulfides, carbides, phosphorus, dioxygen difluoride, barium oxide; lead oxide; diphenyl mercury; alcohols, nitryl chloride; acetonitrile, dioxane, tetrafluoroethylene.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: **0.20**$_{\mathbf{A}}$ milligram per cubic meter

PAC-2: **8.7**$_{\mathbf{A}}$ milligram per cubic meter

PAC-3: **160**$_{\mathbf{A}}$ milligram per cubic meter

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

Finland: STEL 1 ppm (3 milligram per cubic meter) [skin], 1999; Hungary: STEL 1 milligram per cubic meter, 1993; Poland: MAC (TWA) 1 milligram per cubic meter; MAC (STEL) 3 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter [skin], 1993

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This material is highly toxic and corrosive. Contact can severely irritate and burn the skin and eyes with possible permanent eye damage. It is an irritant and corrosive to mucous membranes. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Poisonous if inhaled or swallowed. Contact causes severe burns to skin and eyes. This material may cause coughing, choking, and severe discomfort at a concentration of 1 ppm.

Long-Term Exposure: Repeated exposure can cause lung irritation; bronchitis may develop.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all forms of moisture and incompatible materials listed above. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Outdoor, ventilated, fireproof storage preferred. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1829 Sulfur trioxide, stabilized, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous Inhalation Hazard, Inhalation Hazard Zone B.

Spill Handling:

Sulfur trioxide, stabilized

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Sulfur trioxide, used as a weapon−not listed in current DOT tables

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1250/400
Then: Protect persons downwind (mi/km)
Day 1.8/2.9
Night 3.5/5.6

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Avoid inhalation. Do not touch spilled material. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Dike spill for later disposal; do not apply water unless directed to so. Clean up only under supervision of an expert. Remove all ignition sources. *Solid:* Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate and wash area after clean-up is complete. *Gas:* Ventilate area of leak to disperse gas. Stop flow of gas if it can be done without harm to personnel. If the source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Toxic and corrosive gases are produced in fire, including sulfur oxides and hydrogen fluoride. Sulfur trioxide may burn but does not easily ignite. *Do not use water.* Use dry chemical or carbon dioxide extinguishers. *Small fires:* dry chemical or carbon dioxide. Spray cooling water on containers that are exposed to flames until well after fire is out. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

EC Number: 232-245-6 [*Annex I Index No.:* 016-016-00-6]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Lacramator, Violently water reactive, Hygroscopic, Air reactive, Possible risk of forming tumors.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

United States National Primary Drinking Water Regulations: SMCL = 250 mg$[Cl^-]$/L as Chloride

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C; risk phrases: R14; R15/29; R29; R34; R37; R40; R51; safety phrases: S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: A colorless to light yellow fuming liquid. Pungent acrid odor. Molecular weight = 134.965; specific gravity (H_2O:1) = 1.67 @ 20°C; boiling point = 69°C @ 760 mmHg; freezing/melting point = ~ −50C; vapor pressure = 135 mmHg @ 25°C; relative vapor density (air = 1) = 4.6[136]; flash point = Not flammable. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 2 ₩. Mixes with water; decomposes exothermically, releasing heat, hydrogen chloride and sulfur dioxide gas and sulfuric acid.

Potential Exposure: Sulfuryl chloride is used to make other chemicals, including chlorophenol and chlorothymol, disinfectants, pharmaceuticals, phosphate insecticides, heterocyclic herbicides, fungicides, dyestuffs, and some plastics; as a solvent and catalyst; as a chlorosulfonating agent in organic synthesis. Also used as a dehydrating agent, as cathode material and in lithium batteries; as a wool treatment to prevent shrinkage[NLM].

Incompatibilities: Water and air reactive. When spilled in water, hydrogen chloride, sulfur dioxide and sulfuric acid are produced. Forms corrosive mixture with air (NFPA Fire Rating: 0). Reacts exothermically with moisture in air, water or steam, releasing heat and yielding sulfuric acid and HCl vapors. Reacts violently with bases, amines, amides, inorganic hydroxides; alkalis, alkali metals, dimethyl sulfoxide, dinitrogen pentoxide, lead dioxide (explosive reaction); *N*-methylformamide, red phosphorus. Reacts, possibly violently, with oxidizers, organic substances, strong acids, alcohols, amines, ethers e.g., diethyl ether, diisopropyl ether, especially if trace amounts of metal salts are present); glycols, peroxides. Attacks metals in the presence of moisture, forming flammable hydrogen gas. Acid formed by reaction with water can be neutralized by limestone, lime, or soda ash.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 0.3 ppm

PAC-2: 3.7 ppm

PAC-3: 11 ppm

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive and poisonous. Breathing the vapor can cause death; skin or eye contact causes severe burns, impaired vision, or blindness. Highly toxic by inhalation. Vapors are corrosive to body tissues, skin, eyes, and respiratory system. Poisonous if ingested; can cause severe burns of mouth and stomach. Exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Poisonous if inhaled or swallowed.

Long-Term Exposure: Repeated small exposure can cause lung irritation; bronchitis may develop. May cause tumors to develop.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Removal of solidified molten material from skin requires medical assistance. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Do not put yourself in danger by entering a contaminated area to rescue a victim. Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible. Fully encapsulating, vapor protective clothing should be worn for spills and leaks with no fire. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing.

Respirator Selection: *(sulfuric acid) Up to 15 milligram per cubic meter:* Sa:Cf (APF = 25)$^{\pounds}$ (any supplied-air respirator operated in a continuous-flow mode); or PaprAgHie (APF = 25) (APF = 25)$^{\pounds}$ (any powered, air-purifying respirator with acid gas cartridge(s) in combination with a high-efficiency particulate filter); or CcrFAg100 (APF = 50) [Any chemical cartridge respirator with a full facepiece and acid gas cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF; PDPP (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF; PD,PP: ASCUBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus).

Escape: GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: PIH; check oxygen content prior to entering storage area. (1) Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all forms of moisture and incompatible materials listed above. Outdoor, ventilated, fireproof storage preferred.

Shipping: UN1834 Sulfuryl chloride, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard; 8-Corrosive material; Inhalation Hazard Zone A. STN: 4930260; Sulfuryl chloride.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

When spilled on land

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/90

Then: Protect persons downwind (mi/km)

Day 0.6/1.0

Night 1.3/2.0

When spilled in water *Note:* When spilled in water, large amounts of Hydrogen chloride (HCl) may be produced.

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60

Then: Protect persons downwind (mi/km)

Day 0.3/0.5

Night 1.1/1.8

Fully encapsulating, vapor protective clothing should be worn for spills and leaks with no fire. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Use water spray to reduce vapors; do not put water directly on leak, spill area or inside container. Keep combustibles (wood, paper, oil, etc.) away from spilled material. *Small spills:* Cover with DRY earth, DRY sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with rain. Use clean nonsparking tools to collect material and place it into loosely covered plastic containers for later disposal. Prevent entry into waterways, sewers, basements, or confined areas. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Decomposes in fire, releasing corrosive and toxic gases, including chlorine, hydrogen chloride, and oxides of sulfur. Nonflammable. If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 m (1/2 mi) in all directions; also, consider initial evacuation for 800 m (1/2 mi) in all directions. When material is not involved in fire: do not use water on material itself. *Small fires:* Dry chemical or CO_2. Move containers from fire area if you can do it without risk. *Large Fires*: Flood fire area with large quantities of water, while knocking down vapors with water fog. If insufficient water supply: knock down vapors only. Fire involving tanks or car/trailer loads: Cool containers with flooding quantities of water until well after fire is out. Do not get water inside containers. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. May ignite combustibles (wood, paper, oil, clothing, etc.). Substance will react with water (some violently), releasing corrosive and/or toxic gases. Flammable/toxic gases may accumulate in confined areas (basement, tanks, hopper/tank cars etc.). Containers may explode when heated or if contaminated with water. Substance may be transported in a molten form. Runoff from fire control or dilution water may cause pollution. Contact with metals may evolve flammable hydrogen gas.

Disposal Method Suggested: Wear nitrile rubber gloves, laboratory coat, eye protection and, if necessary, a SCBA. Cover the spill with a 1:1:1 mixture by weight of sodium carbonate or calcium carbonate, clay cat litter (bentonite) and sand. When the sulfuryl chloride has been absorbed, scoop the mixture into a plastic pail of cold water. Allow to stand for 24 hours. Test the pH of the solution and neutralize if necessary with sodium carbonate. Decant the solution to the drain flushing with 50 times its volume of water. Treat the solid residue as normal refuse[CRC].

Sulfuryl Fluoride S:0820

Formula: F_2O_2S; SO_2F_2

Synonyms: Fluorure de sulfuryle (French); Fluoruro de sulfurilo (Spanish); Sulfonyl fluoride; Sulfur difluoride dioxide; Sulfuric oxyfluoride; Sulfuryl fluoride; Sulfuryl difluoride; Vikane; Vikane fumigant

CAS Registry Number: 2699-79-8

HSDB Number: 828

RTECS Number: WT5075000

UN/NA & ERG Number: (PIH) UN2191/123

EC Number: 220-281-5 [*Annex I Index No.:* 009-015-00-7]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Poison inhalation hazard, Corrosive, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Suspected of causing genetic defects.

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg[F]/L, as Fluoride.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C, N; risk phrases: R5; R14; R20; R21 (frostbite); R23/24/25; R35; R36/37/38; R39; R48/20; R50; safety phrases: S1; S9; S16; S26; S23; S33; S37/S39; S38; S41; S45; S60; S61; S63 (see Appendix 4)

Description: Sulfuryl fluoride is a colorless, poisonous gas. Odorless. Molecular weight = 102.06; specific gravity (H_2O:1) = 1.7 @ − 55°C; boiling point = −55°C; freezing/melting point = −137°C; relative vapor density (air = 1) = 3.72; vapor pressure = 12,000 mmHg @ 21°C. Slightly soluble in water; solubility = 0.2 @ 0°C. ₩ Water and air reactive.

Potential Exposure: Sulfuryl fluoride is used an insecticidal fumigant. It is also used in organic synthesis of drugs and dyes.

Incompatibilities: Reacts with water and steam; at temperatures >300°C, forms strong, highly corrosive acids. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from metal hydroxides, alcohols, alkaline materials, amines, strong acids, strong bases. Fluorides form explosive gases on contact with strong acids or acid fumes.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm

Conversion factor: 1 ppm = 4.18 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/20 milligram per cubic meter TWA

NIOSH REL: 5 ppm/20 milligram per cubic meter TWA; 10 ppm/42 milligram per cubic meter STEL

ACGIH TLV[1]: 5 ppm/21 milligram per cubic meter TWA; 10 ppm/40 milligram per cubic meter STEL

PAC* Ver. 29[138]

PAC-1: 10 ppm

PAC-2: $\mathbf{21_A}$ ppm

PAC-3: **64_A** ppm
*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.
Australia: TWA 5 ppm (20 milligram per cubic meter), STEL 10 ppm, 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Belgium: TWA 5 ppm (21 milligram per cubic meter), STEL 10 ppm (42 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (20 milligram per cubic meter), 1999; Finland: TWA 5 ppm (20 milligram per cubic meter), STEL 10 ppm (40 milligram per cubic meter), 1999; France: VME 5 ppm (20 milligram per cubic meter), 1999; Norway: TWA 5 ppm (20 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 20 milligram per cubic meter, 2003; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 3 mg[HF]/m^3, 1999; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 5 ppm (20 milligram per cubic meter), 1999; United Kingdom: TWA 5 ppm (21 milligram per cubic meter), STEL 10 ppm (42 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 10 ppm. Several states have set guidelines or standards for sulfuryl fluoride in ambient air[60] ranging from 200−400 μ/m^3 (North Dakota); to 350 μ/m^3 (Virginia); to 400 μ/m^3 (Connecticut); to 476 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6012, Sulfuryl fluoride.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, eye, and/or skin contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: May cause conjunctivitis, rhinitis, pharyngitis, paresthesia. Contact with the liquid may cause frostbite. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Overexposure can cause nausea, vomiting, itching, muscle twitching; tremors and seizures.

Long-Term Exposure: May cause kidney damage. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability, and mottling of the teeth.

Points of Attack: Eyes, skin, respiratory system; CNS; kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. The fluoride level in urine, (for fluoride in urine use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure, kidney function tests, examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 50* ppm*:* Sa* (APF = 10) (any supplied-air respirator). *Up to 125* ppm*:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 200* ppm*:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poison gas. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, steam and strong acids. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2191 Sulfuryl fluoride, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, Inhalation Hazard Zone D.

***Spill Handling*: Sulfuryl fluoride**

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.3/0.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.2/1.9
Night 3.2/5.1

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include sulfur dioxide and hydrogen fluoride. This chemical is a nonflammable gas. For small fires use dry chemical or carbon dioxide extinguishers. Gas is heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Addition of soda ash-slaked lime solution to form the corresponding sodium and calcium salt solution. This solution can be safely discharged after dilution. The precipitated calcium fluoride may be buried or added to a landfill. Small amounts could also be released directly to the atmosphere without serious harm.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: Sulfuryl Fluoride,* Trenton, NJ (May 2000).

Sulfamic Acid S:0830

Formula: H_3NO_3S; H_2NSO_3H

Synonyms: Amidosulfonic acid; Amidosulfuric acid; Aminosulfonic acid; Sulfamic acid; Sulfamidic acid

CAS Registry Number: 5329-14-6

HSDB Number: 795

RTECS Number: WO5950000

UN/NA & ERG Number: UN2967/154

EC Number: 226-218-8 [*Annex I Index No.:* 016-026-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Primary irritant (w/o allergic reaction), Environmental hazard.

United States Environmental Protection Agency, FIFRA, 1998 Status of Pesticides: Unsupported

Canada, WHMIS, Ingredients Disclosure List Concentration 1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Harmful to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R36/38; R52/53; safety phrases: S2; S26; S28; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sulfamic acid is a white crystalline solid. Molecular weight = 97.1; specific gravity (H_2O:1) = 2.15 @ 20°C; freezing/melting point = about 205°C (decomposition). Soluble in water; slowly reactive.

Potential Exposure: Sulfamic acid is used in metal and ceramic cleaning, bleaching paper pulp; and textiles metal; in acid cleaning; as a stabilizing agent for chlorine and hypochlorite in swimming pools; cooling towers; and paper mills.

Incompatibilities: The aqueous solution is a strong acid. Reacts violently with strong acids (especially fuming nitric acid), bases, chlorine. Reacts slowly with water, forming ammonium bisulfate. Incompatible with ammonia, amines, isocyanates, alkylene oxides; epichlorohydrin, oxidizers.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 9.5 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 630 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Sulfamic acid can affect you when breathed in. Contact can burn the skin and eyes. Breathing the dust (crystals) or vapor can irritate the nose, mouth and lower airways; and may cause cough with phlegm. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause dermatitis and skin allergy. Some closely related sulfonates cause skin allergy. May affect the lungs.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to sulfamic acid, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Sulfamic acid must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from chlorine and nitric acid.

Shipping: UN2967 Sulfamic acid, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-

up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sulfamic acid may burn, but does not readily ignite. Use dry chemical, CO_2, dry sand. *Do not use water* directly on material. If large quantities of combustibles are involved, use water in flooding quantities as spray and fog Thermal decomposition products may include oxides of sulfur and nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: (PIH) UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 252-545-0

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Suspected of causing genetic defects; Environmental hazard.

Banned or Severely Restricted (Germany, Malaysia) (UN)[13]

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R21; R23/25; R24/25; R26; R33; R50/53; R62; safety phrases: S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sulprofos is a tan colored liquid. Molecular weight = 322.46; specific gravity (H_2O:1) = 1.20 @ 25°C; boiling point = 155−158°C @ 0.1 mmHg; vapor pressure = 63 mmHg @ 20°C. Poor solubility in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this insecticide that is used for control of certain lepidopterous, dipterous, and hemipterous insects on cotton, etc.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 1 milligram per cubic meter TWA

ACGIH TLV[1]: 0.008 ppm/0.1 milligram per cubic meter measured as inhalable fraction and vapor TWA; not classifiable as a human carcinogen; BEIA issued for Acetylcholinesterase inhibiting pesticides.

PAC not available.

Australia: TWA 1 milligram per cubic meter, 1993; Belgium: TWA 1 milligram per cubic meter, 1993; France: VME 1 milligram per cubic meter, 1999; Switzerland: MAK-W 1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines of standards for sulprofos in ambient air[60] ranging from 16.0 μ/m^3 (Virginia); to 20.0 μ/m^3

(Connecticut); to 24.0 μ/m^3 (Nevada); to 100.0 μ/m^3 (North Dakota).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus pesticides; OSHA Analytical Method PV-2037, Sulprofos.

Determination in Water: Fish Tox = 63.99264000 ppb (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: May affect the nervous system; causing convulsions and respiratory failure. Shows typical anticholinesterase effects. Sulprofos can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is an organophosphate pesticide. Exposure can cause rapid severe poisoning with headaches, sweating, nausea and vomiting; diarrhea, loss of coordination; convulsions, respiratory failure; and death. This is considered a moderately toxic compound (LD_{50} for rats is 65 mg/kg).

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. Human Tox = 21.00000 ppb (INTERMEDIATE).

Points of Attack: Respiratory system; CNS; cardiovascular system, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index $(K_{\mathrm{oc}}) = 12{,}000$ (Estimate).

Fire Extinguishing: Sulprofos may burn, but does not readily ignite. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00019-3

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.

per cubic meter, 1993; United Kingdom: TWA 10 milligram per cubic meter, STEL 20 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Not classifiable as a human carcinogen. Several states have set guidelines or standards for 2,4,5-T in ambient air[60] ranging from 1.0 μ/m^3 (Pennsylvania); to 100.0 μ/m^3 (North Dakota); to 160 μ/m^3 (Virginia); to 238.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5001, 2,4,5-T.

Permissible Concentration in Water: The EPA (see "References" below) has set a lifetime health advisory of 21.0 μg/L. (31); (173); Mexico[35] has set limits of 100 μg/L in estuaries and 10 μg/L in coastal waters. The state of Kansas[61] has set(100). a guideline for (2). drinking water of 700.0 μg/L.

Determination in Water: Liquid-liquid extraction and gas chromatography (See EPA reference below). Fish Tox = 79154.36150000 ppb (VERY LOW). Octanol-water coefficient: Log $K_{ow} = -4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation*: Increasingly severe symptoms may include nose and throat irritation; weakness, tiredness, metallic taste in mouth; loss of appetite; diarrhea, heart problems; heart failure and death. *Skin*: Reddening and itching may develop. Absorption is slow, but may contribute significantly to total exposure. *Eyes*: Irritation may develop. *Ingestion*: 350 mg (0.01 ounce) produces only a metallic taste in the mouth, lasting about 2 hours. Approximate 4 teaspoonfuls (150 lb man) may cause weakness, tiredness, loss of appetite; diarrhea, heart problems, heart failure; and death. *Note*: Reported effects of 2,4,5-T are due to accidental exposures, often at unknown levels or duration. In addition, 2,4,5-T may be contaminated with very small amounts of another more toxic compound 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD, Dioxin). Therefore, some of the symptoms of exposure to 2,4,5,-T may be due to contaminants.

Long-Term Exposure: Levels above the standard may produce skin irritation, acne-like skin sores; loss of skin coloration in small patches; Gl tract ulcer; and nerve disorders resulting in difficulty controlling muscles. Animal studies also indicate the possibility of an increased susceptibility to infection. Changes in generic material and birth defects have been reported in laboratory studies and may be due to 2,4,5-T or its contaminant. Whether these effects are produced in humans is unknown. In animals: ataxia, skin irritation; acne-like rash; liver damage. Human Tox = 70.00000 ppb (LOW)

Points of Attack: Skin, liver, gastrointestinal tract.

Medical Surveillance: NIOSH lists the following tests: blood plasma; urine (chemical/metabolite); urine (chemical/metabolite), 24-hour collection. If symptoms develop or overexposure is suspected, liver or kidney function tests may be useful.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: If ingested, remove by lavage or emesis. Use general supportive measures for central nervous system (CNS) depression. Use quinidine for myotonia.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *100 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *250 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PAPRDM, if not present as a fume (any powered, air-purifying respirator with a dust and mist filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA

(APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, such as chlorine, bromine, fluorine, and strong bases. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3345 Phenoxyacetic acid derivative pesticide, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

UN2811: *Isolation Distance, Spill*: 25 meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 80.

Fire Extinguishing: 2,4,5-T Acid may burn, but does not readily ignite. Use dry chemical, CO_2, water spray; or foam extinguishers. Thermal decomposition products may include phosgene, hydrogen chloride, and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Two disposal procedures have been discussed for 2,4,5-T: (1) Mix with excess sodium carbonate, add water and let stand for 24 hours before flushing down the drain with excess water; and (2) pour onto vermiculite and incinerate with wood, paper, and waste alcohol[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

United States DOT 49CFR172.101, Inhalation Hazard Chemical *Note*: Army Regulation, AR 50-6, deals specifically with the shipment of chemical agents; must be escorted in accordance with Army Regulation, AR 740-32.

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B) as cyanide mixtures, cyanide solutions

Canada, National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited

Description: Tabun (GA), an organophosphorous compound, is a nerve agents, and among the most toxic of the known chemical warfare agents. Exposure to tabun can cause death in minutes. A fraction of an ounce (1−10 mL) of tabun on the skin can be fatal. GA is a clear, colorless to brownish, oily liquid, with a slight fruity odor, like almonds. No odor when pure. *Warning*: Odor is not a reliable indicator of the presence of toxic amounts of Tabun. It is tasteless. Tabun is chemically similar to malathion or parathion, and other organophosphates. Molecular weight = 162.12; Specific gravity (H_2O:1) = 1.07 @ 25°C; Boiling point = 230°C (decomposition); Freezing/Melting point = −50°C; Vapor density (air = 1) = 5.6; Vapor pressure = 0.057 mmHg @ 25°C/0.07@24°C; Volatility = 490 milligram per cubic meter @25°C; Flash point = 78°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 0 ₩. Soluble in water; readily hydrolyzed forming hydrogen cyanide; solubility = 9.8×10^4 @ 25°C/7.2 @ 20°C. Henry's Law constant = 1.5×10^{-7} atm-m^3/mol @ 25°C (est)[72].

Potential Exposure: GA is a highly persistent (may remain liquid for more than 24 hours) chemical warfare agent; military nerve gas. Nerve agents are more toxic and potent than insecticides. *Note*: If used as a weapon, notify United States Department of Defense: Army. Damage and/or death may occur before chemical detection can take place. Use M8 paper if available (Detection: yellow) or M256-A1 Detector Kit (Detection limit: 0.005 milligram per cubic meter).

Persistence of Chemical Agent: Tabun (GA): Summer: 10 min to 24 hours; Winter: 2 hours to 3 days. Less toxic than sarin.

Incompatibilities: Tabun (GA) decomposes slowly in water; hydrolysis forms hydrogen cyanide. Under acid conditions, GA hydrolyzes to form hydrofluoric acid (HF). Raising the pH increases the rate of decomposition significantly. Rapidly hydrolyzed in basic solutions (Na_2CO_3, NaOH, or KOH) with a half-life of 1.5 minutes at pH 11 @25°C. GA and its hydrolysis products exhibit no significant phototransformations in sunlight. Tabun and its hydrolysis products are thermally stable at temperatures less than 49°C. Reacts with oxidizing materials. Tabun is destroyed by bleaching powder, but the reaction produces cyanogen chloride (CNCl). Decomposes within six months @ 60°C. Complete decomposition in 3.5 hours @ 150°C; may produce hydrogen cyanide, oxides of nitrogen; oxides of phosphorus; carbon monoxide; and hydogen cyanide. Contact with metals may evolve flammable hydrogen gas

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)* GA

PAC-1: **0.00042**$_{\mathbf{A}}$ **(4.20E-04)** ppm

PAC-2: **0.0053**$_{\mathbf{A}}$ ppm

PAC-3: **0.039**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

STEL: **0.0001** milligram per cubic meter

The suggested permissible airborne exposure concentration for GA for an 8-hour workday or a 40 hour work week is an 8 hour time weight average (TWA) of 0.0001 milligram per cubic meter (2×10^{-5} ppm). This value is based on the TWA of GA as proposed in the USAEHA Technical Guide 169, *Occupational Health Guildelines for the Evaluation and Control of Occupational Exposure to Nerve Agents, GA, GB, GD, and VX*.

WPL (Worker population limit): 0.00003 milligram per cubic meter

GPL (General population limit): 0.000001 milligram per cubic meter

Determination in Air: Military chemical agent detection papers and kits (M18A2 for liquid; M256A1, M8A1, M18A2, ICAD, CAM for vapor). M8, M9 paper will quickly detect the presence of a nerve agents but will not identify the type of agent being used. Also, the following may be helpful: "Accuro" or "Accuro 2000" (Draeger) Air Sampling/Gas (Vapor) System; or use NIOSH Analytical Method (IV) #5600, Organophosphorus pesticides; NIOSH Analytical Method #7904, Cyanides.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Octanol-water coefficient: Log K_{ow} = (estimated) 0.29−0.38. Tabun dissolves in water and remains very dangerous. To prevent anyone from drinking water mixed with tabun, notify local health and pollution control officials. Also, notify operators of nearby water intakes and advise shutting water intakes. Use M272 Chemical Agent Water Testing Kit. Detection limit for nerve agents is 0.02 mg/L. Also, for cyanides, distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid). If used as a weapon, utilize an M272 Water Detection Kit (Detection limit: 0.02 mg/L). Dangerous to aquatic life in high concentrations. May be dangerous if it enters water intakes. This material will be broken down in water quickly, but small amounts may evaporate. This material will be broken down in moist soil quickly. Small amounts may evaporate into the air or travel below the soil surface and contaminate groundwater. Persists 1½ to 2 days in soil. Bleaching powder (chlorinated line) destroys tabun but gives rise to cyanogen chloride (CAS: 506-77-4). See table of contents or name index for location of entry for cyanogen chloride.

Routes of Entry: Skin absorption, absorption through eyes; and inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Tabun is a nerve agent; it acts as a cholinesterase inhibitor. The median lethal dosage (vapor/respiratory) $LCt_{50} = 400$ mg-minute/m^3 for humans; the median incapacitating dosage is 300 mg-minute/m^3. Respiratory lethal dosages kill in 1 to 10 minutes; liquid in the eye kills nearly as rapidly. The LD_{50} (skin) = 1.0 g/70 kg/156.8 lb [man] (*Medical Aspects of Chemical and Biological Warfare, Part I*, Walter Reed Medical Center, 1997). Skin absorption great enough to cause death may occur in 1−2 minutes, but may be delayed for 1−2 hours. Nerve agent symptoms include difficulty in breathing; drooling, nausea, vomiting, cramps, involuntary defecation and urination; twitching, jerking, staggering, headache, confusion, drowsiness, coma, and convulsions. Inhalation causes dimness of vision and pinpointing of the pupils. GA is an anticholinesterase agent similar in action to GB (sarin). Although only about half as toxic as GB (sarin) by inhalation, GA in low concentrations is more irritating to the eyes than GB (sarin). The number and severity of symptoms which appear are dependent on the quantity, and rate of entry of the nerve agent which is introduced into the body (very small skin dosages sometimes cause local sweating and tremors with few other effects.) Individuals poisoned by GA display approximately the same sequence of symptoms regardless of the route by which the poison enters the body (whether by inhalation, absorption, or ingestion). These symptoms, in normal order of appearance, runny nose; tightness of chest; dimness of vision and pin pointing of the eye pupils; difficulty in breathing; drooling and excessive sweating; nausea, vomiting, cramps; and involuntary defecation and urination; twitching, jerking, staggering, headaches, confusion, drowsiness, coma, and convulsions. These symptoms are followed by cessation of breathing and death. Onset Time of Symptoms: Symptoms appear much more slowly from skin dosage than from respiratory dosage. Although skin absorption great enough to cause death may occur in 1 to 2 minutes, death may be delayed for 1 to 2 hours. Respiratory lethal dosages kill in 1 to 10 minutes, and liquid in the eye kills almost as rapidly. Median Lethal Dosage, animals: LD_{50} (monkey, percutaneous) = 9.3 mg/kg (shaved skin); LCt_{50} (monkey, inhalation) = 187 mg-min/m^3 (t = 10); Median Lethal Dosage, Man: LCt_{50} (man, inhalation) = 135 mg-min/m^3 ($t = 0.5−2$ min) at RMV (Respiratory Minute Volume) of 151/min; 200 mg-min/m^3 at RMV of 101/min GA is not listed by the International Agency for Research on Cancer (IARC); american Conference of Governmental Industrial Hygienists (ACGIH); Occupational Safety and Health Administration (OSHA); or National Toxicology Program (NTP) as a carcinogen.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase. Liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. Complete blood count (CBC). Evaluation of thyroid function. Liver function tests. Kidney function tests. CNS tests. EKG.

First Aid: *Inhalation*: Hold breath until respiratory protective mask is donned. If severe signs of agent exposure appear (chest tightens, pupil construction, a lack of coordination; etc.), immediately administer, in rapid succession, all three Nerve Agent Antidote Kit(s), Mark I injectors (or atropine if directed by the local physician). Injections using the Mark I kit injectors may be repeated @ 5 to 20 minute intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. If breathing has stopped, give artificial respiration. Mouth-to-mouth resuscitation should be used when approved mask-bag or oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. If breathing is difficult, administer oxygen. Seek medical attention *immediately*. *Eye contact: immediately* flush eyes with water for 10−15 minutes then don respiratory protective mask. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection will not be administered when miosis is the only sign present. Instead, the individual will be taken immediately to the medical treatment facility for observation. *Skin contact*: Don respiratory protection mask and remove contaminated clothing. Immediately wash contaminated skin with copious amounts of soap and water, 10% sodium carbonate solution, or 5% liquid household bleach. Rinse well with water to remove decontaminate. Use M258A1 and/or M291 kit for skin decontamination. Speed in removing material from skin is of extreme importance. Administer an intramuscular injection with the MARK I kit injectors only if local sweating and muscular twitching symptoms are observed. Seek medical attention *immediately*. *Ingestion*: Do not induce vomiting. First symptoms are likely to be gastrointestinal. *Immediately* administer 2 mg. intramuscular injection of the MARK I kit auto-injectors. Seek medical attention *immediately*.

Medical treatment: Electrocardiogram (EKG), and adequacy of respiration and ventilation, should be monitored. Supplemental oxygenation, frequent suctioning of secretions, insertion of a tube into the trachea (endotracheal intubation), and assisted ventilation may be required. Diazepam (5 to 10 mg in adults and 0.2−0.5 mg/kg in children) may be used to control convulsions. Lorazepam or other benzodiazepines may be used, but barbiturates, phenytoin, and other anticonvulsants are not effective. Administration of atropine (if not already given) should precede the administration of benzodiazepines in order to best control seizures. Patients/victims who have inhalation exposure and who complain of chest pain, chest tightness, or cough should be observed and examined periodically for 6−12 hours to detect delayed-onset inflammation of the large airways (bronchitis), inflammatory lung disease (pneumonia), accumulation of fluid in the lungs (pulmonary edema), or respiratory failure.

Decontamination: This is very important. The rapid physical removal of a chemical agent is essential. If you don't have the equipment and training, don't enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim can't move, decontaminate without touching and without entering the hot or the warm zone. Nerve gasses stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a sealed double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Don't wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 minutes. Use caution to avoid hypothermia in children and the elderly. Wash—strip—wash—evacuate up wind and uphill: Patients exposed to nerve agent by vapor. only. should be decontaminated by removing all clothing in a clean-air environment and shampooing or rinsing the hair to prevent vapor-off gassing; Patients exposed to liquid nerve agent should be decontaminated by washing in available clean water at least three times. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. Decontaminate with diluted household bleach* (0.5%, or one part bleach to 200 parts water), but don't let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Remember that the water you use to decontaminate the victims is dangerous. Be sure you've decontaminated the victims as much as you can before they are released from the area, so they don't spread the nerve gas. Rinse the eyes, mucous membranes; or open wounds with sterile saline or water and then move away from the hot zone in an upwind and up hill direction.
**Note*: The following can be used in addition to household bleach: (1) solids, powders and solutions containing various types of bleach (NaOCl or $Ca(OCl)_2$); (2) DS2 (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether); (3) towelettes moistened with sodium hydroxide (NaOH) dissolved in water, phenol, ethanol, and ammonia. *Note*: Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 ounces per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes and other items.

Personal Protective Methods:
General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*)**:** select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents.

Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when de contaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Other information: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber gloves and Tyvek "F" decontamination suits provide barrier protection against chemical warfare agents. Although resistant to liquid chemical agents, impermeable protective clothing may be penetrated after a few hours of exposure to heavy concentration of agent. Consequently, liquid contamination on the clothing must be neutralized or removed as soon as possible. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode. The M40 Series (which replaced the M17A1 protective mask) mask provides respiratory protection against all known military toxic chemical agents, but it cannot be used in an oxygen deficient environment and is *not approved for civilian use*. It does not afford protection against industrial toxics, such as ammonia and carbon monoxide.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, Technical Name Required. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

GA, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 0.4/0.6

Fire: If tank, rail car, or tank truck is involved in fire, isolate for at least 800 meters (½ mile) in all directions; also, consider initial evacuation for 800 meters (½ mile) in all directions.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Spills must be contained by covering with vermiculite, diatomaceous earth; clay, fine sand; sponges, and paper or cloth towels. This containment is followed by treatment with copious amounts of aqueous sodium hydroxide solution (a minimum 10% wt.). Scoop up all material and place in a fully removable head drum with a high density polyethylene liner. The decontamination solution must be treated with excess bleach to destroy the CN formed during hydrolysis. Cover the contents with additional bleach before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW EPA and DOT regulations. Dispose of the material per IAW waste disposal methods provided below. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If 10% wt. sodium hydroxide is not available then the following decontaminants may be used instead and are listed in order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate and Supertropical Bleach Slurry (STB). Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tabun is a combustible liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen, phosphorus and carbon. When heated, vapors may form explosive mixture with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. Water, fog, foam, CO_2-Avoid using extinguishing methods that will cause splashing or spreading of the GA. Respiratory protection is required. Positive pressure, full facepiece, NIOSH-approved SCBA will be worn where there is danger of oxygen deficiency and when directed by the fire chief or chemical accident/incident (CAI) operations officer. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a chemical accident/incident for rescue/reconnaissance purposes they will wear appropriate levels of protective clothing. Complete protection required; have decontaminants available (bleach, alkali) and atropine. Bleaching powder (chlorinated line) destroys tabun but gives rise to cyanogen chloride. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Principles and methods for destruction of chemical weapons: "Destruction of chemical weapons" means a process by which chemicals are converted in an essentially irreversible way to a form unsuitable for production of chemical weapons, and which in an irreversible manner renders munitions and other devices unusable as such. Each/nation/shall determine how it shall destroy chemical weapons, except that the following processes may not be used: dumping in any body of water, land burial or open-pit burning. It shall destroy chemical weapons only at specifically designated and appropriately designed and equipped facilities. Each. /nation/ shall ensure that its chemical weapons destruction facilities are constructed and operated in a manner to ensure the destruction of the chemical weapons; and that the destruction process can be verified under the provisions of this Convention. [Organization for the Prohibition of Chemical Weapons; Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and Their Destruction]. A minimum of 56 grams of decon solution is required for each gram of GA. The decontamination solution is agitated while GA is added and the agitation is maintained for at least one hour. The resulting solution is allowed to react for 24 hours. At the end of 24 hours, the solution must be tritrated to a pH between 10 and 12. After completion of the 24 hour period, the decontamination solution must be treated with excess bleach (2.5 mole OC1-/mole GA) to destroy the CN formed during hydrolysis.

Scoop up all material and place in a fully removable head drum with a high density polyethylene liner. Cover the contents with additional bleach before affixing the drum head. All contaminated clothing will be placed in a fully removable head drum with a high density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled per IAW state, EPA and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, state, EPA, and DOT regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit.

HSDB Number: 830
RTECS Number: VV8790000
EC Number: 238-877-9
Regulatory Authority and Advisory Information
Carcinogenicty: IARC: Sufficient (*for talc containing asbestiform fibrers*) Group 1; Human Inadequate Evidence (*talc not containing asbestiform fibers*) group 3; NTP (*for talc containing asbestiform fibrers*): Known to be a human carcinogen; NCI: Carcinogenesis Studies (inhalation); clear evidence: rat; no evidence: mouse.
California Proposition 65 Chemical[102]: Cancer (*talc containing asbestiform fibers*) 4/1/90.
Hazard Alert: Possible risk of forming tumors, Primary irritant (w/o allergic reaction).; FDA-over the counter drug
Hazard Symbols, Risk & Safety statements:: Hazard Symbol: Risk phrases: R; Safety phrases: (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Talc is an odorless solid which exists in both a nonasbestos form and a fibrous form. This entry will be concerned with the nonfibrous form. Molecular weight = 96.33; Freezing/Melting point = 900°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.
Potential Exposure: Talc is used in the ceramics, paint, roofing, insecticide, paper, cosmetics, lubricant, pharmaceutical, and rubber industries; electrical insulation.
Incompatibilities: None reported.
Permissible Exposure Limits in Air
for talc containing asbestos fibers: See asbestos
the following is for talc containing NO asbestos fibers
NIOSH IDLH = 1000 milligram per cubic meter
OSHA PEL (*containing less than 1% quartz*): 20 mppcf TWA
NIOSH REL: 2 milligram per cubic meter TWA, respirable dust
ACGIH TLV[1]: 2 milligram per cubic meter TWA, (respirable fraction, for particulate matter containing no asbestos and < 1% crystalline silica); not classifiable as a human carcinogen
Protective Action Criteria (PAC) Ver. 28, no values found in Ver. 29[138]
talc
PAC-1: 6 milligram per cubic meter
PAC-2: 66 milligram per cubic meter
PAC-3: 400 milligram per cubic meter
Australia: TWA 2.5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 2 milligram per cubic meter, 1993; Finland: TWA 5 milligram per cubic meter, 1999; Switzerland: MAK-W 2 milligram per cubic meter (respirable dust), 1999; United Kingdom: TWA 1 milligram per cubic meter, respirable dust, 2000; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen
Determination in Air: Use NIOSH (III) P&CAM, Method #355.
Routes of Entry: Inhalation of dust, skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Talc can affect you when breathed in. Can cause eye and lung irritation.
Long-Term Exposure: May affect the lungs, causing talc fibrotic pneumoconiosis. Repeated high exposure can cause scarring of the lungs. Symptoms of shortness of breath and cough can develop. This disease can be disabling and fatal. Talc can cause the chest X-ray to become abnormal. Contact can cause eye irritation, and may lead to a reaction causing serious eye damage.

Points of Attack: Eyes, respiratory system; cardiovascular system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Chest X-ray every one to three years, after five or more years of heavy exposure should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 10 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 20 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 50 milligram per cubic meter*: PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 100 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); SaF (any supplied-air respirator with a full facepiece). *Up to 1000 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode. *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue (*only for talc containing asbestiform fibrers*): Health Hazard/Poison: Store in a secure poison location. Color code-Green (*talc powder or tablets*): General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Talc itself does not burn. Thermal decomposition products may include acrid fumes and irritating gases. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land fill.

Tantalum & Tantalum Oxide Dusts T:0130

Formula: Ta; O_5Ta_2 (oxide)
Synonyms: *metal*: Elemental tantalum; Tantalum 181; Tantalum metal powder
oxide: Tantalic acid anhydride; Tantalum (V) oxide; Tantalum pentaoxide; Tantalum pentoxide
CAS Registry Number: 7440-25-7 (elemental); 1314-61-0 (oxide)
HSDB Number: 2533 (elemental); 7122 (tantalum compounds)
RTECS Number: WW5505000 (elemental)
UN/NA & ERG Number: Metal powder, in bulk, may be pyrophoric. UN3089 (metal powder, flammable, n.o.s.)/170
EC Number: 231-135-5; 215-238-2 (pentoxide)
Regulatory Authority and Advisory Information
Hazard Alert: Possible risk of forming tumors, Strong reducing agent, Pyrophoric; Flammable solid.
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Toxic Inhalation Hazard, OSHA
Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F, Xi, Xn; Risk phrases: R11; R21/22; R23/24/25; R36/37/38; R29; R39; R60; R61; Safety phrases: S3/7; S15; S16; S26; S36/37; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): Non hazard to water. (*metal and oxide*) provided they are solid with a particle size $> = 1$ mm; no reaction with water or atmospheric oxygen.
Description: Tantalum is a refractory metal in Group V-B of the periodic table. The pure metal is ductile, steel-blue to gray solid or black, odorless powder. Molecular weight = 180.95; 441.9 (oxide); Specific gravity (H_2O:1) = 16.7 (*metal*); 14.40 (powder) @ 25°C; 8.2 (oxide); Boiling point = 5425°C; Freezing/Melting point = 2996°C; 1872 (oxide); Maximum Explosive concentration (MEC) = < 200 g/m^3. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.
Potential Exposure: Tantalum metal is used in electronic components: electric capacitors; rectifiers, in chemical equipment; in nuclear reactor components; in chemical equipment; body implants. Tantalum carbide is used in metal cutting tools and wear-resistant parts. Some tantalum salts are used in catalysts.
Incompatibilities: A flammable solid; the dry powder can ignite spontaneously in air. Incompatible with lead chromate. A strong reducing agent; incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, bromine trifluoride, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Tantalum metal is attacked by hydrogen fluoride, fused alkalis, fuming sulfuric acid.
Permissible Exposure Limits in Air
metal, oxides, and dusts
NIOSH IDLH = 2500 milligram per cubic meter
OSHA PEL: 5 milligram per cubic meter TWA
NIOSH REL: 5 milligram per cubic meter TWA; 10 mg [Ta]/m^3 STEL
ACGIH TLV[1]: Withdrawn due to insufficient data.
Protective Action Criteria (PAC) Ver. 29[138]
7440-25-7, elemental
PAC-1: 10 milligram per cubic meter
PAC-2: 11 milligram per cubic meter
PAC-3: 64 milligram per cubic meter
1314-61-0, oxide
PAC-1: 12 milligram per cubic meter
PAC-2: 260 milligram per cubic meter
PAC-3: 1600 milligram per cubic meter
DFG MAK (*metal*): 1.5 milligram per cubic meter, respirable fraction (previously “fine dust”); 4 mg[Ta]/m^3, inhalable fraction (previously “total dust”); Pregnancy Risk Group C.
Arab Republic of Egypt: TWA 0.1 milligram per cubic meter, 1993; Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 5 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; the Phillipines: TWA 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 5 milligram per cubic meter, 1999; Russia: STEL 10 milligram per cubic meter, 1993; Switzerland: MAK-W 5 milligram per cubic meter, 1999; United Kingdom: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 mg. Several states have set guidelines or standards for tantalum in ambient air[60] ranging from 50−100 μ/m^3 (North Dakota); to 80 μ/m^3 (Virginia); to 100 μ/m^3 (Connecticut); to 119 μ/m^3 (Nevada).
Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.
Permissible Concentration in Water: No criteria set. Insoluble.
Routes of Entry: Inhalation, skin, and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Irritates the eyes and skin. In animals: pulmonary irritation.
Long-Term Exposure: May be a systemic poison.
Points of Attack: Eyes, skin, respiratory system.
Medical Surveillance. Lung function tests. Consider chest X-ray following acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 25 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 50 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 250 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 2,500 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) (100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Sipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Powder is a flammable solid. Thermal decomposition products may include metal oxides. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water*. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sanitary landfill if necessary; recover if possible because of economic value. Technology exists for tantalum recovery from spent catalysts, for example.

RTECS Number: KI070000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN2761/151

EC Number: 200-783-0

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (feed); clear evidence: rat; no evidence: mouse

California Proposition 65 Chemical[102]: Cancer 1/1/1989

Hazard Alert: Poison, Environmental hazard, Agricultural chemical.

Clean Water Act: Section 311 Hazardous Substances/ RQ40CFR117.3 (same as CERCLA, see below); 40CFR423, Appendix A, Priority Pollutants

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U060

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.023; Nonwastewater (mg/kg), 0.087

RCRA 40CFR264, appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8080 (0.1); 8270 (10)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F, N; Risk phrases: R11; R21; R25; R38; R39/ 23/24/25; R29; R40; R50/53; Safety phrases: S7; S16; S29; S36/37; S45; S53; S60; S61; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: TDE is a colorless, combustible, crystalline compound. Molecular weight = 320.04; Vapor pressure = 1×10^{-6} mmHg @ 20°C; Freezing/Melting point = 109°C−110°C. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this insecticide. In an action of March 18, 1971, EPA cancelled all pesticide uses of this product which is a metabolite of DDT. Hence it is no longer manufactured commercially.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 2.4 milligram per cubic meter

PAC-2: 26 milligram per cubic meter

PAC-3: 160 milligram per cubic meter

Permissible Concentration in Water: Very toxic to aquatic life with long-lasting effects. For the protection of freshwater aquatic life, the value is 0.6 μg/L, based on acute toxicity. For saltwater aquatic life, the value is 3.6 μg/L, based on acute toxicity. For the protection of human health, with respect to TDE, see criteria proposed for DDT, since TDE is a metabolite of DDT. Mexico[35] has set a limit of 30 μg/L in estuaries and 3 μg/L in coastal waters. Russia set a MAC of zero in surface water used for fishery purposes.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method #625). Fish Tox = 0.59514000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms: In varying degrees, organochlorines are absorbed from the gut and also by the lung and across the skin[72].

Short-Term Exposure: Since DDD is a metabolite of DDT, as well as a contaminant of commercial preparations of DDT, many of the effects of DDT could be mediated through DDD. Irritates the eyes, skin, and respiratory tract. May affect the CNS; causing convulsions and respiratory failure. Exposure may result in death. Symptoms of exposure include lethargy, anorexia, nausea, vomiting, diarrhea, paresthesia of tongue, lips, face; tremor, apprehension, dizziness, confusion, malaise (vague feeling of discomfort), headache, fatigue; convulsions; paresis of hands.

Long-Term Exposure: Based on DDT, them chemical may affect the CNS. May damage the liver. A Suspected Human Carcinogen; there is some evidence that DDD is carcinogenic in mice; however, in other species, it appears to be noncarcinogenic. DDD has been shown to be mutagenic in drosophila, but not in yeast or bacteria. In cell culture, DDD causes chromosomal breaks.

Points of Attack: Eyes, skin, CNS; kidneys, liver, peripheral nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Kidney and liver function tests. Examination of the nervous system.

First Aid: *Skin Contact*:[52] Flood all areas of the body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20–30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting. Medical observation is recommended following acute overexposure.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. Store in a cool, dry place. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25 meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Dampen spilled material with acetone to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 10000

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and chlorine. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a unit operating above 850°C equipped with HCl scrubber. Incineration above 1200°C for 1−2 seconds is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Tellurium T:0150

Formula: Te

Synonyms: Aurum paradoxum; Elemental tellurium; Metallum problematum; Telloy; Telurio (Spanish); Tellurium elemental

CAS Registry Number: 13494-80-9; *(alt.)* 137322-20-4

HSDB Number: 2532

UN/NA & ERG Number: UN3288 (Toxic solid, inorganic, n.o.s.)/151

RTECS Number: WY2625000 (elemental)

UN/NA & ERG Number: Available for Te compounds only: 3284 (tellurium compound, n.o.s.)/151

EC Number: 236-813-4

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Pyrophoric (powder), Suspected of causing genetic defects.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, T: Risk phrases: R12 (powder); R17; R25; R62; Safety phrases: S45 (see Appendix 4)

Description: Tellurium is a grayish or silvery white, lustrous, crystalline, semimetallic element. It may exist in a hexagonal crystalline form or an amorphous powder. It is found in sulfide ores and is produced as a by-product of copper or bismuth refining. Molecular weight = 127.6; Specific gravity (H_2O:1) = 6.2 @ 25°C; Boiling point = 998°C; Freezing/Melting point = 450°C; Vapor pressure = 0.75 mmHg @ 500°C; Autoignition temperature = 340°C. Insoluble in water.

Potential Exposure: The primary use of tellurium is in the vulcanization of rubber and as an additive in ferritic steel production. It is also used as a carbide stabilizer in cast iron, a chemical catalyst; a coloring agent in glazes and glass; a thermocoupling material in refrigerating equipment; as an additive to selenium rectifiers; in alloys of lead, copper, steel, and tin for increased resistance to corrosion and stress, workability, machinability, and creep strength; and in certain culture media in bacteriology. Since tellurium is present in silver, copper, lead, and bismuth ores, exposure may occur during purification of these ores.

Incompatibilities: Finely divided powder or dust may be flammable and explosive. Violent reaction with halogens, interhalogens, zinc and lithium silicide; with incandescence. Incompatible with oxidizers, cadmium; strong bases; chemically active metals; silver bromate; nitric acid.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[Te]/m^3

OSHA PEL: 0.1 mg[Te]/m^3 TWA

NIOSH REL: 0.1 mg[Te]/m^3 TWA, *except tellurium hexafluoride and bismuth telluride*.

ACGIH TLV[1]: 0.1 mg[Te]/m^3 TWA, *except hydrogen telluride*.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.8 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 110 milligram per cubic meter

Australia: TWA 0.1 milligram per cubic meter, 1993; Austria: MAK

0.1 milligram per cubic meter, 1999; Belgium: TWA 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; Finland: TWA 0.1 milligram per cubic meter, STEL 0.3 milligram per cubic meter, 1999; France: VME 0.1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 mg[Te]/m^3, 2003; the Phillipines: TWA 0.1 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter; MAC (STEL) 0.03 milligram per cubic meter, 1999; Sweden: NGV 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, KZG-W 0.5 milligram per cubic meter, 1999; Turkey: TWA 0.1 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 mg[Te]/m^3. Several states have set guidelines or standards for tellurium in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota); to 1.6 μ/m^3 (Virginia); to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7900. See also #7300, Elements; #7301; #7303; #9102; OSHA Analytical Method ID-121.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects. Russia [43] set a MAC for tellurium in water bodies used for domestic purposes of 0.01 mg/L.

Routes of Entry: Inhalation of dust or fume; percutaneous absorption from dust,ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Tellurium compounds are both an oral and dermal toxic hazard. The material is toxic by ingestion. Oral ingestion of tellurium compounds is generally regarded as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 70 kg (150 pound) person. Tellurium compounds are regarded as super toxic for skin exposures.

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Causes CNS depression. Mode rate skin and eye irritant. Tellurium is capable of doing harm within the body by replacing the essential element sulfur. Signs and symptoms of acute exposure to tellurium may include garlicky breath, metallic taste; sweating; dry mouth; drowsiness, no sweating headache; drowsiness, malaise, fatigue, lassitude, weakness, and dizziness. Gastrointestinal symptoms may include nausea, vomiting, anorexia, and constipation. High levels of the dust or fume may cause bronchitis or pneumonia to develop. In animals: CNS; red blood cell changes.

Long-Term Exposure: Repeated exposure can cause garlic odor on the breath, nausea, vomiting, anorexia, metallic taste; and irritability. Kidney damage, liver injury; and pulmonary effects may also occur. Dermal exposure may result in dermatitis; red, inflamed skin; drying and cracking. At doses which are severely toxic to the mother, tellurium produces teratogenic effects. May damage the unborn fetus. High exposures may cause damage to the nervous system.

Points of Attack: Skin, lungs, cardiovascular system, CNS, kidneys, liver.

Medical Surveillance: Oral hygiene and the respiratory tract should receive special attention in preplacement or periodic examinations. Liver and kidney function tests. Blood tests for liver and kidney function. Examination of the cardiovascular and nervous systems. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Give a slurry of activated charcoal in water to drink. Seek medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning *do not* use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from tellurium.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 1 milligram per cubic meter*: 95Q X [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 25 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, chlorine, cadmium. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical in powder form is a flammable solid. Thermal decomposition products may include metallic oxides of tellurium. Use water spry. Tellurium will burn only slowly in air. Straight water streams will scatter molten tellurium oxide. Wear goggles, rubber gloves, and proper respirator with filter. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Description: Tellurium hexafluoride is a colorless gas with a repulsive odor. Molecular weight = 241.59; Specific gravity (H_2O:1) = 9.9; Boiling point = (sublimes before reaching its BP) −39°C; Freezing/Melting point = (sublimes) −38°C; Vapor pressure = 760 mmHg @ 20°C; Relative vapor density (air = 1) = 8.34. ₩ Decomposes in water.

Potential Exposure: Tellurium hexafluoride is stated to be a by-product of ore refining.

Incompatibilities: Hydrolyzes slowly in water forming telluric acid. Emits highly toxic fumes when heated or on contact with acid or acid fumes.

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift
Australia: TWA 0.02 ppm (0.2 milligram per cubic meter), 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Austria: MAK 0.1 mg[Te]/m^3, 1999; Belgium: TWA 0.02 ppm (0.1 milligram per cubic meter), 1993; Denmark: TWA 0.02 ppm (0.2 milligram per cubic meter), 1999; Finland: TWA 0.02 ppm (0.2 milligram per cubic meter), STEL 0.06 ppm (0.6 milligram per cubic meter), 1999; France: VME 0.02 ppm (0.2 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.2 milligram per cubic meter, 2003; the Phillipines: TWA 0.02 ppm (0.2 milligram per cubic meter), 1993; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 3 mg[HF]/m^3, 1999; Poland: MAC (TWA) 0.01 mg[Te]/m^3; MAC (STEL) 0.03 mg[Te]/m^3, 1999; Sweden: NGV 2 mg[F]/m^3, 1999; Sweden: NGV 0.1 mg[Te]/m^3, 1999; Switzerland: MAK-W 0.02 ppm (0.2 milligram per cubic meter), 1999; United Kingdom: TWA 2.5 mg[F]/m^3; TWA 0.1 mg[Te]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.02 ppm. Several states have set guidelines or standards for TeF_6 in ambient air[60] ranging from 2.0 μ/m^3 (North Dakota); to 3.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (Connecticut); to 5.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH II (3), Method #S-187.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Tellurium hexafluoride can cause death or permanent injury. *Acute*: the material is highly toxic by inhalation exposure and a strong irritant to skin, eyes, lungs, throat, and stomach. Death can occur from filling of the lungs with fluid (pulmonary edema) or from asphyxiation due to spasm of the throat (larynx), or bronchi. Signs and symptoms of acute exposure to tellurium hexafluoride may include drowsiness, malaise, lassitude, weakness, and dizziness.

Long-Term Exposure: Dermal exposure may result in dermatitis; red, inflamed skin; drying and cracking. May cause kidney and liver injury. A metallic taste; garlicky breath; and profuse sweating may develop. Gastrointestinal effects may include nausea, vomiting, anorexia, and constipation.

Points of Attack: Respiratory system, liver and kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 seconds). Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning *do not* use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from tellurium.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.2 ppm*: Sa (APF = 10) (any supplied-air respirator). *Up to 0.5 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 1 ppm*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code-White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN2195 Tellurium hexafluoride, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, inhalation hazard zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: *Tellurium hexafluoride*

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 2.8/4.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 4.2/6.8
Night 7.0+/11.0+*

*+ means distance can be larger in certain atmospheric conditions.

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse vapors. Stop the flow of the leak. Remove the leaking container to a safe place in the open air and allow the leak to disperse. Use water spray to reduce vapor but do not put water on leak or spill area. *Small spills*: flush area with flooding amounts of water. *Large spills*: dike far ahead of spill for later disposal. Do not get water inside container. Isolate area until gas has dispersed. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition may include highly poisonous tellurium and hydrogen fluorides and metallic tellurium. This chemical is a nonflammable gas but containers may rupture and explode in fire. *Small fires*: dry chemical or carbon dioxide. *Large fires*: water spray, fog or foam. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and full protective clothing. Do not get water inside container. Move container from fire area if you can do so without risk. Stay away from ends of tanks. Spray cooling water on containers that are exposed to flames until well after fire is out. Isolate area until gas has dispersed. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Water reactive, Environmental hazard, Drug, Human Data.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P111

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long-lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R26; R27/28; R33; R50/53; Safety phrases: S1/2; S29/35; S36/37/39; S38; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: TEPP is a colorless to amber liquid. Some liquid formulation may contain flammable organic solvents.* A solid (glass-like state) below 0°C. May be transported in molten form. Faint, fruity, aromatic odor. Molecular weight = 290.22; Specific gravity (H_2O:1) = 1.19 @ 25°C; Boiling point = decomposes $<$ BP @ 170°C; 138°C under 2.3 mmHg; Freezing/Melting point = 0°C; Vapor pressure = 2×10^{-4} mmHg @ 25°C; Flash point = $>$ 100°C. ₩ Soluble in water; slow decomposition, forming pyrophosphoric acid. *Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: A potential danger to those engaged in the manufacture, formulation and application of this aphicide and acaricide; used as an insecticide to control aphids, thrips, and mites; as an anticholinesterase.

Incompatibilities: Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101]. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alkalis, water. Hydrolyzes quicklyin water to form pyrophosphoric acid.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 milligram per cubic meter

Conversion factor: 1 ppm = 11.87 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.05 milligram per cubic meter TWA [skin]

NIOSH REL: 0.05 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.01 milligram per cubic meter, measured as inhalable fraction and vapor TWA [skin]; BEI_A issued for Acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.091 milligram per cubic meter

PAC-2: 1 milligram per cubic meter

PAC-3: 10 milligram per cubic meter

DFG MAK: 0.005 ppm/0.06 milligram per cubic meter; Peak Limitation Category II(2) [skin]

Arab Republic of Egypt: TWA 0.004 ppm (0.05 milligram per cubic meter), [skin], 1993; Australia: TWA 0.004 ppm (0.05 milligram per cubic meter), [skin], 1993; Austria: MAK 0.005 ppm (0.05 milligram per cubic meter), [skin], 1999; Belgium: TWA 0.004 ppm (0.047 milligram per cubic meter), [skin], 1993; Denmark: TWA 0.004 ppm (0.05 milligram per cubic meter), [skin], 1999; France: VME 0.004 ppm (0.05 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 0.05 milligram per cubic meter, [skin], 2003; the Phillipines: TWA 0.05 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 0.005 ppm (0.05 milligram per cubic meter), [skin], 1999; Turkey: TWA 0.05 milligram per cubic meter, [skin], 1993 Occupational Exposure Limit United Kingdom: TWA 0.004 ppm (0.05 milligram per cubic meter), STEL 0.1 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.05 milligram per cubic meter (skin)

Determination in Air: Use NIOSH Analytical Method (IV) #2504, Tetraethyl Pyrophosphate; see also NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure include eye pain; blurred vision; lacrimation (discharge of tears); rhinorrhea (discharge of thin nasal mucous); headache, chest tightness; cyanosis, anorexia, nausea, vomiting, diarrhea, weakness, twitching, paralysis, Cheyne-Stokes respiration, convulsions, low blood pressure; cardiac irregular/irregularities; sweating. TEPP is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg (a taste) for a 150 lb person. A small drop in the eye may cause death. Small doses at frequent intervals are additive. Poisonings always develop at a rapid rate. Cholinesterase toxin; Eye irritant; Eye, acute other than irritation; Respiratory irritant-acute, severe, or moderate but not mild irritant effects; Skin irritant-severe; Heart cardiovascular system, acute; Brain, acute; CNS, acute; Nervous system toxin, acute; Respiratory toxin, acute other than severe or moderate irritation[138].

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Eyes, respiratory system; CNS; cardiovascular system, gastrointestinal tract; blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in one to two weeks while red blood cell levels may be reduced for one to three months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: *Specific treatment is necessary in case of poisoning with this substance; the appropriate means with instructions must be available.* If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink. *Do NOT* induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 0.5 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator). 1.25 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 2.5 milligram per cubic meter: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 5 milligram per cubic meter: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. *Note*: See T:0305 for TEPP + compressd gas.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid that may be formulated with a flammable substance. Thermal decomposition products may include phosphoric acid and oxides of phosphorus, nitrogen and carbon. Use dry chemical, carbon dioxide; or foam extinguishers if formulated with a flammable substance. Vapors are heavier than air and will collect in low areas. Vapors from a flammable carrier may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. TEPP is 50% hydrolyzed in water in 6.8 hour @ 25°C, and 3.3 hours @ 38°C; 99% hydrolysis requires 45.2 hours @ 25°C, or 21.9 hours @ 38°C. Hydrolysis of TEPP yields nontoxic products. Incineration is, however, an option for TEPP disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Dsescription: Terbufos is a colorless to pale yellow liquid. Molecular weight = 288.45; Boiling point = 70°C @ 0.01 mm; Freezing/Melting point = −29°C; Vapor pressure = 3×10^{-4} mmHg @ 20°C; Flash point = 88°C (oc). Hazard Identification (based on NFPA-704 M Rating System) (liquid in flammable carrier): Health 4, Flammability 2−3, Reactivity 0. Slightly soluble in water.
Potential Exposure: A potential danger to those involved in the manufacture, formulation or application of this organophosphate soil insecticide.
Incompatibilities: Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101]. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents, such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.
Permissible Exposure Limits in Air
ACGIH TLV[1]: 0.01 milligram per cubic meter TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI issued (1999)
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 0.091 milligram per cubic meter
PAC-2: 1 milligram per cubic meter
PAC-3: 2.2 milligram per cubic meter
Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.
Permissible Concentration in Water: The EPA (see "References" below) has developed a lifetime health advisory of 0.18 μg/L; (100).
Determination in Water: Analysis of terbufos is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen-phosphorus containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen-phosphorus detector. Fish Tox = 0.04733000 ppb (EXTRA HIGH).
Routes of Entry: Inhalation, ingestion, skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: This material may be fatal if swallowed, inhaled, or absorbed through the skin. Repeated inhalation or skin contact may progressively increase susceptibility to poisoning. Acute exposure to terbufos may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may be noted, although hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression; and respiratory paralysis. Psychosis may occur.
Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in one to two weeks while red blood cell levels may be reduced for one to three months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Transport to a health care facility.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 500.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Terbufos, Washington, DC, Chemical Emergency Preparedness Program (November 30, 1987)

Terephthalic Acid T:0200

Formula: $C_8H_6O_4$; $HOOCC_6H_4COOH$

Synonyms: Acide terephthalique (French); *p*-Benzene dicarboxylic acid; 1,4-B enzenedicarboxylic acid; *p*-Phthalic acid; Phthalic acid, *p*-isomer; TA 12; TA

CAS Registry Number: 100-21-0

HSDB Number: 834

RTECS Number: WZ0875000

EC Number: 202-830-0

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi; Risk phrases: R36/37/38; Safety phrases: S26; S36; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: TPA is a white crystalline solid. Molecular weight = 166.14; Specific gravity (H_2O:1) = 1.51 @ 20°C; Sublimation point ≥ 400°C; Flash point = 260°C; Autoignition temperature = 495°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: TPA is used primarily in the production of polyethylene terephthalate polymer for the fabrication of polyester fibers and films. A high-volume production chemical in the United States.

Incompatibilities: Combustible; dust may form an explosive mixture with air. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 10 milligram per cubic meter TWA

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 140 milligram per cubic meter

PAC-3: 840 milligram per cubic meter

DFG MAK: 0.1 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group C

The Netherlands: MAC-TGG 10 milligram per cubic meter, 2003. Russia[43] set a MAC in workplace air of 0.1 milligram per cubic meter. Kansas[60] has set a guideline for ambient air of 556 μ/m^3.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.1 mg/L.

Determination in Water: Octanol-water coefficient: Log K_{ow} = 1.96. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: May cause irritation to mouth, nose, or throat. *Skin*: May cause irritation, especially in open cuts or sores. *Eyes*: Can cause irritation. *Ingestion*: Mildly toxic.

Long-Term Exposure: In a 2001 study, postnatal developmental effects were observed in rats.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician*: May require supportive measures for allergic reaction. Urinary excretion is rapid.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wear a dust mask. Where there is potential for overexposure to this chemical, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in detached units of noncombustible construction. As far as possible use dust-tight equipment and vacuum cleaning.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Fine dust may form explosive mixture with air and produce a severe hazard. Thermal decomposition products may include oxides of carbon. Use carbon dioxide, dry chemical or water. Wear SCBA and full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible (all isomers),

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. (*m-, o-, p*-isomers).

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. (*p*-isomer)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi, N; Risk phrases: R20, R36/37/38; R50/53; Safety phrases: S26; S36/37; S45; S53; S61; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water (*o*- and *p*-isomers; mixed isomers).

Description: There are multiple isomeric terphenyls, all having the formula C_6H_5-C_6H_4-C_6H_5. Pure terphenyl is a white, crystalline solid. The commercial grades are light yellow. All three isomers are unusually stable toward heat. Molecular weight = 230.32 (*m-, o-, p-isomers*). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. All are insoluble in water.

The properties of the terphenyls are:

m-isomer: Specific gravity (H_2O:1) = 1.23 @ 25°C; Boiling point = 365°C; Freezing/Melting point = 89°C; Vapor pressure = 0.01 mmHg @ 93°C; Flash point = 191°C.

o-isomer: Specific gravity (H_2O:1) = 1.10 @ 25°C; Boiling point = 332°C; Freezing/Melting point = 58°C; Vapor pressure = 0.09 mmHg @ 93°C; Flash point = 163°C.

p-isomer: Specific gravity (H_2O:1) = 1.23 @ 25°C; Boiling point = 405°C; Freezing/Melting point = 212.8°C; Vapor pressure = 1.23 mmHg @ 93°C; Flash point = 207°C.

hydrogenated: Molecular weight = 298; Specific gravity (H_2O:1) = 1.01 @ 20°C; Boiling point = 340°C.

Potential Exposure: (*p*-isomer): Agricultural Chemical. Terphenyl is used primarily as a plasticizer and heat transfer agent. It is also used as a high-temperature lubricant; a constituent of waxes and polishes; as a plasticizer for resin-bodied paints; as a coolant and heat storage agent.

Incompatibilities: Materials are combustible. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 milligram per cubic meter

Conversion factor: 1 ppm = 9.57 milligram per cubic meter (*m*-and *p*-isomers); 1 ppm = 9.42 milligram per cubic meter @ 25°C & 1 atm (*o*-isomer)

all isomers

OSHA PEL: 1 ppm/9 milligram per cubic meter Ceiling Concentration

Terphenyls, hydrogenated

Australia: Ceiling Concentration 0.5 ppm (5 milligram per cubic meter), 1993; Belgium: Ceiling Concentration 0.5 ppm (4.9 milligram per cubic meter), 1993; Denmark: Ceiling Concentration 0.4 ppm (4.4 milligram per cubic meter), 1999; France: VME 0.5 ppm (5 milligram per cubic meter), 1999; Russia: STEL 5 milligram per cubic meter, 1993; Switzerland: MAK-W 0.5 ppm (5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.5 ppm

Russia: MAC 5 milligram per cubic meter. Several states have set guidelines or standards for terphenyls in ambient air[60] ranging from 40 μ/m^3 (Virginia); to 50 μ/m^3 (North Dakota); to 119 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 5021, *o*-terphenyl

Routes of Entry: Inhalation of dusts and mists, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of eyes, skin and respiratory tract. Skin or eye contact may cause thermal burns. Inhalation can cause lung irritation with coughing, wheezing and/or shortness of breath. Symptoms of exposure include headache, sore throat.

Long-Term Exposure: May affect the liver and kidneys. Repeated skin contact can cause dermatitis; drying and cracking. In animals: liver, kidney damage

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 25 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 50 milligram per cubic meter*: 95XQ (APF = 10)$^{£}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 250 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3151 Polyhalogenated biphenyls, liquid or Polyhalogenated terphenyls liquid, Hazard class: 9; Labels: 9-Miscellaneous hazardous material. UN3152 Polyhalogenated biphenyls, solid or Polyhalogenated terphenylssolid, Hazard class: 9; Labels: 9-Miscellaneous hazardous material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Terphenyls are combustible solid, but do not easily ignite. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Testosterone T:0220

Formula: $C_{19}H_{28}O_2$

Synonyms: Androlin; Andronaq; Androst-4-en-17(*β*)-ol-3-one; Androst-4-en-3-one, 17-β-hydroxy-; Androst-4-en-3-one, 17-hydroxy-, (17-*β*)-; Andrusol; Cristerone T; Geno-cristaux gremy; Homosteron; Homosterone; 17-*β*-Hydroxy-4-androsten-3-one; 17-*β*-Hydroxyandrost-4-en-3-one; 7-*β*-Hydroxyandrost-4-en-3-one; Malestrone (AMPS); Mertestate; Neo-testis; Oreton; Oreton-F; Orquisteron; Perandren; Percutacrine androgenique; Primotest; Primoteston; Sustanone; Synandrol F; Teslen; Testandrone; Testiculosterone; Testobase; Testopropon; Testosteroid; Testosteron; Testosterone hydrate; Testostosterone; Testoviron schering; Testoviron T; Testrone; Testryl; Virormone; Virosterone

CAS Registry Number: 58-22-0; 57-85-2 (testosterone propionate)

HSDB Number: 3398

RTECS Number: XA3030000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171; UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 200-370-5; 200-351-1 (testosterone propionate)

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Limited Evidence, 1979

California Proposition 65 Chemical[102]: Cancer, (testosterone and its esters) 1/1/1988

Hazard Alert: Poison, Environmental hazard,

Hazardous to aquatic life or environment, with possible long-lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xn; Risk phrases: R45; R20; R36/37/38; R34; R40; R50/53; R60; R61; R63; Safety phrases: S22; S24/25; S26; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Testosterone is an odorless, white or slight cream-colored crystals or crystalline powder. Molecular weight = 288.47; Freezing/Melting point = 155°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Practically insoluble in water.

Potential Exposure: Used as an androgenic, anabolic and estrogenic hormone for both males and females.

Incompatibilities: Combustible; dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Russia[43] set a MAC in workplace air of 0.005 milligram per cubic meter ($5\ \mu/m^3$).

Determination in Water: Log $K_{ow} = > 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Harmful Effects and Symptoms

Short-Term Exposure: Testosterone can affect you when breathed in and by passing through your skin. Testosterone is a teratogen. Handle with extreme caution. Exposure can cause nausea, upset stomach; acne, and fluid and salt retention in body tissues.

Long-Term Exposure: Women can also develop male features, baldness, increased body hair; deep voice and menstrual changes. Men can have lower sperm production, painful enlarged breasts; enlarged prostate; and excess of red blood cells. Repeated exposure can cause women to develop male characteristics including face and body hair, badness, deepened voice and enlarged female genitalia (clitoris). Higher levels can cause irregular menstrual cycles, lighter periods and smaller breasts. If carried home (clothing, etc.) children in the home may have stunted growth, premature puberty in boys, and masculine appearance and abnormal genitals in girls.

Points of Attack: Blood cells, sex organs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Frequent exams (at least monthly) are recommended to evaluate for any signs or symptoms of exposure. If exposure is suspected, the following are recommended: red blood cell count (in men). Urine test for androsterone and/or etiocholanolone. (The more common 17-ketosteroid test is not sufficiently sensitive for such exposures).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard /Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Testosterone may burn, but does not readily ignite. Use dry chemical, CO_2, water spray; or foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

List of Stockholm Convention POPs: Annex C (Unintentional production and release) as *polychlorinated dibenzo-p-dioxins (PCDD).*

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F, Xn; Risk phrases: R45; R19; R20; R22; R23/24/25; R36/37/38; R34; R39; R48/20; R50; R62; R63; R65; R67; Safety phrases: S7; S16; S22; S24/25; S26; S36/37/39; S45; S53; S62; S41 (see Appendix 4)

Description: Tetrachlorodibenzo-*p*-dioxin is a white, needle-shaped, crystalline solid. Molecular weight = 321.97; Boiling point = (decomposition); Freezing/Melting point = 295°C; Vapor pressure = 2×10^{-6} mmHg @ 25°C. Thermal decomposition begins @ 500°C and is virtually complete within 21 seconds @ 800°C. Very slightly soluble in water; solubility = 0.00000002%. Polychlorinated dibenzo-p-dioxins are formed in the manufacturing process of all chlorophenols. However, the amount formed is dependent on the degree to which the temperature and pressure are controlled during production. An especially toxic dioxin, 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD), is formed during the production of 2,4,5,-TCP (trichlorophenol); by the alkaline hydrolysis of 1,2,4,5-tetrachloorobenzene.

Potential Exposure: TCDD is primarilly a research chemical. As noted above, TCDD is an inadvertent contaminant in herbicide precursors and thus in the herbicides themselves. It is also formed during various combustion processes including the incineration of chemical wastes (chlorophenols, chlorinated benzenes, and biphenyl ethers). It may be found in flue gases, fly ash, and soot particles. It is highly persistent in soil, and contamination may be retained for years. TCDD is the most toxic of all the dioxins, and has the potential for bio-accumulation in animals. Thus, it is applied in herbicide formulations, but is not used per se. It has been estimated that approximately 2 million acres in the United States have been treated for weed control on one or more occasions with approximately 15 million pounds of TCDD contaminated 2,4,5,-T, 2,4,-D, or combinations of the two.

Incompatibilities: Decomposes in ultraviolet (UV) light.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: Carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.30E-04E milligram per cubic meter

PAC-2: 0.0014 milligram per cubic meter

PAC-3: 0.0085 milligram per cubic meter

DFG MAK: 1.0×10^{-8}, inhalable fraction Peak Limitation Category II(8) [skin]; Carcinogen Category 4; Pregnancy Risk Group C.

Austria: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Switzerland: carcinogen, 1999. Several states have set guidelines or standards for TCDD in ambient air[60] ranging from zero (North Dakota and South Carolina); to 1.1 picograms/m^3 (Massachusetts); to 0.003 nanogram/m^3 (North Carolina); to 0.0001 μ/m^3 (Pennsylvania); to 3.0 μ/m^3 (Virginia); to 450.0 μ/m^3 (Indiana).

Determination in Air: No method available.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.000000003 mg/L; MCLG, zero. For the protection of human health, the concentration is preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed at a concentration of 4.55×10^{-7} μg/L as of 1979. A concentration of 0.0039 μg/L was estimated to limit cancer risk to one in a million by EPA in 1980. States which have set guidelines for TCDD in drinking water include Maine @ 2×10^{-4} μg/L and Minnesota @ 2×10^{-6} μg/L[61].

Determination in Water: Methylene chloride extraction followed by transfer to benzene and capillary column gas chromatography/mass spectrometry with electron impact ionization (EPA Method 613); or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

In varying degrees, organochlorines are absorbed from the gut and also by the lung and across the skin[72].

Short-Term Exposure: *Note*: 2,3,7,8-TCDD is one of the most toxic synthetic chemicals, and the most toxic of the 75 dioxins. LD_{50} = (oral-rat) 0.05 mg/kg. Exposure can headache, weakness, and digestive disturbances. Most symptoms develop slowly, over many days. Inhalation can cause burning sensation in nose and throat, headache, dizziness, nausea, vomiting, pain in the joints; tiredness, emotional disorders; blurred vision; muscle pain; nervousness, irritability and intolerance to cold. Itching, swelling and redness, followed by acne-like eruptions of the skin known as chloracne commonly occur. Symptoms of chloracne may appear weeks or months after initial exposure and may last a few months or Up to 15 years. Can cause abnormalities of liver, pancreas, circulatory system, respiratory system, and death. Skin contact with very small amounts can cause chloracne. Eye contact can cause burning and irritation. Animal studies suggest that daily exposure to amounts smaller than one grain of salt may cause severe symptoms and death within a few weeks.

Long-Term Exposure: Reproductive difficulties; increased risk of cancer (2,3,7,8-TCDD). Can cause effects under inhalation, especially chloracne (an acne-like skin rash), as well as numbness and tingling in arms and legs. Can cause allergic dermatitis porphyria; gastrointestinal disturbance; possible reproductive problems. A blood abnormality may occur which may include light sensitive skin, blisters, dark skin coloration; excessive hair growth and dark red urine. Reproductive problems and an increased susceptibility to infection may occur. TCDD is considered a potential occupational carcinogen because extremely low levels cause cancer and birth defects in animals. May cause liver, kidney damage. May be a teratogen. May decrease fertility in males and females.

Points of Attack: Eyes, skin, liver, kidneys, reproductive system, liver and kidneys. Cancer site in animals: tumors at many sites; liver, lung, mouth, tongue, skin cancer. Causes lymphomas in humans.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. In short, contact with TCDD should be avoided but obviously careful preplacement and regular physical exams should be carried out in those cases where worker exposure cannot be avoided, with emphasis on liver and kidney function studies. Examination of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Liver and nerve function screening tests should be performed. Also monitor serum triglycerides and cholesterol.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Use in isolated area with adequate ventilation, preferably a hood; segregated glass-ware and tools; and plastic backed absorbent. Thoroughly wash hands and forearms after each manipulation and before leaving work area. Use the same precautions required for radioactive work.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Warn other workers of spill. Wearing protective clothing, collect powdered material in the most convenient and safe manner and deposit in sealed containers. Rinse area with 1,1,1-trichloroethane, then wash with detergent and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

NIOSH REL: 500 ppm/4170 milligram per cubic meter TWA

ACGIH TLV[1]: 100 ppm /834 milligram per cubic meter TWA

DFG MAK: 200 ppm/1700 milligram per cubic meter TWA; Peak Limitation Category II(2) [Pregnancy Risk Group D.

Australia: TWA 500 ppm (4170 milligram per cubic meter), 1993; Austria: MAK 500 ppm (4179 milligram per cubic meter), 1999; Belgium: TWA 500 ppm (4170 milligram per cubic meter), 1993; Denmark: TWA 500 ppm (4170 milligram per cubic meter), 1999; Finland: TWA 500 ppm (4170 milligram per cubic meter), STEL 625 ppm (5215 milligram per cubic meter), 1999; France: VME 500 ppm (4170 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 4170 milligram per cubic meter, 2003; Switzerland: MAK-W 500 ppm (4200 milligram per cubic meter), 1999; United Kingdom: TWA 100 ppm (847 milligram per cubic meter), STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 500 ppm

76-11-9, (1,1,2,2-)

NIOSH IDLH = 2000 ppm

OSHA PEL: 500 ppm/4170 milligram per cubic meter TWA

NIOSH REL: 500 ppm/4170 milligram per cubic meter TWA

ACGIH TLV[1]: 500 TWA

Protective Action Criteria (PAC) Ver. 29[138]

76-12-0, (1,1,2,2-T-1,2,-D)

PAC-1: 150 ppm

PAC-2: 1600 ppm

PAC-3: 15,000 ppm

DFG MAK: 200 ppm/1700 milligram per cubic meter; Pregnancy Risk Group D

Australia: TWA 500 ppm (4170 milligram per cubic meter), 1993; Austria: MAK 200 ppm (1690 milligram per cubic meter), 1999; Belgium: TWA 500 ppm (4170 milligram per cubic meter), 1993; Denmark: TWA 200 ppm (1665 milligram per cubic meter), 1999; Finland: TWA 500 ppm (4170 milligram per cubic meter), STEL 625 ppm (5215 milligram per cubic meter), 1999; France: VME 500 ppm (4170 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 850 milligram per cubic meter, 2003; the Phillipines: TWA 500 ppm (4170 milligram per cubic meter), 1993; Switzerland : MAK-W 500 ppm (4200 milligram per cubic meter), STEL 1000 ppm, 1999; United Kingdom: TWA 100 PPM (847 MG/ minute3), STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 500 ppm. Several states have set guidelines or standards for these compounds in ambient air[60] ranging from 0.57 milligram per cubic meter (Massachusetts); to 41.7 milligram per cubic meter (North Dakota); to 51.7 milligram per cubic meter (North Carolina); to 70.0 milligram per cubic meter (Virginia); to 83.4 milligram per cubic meter (Connecticut); to 99.296 milligram per cubic meter (Nevada).

Determination in Air: NIOSH Analytical Method (IV) #1016; OSHA Analytical Method 7.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guide lines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with either chemical can irritate the eyes and the skin, causing a rash or a burning feeling. 1,1,1,2-Tetrachloro-2,2-difluoroethane can affect you when breathed in. May cause CNS depression. High levels may irritate the lungs, causing coughing, shortness of breath; drowsiness, dyspnea (breathing difficulty). Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. 1,1,2,2,-Tetrachloro-1,2-difluoroethane can affect you when breathed in. Exposure can cause you to become dizzy, lightheaded and to pass out. Very high exposures could cause death. May affect the heart, causing an irregular rhythm. Exposure can cause you to become dizzy and lightheaded. Extremely high levels could cause you to pass out and even die. It can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Either compound may cause liver damage. Repeated exposure to either compound may reduce the number of white blood cells.

Points of Attack: Eyes, skin, respiratory system; CNS; heart.

Medical Surveillance: *For the 1,1,1,2-compound*: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Holter monitor (a special 24 hour EKG to look for irregular heart rhythms). Consider chest X-ray after acute overexposure. Liver function tests. CBC.

For the *1,1,2,2-compound*: If symptoms develop or overexposure has occurred, blood tests for liver function, a CBC and lung function tests may be useful. If heart rhythm symptoms are occurring, special 24-hour EKG test might be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. (This is particularly true of the 1,1,1,2-compound).

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Barrier and Viton gloves; Tychem BR, Tychem TK, Responder, and Trellchem suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid or dust-proof goggles and face shield when working with powders or dusts, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2000 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,P p: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Check oxygen content before entering area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Tetrachloro-difluoroethanes must be stored to avoid contact with chemically active metals (such as sodium, potassium, beryllium, zinc, powdered aluminum; or magnesium), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: UN1078 Refrigerant gases, n.o.s., Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas, Technical Name Required

Spill Handling: Absorb liquid in vermiculite, dry sand; earth, or similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, hydrogen fluoride, phosgene and oxides of carbon. Extinguish fire using an agent suitable for type of surrounding fire. Tetrachloro-difluoroethanes do not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: 1,1,1,2-Tetrachloroethane is a colorless to yellowish-red liquid. Molecular weight = 167.85; Specific gravity (H_2O:1) = 1.54 @ 20°C; Boiling point = 136°C; Freezing/Melting point = −70°C; Vapor pressure = 14 mmHg @ 25°C; 7.5 mmHg @ 17°C[138]. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 0.1%.

Potential Exposure: 1,1,1,2-Tetrachloroethane is used as a solvent and in manufacture of insecticides, herbicides, soil fumigants; blanches, paints, and a number of widely used products; as are the other chloroethanes.

Incompatibilities: 1,1,1,2-Tetrachloroethane is incompatible with strong oxidizing agents and strong bases. It is also incompatible with dinitrogen tetraoxide, 2,4-dinitrophenyl disulfide, potassium, potassium hydroxide, nitrogen tetraoxide, sodium and sodium potassium alloy. It may react with chemically active metals, strong caustics, hot iron, aluminum and zinc in presence of steam. It may also react with mixtures of dinitrogen tetraoxide with halocarbons[NTP,1992].

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: No numerical value but users are cautioned to handle with caution in the workplace. See *NIOSH Pocket Guide*, Appendix C.

Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 0.2 ppm
PAC-2: 2.2 ppm
PAC-3: 13 ppm

Brazil[35] 4 ppm (27 milligram per cubic meter) for workplace air over a 48 hour week. Russia[43] set a MAC for tetrachloroethanes (no isomer indicated) of 5 milligram per cubic meter in workplace air.

Determination in Air: No method available.

Permissible Concentration in Water: For 1,1,1,2-tetrachoroethane the criterion to protect freshwater aquatic life is 9,320 μg/L based on acute toxicity data. For saltwater aquatic life, no criterion for 1,1,1,2-tetrachloroethane can be derived using the guidelines, and there is insufficient data to estimate a criterion using other procedures. For the protection of human health, there is insufficient data to derive criteria for 1,1,1,2-tetrachloroethane.

Determination in Water: Octanol-water coefficient: Log K_{ow} = 2.4. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact irritates the eyes and skin. Inhalation can irritate the respiratory tract causing coughing, wheezing, and/or shortness of breath. Can cause headache, nausea and vomiting. May cause CNS depression. Symptoms of exposure include weakness, restlessness, tremor, dizziness, drowsiness, irregular/irregularities of respiration; decreased muscle coordination; coma.

Long-Term Exposure: There is limited evidence that this chemical causes liver cancer in animals. Can cause dermatitis; drying and cracking. May affect the liver and nervous system.

Points of Attack: Eyes, skin, CNS; liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests. Examination of the nervous system. Evaluation by a dermatologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from potassium, sodium, dinitrogen tetraoxide; potassium hydroxide; nitrogen tetroxide; sodium potassium alloy; 2,4-dinitrophenyl disulfide. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded.

Shipping: UN1702 Tetrachloroethane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Thermal decomposition products may include chlorine and hydrogen chloride. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rock et great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R26/27; R50/53; R62; Safety phrases: S1/2; S29/35; S38; S41; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Tetrachloroethane is a heavy, volatile colorless to light yellow liquid. It has a sweetish, chloroform-like odor. The Odor Threshold is 0.5 ppm in water and 1.5 ppm in air. Molecular weight = 167.9; Specific gravity (H_2O:1) = 1.6 @ 20°C; Boiling point = 145°C; Freezing/Melting point = −42.4°C; Vapor pressure = 5.8 mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 0.29% @ 20°C.
Potential Exposure: Tetrachloroethane is used as an intermediate in the trichloroethylene production from acetylene and as a solvent; as a dry cleaning agent; as a fumigant; in cement; and in lacquers. It is used in the manufacture of artificial silk, artificial leather, and artificial pearls. Recently, its use as a solvent has declined due to replacement by less toxic compounds. It is also used in the estimation of water content in tobacco and many drugs, and as a solvent for chromium chloride impregnation of furs.
Incompatibilities: Violent reaction with chemically active metals; strong caustics; strong acids; especially fuming sulfuric acid. Degrades slowly when exposed to air. Attacks plastic and rubber.
Permissible Exposure Limits in Air
NIOSH IDLH = 100 ppm, potential occupational carcinogen.
The Odor Threshold is 1.5 ppm in air.
OSHA PEL: 5 ppm/35 milligram per cubic meter TWA [skin]
NIOSH REL: 1 ppm/7 milligram per cubic meter TWA [skin]; potential occupational carcinogen; See *NIOSH Pocket Guide*, Appendix A and C (chloroethanes).
ACGIH TLV[1]: 1 ppm/6.9 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 3 ppm
PAC-2: 120 ppm
PAC-3: 150 ppm

DFG MAK: 1 ppm /7.0 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Carcinogen Category 3B; Pregnancy Risk Group D

Australia: TWA 1 ppm (7 milligram per cubic meter), [skin], 1993; Austria: MAK 1 ppm (7 milligram per cubic meter), [skin], Suspected: carcinogen, 1993; Belgium: TWA 1 ppm (6.9 milligram per cubic meter), [skin], 1993; Denmark: TWA 1 ppm (7 milligram per cubic meter), [skin], 1999; Finland: TWA 1 ppm (7 milligram per cubic meter), STEL 3 ppm (21 milligram per cubic meter), [skin], 1999; France: VME 1 ppm (7 milligram per cubic meter), VLE 5 ppm (35 milligram per cubic meter), 1999; Japan: 1 ppm (6.9 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 7 milligram per cubic meter, [skin], 2003; Norway: TWA 1 ppm (7 milligram per cubic meter), 1999; the Phillipines: TWA 5 ppm (35 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 35 milligram per cubic meter, 1999; Russia: TWA 1 ppm, 1993; Switzerland: MAK-W 1 ppm (7 milligram per cubic meter), [skin], 1999; Turkey: TWA 5 ppm (35 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia set a MAC for ambient air in residential areas[35] of 60 μ/m^3 on a once-daily basis. Several states have set guidelines or standards for 1,1,2,2-tetrachloro ethane in ambient air[60] ranging from zero (North Carolina); to 1.2 μ/m^3 (Massachusetts); to 16.667 μ/m^3 (Kansas); to 23.3 μ/m^3 (New York); to 34.4 μ/m^3 (Connecticut); to 167.0 μ/m^3 (Pennsylvania).

Determination in Air: Adsorption on charcoal, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method 1019[18].

Permissible Concentration in Water: Clean Water Act: Section 307(a)(1)Toxic Pollutants subject to effluent limitations as chlorinated ethanes. State Drinking Water Standards: California 1 μg/L; New Jersey 1 μg/L. State Drinking Water Guidelines: Arizona 0.17 μg/L; Connecticut 28 μg/L; Florida 1 μg/L; Maine 1.8 μg/L; Minnesota 2 μg/L; Wisconsin 2 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Inhalation of vapor and absorption of liquid through the skin (there is some evidence that tetrachloroethane absorbed through the skin affects the CNS only), ingestion, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: A CNS depressant. Symptoms may include nervousness, loss of appetite; constipation, tremors, fatigue, dizziness, nausea, vomiting and headache. May cause liver and kidney damage. These symptoms have been reported after prolonged exposure to 75 ppm. *Inhalation*: Exposure of 116 ppm for 20 minutes has caused dizziness and vomiting. At 260 ppm for 10 minutes, irritation of nose and throat were felt also. At 335 ppm for 10 minutes, rapid fatigue was also experienced. These symptoms generally disappear when exposure stops. Large accidental exposures have resulted in death. *Skin*: Causes skin irritation. Absorption through skin is possible. Significant skin absorption may occur to produce toxic effects. Earliest and most common symptom is tremors of hands, followed by skin irritation, numbness and effects listed above. Death has occurred from a combination of inhalation and skin absorption. *Eyes*: Causes irritation and tearing. *Ingestion*: Abdominal pain; nausea, and vomiting followed by similar symptoms as *inhalation*. As little as 3 mL (1/10 liquid oz) may cause unconsciousness. LD_{50} = (oral-rat) 25 mg/kg.

Long-Term Exposure: Repeated exposure may cause dermatitis, drying and cracking. May damage the blood forming organs, causing monocytosis (increased blood monocytes). May affect the CNS causing tremors, weakness, dizziness, decreased coordination; and even unconsciousness and death. May cause kidney and liver damage; jaundice, hepatitis, liver tenderness. Tetrachloroethane is a mutagen and a potential occupational carcinogen. There is limited evidence that this chemical is a teratogen in animals.

Points of Attack: Skin, liver, kidneys, CNS; gastrointestinal tract. Cancer site in animals: liver tumors.

Medical Surveillance: NIOSH lists the following tests: Blood Urea Nitrogen; liver function tests; urinalysis (routine). Preplacement and periodic examination should be comprehensive because of the possible involvement of many systems. Special attention should be given to liver, kidney, and bone marrow function, as well as to the central and peripheral nervous system. Alcoholism may be a predisposing factor.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon, Viton, and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. 1,1,2,2-Tetrachloroethane must be stored to avoid contact with chemically active metals (such as potassium, powdered aluminum; sodium, magnesium, and zinc) or strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN1702 Tetrachloroethane or 1,1,2,2-Tetrachloroe thane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include phosgene, chlorine, and hydrogen chloride. Extinguish fire using an agent suitable for type of surrounding fire. 1,1,2,2-Tetrachloroethane itself does not burn. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Tetrachloroethylene is a clear, colorless, nonflammable liquid with a characteristic odor. The odor is noticeable @ 47 ppm, though after a short period it may become inconspicuous, thereby becoming an unreliable warning signal. The Odor Threshold is variously given as 5 ppm[41] to 6.17 (3M). Molecular weight = 165.83; Specific gravity (H_2O:1) = 1.62 @ 20°C; Boiling point = 121.1°C; Freezing/Melting point = −18.9°C; −22°C[138]; Vapor pressure = 14 mmHg @ 25°C; 7.5 mmHg @ 10°C. Explosive limits: LEL = 12,000 ppm, UEL: Unknown. Slightly soluble in water; solubility = 0.02%.

Potential Exposure: Tetrachloroethylene is used in the textile industry and as a chemical intermediate or a heat-exchange fluid; a widely used solvent with particular use as a dry cleaning agent; a degreaser; a fumigant, and medically as an anthelmintic.

Incompatibilities: Violent reaction with strong oxidizers; powdered, chemically active metals, such as aluminum, lithium, beryllium, and barium; caustic soda; sodium hydroxide; potash. Tetrachloroethylene is quite stable. However, it reacts violently with concentrated nitric acid to give carbon dioxide as a primary product. Slowly decomposes on contact with moisture producing trichloroacetic acid and hydrochloric acid. Decomposes in UV light and in temperatures above 150°C, forming hydrochloric acid and phosgene.

Permissible Exposure Limits in Air

NIOSH IDLH = 150 ppm, potential occupational carcinogen.

Conversion factor: 1 ppm = 6.78 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 100 ppm TWA; 200 ppm Ceiling Concentration; 300 ppm [5-min. maximum peak in any 3 hrs]

NIOSH REL: Potential occupational carcinogen; limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 25 ppm/170 milligram per cubic meter TWA; 100 ppm/685 milligram per cubic meter STEL, animal carcinogen with unknown relevance to humans; BEI issued

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{35_A}$ ppm

PAC-2: $\mathbf{230_A}$ ppm

PAC-3: $\mathbf{1200_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin]; Carcinogen Category 3B; BAT: 1 mg [tetrachloroethylene]/L in blood at the beginning of the next shift.

Arab Republic of Egypt: TWA 5 ppm (35 milligram per cubic meter), [skin], 1993; Australia: TWA 50 ppm (335 milligram per cubic meter), STEL 150 ppm, carcinogen, 1993; Austria: MAK 50 ppm (345 milligram per cubic meter), Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (339 milligram per cubic meter), STEL 200 ppm (1368 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (70 milligram per cubic meter), [skin], 1999; Finland: TWA 50 ppm (335 milligram per cubic meter), STEL 75 ppm (520 milligram per cubic meter), [skin], 1999; France: VME 50 ppm (335 milligram per cubic meter), carcinogen, 1999; the Netherlands: MAC-TGG 240 milligram per cubic meter, [skin], 2003; Japan: 50 ppm (340 milligram per cubic meter), 2B carcinogen, 1999; Norway: TWA 20 ppm (130 milligram per cubic meter), 1999; the Phillipines: TWA 100 ppm (670 milligram per cubic meter), 1993; Poland: MAC (TWA) 60 milligram per cubic meter; MAC (STEL) 480 milligram per cubic meter, 1999; Russia: TWA 50 ppm, STEL 10 milligram per cubic meter, 1993; Sweden: NGV 10 ppm (70 milligram per cubic meter), KTV 25 ppm (170 milligram per cubic meter), carcinogen, 1999; Switzerland: MAK-W 50 ppm (345 milligram per cubic meter), STEL 100 ppm, [skin], 1999; Thailand: TWA 100 ppm, STEL 200 ppm, 1993; United Kingdom: TWA 50 ppm (345 milligram per cubic meter), STEL 199 ppm, 2000; New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 100 ppm. Limits in ambient air in residential areas have been set by The Czech Republic[35] @ 1.0 milligram per cubic meter on a daily average basis and 4.0 milligram per cubic meter on a half-hour basis as well as by Russia at 0.06 milligram per cubic meter on a daily average basis and 0.5 milligram per cubic meter on a once-daily basis. Several states have set guidelines or standards for tetrachloroethylene in ambient air[60] ranging from 0.05 μ/m^3 (Rhode Island); to 0.18 μ/m^3 (Massachusetts); to 1.7 μ/m^3 (Michigan); to 5.882 μ/m^3 (Kansas); to 21.0 μ/m^3 (North Carolina); to 1,116.0 μ/m^3 (New York); to 1,700.0 μ/m^3 (Connecticut); to 3,350.0 μ/m^3 (Indiana, South Carolina, South Dakota); to 3,350−13,400 μ/m^3 (North Dakota); to 5,600 μ/m^3 (Virginia); to 7,976.0 μ/m^3 (Nevada); to 8,040 μ/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated[18]; #2549, Volatile organic compounds; OSHA Analytical Method 1001.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.005 mg/L; MCLG, zero. State Drinking Water Standards: Delaware 1 μg/L; Florida 3 μg/L; New Jersey 1 μg/L; State Drinking Water Guidelines: Arizona 0.67 μg/L; Connecticut 5 μg/L; Maine 7 μg/L; Minnesota 5 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601); or gas chromatography plus mass spectrometry (EPA Method 624). Octanol-water coefficient: Log $K_{ow} = -3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Irritates the eyes and respiratory tract causing coughing and/or shortness of breath. High exposure can cause headache, dizziness, lightheadedness, nausea, vomiting, and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposures of 200 ppm for 1 hour can cause irritation of the nose, mouth and throat; dizziness, headaches and lightheadedness; exposures of 1000 ppm for 30 minutes can cause difficult breathing; weakness, loss of muscle control; irritability, tremors, convulsions, paralysis, coma, heart irregularities and death. *Skin*: Contact can cause irritation and burns. Can cause dry, scaly skin; a mild to moderate burning sensation; redness and inflammation. *Eyes*: Can cause burning and irritation. *Ingestion*: Can cause nausea, vomiting, diarrhea, bloody stool; a reddening of face and neck; weakness and loss of muscle control.

Long-Term Exposure: Liver problems; increased risk of cancer. May affect the liver, kidneys and nervous system. Exposures *over 200 ppm* during weeks or months can cause irritation of the respiratory tract, nausea, head ache, sleeplessness, abdominal pain; constipation, dizziness, increased perspiration; fatigue, skin infection; kidney and liver damage; fluid in the lungs and coma. Long-term exposure can cause dermatitis; drying and cracking of the skin. Tetrachloroethylene has caused liver cancer and birth defects in mice. Whether it causes cancer in humans is unknown. May damage the developing fetus.

Points of Attack: Liver, kidneys, lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: whole blood (chemical/metabolite). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: urinalysis. Liver function tests. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Special 24 hour EKG (Holter monitor) to look for irregular hearthbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Exposure to tetrachloroethylene should not be controlled with the use of respirators except: during the time period necessary to install or implement engineering or work practice controls; in work situations in which engineering and work practice controls are technically not feasible; to supplement engineering and work practice controls when such controls fail to adequately control exposure to tetrachloroethylene; for operations which require entry into tanks or closed vessels; or in emergencies.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Tetrachloroethylene must be stored to avoid contact with strong oxidizers, such as chlorine, bromine, and chlorine dioxide; chemically active metals; such as barium, lithium, and beryllium; and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: UN1897 Tetrachloroethylene, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Tetrachloroethylene itself does not burn. Thermal decomposition products may include hydrogen chloride, phosgene, chlorine and oxides of carbon are produced in fire or heat above 150°C. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire.

Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Alternatively, PCE may be recovered from waste gases and reused.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

Banned or Severely Restricted (several countries) (UN)[13]

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N, Xi; Risk phrases: R20/21/22; R36/37/38;

R50/53; R62; R63; Safety phrases: S22; S26; S29/35; S36; S45 (see Appendix 4)

hydrochloride:

EPCRA Section 313 Form R *de minimis* Concentration Reporting Level: 1.0%.

California Proposition 65 Developmental/Reproductive toxin [Tetracycline (internal use)] 10/1/1992; [Tetracycline hydrochloride (internal use)] 1/1/1991

Hazard Alert: Combustible, Reproductive toxin, Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[192]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, Xi; Risk phrases: R20/21/22; R36/37/38; R50/53; R51 (hydrochloride); R62; R63; Safety phrases: S22; S26; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water; *hydrochloride*: 2-Hazard to water.

Description: Tetracycline trihydrate is a white crystalline substance. Molecular weight = 280.94 (hydrochloride, 64-75-5); 444.48; Freezing/Melting point = 170°C−175°C (decomposition). It is commonly employed as the *hydrochloride*; Molecular weight = 480.94; Freezing/Melting point = 214°C (decomposes). Explosive limits: LEL = 49,000 ppm, UEL: unknown; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Tetracycline is slightly soluble in water; the hydrochloride is highly soluble in water.

Potential Exposure: Tetracycline is an antibiotic medicine used as capsules, tablets, or intravenous injections against certain infections in humans and animals.

Incompatibilities: Although no dangerous incompatibilities are reported, the potency of this medicine is reduced by heat, sunlight, and solutions with pH <2; and destroyed by caustic hydroxide solutions.

Permissible Exposure Limits in Air

64-75-5, hydrochloride

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 19 milligram per cubic meter

PAC-2: 210 milligram per cubic meter

PAC-3: 1300 milligram per cubic meter

Russia[43] set a MAC in workplace air of 0.1 milligram per cubic meter and also MAC values for ambient air in residential areas of 0.01 milligram per cubic meter on a momentary basis and 0.006 milligram per cubic meter on a daily average basis.

Determination in Air: No method available.

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Tetracycline can affect you when breathed in. Exposure can cause sneezing, itching of the nose; stomach upset; vomiting and diarrhea.

Long-Term Exposure: Tetracycline can cause an allergic skin rash to develop. If skin allergy develops, sunlight may exacerbate the reaction. May cause stomach upset with nausea, vomiting, and diarrhea. Tetracycline is used as a medical drug. Used that way, it may cause liver and kidney damage. It is not known if this can occur with occupational exposure. May cause mutations. Whether it poses a cancer risk requires more study. Handle with extreme caution. It may also damage the developing fetus.

Points of Attack: Liver, kidneys, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from sunlight, heat and caustic materials.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include nitrogen oxides [and in the case of the *hydrochloride*: hydrogen chloride] and, for both, oxides of carbon. This chemical is a non combustible solid. Use any agent suitable for surrounding fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

RTECS Number: KH8585000

UN/NA & ERG Number: UN2320/153

EC Number: 203-986-2 [*Annex I Index No.*: 612-060-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Corrosive, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction) Sensitization hazard (skin), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C, N, Xi; Risk phrases: R21/22; R34; R36/37/38; R43; R51/53; R62; Safety phrases: S1/2; S29/35; S26; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Tetraethylenepentamine is a yellow, viscous liquid. Molecular weight = 189.36; Specific gravity (H_2O:1) = 1 @ 20°C; Boiling point = 333°C–340°C; Freezing/Melting point = −40°C to −30°C; Flash point = 163°C–185°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water; solution can be strongly acidic.

Potential Exposure: Tetraethylenepentamine is used as a solvent for resins and dyes, in manufacture of synthetic rubber; and intermediate for oil additives; in papermaking.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. This chemical is strongly alkaline; reacts with acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 790 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Tetraethylenepentamine can affect you when breathed in and by passing through your skin. Tetraethylenepentamine is a corrosive chemical, and skin or eye contact can cause burns. The vapor is strongly irritating to the nose, throat and bronchial tubes. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated exposure may damage the liver, kidneys, heart muscle and/or brain; impairing thinking; reasoning, and concentration. Some related chemicals can cause a skin or lung allergy to develop. It is not known whether this chemical can cause the same allergies.

Points of Attack: Lungs, liver, kidneys, heart, brain.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. Exam of CNS. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer 50/50 solution of vinegar/water, water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to Tetraethylenepentamine, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Tetraethylenepentamine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where tetraethylenepentamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2320 Tetraethylenepentamine, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Tetraethyl lead is a colorless oily liquid. Sweet, slight musty odor. In commerce it is usually dyed red, orange or blue. Tetraethyl lead will decompose in bright sunlight yielding needlelike crystals of tri-, di-, and mono-ethyl lead compounds, which have a garlic odor. Molecular weight = 323.47; Specific gravity (H_2O:1) = 1.66 @ 20°C; Boiling point (decomposes) 118.9°C; Freezing/Melting point = −130°C; Vapor pressure = 0.2 mmHg @ 25°C; 1 mmHg @ 38.4C[138]; Flash point = 93°C; Autoignition temperature ≥110°C. Explosive limits: LEL = 1.8%; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩. Practically insoluble in water; solubility 0.00002%.
Potential Exposure: Tetraethyl lead is used as a component of antiknock mixes for gas and as an intermediate in making fungicides; Tetraethyl lead (used as an antiknock compound in gasoline) can also contains impurities, such as *ethylene dibromide* and *ethylene dichloride*.
Incompatibilities: Vapors may form explosive mixture with air. A strong reducing agent. Violent reaction with strong oxidizers, sulfuryl chloride; halogens, oils and fats; rust, potassium permanganate. Decomposes slowly in light and at room temperature, and more rapidly at temperatures above 110°C. Attacks rubber and some plastics and coatings.
Permissible Exposure Limits in Air
NIOSH IDLH = 40 mg[Pb]/m^3
OSHA PEL: 0.075 mg[Pb]/m^3 TWA [skin]
NIOSH REL: 0.075 mg[Pb]/m^3 TWA [skin]
ACGIH TLV[1]: 0.1 mg[Pb]/m^3 [skin]; not classifiable as a human carcinogen
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 0.3 milligram per cubic meter
PAC-2: 4 milligram per cubic meter
PAC-3: 40 milligram per cubic meter
DFG MAK: 0.05 mg[Pb]/m^3; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group B
National primary and secondary ambient air quality standards for lead and its compounds, 1.5 μ[Pb]/m^3, maximum arithmetic mean averaged over a calendar quarter [40 CFR50.12, Appendix G].
Arab Republic of Egypt: TWA 0.1 milligram per cubic meter, 1993; Australia: TWA 0.1 milligram per cubic

meter, [skin], 1993; Austria: MAK 0.1 ppm (0.075 milligram per cubic meter), [skin], 1999; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.007 ppm (0.05 milligram per cubic meter), [skin], 1999; France: VME 0.10 milligram per cubic meter, [skin], 1999; Hungary: TWA 0.005 milligram per cubic meter, STEL 0.01 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 0.05 milligram per cubic meter, [skin], 2003; Norway: TWA 0.001 ppm (0.075 milligram per cubic meter), 1999; the Phillipines: TWA 0.075 milligram per cubic meter, [skin], 1993; Poland: MAC (TWA) 0.05 milligram per cubic meter; MAC (STEL) 0.1 milligram per cubic meter, 1999; Russia: STEL 0.005 milligram per cubic meter, [skin], 1993; Sweden: NGV 0.05 milligram per cubic meter, ktv 0.2 milligram per cubic meter, [skin], 1999; Switzerland: MAK-W 0.01 ppm (0.075 milligram per cubic meter), KZG-W 0.02 ppm, [skin], 1999; Thailand: TWA 0.075 milligram per cubic meter, 1993; United Kingdom: LTEL 0.10 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV : not classifiable as a human carcinogen. Several states have set guidelines or standards for TEL in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota); to 1.5 μ/m^3 (Connecticut); to 1.6 μ/m^3 (Virginia); to 2.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2533, Tetraethyl lead (as Pb).

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects. Russia[35,43] set a MAC of zero in water bodies used for domestic purposes.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. See also "Lead" entry.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Tetraethyl lead is extremely poisonous; may be fatal if inhaled, swallowed, or absorbed through the skin. Irrita tes the moist eyes, skin, and respiratory tract. Contact may cause burns to skin and eyes; causing permanent loss of vision. Most symptoms of poisoning are due to the effects of tetraethyl lead on the nervous system. Signs and symptoms of acute exposure to tetraethyl lead may be severe and include intoxication, anxiety, irritability, insomnia, violent/frightening, strange dreams; headache, disorientation, hyperexcitability, delusions, reduced memory; hallucinations, personality changes; tremors, convulsions, and death. Muscular weakness, ataxia, tremors, convulsions, cerebral edema; and coma may occur. A metallic taste may be noted. Sneezing, bronchitis, and pneumonia may be ob served. Bradycardia (slow heart rate), Hypotension (low blood pressure), hypothermia, and pallor may also occur. Gastrointestinal symptoms include vomiting and diarrhea.

Long-Term Exposure: May be a reproductive toxin; may damage the developing fetus. There is limited evidence that this chemical causes cancer in animals. High levels can cause muscle and joint pains, weakness, muscle cramps; and easy fatigue. Repeated exposure may cause lead to accumulate in the body. May cause kidney and brain damage, and damage to the blood cells; causing anemia.

Points of Attack: CNS; cardiovascular system, kidneys, eyes.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite): blood urea nitrogen, Calcium, carbon dioxide; Sugar/Glucose; Biologic Monitoring of Urine every 3 Months; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urinalysis (routine). If symptoms develop or overexposure is suspected, the following may be useful: Urine test for lead (levels of 0.1 mg/L of urine indicate increased exposure. Such levels increase risk from further exposure). Blood lead tests are not usually accurate with exposure to tetraethyl lead. Kidney function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.75 ppm*: Sa (APF = 10) (any supplied-air respirator). *1.875 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *3.75 ppm*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *40 ppm*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (milligrams per cubic meter) (10 × PEL) Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-face piece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. >100 milligram per cubic meter, unknown concentration, or firefighting full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard /Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Tetraethyl lead must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where tetraethyl lead is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of tetraethyl lead. Wherever tetraethyl lead is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1649 Motor fuel antiknock mixtures, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include lead and carbon monoxide. Use dry chemical, carbon dioxide; mist, and foam. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Use water from unmanned monitors and hose-holders to keep fire-exposed containers cool. When stopping leak, use water spray to protect firefighters from a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration with scrubbing for collection of lead oxides which may be recycled or land filled. It is also possible to recover alkyl lead compound from wastewaters as an alternative to disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Tetraethyl pyrophosphate and compressed gas mixture is a liquid charged with a gas. It is a colorless liquid. Its vapor is heavier than air. Faint, fruity, aromatic odor. Molecular weight = 290.22; Specific gravity (H_2O:1) = 1.19 @ 25°C; Boiling point = Decomposes below BP @ 170°C; 138°C under 2.3 mmHg; Freezing/Melting point = 0°C; Vapor pressure = 2×10^{-4} mmHg @ 25°C. It is soluble in water; reacts slowly in cold water forming phosphoric acid. Physical and toxicological properties may be affected by the carrier solvents and gas mixtures used in commercial formulations.

Incompatibilities: Tetraethyl pyrophosphate may be susceptible to formation of highly toxic and flammable phosphine gas in the presence of hydrides and other strong reducing agents. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides. Hygroscopic. Hydrolyzed in water with formation of mono-. di-, and triethyl-orthophosphates. Reacts slowly with cold water forming phosphoric acid. Attacks metals in the presence of water.

Permissible Exposure Limits in Air:

NIOSH IDLH = 5 milligram per cubic meter as TEPP

Conversion factor: 1 ppm = 11.87 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.05 milligram per cubic meter TWA [skin]

NIOSH REL: 0.05 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.01 milligram per cubic meter, measured as inhalable fraction and vapor TWA [skin]; BEI issued for Acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.091 milligram per cubic meter

PAC-2: 1 milligram per cubic meter

PAC-3: 10 milligram per cubic meter

DFG MAK: 0.005 ppm/0.06 milligram per cubic meter; Peak Limitation Category II(2) [skin]

0.05 milligram per cubic meter, [skin], 1993 Occupational Exposure Limit United Kingdom: TWA 0.004 ppm (0.05 milligram per cubic meter), STEL 0.1 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.05 milligram per cubic meter (skin)

Determination in Air: Use NIOSH Analytical Method (IV) #2504, Tetraethyl Pyrophosphate; see also NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure include eye pain; blurred vision; lacrimation (discharge of tears); rhinorrhea (discharge of thin nasal mucous); headache, chest tightness; cyanosis, anorexia, nausea, vomiting, diarrhea, weakness, twitching, paralysis, Cheyne-Stokes respiration, convulsions, low blood pressure; cardiac irregular/irregularities; sweating. TEPP is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg (a taste) for a 150 lb person. A small drop in the eye may cause death. Small doses at frequent intervals are additive. Poisonings always develop at a rapid rate. Cholinesterase toxin; Eye irritant; Eye, acute other than irritation; Respiratory irritant-acute, severe, or moderate but not mild irritant effects; Skin irritant-severe; Heart cardiovascular system, acute; Brain, acute; CNS, acute; Nervous system toxin, acute; Respiratory toxin, acute other than severe or moderate irritation[138].

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Eyes, respiratory system; CNS; cardiovascular system, gastrointestinal tract; blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in one to two weeks while red blood cell levels may be reduced for one to three months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: *Specific treatment is necessary in case of poisoning with this substance; the appropriate means with instructions must be available.* If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink. *Do NOT* induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 0.5 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator). 1.25 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 2.5 milligram per cubic meter: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 5 milligram per cubic meter: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained).

Storage: Poison inhalation hazard chemical (PIH) chemical; check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: NA1955 Organic phosphate, mixed with compressed gas or Organic phosphate compound, mixed with compressed gas or Organic phosphorus compound, mixed with compressed gas, Hazard Class: 2.3; Labels: 2.3-Poison Gas, Domestic (USA), Inhalation Hazard Zone C. UN/NA1955* *(NA prefix) Compressed gas, toxic, n.o.s., Hazard Class: 2.3; Labels: 2.3-Poison Gas, Technical Name Required, Inhalation Hazard Zone C; NA2783 *(NA prefix) Organic phosphate, mixed with compressed gas; or, Organic phosphate compound, mixed with compressed gas; or, Organic phosphorus compound, mixed with compressed gas: Hazard Class 2.3; Labels: 2.3-Poisonous gas, Domestic United States, Inhalation Hazard Zone C. (UN-prefix) Compressed gas, toxic, n.o.s., Inhalation Hazard Zone A: Hazard Class: 2.3; Labels: 2.3-Poisonous gas, Technical Name Required, Inhalation Hazard Zone A. (UN-prefix) Compressed gas, toxic, n.o.s. Inhalation Hazard Zone B; Hazard Class: 2.3; Labels: 2.3-Poisonous gas, Technical Name Required, Inhalation Hazard Zone B. (UN-prefix) Compressed gas, toxic, n.o.s. Inhalation Hazard Zone C; Hazard Class: 2.3; Labels: 2.3-Poisonous gas, Technical Name Required, Inhalation Hazard Zone C; (UN-prefix) Compressed gas, toxic, n.o.s. Inhalation Hazard Zone D, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, Technical Name Required, Inhalation Hazard Zone D.

**Notes*: (1) whether the displayed information is for domestic (USA) or international shipping (UN), if neither is specifically indicated, it applies to both, (2) whether the proper shipping name must include one or more technical names of the hazardous material in parentheses, and (3) whether the hazardous material is an inhalation hazard.

Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the com pressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Compound burn but may not ignite readily. Vapors from liquefied gas are initially heavier than air and spread along ground. Cylinders exposed to fire may vent and release toxic and/or corrosive gas through pressure relief devices. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers. *Small fires*: dry chemical or carbon dioxide. *Large fires*: water spray, fog or foam. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and full protective clothing. Do not get water inside container. Move container from fire area if you can do so without risk. Stay away from ends of tanks. Spray cooling water on containers that are exposed to flames until well after fire is out. Isolate area until gas has dispersed. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. TEPP is 50% hydrolyzed in water in 6.8 hours @ 25°C, and 3.3 hours @ 38°C; 99% hydrolysis requires 45.2 hours @ 25°C, or 21.9 hours @ 38°C. Hydrolysis of TEPP yields nontoxic products. Incineration is, however, an option for TEPP disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R11; R17; R26/27/28; R34; R36/37/38; R42; R50/53; Safety phrases: S16; S21; S23; S26; S28; S29; S36 /37; S39; S45; S57; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Tetraethyltin is a colorless organotin liquid. Molecular weight = 234.97; Specific gravity (H_2O:1) = 1.2 @ 23°C; Boiling point = 181°C; Freezing/Melting point = −112°C; Vapor pressure = 1.99 mmHg @ 25°C Flash point = 53°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Used as biocide, bactericide, fungicide and insecticide; preservative for wood, textile, paper, and leather. Not registered as a pesticide in the United States.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[Sn]/m^3 [skin]

OSHA PEL: 0.1 mg[Sn]/m^3 TWA

NIOSH REL: 0.1 mg[Sn]/m^3 TWA [skin]

ACGIH TLV[1]: 0.1 mg[Sn]/m^3 TWA; 0.2 mg[Sn]/m^3 STEL [skin]

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.4 milligram per cubic meter

PAC-2: 7 milligram per cubic meter

PAC-3: 42 milligram per cubic meter

DFG MAK: 0.1 mg[Sn]/m^3 inhalable fraction [skin]; Pregnancy Risk Group D

Determination in Air: Use NIOSH Analytical Method (IV) #5504, Organotin.

Permissible Concentration in Water: State Drinking Water Guidelines: Minnesota 4000 μg[Sn]/L.

Routes of Entry: Inhalation, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact may cause skin burns. Inhalation can cause coughing, wheezing and/or shortness of breath. Toxic hazard rating is high for oral, intravenous, intraperitoneal administration. This material causes swelling of the brain and spinal cord. Exposure may result in muscular weakness and paralysis, leading to respiratory failure; convulsive movements; closure of eyelids and sensitivity to light; headaches, EEG changes; dizziness, psychological and neurological disturbances; vertigo (an illusion of movement), sore throat; cough, abdominal pain; nausea, vomiting, diarrhea, urine retention; paresis, focal anesthesia; pruritus. Higher levels can cause unconsciousness, collapse and death.

Long-Term Exposure: Repeated or prolonged contact can cause dermatitis; dry and cracked skin. May cause brain damage, hepatic necrosis; kidney damage.

Points of Attack: Skin, brain, kidneys.

Medical Surveillance: NIOSH lists the following tests: Glaucoma; Kidney Function tests; liver function tests; urine (chemical/metabolite); urinalysis (routine). Also consider, psychological testing; examination of the nervous system; EEG.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with sub stance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 milligram per cubic meter*: CcrOvDM [any chemical cartridge respirator with organic vapor cartridge(s) in combination with a dust and mist filter]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter*: CcrFOv100 (APF = 50) (any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter); or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 25 milligram per cubic meter*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF : Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color cod e-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3384 Toxic by inhalation liquid, flammable, n.o.s. with an LC_{50} $\leq 1000\ mL/m^3$ and saturated vapor concentration $\geq$ to 10 LC_{50}, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid, Technical Name Required, Inhalation Hazard Zone B. UN2788

Organotin compounds, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Poisonous by inhalation liquid, flammable, n.o.s. (Inhalation Hazard Zone B)

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.8

Wear fully encapsulating, vapor protective clothing. Stop the release if it can be done safely from a distance. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. *Small spill*: absorb with earth, sand, or other noncombustible material and transfer to containers with clean, nonsparking tools for later disposal. *Large spill*: Dike far ahead of liquid spill for later disposal. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Ventilate confined area if it can be done without placing personnel at risk Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a flammable liquid. Thermal decomposition products may include oxides of tin and carbon. Fire: If tank, rail car or tank truck is involved in a fire, *isolate* for 0.5 miles/800 meters in all directions; also, consider initial evacuation for 0.5 miles/800 meters in all directions. Extinguish small fires with dry chemical, carbon dioxide; water spray or foam. For large fires, use water spray, fog, or foam. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Tetraethyltin, Washington, DC, Chemical Emergency Preparedness Program (November 30, 1987)

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Tetraethyltin, Trenton NJ (November 1999)

Tetrafluoroethylene T:0320

Formula: C_2F_4

Synonyms: Ethene, tetrafluoro-; Ethylene, tetrafluoro-; Fluroplast 4; Perfluoroethene; Perfluoroethylene; Teflon 1,1,2,2-Tetrafluoroethylene; Tetrafluoroethylene, Inhibited; Tetrafluoroethene; TFE

CAS Registry Number: 116-14-3

HSDB Number: 844

RTECS Number: KX4000000

UN/NA & ERG Number: UN1081 (stabilized)/116 (P)

EC Number: 204-126-9

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B.

California Proposition 65 Chemical[102]: Cancer 5/1/1997

Hazard Alert: Extremely flammable gas, Polymerization hazard (nonstabilized), Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F+; Risk phrases: R45; R5; R12; R19; R20/22; R21; R23/24/25; R36/37/38; R3923/24/25; R44; Safety phrases: S1; S7; S9; S16; S26; s33; S36/37/39; S38; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: TFE is a colorless, flammable gas. Molecular weight = 100.02; Specific gravity (H_2O:1) = 1.5 @ −76°C; Boiling point = −76°C; Freezing/Melting point = −143°C; Vapor pressure = 750 mmHg @ −76°C; Flash point ≤ 0°C; Autoignition temperature = 188°C. Its flammable limits in air are LEL = 10%; UEL: 50%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 3. Insoluble in water.

Potential Exposure: A potential danger to those involved in the production of TFE and the manufacture of fluorocarbon polymers.

Incompatibilities: Reacts with air. Hazardous polymerization may occur unless inhibited. Will explode at pressures above 2.7 bar if terpene inhibitor is not added. Inhibited monomer can decompose explosively in fire, under pressure, or upon contact with materials with which it can react exothermically. Violent reaction with oxygen, oxidizers, sulfur trioxide; halogen compounds.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 2 ppm/8.2 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{22_A}$ ppm

PAC-2: $\mathbf{55_A}$ ppm

PAC-3: $\mathbf{330_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category 2

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Routes of Entry: Inhalation, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Tetrafluoroethylene can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Very high exposures can displace the oxygen in the air, causing lightheadedness, dizziness, poor coordination and unconsciousness. High levels may also damage the liver and/or kidneys and irritate the lungs. Contact with liquefied gas may cause frostbite.

Long-Term Exposure: May cause lung irritation; bronchitis may develop. May cause kidney and liver damage.

Points of Attack: Lungs, kidneys, liver

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: chest X-ray, EKG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 seconds); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) preand postshift; urinalysis (routine); CBC/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene, Viton, butyl rubber; and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or

European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Check that oxygen content is at least 19% before entering storage or spill area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Tetrafluoroethylene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilate area. Protect storage against physical damage. Will explode at pressures above 2.7 bar if terpene inhibitor is not added. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1081 Tetrafluoroethylene, stabilized, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include hydrogen fluoride and carbonyl fluoride. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Tetrafluoroethylene, Trenton, NJ (May 2004)

Tetrafluoromethane T:0330

Formula: CF_4

Synonyms: Arcton O; Carbon fluoride; Carbon tetrafluoride; F 14; FC 14; Freon 14; Halocarbon 14; Halon 14; Methane, tetrafluoro-; Perfluoromethane; R 14

CAS Registry Number: 75-73-0

HSDB Number: 1327

RTECS Number: FG4920000

UN/NA & ERG Number: UN1982/126

Ec Number: 200-896-5

Regulatory Authority and Advisory Information

Hazard Alert: Contains gas under pressure; may explode if heated, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated,

Global Warming potential (100 year time horizon): 7390 (40 CFR 98, Subpart A)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: N; Risk phrases: R5; R21; R44; Safety phrases: S9; S15; S16; S33; S38; S45 (see Appendix 4)

Description: Tetrafluoromethane is a colorless, odorless gas. Molecular weight = 88.01; Specific gravity (H_2O:1) = 3.03 @ 20°C; Boiling point = −128°C; Freezing/Melting point = −184°C. Explosive limits: LEL = 120,000 ppm, UEL: unknown; Autoignition temperature ≥ 1100°C. Insoluble in water.

Potential Exposure: Tetrafluoromethane is used in fire extinguishers and as a low temperature refrigerant.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Forms hydrogen fluoride and fluorides on decomposition with hot surfaces above 125°F/52°C or open flame. Incompatible with powdered metals; including aluminum, zinc, and beryllium.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 92 ppm

PAC-2: 1000 ppm

PAC-3: 6000 ppm

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Tetrafluoromethane can affect you when breathed in. High levels can cause you to feel dizzy, lightheaded and to pass out. Very high levels could cause death. Similar chemicals can affect the cardiovascular system, causing irregular heartbeat, which could lead to death. Contact with the liquefied gas could cause frostbite. Exposure at high levels can cause depletion of oxygen, causing unconsciousness and death by suffocation.

Long-Term Exposure: Unknown at this time.

Points of Attack: Cardiovascular system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24 hour EKG (Holter monitor) to look for irregular heart beat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles unless full facepiece respiratory protections is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to tetrafluoromethane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full face piece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Prior to working with this chemical, personnel should be trained on its proper hand ling and storage. Store in tightly closed containers in a cool, well-ventilated area away from powdered metals; including aluminum, zinc and beryllium; and from open flames or temperatures above 125°F/51.6°C. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1982 Tetrafluoromethane, compressed or or Refrigerant gas R14, Hazard Class: 2.2; Labels: 2.2-Nonflammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tetrafluoromethane may burn, but does not readily ignite. Use dry chemical or CO_2 extinguishers. Thermal decomposition products may include fluorides, such as hydrogen fluoride. Containers may explode in fire. If liquid or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Tetrahydrofuran is a colorless liquid. Ethereal odor. The Odor Threshold is listed @ 3.8 (3M), 20−50 ppm,[41] and 31 ppm. Molecular weight = 72.1; Specific gravity (H_2O:1) = 0.89 @ 20°C; Boiling point = 65°C; Freezing/Melting point: −108.4°C; Vapor pressure = 75 mmHg @ 9°C; Flash point = −15°C (cc); Autoignition temperature = 321°C. Explosive limits: LEL = 2%; UEL:

11.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Soluble in water.

Potential Exposure: The primary use of tetrahydrofuran is as a solvent to dissolve synthetic resins, particularly polyvinyl chloride and vinylidene chloride copolymers. It is also used to cast polyvinyl chloride films, to coat substrates with vinyl and vinylidene chloride; and to solubilize adhesives based on or containing polyvinyl chloride resins. A second large market for THF is as an electrolytic solvent in the Grignard reaction-based production of tetramethyl lead. THF is used as an intermediate in the production of polytetramethylene glycol.

Incompatibilities: Forms thermally explosive peroxides in air on standing (in absence of inhibitors). Peroxides can be detonated by heating, friction, or impact. Reacts violently with strong oxidizers, strong bases and some metal halides. Attacks some forms of plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 ppm [LEL]

Conversion factor: 1 ppm = 2.95 milligram per cubic meter @ 25°C & 1 atm.

OSHA PEL: 200 ppm/590 milligram per cubic meter TWA

NIOSH REL: 200 ppm/590 milligram per cubic meter TWA; 250 ppm/735 milligram per cubic meter STEL

ACGIH TLV[1]: 50 ppm/147 milligram per cubic meter TWA; 100 ppm /295 milligram per cubic meter STEL [skin] confirmed animal carcinogen with unknown relevance to humans

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{100_A}$ ppm

PAC-2: $\mathbf{500_A}$ ppm

PAC-3: $\mathbf{5000_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 50 ppm/150 milligram per cubic meter TWA; Peak Limitation Category I(2) [skin]; Carcinogen Category 4; Pregnancy Risk Group C; BAT: 8 mg/L in urine/end o f shift.

Australia: TWA 200 ppm (590 milligram per cubic meter), STEL 250 ppm, 1993; Austria: MAK 200 ppm (590 milligram per cubic meter), 1999; Belgium: TWA 200 ppm (590 milligram per cubic meter), STEL 250 ppm (738 milligram per cubic meter), 1993; Denmark: TWA 100 ppm (295 milligram per cubic meter), 1999; Finland: TWA 100 ppm (290 milligram per cubic meter), STEL 150 ppm (440 milligram per cubic meter), 1999; France: VME 200 ppm (590 milligram per cubic meter), 1999; Hungary: TWA 200 milligram per cubic meter, STEL 400 milligram per cubic meter, 1999; Japan: 200 ppm (590 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 300 milligram per cubic meter, [skin], 2003; Norway: TWA 50 ppm (150 milligram per cubic meter), 1999; the Phillipines: TWA 200 ppm (590 milligram per cubic meter), 1993; Poland: MAC (TWA) 600 milligram per cubic meter, MAC (STEL) 750 milligram per cubic meter, 1999; Russia: TWA 200 ppm, STEL 100 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (150 milligram per cubic meter), KTV 80 ppm (250 milligram per cubic meter), 1999; Switzerland: MAK-W 200 ppm (590 milligram per cubic meter), STEL 1000 ppm, 1999; Turkey: TWA 200 ppm (590 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (300 milligram per cubic meter), STEL 200 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 250 ppm; Russia[43] set a MAC values for ambient air in residential areas of 0.2 milligram per cubic meter both on a momentary and a daily average basis. Several states have set guidelines or standards for tetrahydrofuran in ambient air[61] ranging from zero (North Carolina); to 0.8 milligram per cubic meter (Massachusetts); to 5.9−7.35 milligram per cubic meter (North Dakota); to 9.8 milligram per cubic meter (Virginia); to 11.8 milligram per cubic meter (Connecticut, Florida, New York); to 14.048 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1609;[18] 3800; OSHA Analytical Method 7.

Permissible Concentration in Water: No criteria set but EPA[32] has suggested a permissible ambient goal of 8,100 μg/L (based on health effects. Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L (500 μg/L). States which have set guidelines for tetrahydrofuran in drinking water include Wisconsin @ 50.0 μg/L and New Hampshire @ 154 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Tetrahydrofuran can affect you when breathed in and may enter the body through the skin. Eye contact causes severe irritation and possible damage. Skin contact causes severe irritation. If covered by clothing or prolonged, blistering can occur. The vapors irritate the eyes, nose, throat and lungs. Very high exposures can affect the CNS; causing narcosis, unconsciousness, and rapid death. High exposure can damage the liver and kidneys. The probable oral lethal dose in humans is 50−500 mg/kg[88].

Long-Term Exposure: May cause dermatitis; drying and cracking. Repeated exposure may cause liver and kidney damage. May cause lung irritation; bronchitis may develop.

Points of Attack: Eyes, skin, respiratory system; CNS; liver and kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended.

Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver and kidney function tests. Evaluation by a dermatologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: As a suspected carcinogen: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

2000 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Tetrahydrofuran must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where tetrahydrofuran is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of tetrahydrofuran should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of tetrahydrofuran.

Shipping: UN2056 Tetrahydrofuran, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Concentrated waste containing peroxides-perforation of a container of the waste from a safe distance followed by open burning.

R33; R36/37/38; R50/53; R52/53; R61; R62; Safety phrases: S1; S1; S21; S22; S26; S28; S29/35; S36/37/39; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Tetramethyl lead is a colorless liquid with a slight musty odor. In commerce it is usually dyed red, orange or blue. Molecular weight = 267.35; Specific gravity (H_2O:1) = 1.99 @ 20°C; Boiling point ≥ (decomposes) 100°C−110°C; Freezing/Melting point = −28°C; Vapor pressure = 0.2 mmHg @ 20°C; Flash point = 37°C. Explosive limits: LEL = 1.8%; UEL = 12.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 3₩. Insoluble in water.

Potential Exposure: Those engaged in the manufacture, distribution, and blending into gasoline of this antiknock agent for aviation gasoline.

Incompatibilities: Highly flammable liquid; Vapors may form explosive mixture with air. Violent reaction with oxidizers, such as sulfuryl chloride or potassium permanganate; strong acids; especially nitric acid; chemically active metals. Decomposes and may explode in heat above 90°C. Attacks rubber.

Permissible Exposure Limits in Air

NIOSH IDLH = 40 mg[Pb]/m^3

OSHA PEL: 0.075 mg[Pb]/m^3 TWA [skin]

NIOSH REL: 0.075 mg[Pb]/m^3 TWA [skin]

ACGIH TLV[1]: 0.15 mg[Pb]/m^3 [skin]

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.45 milligram per cubic meter

PAC-2: 4 milligram per cubic meter

PAC-3: 40 milligram per cubic meter

National primary and secondary ambient air quality standards for lead and its compounds, 1.5 μ[Pb]/m^3, maximum arithmetic mean averaged over a calendar quarter [40 CFR50.12, Appendix G].

DFG MAK: 0.05 mg[Pb]/m^3; Peak Limitation Category II (2); Peak Limitation Category II(2) [skin]; Pregnancy Risk Group B

Several states have set guidelines or standards for TML in ambient air[60] ranging from 1.5 μ/m^3 (Connecticut and North Dakota); to 2.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2534.

Permissible concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Vapors are very toxic. Tetramethyl lead irritates the moist skin, eyes, and mucous membrane. May affect the CNS. Fatal lead poisoning may occur by ingestion, vapor inhalation or skin absorption. Several cases of acute toxicity, usually in the form of degenerative brain disease, have been described following occupational exposure. Signs and symptoms of acute exposure to tetramethyl lead may be severe and include nausea, delirium, mania, anxiety, irritability, headache, insomnia, disorientation, violent/frightening dreams; hyperexcitability, delusions, and hallucinations. Muscular weakness, tremor, a lack of coordination; convulsions, cerebral edema; and coma may occur. A metallic taste may be noted. Sneezing, bronchitis, and pneumonia may be noted. Bradycardia (slow heart rate), hypotension (low blood pressure), hypothermia, and pallor may also occur. Gastrointestinal symptoms include vomiting and diarrhea.

Long-Term Exposure: High levels can cause muscle and joint pains, weakness, muscle cramps; and fatigue. Lead can accumulate in the body with repeated exposure. May affect the kidneys.

Points of Attack: CNS; cardiovascular system, kidneys.

Medical Surveillance: NIOSH lists the following tests: Biologic monitoring of urine every three months; urine (chemical/metabolite); urine (chemical/metabolite), end-of-Shift; urinalysis (routine). If symptoms develop or overexposure is suspected, the following may be useful: Urine test for lead levels of 0.1 mg/L of urine indicate increased exposure. Such levels increase risk from further exposure. Blood lead tests are not usually accurate with exposure to tetramethyl lead. CBC. Kidney function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.75 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator). *1.875 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *3.75 milligram per cubic meter*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *40 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in to unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Lead (1910.1025 & 1926.62): $<$ or = 0.5 milligram per cubic meter (milligrams per cubic meter) (10 × PEL) Half-mask* air-purifying respirator equipped with high-efficiency filters**. $<$ or = 2.5 milligram per cubic meter (50 × PEL) Full-face piece air-purifying respirator with high-efficiency filters**. $<$ or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. $<$ or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. $>$ 100 milligram per cubic meter, unknown concentration, or firefighting full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm in diameter or higher.

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Tetramethyl lead must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where Tetramethyl lead is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of tetramethyl lead should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of tetramethyl lead. Wherever tetramethyl lead is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1649 Motor fuel antiknock mixtures, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tetramethyl lead is a flammable and reactive liquid. Use dry chemical, CO_2, water spray; or foam extinguishers. Thermal decomposition products may include lead, lead oxides and carbon monoxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration with scrubbing for collection of lead oxides which may be recycled or landfilled. It is also possible to recover alkyl lead compounds from wastewaters (A-58) as an alternative to disposal.

RTECS Number: PB4025000

UN/NA & ERG Number: (PIH) UN1510/143

EC Number: 208-094-7

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1996; NCI: Carcinogenesis Studies (inhalation); clear evidence: mouse, rat

California Proposition 65 Chemical[102]: Cancer 7/1/1990.

Hazard Alert: Poison inhalation hazard, Combustible, Explosive, Possible risk of forming tumors, Suspected reprotoxic hazard.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P112

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: O, T; Risk phrases: R45; R8, R9, R20/22; R23/24/25; R26; R36/37/38; R50/53; R60; R61; Safety phrases: S1; S8; S28; 36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Tetranitromethane, a nitroparaffin, is a colorless to pale yellow liquid or solid with a pungent odor. It causes tears. Molecular weight = 196.03; Specific gravity (H_2O:1) = 1.64 @ 25°C; Boiling point = 126°C; Freezing/Melting point 14°C; Vapor pressure = 7.5 mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 3 (Oxidizer). Insoluble in water.

Potential Exposure: Tetranitromethane is used as a solvent for polymers and as a stabilizer; as an oxidizer in rocket propellant combinations. It is also used as an explosive in admixture with toluene.

Incompatibilities: Tetranitromethane is a powerful oxidizer. It is more easily detonated than TNT. Contact with hydrocarbons, alkalis, or metals form explosive mixtures. Contact with toluene or cotton may cause fire and explosion. Combustible material wet with tetranitromethane may be highly explosive. The potential for explosion is severe, especially when exposed to heat, powerful oxidizers, or reducing agents; or, when subject to mild shock. Impurities can also cause explosives. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 4 ppm

Conversion factor: 1 ppm = 8.02 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 ppm/8 milligram per cubic meter TWA

NIOSH REL: 1 ppm/8 milligram per cubic meter TWA

ACGIH TLV[1]: 0.005 ppm/0.04 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 0.047 ppm

PAC-2: $\mathbf{0.52_A}$ ppm

PAC-3: $\mathbf{1.7_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK : [skin] Carcinogen Category 2

Australia: TWA 1 ppm (8 milligram per cubic meter), 1993; Austria: carcinogen, 1999; Belgium: TWA 1 ppm (8 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (8 milligram per cubic meter), 1999; Finland: TWA 1 ppm (8 milligram per cubic meter), STEL 3 ppm (24 milligram per cubic meter), 1999; France: VME 1 ppm (8 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.04 milligram per cubic meter, 2003; the Phillipines: TWA 1 ppm (8 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.04 milligram per cubic meter, 1999; Russia: STEL 0.3 milligram per cubic meter, 1993; Sweden: NGV 0.05 ppm (0.4 milligram per cubic meter), KTV 0.2 ppm (0.8 milligram per cubic meter), 1999; Switzerland: MAK-W 1 ppm (8 milligram per cubic meter), carcinogen, 1999; Turkey: TWA 1 ppm (8 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV : confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for TNM in ambient air[60] ranging from 80 μ/m^3 (North Dakota); to 130 μ/m^3 (Virginia); to 160 μ/m^3 (Connecticut); to 190 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3513.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact causes burns. After more prolonged inhalation, headache, dizziness, chest pain; dyspnea, and respiratory distress may occur. After prolonged exposure, CNS; heart, liver, and kidney damage can occur as well as pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Can cause methemoglobinemia and cyanosis.

Long-Term Exposure: Chronic signs and symptoms include weariness, and pneumonia. May cause CNS, kidney and liver damage.

Points of Attack: Respiratory system, eyes, skin, blood, CNS.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Consider the points of attack in preplacement and periodic physical examinations. Kidney and liver function tests. CBC. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 4 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); ccrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full face piece.) *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; requires eye protection. Only nonoxidizable sorbents allowed (not charcoal).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. (2) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in an explosion proof freezer. Keep away from metals and other organic and easily oxidized compounds. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1510 Tetranitromethane, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 5.1-Oxidizer, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 0.6/1.0

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid shock and friction if liquid spills on combustible material, such as wood, or paper. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Flush area with flooding amounts of water and dike spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Combustible liquid, but difficult to ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Material is a strong oxidizer. The potential for explosion is severe, especially when exposed to heat or to powerful oxidizing or reducing agents; or when shocked or heated. It is more easily detonated than TNT. Impurities can also cause explosives. Extinguish small fires with water only, no dry chemicals or carbon dioxide. For large fires, flood the fire area with water.

Do not move cargo or vehicle if cargo has been exposed to heat. Cool containers that are exposed to flames with water from the side until well after fire is out. For massive fire, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Open burning at remote burning sites is not entirely satisfactory since it makes no provision for the control of the toxic effluents, nitrogen oxides and HCN. Suggested procedures are to employ modified closed pit burning, using blowers for air supply and passing the effluent combustion gases through wet scrubbers.

Preparedness Program (November 30, 1987)

Tetrasodium EDTA T:0390

Formula: $C_{10}H_{12}N_2N$; O_8; $[(NaOOCCH_2)_2NCH_2]_2$

Synonyms: *N*,*N*′-1,2-Ethanediylbis[*N*-(carboxymethyl)] glycine tetrasodium salt; Ethylene dinitrilotetra-acetic acid tetrasodium salt; Sodium EDTA; Sodium ethylene-diamine-tetraacetate; Sodium ethylenediaminetetraacetic acid; Sodium salt of ethylene-diaminetetraacetic acid; Tetrasodium ethylenediaminetetraacetate; Tetrasodium ethylene-diaminetetracetate; Tetrasodium (ethylenedinitrilo)-tetraacetate; Tetrasodium salt of EDTA; Tetrasodium salt of ethylenediaminetetracetic acid

CAS Registry Number: 64-02-8

HSDB Number: 5003

RTECS Number: AH5075000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 200-573-9 [*Annex I Index No.*: 607-428-00-2]

Regulatory Authority and Advisory Information

This chemical is not specifically listed by the EPA, but ETDA is regulated:

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn; Risk phrases: R22; R41; S51; Safety phrases: S2; S26; S39; S41; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Tetrasodium EDTA is a white crystalline solid. Molecular weight = 380.2; Freezing/Melting point = (decomposes) 220°C; Explosive limits: LEL = 25,000 ppm, UEL: unknown. Highly soluble in water.

Potential Exposure: Used therapeutically in treating arteriosclerosis. Used as a metal cleaner; in detergents, liquid soaps; shampoos; metal chelating agent; in textiles industry to improve dyeing, scouring, and detergent operations; antioxidant.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Can solubilize metals

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 75 milligram per cubic meter

PAC-2: 830 milligram per cubic meter

PAC-3: 5000 milligram per cubic meter

Permissible Concentration in Water: Russia[43] set a MAC for the disodium salt in water bodies used for fishery purposes of 0.05 mg/L. Maryland[61] has set a guideline for drinking water of 180 μg/L (0.18 mg/L)[61].

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Dust may cause irritation of the nose and throat. *Skin*: May cause irritation. Prolonged skin contact to high concentrations may cause irritation, even a mild burn. *Eyes*: May cause irritation. Alkaline solution can burn the eyes. *Ingestion*: Doses of 200 mg/kg have caused muscle spasms. Kidney damage has been reported at doses of 600 mg/kg for 4 days.

Long-Term Exposure: ETDA may cause kidney injury; which may be due to chelating action, not inherent nephrotoxicity. Symptoms of exposure include vomiting, depression, and bloody diarrhea. It is not known if this chemical has the same effects.

Points of Attack: Kidneys.

Medical Surveillance: Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: May cause a negative calcium imbalance.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a well-ventilated area away from sources of heat. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable. Use extinguisher appropriate to other burning material. Thermal decomposition products may include oxides of sodium, nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly lab el and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator

Tetryl T:0410

Formula: $C_7H_5N_5O8$; $(NO_2)_3C_6H_2N(NO_2)CH_3$
Synonyms: *N*-Methyl-*N*-2,4,6-tetranitroaniline; Nitramine; Picrylnitromethylamine; Pyrenite; Tetralite; *N*-2,4,5-Tetranitro-*N*-methylaniline; 2,4,6-Tetryl; 2,4,6-Trinitrophenyl-*N*-methylnitramine; 2,4,6-Trinitro-phenylmethylnitramine; Trinitrophenylmethylnitramine
CAS Registry Number: 479-45-8
HSDB Number: 2857
RTECS Number: BY6300000
UN/NA & ERG Number: UN0208 (Tetryl, Trinitrophenylmethylnitramine)/112
EC Number: 207-531-9 [*Annex I Index No.*: 612-017-00-6]
Regulatory Authority and Advisory Information
Carcinogenicity: The carcinogenicity of tetryl in humans and animals has not been studied.
Hazard Alert: Explosive, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: E, T; Risk phrases: R3; R23/24/25; R33; R51/53; R62; Safety phrases: S1/2; S3/7; S35; S36/37; S41; S45; S63 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water. (est.)
Description: Tetryl is a colorless to yellow, odorless crystalline solid. High explosive material. Molecular weight = 287.2; Specific gravity (H_2O:1) = 1.57 @ 19°C; Boiling point = 180°C−190°C (explodes); Freezing/Melting point = 129°C−131°C; Flash point = 187°C (explodes); Vapor pressure = < 1 mmHg @ 25°C. Practically insoluble in water; solubility = 0.02%.
Potential Exposure: Tetryl is used in explosives; as an intermediary detonating agent; and as a booster charge for military devices; it is also used as a chemical indicator. No longer manufactured or used in the United States.
Incompatibilities: Violent reaction with hydrazine; reducing agents, oxidizable materials. May explosively decompose from heat, shock, friction, or concussion. Explosive decomposition/detonation from heat takes approximately 1000 seconds @ 160°C; 0.1 seconds @ 500°C.
Permissible Exposure Limits in Air
NIOSH IDLH = 750 milligram per cubic meter
OSHA PEL: 1.5 milligram per cubic meter TWA [skin]
NIOSH REL: 1.5 milligram per cubic meter TWA [skin]
ACGIH TLV[1]: 1.5 milligram per cubic meter TWA [skin]
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 4.5 milligram per cubic meter
PAC-2: 14 milligram per cubic meter
PAC-3: 1300 milligram per cubic meter
DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 3B
Australia: TWA 1.5 milligram per cubic meter, 1993; Austria: MAK 1.5 milligram per cubic meter, [skin], 1999; Belgium: TWA 1.5 milligram per cubic meter, 1993; Denmark: TWA 1.5 milligram per cubic meter, [skin], 1999; Finland: TWA 1.5 milligram per cubic meter, STEL 3 milligram per cubic meter, [skin], 1993; France: VME 1.5 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 1.5 milligram per cubic meter, [skin], 2003; the Phillipines: TWA 1.5 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 1.5 milligram per cubic meter, [skin], 1999; Turkey: TWA 1.5 milligram per cubic meter, 1993; United Kingdom: TWA 1.5 milligram per cubic meter, STEL 3 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1.5 milligram per cubic meter
Several states have set guidelines or standards for tetryl in ambient air[60] ranging from $15\ \mu/m^3$ (North Dakota); to $25\ \mu/m^3$ (Virginia); to $30\ \mu/m^3$ (Connecticut); to $36\ \mu/m^3$ (Nevada).
Determination in Air: Use NIOSH II(3), Method #S225.
Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the nervous system. Contact may stain skin and hair yellow or orange. Tetryl is acutely irritating to the mucous membranes of the respiratory tract and the eyes, causing coughing, sneezing, epistaxis, conjunctivitis, and palpebral and periorbital edema.
Long-Term Exposure: Tetryl is a potent sensitizer, and allergic dermatitis is common. Dermatitis first appears on exposed skin areas, but can spread to other parts of the body in fair-skinned individuals or those with poor personal hygiene. Repeated or prolonged inhalation exposure may cause asthma. The severest forms show massive generalized edema with partial obstruction of the trachea due to swelling of the tongue, and these cases require hospitalization. Tetryl exposure may cause irritability, easy fatigability; malaise, headaches, lassitude, insomnia, nausea, and vomiting. Anemia of the marrow depression or deficiency type has been observed among tetryl workers. Tetryl exposure has produced liver and kidney damage in animals. The substance may have effects on the liver, kidneys and blood.
Points of Attack: Eyes, skin, respiratory system; CNS; liver, kidneys.
Medical Surveillance: NIOSH lists the following tests: CBC; anemia; liver function tests. Preplacement physical examination should give special attention to those individuals with a history of allergy, blood dyscrasias, or skin, liver, or kidney disease. Periodic examinations should be directed primarily to the control of dermatitis and allergic

reactions, plus any effects on the respiratory tract, eyes, CNS; blood, liver and kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 7.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 15 milligram per cubic meter*: 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 37.5 milligram per cubic meter*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 75 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 750 milligram per cubic meter*: SaF: Pd, Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full-faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Explosive. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, hydrazine and sources of heat. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN0208 Tetryl, Hazard Class: 1.1D; Labels:1.1D-Explosives (with a mass explosion hazard); D-Substances or articles which may mass detonate (with blast and/or fragment hazard) when exposed to fire.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an explosive solid. Thermal decomposition products may include oxides of nitrogen and carbon. If material is on fire and conditions permit, do not extinguish. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Cool exposed containers from unattended equipment or remove intact containers if it can be done safely. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full

facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Solution in acetone and incineration in furnace equipped with afterburner and caustic soda solution scrubber.

Hazardous to aquatic life or environment, with possible long-lasting effects[291].

European/International Regulations (*thallium; 7440-28-0*): Hazard Symbol: T+, N; Risk phrases: R26/28; R33; R53; Safety phrases: S1/2; S13; S28; S45; S61; (*thallium compounds*): Hazard Symbol: T+, N; Risk phrases: R28; R33; R38; R48/25; R51/53; Safety phrases: S1/2; S13; R33; S36/37; S45; S61.

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Thallium is a soft, bluish-white, heavy, very soft metal insoluble in water and organic solvents. It turns gray on exposure to air. Molecular weight = 204.38; Specific gravity (H_2O:1) = 11.9 @ 20°C; Boiling point = 1457°C; 1473°C[138]; Freezing/Melting point = 304°C; Vapor pressure = 1.41×10^{-23} mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: Thallium is usually obtained as a by-product from the flue dust generated during the roasting of pyrite ores in the smelting and refining of lead and zinc. Thallium has not been produced in the United States since 1984, but is imported for use in the manufacture of electronics, optical lenses, and imitation precious jewels. It also has use in some chemical reactions and medical procedures. Thallium and its compounds are used as a rodenticide* and fungicide; in the manufacture of plates and prisms, high-density liquids; as insecticides, catalysts; in certain organic reactions, in phosphor activators; in bromoiodide crystals for lenses, plates, and prisms in infrared optical instruments; in photoelectric cells; in mineralogical analysis; alloyed with mercury in low-temperature thermometers, switches and closures; in high-density liquids; in dyes and pigments; in fire-works; and imitation precious jewelry. It forms a stainless alloy with silver and a corrosion-resistant alloy with lead. Its medicinal use for epilation has been almost discontinued. Highly persistent in the environment.

**Note*: Thallium was used in the past as a rodenticide, it has been banned in the United States due to its toxicity from accidental exposure. In some countries, thallium(I)sulfate(2:1) is still used as a rat poison and ant bait.

Incompatibilities: Varies. Cold thallium ignites on contact with fluorine. Thallium metal reacts violently with strong acids (such as hydrochloric, sulfuric, and nitric) and strong oxidizers (such as chlorine, bromine, and fluorine). Cold thallium ignites on contact with fluorine. Reacts with other halogens at room temperature.

Permissible Exposure Limits in Air

NIOSH IDLH = 15 mg[Tl]/m^3

OSHA PEL: 0.1 mg[Tl]/m^3 TWA [skin]

NIOSH REL: 0.1 mg[Tl]/m^3 TWA [skin]

ACGIH TLV[1]: 0.1 mg[Tl]/m^3 TWA [skin]

7440-28-0, elemental

Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 0.06 milligram per cubic meter
PAC-2: 33 milligram per cubic meter
PAC-3: 20 milligram per cubic meter
DFG MAK: *soluble compounds*: No numerical value established. Data may be available.
Australia: TWA 0.1 milligram per cubic meter, [skin], 1993; Austria: MAK 0.1 milligram per cubic meter, 1999; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Finland: TWA 0.1 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, 1999; Norway: TWA 0.1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; Poland: MAC (TWA) 0.1 mg[Tl]/m^3; MAC (STEL) 0.3 mg[Tl]/m^3, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, [skin], 1999; Thailand: TWA 0.1 milligram per cubic meter, 1993; Turkey: TWA 0.1 milligram per cubic meter, [skin], 1993; United Kingdom: LTEL 0.1 milligram per cubic meter, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 mg[Tl]/m^3 [skin]. Several states have set guidelines or standards for thallium soluble compounds in ambient air[60] ranging from 0.238 μ/m^3 (Kansas); to 0.33 μ/m^3 (New York); to 1.0 μ/m^3 (Florida, North Dakota); to 1.6 μ/m^3 (Virginia); to 2.0 μ/m^3 (Connecticut and Nevada); to 2.47 μ/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method (IV) #7300; #7301; #7303; #9102; # 8005, (Elements in blood or tissue); OSHA Analytical Method ID-121.

Permissible Concentration in Water: Safe Drinking Water Act (47 FR 9352): MCL, 0.002 mg/L; MCLG, 0.0005 mg/L. Federal Drinking Water Guidelines: EPA 10 μg[Tl]/L; State Drinking Water Guidelines: Arizona 13 μg[Tl]/L; Minnesota 0.6 μg[Tl]/L. United States National Primary Drinking Water Regulations: MCLG = 0.0005 mg/L; MCL = 0.002 mg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: Digestion followed by atomic absorption measurement gives total thallium. Dissolved thallium may be determined by the same procedure preceded by 0.45 micron filtration. Octanol-water coefficient: Log K_{ow} = (estimated) 0.23.

Routes of Entry: Ingestion and percutaneous absorption of dust, eye/skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hair loss, changes in blood; kidney, intestine or liver problems. Thallium salts may be eye and skin irritants and skin sensitizes. Exposure can cause fatigue, weakness, poor appetite; insomnia, and mood changes. Acute poisoning rarely occurs in industry, and is usually due to ingestion of thallium. When it occurs, gastrointestinal symptoms, abdominal colic; loss of kidney function; peripheral neuritis; strabismus, disorientation, convulsions, joint pain; and alopecia develop rapidly. The symptoms of acute thallium poisoning (except for gastrointestinal symptoms) do not become manifest until 12 hours to 4 days after exposure. Death is due to damage to the CNS. Thallium may affect the peripheral and the CNS; liver and kidneys; the gastrointestinal tract; skin (hair) and the cardiovascular system; resulting in polyneuritis; optic nerve atrophy; encephalopathy, cardiac disturbances; liver and kidney damage; alopecia. Exposure may result in death. The nitrate can irritate and burn the skin and eyes. The nitrate can damage the nervous system causing headache, weakness, irritability, pain, "pins and needles" in arms and leg; convulsions, coma, and death. The sulfate(I) irritates the eyes and the skin. May affect the nervous system; cardiovascular system; kidneys and gastrointestinal tract. Exposure may result in death. Exposure may result in hair loss.

Long-Term Exposure: Thallium is an extremely toxic and cumulative poison. In nonfatal occupational cases of moderate or long-term exposure, early symptoms usually include fatigue, limb pain; metallic taste in the mouth and loss of hair; although loss of hair is not always present as an early symptom. Later, peripheral neuritis, proteinuria, and joint pains occur. Occasionally, neurological signs are the presenting factor, especially in more severe poisonings. Long-term exposure may produce optic atrophy, paresthesia, and changes in papillary and superficial tendon reflexes (slowed responses). Some thallium compounds are teratogens in animals.

Points of Attack: Eyes, CNS; lungs, liver, kidneys, gastrointestinal tract; body hair.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); biologic tissue/biopsy; nerve conduction studies; urine (chemical/metabolite); urinalysis (routine). Preplacement and periodic examinations should give special consideration to the eyes, CNS; gastrointestinal symptoms; and liver and kidney function. Hair loss may be a significant sign.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or in haled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. *Skin* : If this chemical contacts the skin, remove contaminated clothing and immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure to substance may be delayed. The symptoms of acute thallium poisoning (except for gastrointestinal symptoms) may not become manifest until 12 hours to 4 days after exposure. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is also recommended for at least 24 to 48 hours after breathing overexposure as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. *Eyes*: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. *Inhalation*: If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. *Ingestion*: Get medical attention. If patient is conscious, give a slurry of activated charcoal in water to drink and induce vomiting. Do not make an unconscious person vomit. *Note for qualified medical personnel*: For severe poisoning consider BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) which has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of thallium it may have *some* value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Person al Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (RED ZONE): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents.

Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Other information: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield un less full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA [as thallium (soluble compounds)]: *0.5 milligram per cubic meter*: Qm (APF = 25), if not present as a fume ((any quarter-mask respirator). *1 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator).

2.5 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PAPRDM, if not present as a fume (any powered, air-purifying respirator with a dust and mist filter). *5 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *15 milligram per cubic meter*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand o r other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard /Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Thallium must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur.

Shipping: Thallium: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN1707 Thallium compounds, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thallium *metal* may burn, but does not readily ignite. Thermal decomposition of thallium metal releases oxides of thallium. Also, poisonous gases produced in fire will vary, including for *thallium sulfide*: oxides of thallium and sulfur; *thaallium nitrates*: oxides of nitrogen and thallium), etc. Extinguish fire using an agent suitable for type of surrounding fire. For the *nitrate* use water only; *do not* use chemicals, foam, or carbon dioxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dilute thallium solutions may be disposed of in chemical waste landfills. When possible, thallium should be recovered and returned to the suppliers.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R45; R22; R36/38; R50/53; R62; R63; Safety phrases: S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Thioacetamide is combustible, crystalline compound. Slight mercaptan odor. Molecular weight = 75.14; Freezing/Melting point = 116°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Highly soluble in water.

Potential Exposure: Thioacetamide is used as a replacement for hydrogen sulfide in qualitative analyses. Thioacetamide has been used as an organic solvent in the leather, textile, and paper industries; as an accelerator in the vulcanization of buna rubber; and as a stabilizer of motor fuel.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.92 milligram per cubic meter

PAC-2: 10 milligram per cubic meter

PAC-3: 60 milligram per cubic meter

United Kingdom: carcinogen, 2000. North Dakota[60] has set a guideline for thioacetamide in ambient air at zero concentration.

Determination in Water: Harmful to aquatic life with long-lasting effects. Octanol-water coefficient: Log K_{ow} = low, about—0.40. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Skin andeye irritation; conjunctivitis. Irritates the respiratory tract causing coughing. Symptoms of exposure include fatigue, nausea, vomiting, anorexia, liver damage; respiratory depression; CNS depression; acidosis, hypotension, tremors, convulsions, and unconsciousness.

Long-Term Exposure: May cause liver damage severe enough to cause death. May cause lung damage. May cause dermatitis; eczema. A potential occupational carcinogen.

Points of Attack: Liver, lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests. Lung function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Where possible, automatically transfer material from other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Use absorbent dampened with 60%−70% acetone to pick up remaining material. Wash surfaces well with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thioacetamide is a combustible solid. Thermal decomposition products may include hydrogen sulfide, sulfur dioxide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Treatment in an incinerator, boiler or cement kiln.

HSDB Number: 5304
RTECS Number: GP3150000
EC Number: 202-525-2
Regulatory Authority and Advisory Information
Carcinogenicity: NCI: Carcinogenesis Studies (feed); no evidence: mouse, rat
Hazard Alert: Combustible, Possible risk of forming tumors,
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xi; Risk phrases: R36/37/38; R48; R51/53; Safety phrases: S16; S26; S36/37/39; S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: 4,4′-Thiobis(6-tert-butyl-*m*-cresol) is a light gray to tan powder. Aromatic odor. Molecular weight = 359; Specific gravity (H_2O:1) = 1.1 @ 25°C; Freezing/Melting point = 150°C; Vapor pressure = 6×10^{-7} mmHg @ 25°C; Flash point = 207°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility 0.08%. This material is sensitive to base hydrolysis and may spontaneously oxidize in solution[101].
Potential Exposure: This material is used as an antioxidant in the plastics and rubber industries; in Neoprene and other synthetic rubbers; in polyethylene and polypropylene.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May evolve explosive hydrogen sulfide upon contact with moisture or acids.
Permissible Exposure Limits in Air
OSHA PEL: 15 milligram per cubic meter, total dust TWA; 5 milligram per cubic meter, respirable fraction TWA
NIOSH REL: 10 milligram per cubic meter, total dust TWA; 5 milligram per cubic meter, respirable fraction TWA
ACGIH TLV[1]: 10 milligram per cubic meter, total dust TWA, not classifiable as a human carcinogen; *Notice of intended change*: 1 milligram per cubic meter inhalable fraction TWA.
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 3 milligram per cubic meter
PAC-2: 82 milligram per cubic meter
PAC-3: 460 milligram per cubic meter
Denmark: TWA 10 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; Switzerland: MAK-W 10 milligram per cubic meter, 1999; United Kingdom: TWA 10 milligram per cubic meter, STEL 20 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for this material in ambient air[60] ranging from 100 μ/m^3 (North Dakota); to 160 μ/m^3 (Virginia); to 200 μ/m^3 (Connecticut); to 238 μ/m^3 (Nevada).
Determination in Air: Use NIOSH(IV), Particulates NOR: Method #0500, total dust; Method #0600 (respirable).
Routes of Entry: Inhalation, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Although reported to be poisonous, this compound is insignificantly toxic on the basis of acute oral toxicity to rats. However, gastroenteritis, retarded weight gain, and enlarged livers resulted in rat feeding studies.
Long-Term Exposure: Repeated or high exposures may cause liver damage.
Points of Attack: Eyes, skin, respiratory system; liver.
Medical Surveillance: Liver function tests.
First Aid: *Skin Contact*: [52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe

fresh air. Proper respiratory protection must be supplied to any rescuers. IF coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for Exposures over *10 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. This material should be protected from exposure to light, and store it at ambient temperatures[101]. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. The spilled material may be dampened with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of sulfur and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP, Reasonably anticipated to be a human carcinogen, 2005; IARC, Group 2B: The agent is possibly carcinogenic to humans, 1987.

California Proposition 65 Chemical[102]: Cancer 4/1/1988.

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R45; R22; R51/53; R62; R63; Safety phrases: S29; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: 4,4′-Thiodianiline is a brown-purple powder or needles. Molecular weight = 216.32; Specific gravity (H_2O:1) = @ 20°C; Boiling point = °C; Vapor pressure = 1.1×10^{-5} mmHg @ 25°C (est.)[72]; Henry's Law constant = 3.9×10^{-12} atm-m^3/mol @ 25°C (est)[72]. Slightly soluble in water; solubility = 310 mg/L @ 25°C. Moisture sensitive.

Potential Exposure: 4,4′-Thiodianiline is used as a dye intermediate; in organic sythesis; as a lab reagent. Antiplatyhelmintic agents; Carcinogens[NLM]

Incompatibilities: This material may be combustible. 4,4′-Thiodianiline is incompatible with acids, diazo and azo compounds, halocarbons, isocyanates, aldehydes, alkali metals, nitrides, hydrides, and other strong reducing agents. May generate heat with these materials and hydrogen gas or hydrogen sulfide gas. May liberate hydrogen sulfide if heated to decomposition or mixed with an acid. Also incompatible with peroxides, phenols (acidic), epoxides, anhydrides, and acid halides[101]. Light and moisture sensitive

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Determination in Water: Thin layer chromatography. Octanol-water coefficient: Log $K_{ow} = 2.2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin, eyes, and respiratory tract. Highly toxic, may be fatal if inhaled, swallowed or absorbed through skin. Effects of contact or inhalation may be delayed. LD_{50} = (oral-rat) <1 g/kg.

Long-Term Exposure: May be carcinogenic, mutagenic and tumorigenic. Suspected of causing genetic defects

Points of Attack: Thyroid

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method* if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed.

Personal Protective Methods:

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison. Refrigerate under nitrogen in a secure poison location. 3,3′-Dimethoxybenzidine may react with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Store in tightly closed containers in a cool, well-ventilated area. Avoid exposure to light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3143 dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. Keep unauthorized personnel away. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind. Keep out of low areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may be combustible. Thermal decomposition products may include toxic hydrogen sulfide and oxides of nitrogen, sulfur, and carbon. Runoff from fire control or dilution water may be corrosive and/or toxic and may cause pollution. Runoff may pollute waterways. If tank, rail car or tank truck is involved in a fire, isolate for 800 meters/0.5 in all directions; also, consider initial evacuation for 800 meters/0.5 in all directions. Small Fire: Use dry chemical, CO_2 or water spray. *Large Fire*: Water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R27/28; R33; R50/53; Safety phrases: S1/2; S27; S29/35; S36/37; S41; S45; S60, 61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Thiofanox is a colorless solid with a pungent odor. Molecular weight = 218; Freezing/Melting point = 57°C.

Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this thiocarbamate systemic insecticide and acaricide.

Incompatibility: Thiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of thiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Many materials in this group slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of thiocarbamates with aldehydes, nitrides, and hydrides. Thiocarbamates are incompatible with acids, peroxides, and acid halides. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.77 milligram per cubic meter

PAC-2: 8.5 milligram per cubic meter

PAC-3: 51 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: This material is moderately to highly toxic. It is a cholinesterase inhibitor. Symptoms of exposure include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; sweating, weakness, runny nose; tightness of chest (inhalation exposure); blurred vision; tearing, muscle spasm; loss of eye coordination; ocular pain, extreme dilation of the pupil; loss of muscle coordination; slurring of speech; difficulty in breathing; excessive respiratory tract mucous; skin discoloration; and hypertension. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure.

Points of Attack: Blood, eyes, lungs.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in one to two weeks while red blood cell levels may be reduced for one to thre months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate or organophosphate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Eye examination. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of sulfur, nitrogen and carbon. Stay upwind; keep out of low areas. Ventilate closed spaces before entering. Use water spray, fog, or foam. Move container from fire area (only without risk). Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Thiofanox, Washington, DC, Chemical Emergency Preparedness Program (November 30, 1987

Thioglycolic Acid T:0460

Formula: $C_2H_4O_2S$; $HSCH_2COOH$

Synonyms: Acetic acid, mercapto-; Acetyl mercaptan; Acide thioglycolique (French); Glycolic acid, 2-thio-; Glycolic acid, thio-; Mercaptoacetate; 2-Mercaptoacetic acid; α-Mercaptoacetic acid; Mercaptoacetic acid; 2-Thioglycolic acid; Thioglycolic acid; Thioglycollic acid; Thiovanic acid

CAS Registry Number: 68-11-1

HSDB Number: 2702 as mercaptoacetic acid

RTECS Number: AI5950000

UN/NA & ERG Number: UN1940/153

EC Number: 200-677-4 [*Annex I Index No*.: 607-090-00-6]

Regulatory Authority and Advisory Information

Hazard Alert: Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, C; Risk phrases: R23/24/25; R26; R34; Safety phrases: S1/2; S23; S25; S27; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Thioglycolic acid is a colorless liquid with a strong unpleasant odor like rotten eggs. Molecular weight = 92.12; Specific gravity (H_2O:1) = 1.32 @ 25°C; Boiling point = 120°C @ 20 mmHg; 104°C−106°C @ 11 mmHg; 220C @ Freezing/Melting point = −16.5°C; Vapor pressure = 10 mmHg @ 18°C; Flash point = > 110°C; Autoignition temperature = 350°C. Explosive limits: LEL = 5.9%; UEL-unknown. Soluble in water.

Potential Exposure: Thioglycolic acid is used to make thioglycolates; in sensitivity tests for iron; in formulations of permanent wave solutions and depilatories; in pharmaceutical manufacture; as a stabilizer in vinyl plastics.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Air, strong oxidizers; bases, active metals, for example, sodium potassium, magnesium, and calcium. Readily oxidized by air. Thermal decomposition causes release of hydrogen sulfide. May attack various metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.77 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 1 ppm/4 milligram per cubic meter TWA [skin]
ACGIH TLV[1]: 1 ppm/3.8 milligram per cubic meter TWA [skin]
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 3 ppm
PAC-2: 33 ppm
PAC-3: 200 ppm
Australia: TWA 1 ppm (4 milligram per cubic meter), 1993; Belgium: TWA 1 ppm (3.8 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (5 milligram per cubic meter), 1999; Finland: TWA 1 ppm (5 milligram per cubic meter), STEL 3 ppm (15 milligram per cubic meter), 1993; France: VME 1 ppm (5 milligram per cubic meter), [skin], 1999; Hungary: TWA 0.5 milligram per cubic meter, STEL 1 milligram per cubic meter, 1993; Norway: TWA 1 ppm (5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 4 milligram per cubic meter, [skin], 2003; Russia: STEL 0.1 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 1 ppm, 3.8 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 ppm [skin]. Several states have set guidelines or standards for thioglycolic acid in ambient air[60] ranging from 40 μ/m^3 (North Dakota); to 80 μ/m^3 (Virginia); to 100 μ/m^3 (Connecticut); to 119 μ/m^3 (Nevada).

Determination in Water: Octanol-water coefficient: Log K_{ow} = low, <0.1. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause eye and skin burns and blisters. It can also cause conjuctival edema and corneal damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Ingesting the liquid may cause chemical pneumonitis. Exposure can cause death. Irritation, blistering, and severe burns of the skin, eyes, and mucous membranes; corrosion of tissues[52]. If ingested, severe burning pain in the mouth, pharynx and abdomen; vomiting, bloody diarrhea; sharp drop in blood pressure: and asphyxia. If inhaled;coughing, choking, headache, dizziness, weakness, tightness in the chest; air hunger; and cyanosis. In animals: weakness, asping respirations; convulsions.

Long-Term Exposure: Repeated contact may cause a skin rash.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. If conscious, do not induce vomiting. For dilute acid; ive water, milk, milk of magnesia; $A(OH)_3$, or $Ca(OH)_2$. Avoid carbonates or bicarbonates. For concentrated acid, it may be dangerous to administer water or antacids. Some authorities suggest ice water or a snow slurry. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema or pneumonitis, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers.

Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: UN1940 Thyoglycolic acid, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Thioglycolic acid may burn, but does not readily ignite. Thermal decomposition products may include hydrogen sulfide and oxides of sulfur and carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in flammable solvent and burn in furnace equipped with afterburner and alkaline scrubber.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Thionyl chloride is a pale yellow to reddish liquid. Suffocating odor like sulfur dioxide. Fumes form when exposed to moist air. Molecular weight = 119; Specific gravity (H_2O:1) = 1.64 @ 16°C; Boiling point = 79°C (decomposes to SO_2 and S_2Sl_2 @ 140°C); Freezing/Melting point = −105°C; Vapor pressure = 100 mmHg @ 21°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2 ₩. Reacts violently with water releasing hydrogen chloride and sulfur dioxide gas.

Potential Exposure: Thionyl chloride is used as specialty chlorinating agent, particularly in preparation of organic acid chlorides; in organic synthesis; as a catalyst.

Incompatibilities: Reacts violently with water releasing sulfur dioxide and hydrogen chloride. Keep away from water, acids, alcohols, alkalis, ammonia, chloryl perchlorate.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.87 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 1 ppm/5 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 0.2 ppm TWA Ceiling Concentration
Protective Action Criteria (PAC)* Ver. 29[138]
PAC-1: **0.2_A** ppm
PAC-2: **2.4_A** ppm
PAC-3: **14_A** ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
Australia: TWA 1 ppm (5 milligram per cubic meter), 1993; Belgium: STEL 1 ppm (4.9 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (5 milligram per cubic meter, 1999; Switzerland: MAK-W 1 ppm (5 milligram per cubic meter), 1999; United Kingdom: STEL 1 ppm (4.9 milligram per cubic meter), 2000; the Netherlands: MAC 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 1 ppm
North Dakota[60] has set a guideline for thionyl chloride in ambient air of 50 μ/m^3 (5 milligram per cubic meter).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: A corrosive irritant to the eyes, skin, and mucous membrane. Contact causes eye and skin burns. Can cause dermatitis, rhinitis (inflammation of the nose), and pneumonia. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. This chemical is more toxic than sulfur dioxide.

Long-Term Exposure: Highly irritating substances can cause lung irritation; bronchitis may develop.

Points of Attack: Lungs. Consider chest X-ray following acute overexposure.

Medical Surveillance. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to medical personnel: Administer oxygen, using intermittent positive-pressure breathing apparatus: 5% solution of sodium bicarbonate may be used, as well as bronchodilators and decongestants.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with thionyl chloride all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from water, acids, alkalis, ammonia, chloryl perchloride. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1836 Thionyl chloride, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Initial isolation and protective action distances; UN1836 Thionyl chloride

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

when spilled on land

Small spills (*From a small package or a small leak from a large package*)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)

Day 0.2/0.3
Night 0.5/0.8
Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 1.2/1.9
Small spills (*From a small package or a small leak from a large package*)
when spilled in water
First: Isolate in all directions (feet/meters) 300/90
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 1.9/3.1
Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 2500/800
Then: Protect persons downwind (miles/kilometers)
Day 6.2/10
Night 7.0 +/11.0 +*
*+ means distance can be larger in certain atmospheric conditions.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Cover with sodium bicarbonate or an equal mixture of soda ash and slaked lime. After mixing, spray water from an atomizer with great caution. Transfer slowly into a large container of water. Neutralize and drain into the sewer with sufficient water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Thermal decomposition products may include chlorine, sulfur chloride, sulfur dioxide, hydrogen chloride and oxides of sulfur and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Keep water out of open containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray on a thick layer of a (1:1) mixture of dry soda ash and slaked lime behind a shield. After mixing, spray water from an atomizer with great precaution. Transfer slowly into a large amount of water. Neutralize and drain into the sewer with sufficient water.

Carcinogenicty: Carcinogenicity[83]: EPA, Likely to be carcinogenic to humans.

California Proposition 65 Chemical[102]: Cancer (5/18/99).

Hazard Alert: Poison, Suspected of causing genetic defects, Suspected reprotoxic hazard, Sensitization hazard, Environmental hazard, Agricultural chemical.

SARA Title III, Section 311/312 Hazard Category: Immediate Health Hazard

RCRA Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U409

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B), severe

EPA Oral reference dose (RfD) = 0.08 mg/kg/day

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xn, N; Risk phrases: R45; R20/21/22; R36; R41; R50/53; R62; R63; R68; Safety phrases: S16; S26; S29; S36/37/39; S45; R46; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methyl thiophanate is a colorless crystals, prisms or light brown powder. Molecular weight = 342.4; Freezing/Melting point = (decomposes) 172°C; Decomposes ~ 163°C[72]; Vapor pressure = $< 1 \times 10^{-7}$ mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Henry's Law constant = 1.21×10^{-9} atm-m^3/mol @ 25°C (est)[72] Slightly soluble in water; solubility = < 30 mg/mL @ 20°C.

Potential Exposure: Methyl thiophanate is thiocarbamate ester, used in the synthesis of polymers and in agriculture as pesticides, soil fumigants, and seed disinfectants.

Incompatibilities: Thiocarbamate esters are combustible; dust may form explosive mixture with air. Decomposes-163°C[72]. Thiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of thiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithio carbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of thiocarbamates with aldehydes, nitrides, and hydrides. Thiocarbamates are incompatible with acids, peroxides, and acid halides[101].

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 1.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: The slow release of poisonous gases from hydrolysis of many thiocarbamates require the use of respirators during handling. LD_{50} = (oral-rat) 6640 mg/kg.

Long-Term Exposure: Suspected reprotoxic hazard, Suspected of causing genetic defects. May cause skin allergy.

Points of Attack:

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. If skin or lung sensitization is suspected, consider evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN2771 Thiocarbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of nitrogen, sulfur, and carbon. Stay upwind; keep out of low areas. Ventilate closed spaces before entering. Use water spray, fog or foam. Move container from fire area (only without risk). Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

United States Code of Regulations, 40 CFR 240-280, 300-306, 702-799, Washington, DC (July 1, 2000)

Thiophosgene T:0485

Formula: CCl_2S

Synonyms: Carbon chlorosulfide; Carbonothioic dichloride; Carbonyl chloride, thio-; Dichlorothiocarbonyl; Phosgene, thio-; Thiocarbonic dichloride; Thiocarbonyl chloride; Thiocarbonyl dichloride; Thiofosgen; Thiokarbonylchlorid

CAS Registry Number: 463-71-8

HSDB Number: 861

RTECS Number: XN2450000

UN/NA & ERG Number: (PIH) UN2474/157

EC Number: 207-341-6; [*Annex I Index No.*: 607-201-00-8]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Combustible, Primary irritant (w/o allergic reaction). United States DOT 49CFR172.101, Inhalation Hazardous Chemical,

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; Risk phrases: R15/29; R22; R23; R36/37/38; Safety phrases: S7; S9; S30; S36/37; S41; S45 (see Appendix 4).

Description: A clear dark red to reddish-yellow liquid. Sharp, choking odor. Molecular weight = 115; Specific gravity = 1.53 @ 20°C. Boiling point 73.5°C; Flash point = < 100°C.Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. ₩ Decomposes in water; reaction with cold water is slow and highly dangerous, liberating hydrogen sulfide and flammable hydrogen gas. Hot water speeds reaction.

Potential Exposure: Primary irritant (w/o allergic reaction). There is not large-scale production of the chemical in the United States It is used to make other chemicals and in laboratory synthesis.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with water and alcohols. Reacts with water releasing toxic hydrogen chloride, carbon disulfide, and carbon dioxide. Reaction is slow unless the water is hot. Decomposes above 200°C to highly flammable carbon bisulfide and carbon tetrachloride[136]. Corrodes metals, rubber and some plastics in the presence of moisture. Thiophosgene is incompatible with acids, diazo and azo compounds, halocarbons, isocyanates, aldehydes, alkali metals, nitrides, hydrides, and other strong reducing agents. Reactions with these materials generate heat and in many cases hydrogen gas. Liberates hydrogen sulfide upon reaction with acids[101].

Permissible Exposure Limits in Air: No standards or Protective Action Criteria (PAC) available.

Determination in Water: Effect of low concentrations on aquatic life is unknown.

Routes of Entry: Inhalation, eyes and skin.

Harmful Effects and Symptoms

Short-Term Exposure: A corrosive lacrimator and irritant to the eyes, skin, and mucous membrane. May severely burn skin and eyes on contact. Highly toxic by inhalation and by skin absorption. Ingestion causes severe irritation of the mouth and stomach. May also cause headache and nausea. Inhalation causes coughing, shortness of breath, rhinitis (inflammation of the nose), and possible pneumonia. Exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Grade 2, LD_{50} = (oral, rat) 929 mg/kg[136]

Long-Term Exposure: skin

Points of Attack: Lungs, skin, organs.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: Get medical attention at once after any exposure to this compound. *Inhalation*: remove victim from exposure. Administer oxygen as soon as possible; support respiration; watch for pulmonary edema. *Eyes*: irrigate with large quantities of water for 15 minutes. *Skin*: flush with water. *Ingestion*: *Do NOT induce vomiting*; give large amount of water[136]

Person al Protective Methods: SCBA or organic canister mask; goggles or face shield; rubber gloves (USCG, 1999)

Respirator Selection: Get medical attention at once after any exposure to this compound. *Inhalation*: remove victim from exposure; support respiration; watch for pulmonary edema. *Eyes*: irrigate with large quantities of water for 15 minutes. *Skin*: flush with water. *Ingestion*: *Do NOT induce vomiting*; give large amount of water[136]

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store under nitrogen in a secure poison location. (2) White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN2474 Thiophosgene, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard; Inhalation Hazard Zone B. PG 2. STN: 49 232 98.

Spill Handling:

Thiophosgene

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.2/1.9

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.7/2.8
Night 3.4/5.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Flammable liquid. Decomposes above 200°C to highly flammable carbon bisulfide and carbon tetrachloride[136]. Thermal decomposition products may include phosgene, carbon disulfide, hydrogen chloride (HCl), hydrogen sulfide, carbon tetrachloride and oxides of sulfur and carbon. Extinguish with dry chemicals or carbon dioxide. *Do not use water or foam on fire*. Cool exposed containers with water. Effect of low concentrations on aquatic life is unknown. May be dangerous if it enters water intakes. Notify local health and wildlife officials. Notify operators of nearby water intakes.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; Risk phrases: R10; R26/27/28; R33; R50/53; R62; Safety phrases: S13; S22; S26; S28; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Thiosemicarbazide is an odorless, white crystalline powder. Molecular weight = 91.15; Freezing/Melting point = 180°C−184°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Thiosemicarbazide is a dithiocarbamide compound is used as an intermedialte for pharmaceuticals and herbicides; as a reagent for ketones and certain metals; in certain photography and dye operations; as a rodenticide. It is also effective for control of bacterial leaf blight of rice.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.) and strong reducing agents; contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May react with nitrates.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.1 milligram per cubic meter

PAC-2: 12 milligram per cubic meter

PAC-3: 13 milligram per cubic meter

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -0.67$. See Feigel; *Spot Tests in Organic Analysis*, Elsevier Publishing Company, New York.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: This material is highly poisonous by ingestion. May cause delayed toxic effects in blood and skin. May be mutagenic in human cells. Thiosemicarbazide may induce goiter and has also been reported to cause bone marrow depression with accompanying decreases in white blood cells and platelets. It may also cause skin irritation.

Long-Term Exposure: May cause delayed toxic effects in blood and skin. May be mutagenic in human cells. May be a cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in one to two weeks while red blood cell levels may be reduced for one to three months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving carbamate pesticides (or organophosphates) is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN2771 Thiosemicarbazide, pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Avoid skin contact, ingestion or inhalation. Do not touch spilled material; stop leak if you can do it without risk. *Small spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Remove all ignition sources. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Flammable solid. Thermal decomposition products may include oxides of sulfur, nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen; IARC: Human Sufficient Evidence, 1978; Animal Sufficient Evidence, *carcinogenic to humans*, Group 1, 1997; NCI: Carcinogenesis Studies (ipr); clear evidence: mo use, rat.

California Proposition 65 Chemical[102]: Cancer 1/1/1988

Hazard Alert: Poison, Polymerization hazard, Environmental hazard.

Banned or Severely Restricted (in household products) (Japan)[13].

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; Risk phrases: R45; R19; R26/27/28; R46; R50/53; Safety phrases: S13; S22; S26; S28; S29/35; S36/ 37/39; S45; S53; S61 (see Appendix 4)

Description: Thiotepa is a crystalline substance. Molecular weight = 189.24; Freezing/Melting point = 51.5°C. Practically insoluble in water.

Potential Exposure: Used in the treatment of cancers resistant to chemotherapy. Antineoplastic: thiotepa has been prescribed for a wide variety of neoplastic diseases: adenocarcinomas of the breast and the ovary; superficial carcinoma of the urinary bladder; controlling intracavitary or localized neoplastic disease; lymphomas, such as lymphosarcomas and Hodgkin's disease; as well as bronchogenic carcinoma.

Incompatibilities: Tris(aziridinyl)phosphine sulfide polymerizes readily upon exposure to heat or moisture, especially at acidic pH[101]. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure to this compound include nausea, anorexia, headache and vomiting. It may also cause leukopenia and thrombocytopenia. Other symptoms include bone-marrow depression, anemia, dizziness, amenorrhea, interference with spermatogenesis, alopecia and apnea. Febrile reaction and weeping from a subcutaneous lesion may occur as the result of breakdown of tumor tissue. Allergic reactions are rare, but hives and skin rash have been noted occasionally. Death from septicemia and hemorrhage has occurred as a direct result of hematopoietic depression. Other symptoms include granulocytopenia, hypoplasia of all elements of bone marrow, lymphopenia and precipitation of uric acid in kidney tubules[101].

Long-Term Exposure: Exposure to this compound may result in the development of acute nonlymphocytic leukemia[101]. Tris(1-aziridinyl)phosphine sulfide (Thiotepa) is carcinogenic in mice and rats after administration by various routes, producing a variety of malignant tumors. There are several reports and epidemiological studies suggesting the development of acute nonlymphocytic leukemia in patients treated with thiotepa for ovarian and other malignant tumors.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Protect from light and store in a refrigerator. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to pro cess containers.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur, phosphorus and carbon. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xn, N, Xi; Risk phrases: R45; R22; R36/37/38; R40; R43; R50/53; R62; R62; R63; Safety phrases: S2; S29/35; S36/37; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Thiourea consists of colorless, lustrous crystals or powder with a bitter taste. Molecular weight = 76.1; Specific gravity (H_2O:1) = 1.4 @ 20°C; Boiling point = decomposes below BP; Freezing/Melting point =

178°C−181°C; Flash point = 55°C. Partially soluble in water.

Potential Exposure: Thiourea is used as rubber antiozonant, toning agent; corrosion inhibitor; and in pharmaceutical manufacture; in the manufacture of photosensitive papers; flame-retardant textile sizes; boiler water treatment. It is also used in photography; pesticide manufacture; in textile chemicals.

Incompatibilities: Dust may form explosive mixture with air. Reacts violently with acrolein, strong acids (nitric acid). Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.38 milligram per cubic meter

PAC-2: 4.1 milligram per cubic meter

PAC-3: 25 milligram per cubic meter

DFG MAK: [skin] Danger of skin sensitization; danger of photo-contact sensitization; Carcinogen Category 3B.

Austria Suspected: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Russia: STEL 0.3 milligram per cubic meter, 1993; Sweden: carcinogen, 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, [skin], 2003. Several states have set guidelines or standards for thiourea in ambient air[60] ranging from zero (North Dakota); to 0.03 μ/m^3 (New York).

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < -1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes. Thiourea may affect you when breathed in. A related chemical (naphthylthiourea) in higher exposures can cause fluid in the lungs, a medical emergency. It is not known if thiourea has this effect. May cause allergic skin eruptions[136].

Long-Term Exposure: Repeated exposure can cause goiter (enlarged thyroid gland). Exposure may damage the bone marrow, causing reduced red blood cells; white blood cells and platelets (reduced blood clotting ability). Thiourea has been identified as a sensitizer in people suffering from photosensitivity. A possible human carcinogen.

Points of Attack: Thyroid gland, blood, skin. Cancer site in animals: thyroid, liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. CBC. Consider thyroid test for thyroxin. If symptoms develop or overexposure is suspected, the following may be useful. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Thiourea must be stored to avoid contact with acrolein, hydrogen peroxide; and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include nitrogen, sulfur and carbon oxides. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)](as dustable powder formulations containing a combination of: Benomyl @ or >7%; carbofuran @ or >10 %; thiram @ or >15%).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N, Xi; Risk phrases: R20/22; R36/38; R43; R48/22; R50/53; R62; R63; Safety phrases: S2; S26; S29/35; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Thiram is a colorless to yellow, crystalline solid. Characteristic odor. Commercial pesticide products may be dyed blue. Molecular weight = 240.44; Boiling point = 129°C; Freezing/Melting point = 156°C; Flash point = 148°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Thiram is a dithiocarbamate. Some thiurams have been used as rubber components: thiram is used as a rubber accelerator and vulcanizer; a seed, nut, fruit, and mushroom disinfectant; a bacteriostat for edible oils and fats; and as an ingredient in suntan and antiseptic sprays and soaps. It is also used as a fungicide, rodent repellent; wood preservative; and may be used in the blending of lubricant oils.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from strong alkaline materials, strong acids, strong bases and nitrating agents.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 milligram per cubic meter
OSHA PEL: 5 milligram per cubic meter TWA
NIOSH REL: 5 milligram per cubic meter TWA
ACGIH TLV[1]: 0.05 milligram per cubic meter, measured as inhalable fraction and vapor TWA; not classifiable as a human carcinogen

Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 0.15 milligram per cubic meter
PAC-2: 250 milligram per cubic meter
PAC-3: 1500 milligram per cubic meter

DFG MAK: MAK: 1 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(2); danger of skin sensitization; Pregnancy Risk Group C.

Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 1 milligram per cubic meter, 1999; Finland: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter, [skin], 1999; France: VME 5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; the Phillipines: TWA 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter; MAC (STEL) 2 milligram per cubic meter, 1999; Russia: STEL 0.5 milligram per cubic meter, [skin], 1993; Sweden: TWA 1 milligram per cubic meter, STEL 2 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, STEL 25 milligram per cubic meter, 1999; Thailand: TWA 5 milligram per cubic meter, 1993; Turkey: TWA 5 milligram per cubic meter, 1993; United Kingdom: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter 2000 Occupational Exposure Limit; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[35][43] has set MAC values for ambient air in residential areas of 0.01 milligram per cubic meter on a momentary basis and 0.006 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for Thiramin ambient air[60] ranging from 50 μ/m^3 (North Dakota); to 80 μ/m^3 (Virginia); to 100 μ/m^3 (Connecticut); to 119 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5005, Thiram.

Permissible Concentration in Water: Russia [43] set a MAC in water bodies used for domestic purposes of 1.0 μg/L. Further it set a MAC in water bodies used for fishery purposes of zero. The state of Maine[61] has set a guideline for thiram in drinking water of 10 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin irritation can lead to rash, and allergy. High exposures can cause kidney and liver damage. Brain and nerve damage can also occur. Inhalation can cause irritation of the respiratory tract with stuffy nose; nosebleeds, hoarseness, cough and/or phlegm. *Inhalation*: Animal studies indicate that irritation of the nose and throat may occur at levels above 5 milligram per cubic meter. *Skin*: Exposure to spray containing 45% Thiram resulted in irritation and skin sensitization. *Eyes*: May cause irritation, tearing and sensitivity to light. *Ingestion*: No information available on human exposure. In animal studies, 38 ppm in food caused nausea, vomiting, diarrhea, hyperexcitability, weakness and loss of muscle control. Death may occur from ingestion of approximately one teaspoonful. *Note*: Can cause extreme illness when exposure is combined with alcohol ingestion.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. Prolonged contact has causedeye irritation; tearing, increased sensitivity to light; reduced night vision and blurred vision. Occupational exposures to 0.03 milligram per cubic meter over a five-year period has caused mild irritation of the nose and throat. Whether it has this effect in humans is not known. May affect the thyroid and liver. Thiram has caused birth defects in laboratory animals and has been shown to be a teratogen in animals.

Points of Attack: Eyes, skin, respiratory system; CNS. Dithiocabamates can affect thyroid function.

Medical Surveillance: Preplacement and periodic medical examinations should give special attention to history of skin allergy, eye irritation; and significant respiratory, liver, or kidney disease. Workers should be aware of the potentiating action of alcoholic beverages when working with tetramethylthiuram disulfide. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *100 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full face piece). *Emergency or planned entry in to unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool place away from strong oxidizers; strong acids; oxidizable materials.

Shipping: UN2771 Thiocarbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Cover the spill with weak solution of calcium hypochlorite (Up to 15%). Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include carbon disulfide and oxides of sulfur, nitrogen and carbon. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Thiram can be dissolved in alcohol or other flammable solvent and burned in an incinerator with an afterburner and scrubber.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: There is sufficient evidence in experimental animals for the carcinogenicity of mixed α-particle emitters. This includes thorium-227, thorium-228, thorium-230, thorium-232[193].

California Proposition 65 Chemical[102]: Cancer, 1/1/1989 as radionuclides.

Thorium:

Hazard Alert: Highly flammable (powder); Pyrophoric hazard, Dangerous radioactive hazard, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as radionuclides

CERCLA *Reportable Quantities (RQs) for radionuclides of Thorium, radioactive compounds*: Persons in charge of vessels or facilities are required to notify the National Response Center (NRC) immediately, when there is a release of this designated hazardous substance, in an amount equal to or greater than its reportable quantity (RQ) reported in curies (ci)/TBq (terabecquerel):

- Thorium_{229}: RQ ≥ 0.001 ci/3.7×10^7 TBq
- Thorium_{228}; Thorium_{230}: RQ ≥ 0.01 ci/3.7×10^8 TBq
- Thorium_{227}: RQ ≥ 1.0 ci/0.37×10^{10} TBq
- Thorium_{226}; Thorium_{231}; Thorium_{234}: RQ ≥ 100 ci/3.7×10^{12} TBq

The toll free number of the NRC is (800) 424-8802. The rule for determining when notification is required is stated in 40 CFR302.4 (section IV. D.3.b).

thorium dioxide:

Carcinogenicity: *Thorium dioxide*: NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen: Thorium dioxide; IARC: Human Sufficient Evidence [diagnostic injection of thorium-232 as stabilized thorium-232 dioxide in colloidal form (Thorotrast)]; Humans Inadequate Evidence (inhalation thorium-232), generally in Group, 2001; RTECS: (thorium dioxide)[9]

California Proposition 65 Chemical[102]: Cancer 2/27/1987

Hazard Alert: Radioactive material, Possible risk of forming tumors.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F, N; Risk phrases: R45; R10 (powder); R23/24/25; R34; Safety phrases: S26; S27; S28; S29/35; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. (all CAS numbers shown above)

Description: Thorium is a silvery-white, soft, ductile metal which is a natural radioactive element. Atomic weight = 232; Specific gravity (H_2O:1) = 11.7 @ 20°C; Boiling point = 4500°C Freezing/Melting point = 1750 ± 30°C. Insoluble in water. It occurs in the minerals monazite, thorite, and thorinite; usually mixed with its disintegration products.

Thorium chloride is a crystalline solid. Molecular weight = 373.80; Boiling point = 927.5°C; Freezing/Melting point = 770°C. Soluble in water

Thorium hydroxide $Th(OH)_4$: Molecular weight = 300.1; Specific gravity (H_2O:1) = @ 20°C; Boiling point = °C; Freezing/Melting point = °C.

Thorium nitrate, [$Th(NO_3)_4$; ThN_4O_{12}]: a crystalline solid which decomposes @ 500°C. Molecular weight = 480; Specific gravity (H_2O:1) = @ 20°C; Boiling point = °C; Freezing/Melting point = °C.

Thorium nitrite: Molecular weight = 416.03; Specific gravity (H_2O:1) = @ 20°C; Boiling point = °C; Freezing/Melting point = °C.

Thorium oxide ($ThO_{2)}$ is a white crystalline powder or solid. Molecular weight = 264.00; Specific gravity (H_2O:1) = 9.7 @ 20°C; Boiling point = 4400°C; Freezing/Melting point = 3390°C. Insoluble in water.

Thorium oxalate: Molecular weight = 444; Specific gravity (H_2O:1) = 4.6 @ 16°C; Boiling point = °C; Freezing/Melting point = °C.

Thorium perchlorate ($ThClO_4$): Molecular weight = 331.49; Specific gravity (H_2O:1) = @ 20°C; Boiling point = °C; Freezing/Melting point = °C.

Potential Exposure: *Metallic thorium* is used in nuclear reactors to produce nuclear fuel; in the manufacture of incandescent mantles; as an alloying material, especially with some of the lighter metals, for example, magnesium as a reducing agent in metallurgy; for filament coatings in incandescent lamps and vacuum tubes; as a catalyst in organic synthesis; in ceramics; and in welding electrodes. Exposure may occur during production and use of thorium-containing materials, in the casting and machining of alloy parts; and from the fume produced during welding with thorium electrodes.

Thorium nitrate is an oxidizer. Contact with combustibles, and reducing agents will cause violent combustion or ignition.

Incompatibilities: The powder may ignite spontaneously in air. Heating may cause violent combustion or explosion. May explosively decompose from shock, friction, or concussion. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause violent fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitryl fluoride; peroxyformic acid; silver, sulfur.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

7440-29-1, elemental; 1314-20-1, oxide; 13825-36-0, hydroxide; *16045-17-3, perchlorate*; *2040-52-0, oxalate*; *z-0090, nitrite*

PAC-1: 30 milligram per cubic meter
PAC-2: 330 milligram per cubic meter
PAC-3: 2000 milligram per cubic meter

13823-29-5, nitrate

PAC-1: 2.9 milligram per cubic meter
PAC-2: 32 milligram per cubic meter
PAC-3: 190 milligram per cubic meter

North Dakota[60] has set a guideline for ambient air of zero for thorium dioxide.

Routes of Entry: Ingestion of liquid, inhalation of dust or gas, and dermal absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation may cause damage to the bone marrow and lungs. May affect the blood forming system, reducing the ability to produce white blood cells, resulting in pernicious anaemia.

Long-Term Exposure: Gas and aerosols can penetrate the body by way of the respiratory system, the digestive system, and the skin. Only 0.001% of an ingested dose is retained in the body. Thorium, once deposited in the body, remains in the bones, lymph system; lungs and other body organs; and parenchymatous tissues for long periods of time. Low repeated exposures may scar the lungs, and damage the liver and kidneys. Characteristic effects of the activity of thorium and its disintegration products are changes in blood forming, nervous and reticuloendothelial systems; and functional and morphological damage to lung and bone tissue. Only much later do illness and symptoms characteristic of chronic radiation disease appear. After a considerable time, neoplasms may occur and the immunological activity of the body may be reduced. Repeated or prolonged contact with skin may cause dermatitis. A potential occupational carcinogen. May cause heritable genetic damage. May cause birth defects.

Points of Attack: Bone marrow, lungs. Liver, kidneys, lungs. Cancer site in humans (thorium dioxide): liver.

Medical Surveillance: Thorium oxide is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Monitoring of personnel for early symptoms and changes, such as abnormal leukocytes in the blood smear, may be of value. In cases of chronic or acute exposure, the determination of thorium in the urine or the use of whole body radiation counts and breath radon are useful methods of monitoring the exposure dose and excretion rates. White blood cell count. Lung function test. Consider periodic chest X-ray for persons with potentially high or repeated lower exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Radioactive. Color code-Yellow Stripe: Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper hand ling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Thorium nitrate must be stored to avoid contact with combustible, organic or other readily oxidizable materials, since violent reactions occur.

Shipping: UN2975 Thorium metal, pyrophoric, Hazard class: 7; Labels: 7-Radioactive material, 4.2-Spontaneously combustible material. Note: UN/NA 2975 doesn't appear in the 49 CFR Hazmat Table.

UN2976* Thorium nitrate, solid, Radioactive Materials (Low to Moderate Level Radiation. *Note: UN/NA 2976 doesn't appear in the 49 CFR Hazmat Table.

UN2909 Radioactive material, excepted package-articles manufactured from natural uranium or depleted uranium or natural thorium, Hazard class: 7; Labels: 7-Radioactive material Notes: There are three notes: (1) whether the displayed information is for domestic (USA) or international shipping (if neither is specifically indicated, it applies to both), (2) whether the proper shipping name must include one or more technical names of the hazardous material in parentheses, and (3) whether the hazardous material is an inhalation hazard.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Fire: When a large quantity of this material is involved in a major fire, consider an initial evacuation distance of 300 meters (1000 feet) in all directions. Radiation presents minimal risk to transport workers, emergency response personnel and the public during transportation accidents. Packaging durability increases as potential hazard of radioactive content increases. Very low levels of contained radioactive materials and low radiation levels outside packages result in low risks to people. Damaged packages may release measurable amounts of radioactive material, but the resulting risks are expected to be low. Some radioactive materials cannot be detected by commonly available instruments. Packages do not have "RADIOACTIVE I, II, or III" labels. Some may have EMPTY labels or may have the word "Radioactive" in the package marking[31]. Thorium dioxide may burn, but does not readily ignite. Thermal decomposition products may include metallic oxides of metal (thorium); and, in thorium nitrate, nitrogen oxides. Thorium nitrate can cause violent combustion or ignition when in contact with readily combustible substances. On thorium nitrate use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and recycling is in the preferred route.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Reducing agent, Possible risk of forming tumors.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%., tin, elemental and tin compounds, n.o.s.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, C, Xi; Risk phrases: R11; R20/21/22; R34; R36/37/38; Safety phrases: S7/9; S16; S24/25; S26; S33; S36/37/39; S45(see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonwater polluting agent (particle size >1 mm; metal, oxide)

Description: Tin is a gray to almost silver-white, ductile, malleable, lustrous metal. Specific gravity (H_2O:1) = 7.28 @ 25°C; Molecular weight = 119; Specific gravity (H_2O:1) = 5.8; Boiling point = 2625°C; Freezing/Melting point = 232°C. Ignition temperature of dust cloud = 630°C; Minimum Explosive concentration = 0.19 oz/ft^3[209]. Relative explosion hazard of dust: Mode rate (due to oxide coating). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Insoluble in water. The primary commercial source of tin is cassiterite (SnO_2, tinstone).

Tin (II) oxide & (IV) oxide, (stannic oxide): Molecular weight = 151; Specific gravity (H_2O:1) = 6.95; Freezing/Melting point = 1630°C.

Tin(II) chloridedihydrate: Molecular weight = 226; Specific gravity (H_2O:1) = 2.7; Boiling point = 652°C; Freezing/Melting point = 38°C. Tin hydroxide [$Sn(OH)_2$]: Molecular weight = 153.

Potential Exposure: The most important use of tin is as a protective coating for other metals, such as in the food and beverage canning industry; in roofing tiles; silverware, coated wire; household utensils; electronic components; and pistons. Common tin alloys are phosphor bronze; light brass; gun metal; high tensile brass; manganese bronze; die-casting alloys; bearing metals; type metal; and pewter. These are used as soft solders, fillers in automobile bodies; and as coatings for hydraulic brake parts; aircraft landing gear and engine parts. Metallic tin is used in the manufacture of collapsible tubes and foil for packaging. Exposures to tin may occur in mining, smelting, and refining; and in the production and use of tin alloys and solders. Inorganic tin compounds are important industrially in the production of ceramics; porcelain, enamel, glass; and inks; in the production of fungicides; anthelmintics, insecticides; as a stabilizer it is used in polyvinyl plastics and chlorinated rubber paints; and it is used in plating baths.

Incompatibilities: TIN is a reducing agent. Stable in bulk form in air, but as powder it corrodes (oxidizes) in air, especially in the presence of moisture. Keep away from strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Incompatible with acids, alkalies, bases, chlorine, turpentine; reacts violently with acetic aldehyde, ammonium nitrate, ammonium perchlorate, hexachloroethane. Strong reducing agents may react violently with halogens, bromine fluoride, chlorine trifluoride, copper nitrate, disulfur dichloride, nitrosyl fluoride, potassium dioxide, sodium peroxide, sulfur, and other chemicals. May form explosive compounds with hexachloroethane, pentachloroethane, picric acid, potassium iodate, potassium peroxide, 2,4,6-trinitrobenzene-1,3,5-triol.

Permissible Exposure Limits in Air

Determination in Air: Use NIOSH Analytical Method (IV) #7300, Element; #7301; #7303; OSHA Analytical Method ID-121; ID-206.

Permissible Concentration in Water: State Drinking Water Guidelines: Minnesota 4000 μg[Sn]/L.

Routes of Entry: Inhalation of dust, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Dust irritates the eyes, skin, and respiratory tract. Tin may be contaminated with toxic lead or arsenic, causing exposure to these chemicals from dust or fumes. Inorganic tin salts are irritants to the skin and mucous membranes; they may be strongly acid or basic depending on the cation or anion present. In animals: vomiting, diarrhea, paralysis with muscle twitching.

Long-Term Exposure: Exposure to dust or fumes of inorganic tin is known to cause a benign pneumoconiosis (stannosis). Tin or dust fumes can cause "spots" to appear on chest X-ray and may represent reduced lung function. This form of pneumoconiosis produces distinctive progressive X-ray changes of the lungs as long as exposure persists, but there is no distinctive fibrosis; no evidence of disability; and no special complicating factors. Because tin is so radio-opaque, early diagnosis is possible. Fumes can also cause chronic cough and may cause reduced lung function. Tin may interfere with the body's ability to absorb iron from food or vitamin pills, contributing to iron deficiency anemia.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), Chest X-ray; urine (chemical/metabolite). Also, see, NIOSH Analytical Method #8310, Metals in urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *Up to 10 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 20 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 milligram per cubic meter*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 100 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter. Click here for information on selection of N, R, or P filters); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry in to unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF; PD,PP: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Powdered tin is combustible and a mode rate explosion risk. Color code-Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Color code-Green (*tin metal*): General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Tin must be stored to avoid contact with chlorine, bromine, bromine trifluoride; chlorine monofluoride; copper nitrate; turpentine, and potassium dioxide, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where tin is used, handled, or stored in a manner that could create A potential fire or explosion hazard.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tin dust may be a combustible fire hazard. Thermal decomposition products may include oxides of metal. On small fires, *Do not use* water, halogenated, or CO$_2$ extinguishers. Smother with dry chemical agents; special powders, dry sand, dry clay, crushed limestone, sodium chloride, dry graphite, dry ground dolomite. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Tin, Trenton, NJ (April 2001).

Tin Tetrachloride T:0550

Formula: Cl$_4$Sn; SnCl$_4$

Synonyms: Libavius fuming spirit; Stannic chloride, anhydrous; Tetrachlorostannane; Tin perchloride; Tin chloride, fuming; Tin perchloride; Tin tetrachloride, anhydrous; Zinntetrachlorid (German)

pentahydrate:

CAS Registry Number: 7646-78-8; 10026-06-9 (pentahydrate)

HSDB Number: 781 (7646-78-8);

HSDB Number: 781 as stannic chloride

RTECS Number: XP8750000

UN/NA & ERG Number: UN1827 (anydrous)/137; UN2440 (pentahydrate)/154

EC Number: 231-588-9 [*Annex I Index No.*: 050-001-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Corrosive, Suspected repro toxic hazard, Violently water reactive, Environmental hazard.

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl$^-$]/L as Chloride

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C, N; Risk phrases: R14; R29; R34; R37; R52/53; Safety phrases: S1/2; S7/8; S26; S29/35; S38; S45; 61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Tin tetrachloride is a colorless fuming liquid. Molecular weight = 261; Specific gravity (H_2O:1) = 2.2 @ 20°C; Boiling point = 114°C; Freezing/Melting point = −33°C; Vapor pressure = 10 mmHg @ 10°C; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1 ₩. Soluble in water;

reacts violently, slowly forming hydrochloric acid. Slow reaction in cold water; fast reaction in hot water and steam.

Potential Exposure: Tin tetrachloride is used in the production of blueprints and electroconductive readings, as a bleaching agent for sugar and resin stabilizer.

Incompatibilities: Slowly forms hydrochloric acid in cold water; fast reaction in hot water and steam. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, water, turpentine, potassium, sodium, ethylene oxide; nitrates, alcohols, amines, chlorine, strong acids; strong bases. Attacks metals, rubbers and some plastics in the resence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[Sn]/m^3

OSHA PEL: 2 mg[Sn]/m^3 TWA (also applies to other inorganic tin compounds (as Sn) except tin oxides)

NIOSH REL: 2 mg[Sn]/m^3 TWA (also applies to other inorganic tin compounds (as Sn) except tin oxides)

ACGIH TLV[1]: 2 mg[Sn]/m^3 TWA

EUR OEL: 2 mg[Sn]/m^3 as TWA

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 13 milligram per cubic meter

PAC-2: 150 milligram per cubic meter

PAC-3: 880 milligram per cubic meter

DFG MAK: *tin, inorganic compounds*: No numerical value established. Data may be available.

Australia: TWA 2 mg[Sn]/m^3, 1993; Austria: MAK 2 milligram per cubic meter, 1999; Belgium: TWA 2 mg[Sn]/m^3, 1993; Denmark: TWA 2 mg[Sn]/m^3, 1999; Finland: TWA 2 mg[Sn]/m^3, 1999; Hungary: TWA 1 mg[Sn]/m^3; STEL 2 mg[Sn]/m^3, [skin], 1993; Norway: TWA 2 mg[Sn]/m^3, 1999; the Phillipines: TWA 2 mg[Sn]/m^3, 1993; Poland: TWA 2 mg[Sn]/m^3, 1999; Switzerland: MAK-W 2 mg[Sn]/m^3, KZG-W 4 mg[Sn]/m^3, 1999; Thailand: TWA 2 mg[Sn]/m^3, 1993; United Kingdom: TWA 2 mg[Sn]/m^3; STEL 4 mg[Sn]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 mg[Sn]/m^3

Determination in Air: Filter; Acid; Inductively coupled plasma; NIOSH Analytical Method (IV) #7300, Element.

Permissible Concentration in Water: State Drinking Water Guidelines: Minnesota 4000 μg[Sn]/L.

Routes of Entry: Inhalation, eyes and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Tin tetrachloride can affect you when breathed in. Tin tetrachloride is a corrosive chemical and eye or skin contact can cause severe burns. Breathing Tin Tetrachloride can irritate the throat and bronchial tubes, causing cough and/or difficulty breathing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May affect the nervous system. May cause lung irritation; bronchitis may develop. Changes may occur on chest X-ray with repeated exposures.

Points of Attack: Eyes, skin, respiratory system; CNS; liver, kidneys, urinary tract; blood.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), Chest X-ray; urine (chemical/metabolite). Also, see, NIOSH Analytical Method #8310, Metals in urine. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Hemoglobin or hematocrit.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *Up to 10 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 20 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 milligram per cubic meter*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 100 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter. Click here for information on selection of N, R, or P filters); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF; PD,PP: ASCBA (any supplied-air respirator that has a full face piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA breathing apparatus). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Tin tetrachloride must be stored to avoid contact with water, alcohols, amines, chlorine, turpentine, ethylene oxide; alkyl nitrates; potassium and sodium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Keep tin tetrachloride dry and out of direct sunlight. If moisture enters containers, pressure may cause the containers to burst. Tin tetrachloride can attack some plastics, rubbers and coatings.

Shipping: UN1827 Stannic chloride, anhydrous, Hazard class: 8; Labels: 8-Corrosive material. UN2440 Stannic chloride pentahydrate, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of tin. Tin tetrachloride does not burn, but it does react violently with water. *Do not use water*. Use dry chemical or CO_2 extinguishers to extinguish surrounding fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers, but do not get water inside containers or on spilled tin tetrachloride as poisonous gases will be formed. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: $SnCl_4$: Pour onto sodium bicarbonate; spray with ammonium hydroxide while adding crushed ice; when reaction subsides, flush down drain.

HSDB Number: 868 (metal)

RTECS Number: XR1700000 (elemental)

UN/NA & ERG Number: UN2546 (titanium powder, dry;)/135; UN1352 (titanium powder, wetted with not <25% water)/170; UN2878(titanium sponge granule or powders)/170; UN1871 (titanium hydride)/170; UN2441/135 titanium trichloride, pyrophoric; titanium trichloride mixture, pyrophoric; UN2869157 titanium trichloride mixture; 3174135 titanium disulfide/disulphide

EC Number: 231-142-3

Regulatory Authority and Advisory Information

Hazard Alert: (powder) Pyrophoric hazard, Self-heating, Highly flammable, Explosion danger, Possible risk of forming tumors, Suspected reprotoxic hazard.

European GHS Class (powder): Catches fire spontaneously if exposed to air H250; Self-heating; may catch fire: H251; Self-heating in large quantities; may catch fire:H252

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, Xi; Risk phrases: R11; R17; R20/21/22; R36/37/38 R62; Safety phrases: S2; S6; S16; S21; S26; S27; S33; S36/37/39; S43 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonwater polluting agent, particle size >1 mm.

Description: Titanium is a silvery metal or dry, dark-gray amorphous, lustrous powder. Molecular weight = 47.9; Specific gravity (H_2O:1) = 4.51; Boiling point = 3260°C−3287°C; Freezing/Melting point = 1668°C −1675°C; Autoignition temperature = 1200°C (solid); 480°C (powder in air). Hazard Identification (based on NFPA-704 M Rating System) (powder): Health 1, Flammability 3, Reactivity 1; (solid metal) Health 1, Flammability 0, Reactivity 0. It is brittle when cold and malleable when hot. The dry powder is easily ignited, and burns with an intense flame. Ignition temperature of dust cloud = 460°C; Minimum Explosive concentration = 0.45 oz/ft^3[USBM]. Relative explosion hazard of dust: Severe. Insoluble in water. The most important minerals containing titanium are ilmenite, rutile, perovskite, and titanite or sphene. Insoluble in water.

Potential Exposure: Titanium metal, because of its low weight, high strength, and heat resistance, is used in the aerospace and aircraft industry as tubing, fittings, fire walls; cowlings, skin sections; jet compressors; and it is also used in surgical appliances. It is used, too, as control-wire casings in nuclear reactors, as a protective coating for mixers in the pulp-paper industry and in other situations in which protection against chlorides or acids is required; in vacuum lamp bulbs and X-ray tubes; as an addition to carbon and tungsten in electrodes and lamp filaments; and to the powder in the pyrotechnics industry. It forms alloys with iron, aluminum, tin, and vanadium, of which ferrotitanium is especially important in the steel industry. Other titanium compounds are utilized in smoke screens, as mordants in dyeing; in the manufacture of cemented metal carbides; as thermal insulators; and in heat resistant surface coatings in paints and plastics.

Incompatibilities: Powder and dust may ignite spontaneously in air. Violent reactions occur on contact with water, steam, halocarbons, halogens, and aluminum. The dry powder is a strong reducing agent; Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

7440-32-6, titanium metal, 12045-63-5, titanium boride; 12070-08-5, titanium carbide; 12137-20-1, titanium(II) oxide; *z-0081, titanium based alloys (titanium compounds)*

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

7704-98-5, titanium hydride

PAC-1: 1.2 milligram per cubic meter

PAC-2: 13 milligram per cubic meter

PAC-3: 79 milligram per cubic meter

13470-08-1, titanium(III) fluoride

PAC-1: 14 milligram per cubic meter

PAC-2: 150 milligram per cubic meter

PAC-3: 920 milligram per cubic meter

Determination in Air: Filter; Acid; Hydride generation atomic absorption spectrometry; NIOSH Analytical Method (IV) #7900. See also #7300, Elements.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal for titanium compounds (as Ti) of 83 μg/L, based on health effects.

Routes of Entry: Inhalation of dust or fume, eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Titanium can affect you when breathed in. Contact may irritate the eyes. Breathing titanium may irritate the throat and air passages with cough and phlegm.

Long-Term Exposure: Repeated exposure may cause chronic bronchitis and possibly emphysema. There is limited evidence that titanium may damage the developing fetus.

Points of Attack: Lungs.

Medical Surveillance: Preemployment and periodic physical examinations should give special attention to lung disease, especially if irritant compounds are involved. Chest X-ray should be included in both examinations and pulmonary function evaluated periodically. Smoking history should be taken. Careful attention should be given to the eyes and the skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to titanium, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (Dust/fume/mist) filters. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a powered-air purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Titanium powder is a severe explosion risk. (1) Color code-Red Stripe: Flammability Hazard (4.2): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. (2) Color code-Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Titanium must be stored to avid contact with water, steam, halocarbons, halogens and aluminum, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where titanium is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of titanium. Wherever titanium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2546 Titanium powder, dry, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material. UN1352 Titanium powder, wetted with not $<$ 25% water (a visible excess of water must be present) (a) mechanically produced, particle size $<$3 microns; (b) chemically produced, particle size $<$840 microns, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN2878 Titanium sponge granules or Titanium sponge powders, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material. UN1871 titanium hydride, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Titanium is a flammable solid; dust and powders are an explosion hazard. Thermal decomposition products may include toxic metal oxides of titanium. *Do not use water* on burning titanium; this can cause explosion. Ordinary extinguishers are often ineffective. Use special extinguishers designed for metal fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States Environmental Protection Agency Gene-Tox Program, Negative: Carcinogenicity-mouse/rat; Cell transformation-SA7/SHE.
Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), FDA-over the counter drug.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xn; Risk phrases: R10; R20/21/22; R36 /37/38; R62; Safety phrases: S2; S25; S26; S36/37; S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): Non hazard to water.
Description: Ttitanium dioxide is an odorless white powder. Molecular weight = 79.9; Specific gravity (H_2O:1) = 4.2 @ 25°C; Boiling point = 2500°C−3000°C; Freezing/Melting point = (decomposes) 1830°C−1850°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.
Potential Exposure: Titanium dioxide is a white pigment used as a pigment in paint; in the rubber, plastics, ceramics, paint, and varnish industries, in dermatological preparations; and is used as a starting material for other titanium compounds; as a gem; in curing concrete; and in coatings for welding rods. It is also used in paper and cardboard manufacture.
Incompatibilities: Titanium dioxide is incompatible with strong oxidizers and strong acids. Violent or incandescent reactions may occur with metals (e.g., aluminum, calcium, magnesium, potassium, sodium, zinc, and lithium)[101].
Permissible Exposure Limits in Air
NIOSH IDLH = 5000 milligram per cubic meter
OSHA PEL: 15 milligram per cubic meter, total dust TWA
NIOSH REL: Potential occupational carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A
ACGIH TLV[1]: 10 milligram per cubic meter TWA, not classifiable as a human carcinogen
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 30 milligram per cubic meter
PAC-2: 330 milligram per cubic meter
PAC-3: 2000 milligram per cubic meter
DFG MAK: 1.5 milligram per cubic meter, respirable fraction (previously "fine dust"); Pregnancy Risk Group C
Arab Republic of Egypt: TWA 15 milligram per cubic meter, 1993; Australia: TWA 10 milligram per cubic meter, 1993; Austria: MAK 6 milligram per cubic meter, 1999; Belgium: TWA 10 milligram per cubic meter, 1993; Denmark: TWA 6 mg[Ti]/m^3, 1999; France: VME 10 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Poland: MAC (TWA) 10 mg [Ti]/m^3; MAC (STEL) 30 mg[Ti]/m^3, 1999; Sweden: NGV 5 milligram per cubic meter, 1999; Turkey: TWA 15 milligram per cubic meter, 1993; United Kingdom: TWA 10 milligram per cubic meter, (total inhalable dust); TWA 4 milligram per cubic meter, (respirable dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia have set limits for ambient air in residential areas at 0.5 milligram per cubic meter on a momentary basis. Several states have set guidelines or standards for titanium dioxide in ambient air[60] ranging from 0.13−0.79 μ/m^3 (Montana); to 17.86 μ/m^3 (Kansas); to 80.0 μ/m^3 (Virginia); to 300.0 μ/m^3 (Connecticut).
Determination in Air: Use NIOSH II(3), Method #S385; #7300, Elements by ICP.
Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal for titanium compounds (as Ti) of 83 μg/L, based on health effects.
Routes of Entry: Inhalation of dust.
Harmful Effects and Symptoms
Short-Term Exposure: Inhalation can cause irritation of the eyes and respiratory tract, causing cough and phlegm. Irritates the skin.
Long-Term Exposure: High exposures may cause lung irritation; bronchitis may develop. Continued exposure may result in emphysema, lung scarring; lung fibrosis; and tumors. A potential occupational carcinogen.
Points of Attack: Respiratory system. Cancer site in animals: lung tumors.
Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity

properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from strong acids and other metals. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: Not subject to transport regulation.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides of metal. Use any extinguishing agent suitable for surrounding fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land fill.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C; Risk phrases: R14; R34; Safety phrases: S1/2; S7/8; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Titanium tetrachloride is a noncombustible, colorless to light yellow liquid that fumes in air. Penetrating acrid odor. Molecular weight = 189.7; Specific gravity (H_2O:1) = 1.7 @ 20°C; Boiling point = 136.5°C; Freezing/ Melting point = −24°C. Reacts with water. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2. ₩ Decomposes in water; if the water is hot or steam, it may explode.

Potential Exposure: Used in the manufacture of titanium salts; mordant dye; titanium pigments; and used as a chemical intermediate for titanium metal; titanium dioxide; as an agent in smoke screens; polymerization catalyst; and iridescent agent in glass and pearl manufacturing.

Incompatibilities: Violent reaction with water or steam, releasing heat and hydrogen chloride fumes. Contact with moist air releases hydrogen chloride. Attacks many metals in presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: **0.65**$_{\mathbf{E}}$ ppm

PAC-2: **1.0**$_{\mathbf{A}}$ ppm

PAC-3: **5.7**$_{\mathbf{A}}$ ppm

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E.**"

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: This compound is a highly corrosive to the eyes and respiratory tract. Acute irritant to the skin, eyes, mucous membranes and the respiratory tract. It is capable of causing death or permanent injury due to exposures encountered in normal use. Even short contact may lead to eye inflammation which may result in corneal opacities. Inhalation symptoms include congestion and irritation of upper respiratory tract, coughing, burning of the throat; headache and weakness. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Prolonged exposure to low concentrations may cause cough and pneumonia. Ingestion causes mouth, throat and gastrointestinal tract irritation, nausea, vomiting, cramps and diarrhea.

Long-Term Exposure: May cause respiratory problems; lung damage; bronchitis may develop.

Points of Attack: Respiratory system, eyes.

Medical Surveillance. Lung function tests. Eye examination. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full

facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store away from possible contact with all forms of moisture. Store in tightly closed containers in a cool, well ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1838 Titanium tetrachloride, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 8-Corrosive material, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

when spilled on land

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.4/0.6

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.1/1.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable. Thermal decomposition products may include hydrogen chloride and oxides of metal. For small fires, use dry chemical or carbon dioxide. For large fires, flood fire area with water from a distance. Do not get solid streams of water on spilled material. Move container from fire area if this can be done without risk. Cool containers exposed to flames with water until well after fire is out. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R45; R10; R 22; R50/53; Safety phrases: S29/35; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: o-Tolidine is a white to reddish crystal or powder. Darkens on exposure to air. Often used in paste or wet cake form. Used as a basis for many dyes. Molecular weight = 212.3; Boiling point = 264.9°C−131°C; Freezing/Melting point = 131°C; Flash point = 243.8°C; Autoignition temperature = 526°C. Explosive limits: LEL = 16,000 ppm, UEL: unknown; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 0.1% @ 25°C.

Potential Exposure: Over 75% of *o*-tolidine is used as a dye and as an intermediate in the production of rubber products, dyestuffs, pigments and pesticides. Approximately 20% of *o*-tolidine is used in the production of polyurethane-based high-strength elastomers, coatings, and rigid plastics. *o*-Tolidine has also been used in small quantities in chlorine test kits by water companies and swimming pool owners. Used as a laboratory agent to detect blood.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, strong reducing agents.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and personal protective equipment, including respirators. See 29 CFR1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: Carcinogen: 0.02 milligram per cubic meter [60 min.] Ceiling Concentration; [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A & C. *Note*: OSHA and NIOSH concluded that benzidine and benzidine-based dyes were potential occupational carcinogens and recommended that worker exposure be reduced to the lowest feasible level. OSHA and NIOSH further concluded that *o*-tolidine and *o*-dianisidine [119-90-4] (and dyes based on these chemicals) may present a cancer risk to workers and should be handled with caution and exposure minimized.

ACGIH TLV[1]: [skin]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.0018 milligram per cubic meter

PAC-2: 0.02 milligram per cubic meter

PAC-3: 36 milligram per cubic meter

No Protective Action Criteria (PAC) available for dihydrochloride.

DFG MAK: Carcinogen Category 2

Australia [skin], carcinogen, 1993; Austria: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV:

confirmed animal carcinogen with unknown relevance to humans.

Guidelines or standards which have been set for *o*-tolidine in ambient air[60] range from zero (North Dakota); to 20.0 μ/m^3 (Virginia).

Determination in Air: OSHA Analytical Method #ID-71; NIOSH Analytical Method (IV) #5013, Dyes.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 2.34$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *o*-Tolidine can affect you when breathed in and can rapidly enter the body through the skin. High exposure can irritate the nose and throat.

Long-Term Exposure: *o*-Tolidine may affect the kidneys and bladder; a known carcinogen of the bladder.

Points of Attack: Eyes, respiratory system; liver, kidneys. Cancer site in animals: liver, bladder, and mammary gland tumors.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before employment and every six months thereafter, the following are recommended to detect bladder cancer at an early stage: Kidney function tests. Urine cytology test (a test for abnormal cells in urine).

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus) *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter].

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from direct light. Sources of ignition, such as smoking and open flames, are prohibited where 3,3′-dimethylbenzidine is used, handled, or stored in a manner that could create A potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in flammable solvent and spray into firebox of an incinera tor equipped with afterburner and scrubber[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, Xn; Risk phrases: R11; R20/21/22; R36/37/38; R48/20; R62; R63; R65; R67; Safety phrases: S2; S21; S36/37; S46; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Toluene is a clear, colorless, noncorrosive liquid with a sweet, pungent, benzene-like odor. The Odor Threshold in air is variously given as 0.17 ppm, [41] 2.9 ppm (NJ) and 8 ppm (EPA). The Odor Threshold in water is 0.04−1.0 mg/L. Molecular weight = 92.1; Specific gravity (H_2O:1) = 0.86; Boiling point = 111°C; Freezing/Melting point = −95°C; Vapor pressure = 21 mm Hg @ 25°C; 7.5 mmHg @ 1.5°C[138]; Flash point = 4°C (cc); Autoignition temperature = 480°C. Explosive limits: LEL = 1.1%; UEL: 7.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Toluene is used as an industrial chemical, chemical intermediate; solvent, and emulsifier; may be encountered in the manufacture of benzene. It is also used as a chemical feed for toluene diisocyanate, phenol, benzyl and benzoyl derivatives; benzoic acid; toluene sulfonates; nitrotoluenes, vinyltoluene, and saccharin; as a solvent for paints and coatings; or as a component of automobile and aviation fuels.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Violent reaction with mixtures of nitric and sulfuric acid.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

Conversion factor: 1 ppm = 3.77 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = variously given as 0.17 ppm, [41] 2.9 ppm[70] and 8 ppm[72].

OSHA PEL: 200 ppm/754 milligram per cubic meter Ceiling Concentration; 300 ppm/500 ppm [10-min. maximum peak per 8-hour shift]

NIOSH REL: 100 ppm/375 milligram per cubic meter TWA; 150 ppm/560 milligram per cubic meter STEL

ACGIH TLV[1]: 20 ppm/75 milligram per cubic meter TWA [skin]. BEI; 0.5 mg[*o*-cresol]/L in urine/end-of-shift; 1.6[hippuric acid]g/L creatinine in urine/end-of-shift; 0.05 mg[toluene]/L in blood, prior to last shift of workweek., not classifiable as a human carcinogen.

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{67_A}$ ppm

PAC-2: $\mathbf{560_A}$ ppm

PAC-3: $\mathbf{3700_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK : 50 ppm/190 milligram per cubic meter TWA; Peak Limitation Category II(4) [skin], Pregnancy Risk Group: C; BAT:0.1 mg[toluene]/L in blood/end-of-shift; 0.3 mg

[*o*-cresol]/L in urine/end-of-shift, for long-term exposure, after several shifts. Australia: TWA 100 ppm (375 milligram per cubic meter), STEL 150 ppm, 1993; Austria: MAK 100 ppm (380 milligram per cubic meter), 1999; Belgium: TWA 100 ppm (377 milligram per cubic meter), STEL 150 ppm (565 milligram per cubic meter), 1993; Denmark: TWA 35 ppm (130 milligram per cubic meter), [skin], 1999; Finland: TWA 100 ppm (375 milligram per cubic meter), STEL 150 ppm, [skin], 1999; France: VME 100 ppm (375 milligram per cubic meter), VLE 150 ppm (550 milligram per cubic meter), 1999; Hungary: TWA 100 milligram per cubic meter, STEL 300 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 150 milligram per cubic meter, 2003; Norway: TWA 25 ppm (94 milligram per cubic meter), 1999; the Phillipines: TWA 100 ppm (375 milligram per cubic meter), 1993; Poland: MAC (TWA) 100 milligram per cubic meter; MAC (STEL) 350 milligram per cubic meter, 1999; Russia: TWA 100 ppm, STEL 50 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (200 milligram per cubic meter), TKV 100 ppm (400 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 50 ppm (190 milligram per cubic meter), KZG-W 250 ppm (950 milligram per cubic meter), 1999; Thailand: TWA 200 ppm, STEL 300 ppm, 1993; Turkey: TWA 200 ppm (750 milligram per cubic meter), 1993; United Kingdom: TWA 50 ppm (191 milligram per cubic meter), STEL 150 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a hum an carcinogen. Russia[35,43] has also set a MAC for ambient air in residential areas of 0.6 milligram per cubic meter, both on a momentary and a daily average basis. Several states have set guidelines or standards for toluene in ambient air[60] ranging from 0.05 milligram per cubic meter (Massachusetts); to 1.0 milligram per cubic meter (Arizona); to 0.4−2.0 milligram per cubic meter (Rhode Island); to 1.875 milligram per cubic meter (Indiana); to 3.75−5.60 milligram per cubic meter (North Dakota); to 6.0 milligram per cubic meter (Virginia); to 7.5 milligram per cubic meter (Connecticut, New York and South Dakota); to 8.929 milligram per cubic meter (Nevada); to 4.7−56.0 milligram per cubic meter (North Carolina).

Determination in Air: Use NIOSH Analytical Method #8002, Toluene in blood; #1500 Hydrocarbons, (BP 36°C−126°C), #1501, Hydrocarbons, aromatic, #4000, Toluene (passive); OSHA Analytical Method #111

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 1.0 mg/L; MCLG, 1.0 mg/L. Federal Drinking Water Standards: EPA 1000 μg/L; Federal Drinking Water Guidelines: EPA 1000 μg/L; State Drinking Water Standards: California 150 μg/L; State Drinking Water Guidelines: Arizona 2000 μg/L; Maine 1400 μg/L; Minnesota 1000 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography and photoionization detection (EPA Method 602) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol-water coefficient: Log $K_{ow} = 2.7$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and respiratory tract. Causes CNS depression. High levels of exposure may cause fatigue, weakness, confusion, euphoria, dizziness, headache, dilated pupils; lacrimation (discharge of tears); nervousness, muscle fatigue, insomnia, paresthesia; cardiac dysrhythmia; unconsciousness and death may occur. *Inhalation*: 100 ppm exposure can cause dizziness, drowsiness and hallucinations. 100−200 ppm can cause depression; 200−500 ppm can cause headaches; nausea, loss of appetite; loss of energy; loss of coordination and coma. In addition to the above, death has resulted from exposure to 10,000 ppm for an unknown time. *Skin*: Can cause dryness and irritation. Absorption may cause or increase the severity of symptoms listed above. *Eyes*: Can cause irritation @ 300 ppm. *Ingestion*: Can cause a burning sensation in the mouth and stomach, upper abdominal pain; cough, hoarseness, headache, nausea, loss of appetite; loss of energy; loss of coordination; and coma.

Long-Term Exposure: Nervous system, kidney or liver problems. Repeated or prolonged contact with skin may cause dermatitis; drying, cracking, itching, and skin rash. May cause liver, kidney, and brain damage; decreased learning ability; psychological disorders. Levels below 200 ppm may produce headache, tiredness and nausea. From 200–750 ppm symptoms may include insomnia, irritability, dizziness, some loss of memory; cause heart palpitations and loss of coordination. Blood effects and anemia have been reported but are probably due to contamination by benzene.

Points of Attack: Eyes, skin, respiratory system; CNS; liver, kidneys. May affect the reproductive system.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum follicle-stimulating hormone (FSH), and serum lutenizing hormone (LH), may be indicated. Whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; whole blood (chemical/metabolite), end-of-workweek; whole blood (chemical/metabolite), prior-to-last-shift-of-workweek, expired air, Expired Air, During Exposure; urine (chemical/metabolite). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following is recommended before beginning work and at regular times after that: Urinary hippuric acid excretion (at the end-of-shift) as an index of overexposure. If symptoms develop or overexposure is suspected, the following may be useful: exam of the nervous system. Liver and kidney function tests, and evaluation for renal tubular acidosis. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician*: Exposure to toluene at levels greater than 200 ppm may result in hippuric acid levels above 5 gm/L urine. After elevated exposure, toluene may also be detected in blood.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton/Neoprene, Teflon, Viton/chlorobutyl, and Silvershield, are recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm*: CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Toluene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where toluene is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of toluene should be grounded and bonded. Drums must be equipped with self-closing, valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of toluene.

Shipping: UN1294 Toluene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T; Risk phrases: R62; R63;?; Safety phrases: (see Appendix 4).

WGK[100] (German Aquatic Hazard Class) (*25376-45-8*): 3-Severe hazard to water.

Description: Toluene-2,4-diamine takes the form of colorless needles. Molecular weight = 122.2 (-2,4-diamine and-2,6-diamine); Specific gravity (H_2O:1) = 1.05 (liquid @ 100°C); Boiling point = 292°C; Freezing/Melting point = 99°C; 105°C (-2,6-diamine); Vapor pressure = 1 mmHg @ 107°C; Flash point = 148°C. Soluble in water.

Potential Exposure: Toluene-2,4-diamine is a chemical intermediate for toluene diisocyanate (used in the production of flexible and rigid polyurethane foams, polyurethane coatings; cast elastomers including fabric coatings and polyurethane and other adhesives), for dyes used on textiles; leather, furs; and in hair-dye formulations.

Incompatibilities: Strong acids; chloro formates, oxidizers.

Permissible Exposure Limits in Air

PAC-2: 33 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method (IV) #5516, OSHA Analytical Method #ID-65.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. Eye contact may cause permanent damage. Skin contact may cause burns and blistering. Methemoglobinemia, CNS depression, and degeneration of the liver typically result from exposure to toluene-2,4-diamine. Exposure can cause cyanosis, headache, fatigue, dizziness, nausea, vomiting.

Long-Term Exposure: May cause liver damage. Jaundice and anemia are reported. Repeated exposure causes CNS depression causing headache, weakness, dizziness, fatigue, nausea, vomiting, and possible death. There is limited evidence that toluenediamines may reduce fertility in males and may affect the developing fetus. 2,4-Diaminotoluene is carcinogenic in rats and after its oral administration, producing hepatocellular carcinomas; and its subcutaneous injection, inducing local sarcomas. Diaminotoluenes are mutagens.

Points of Attack: CNS; liver, blood. Cancer site in animals: liver, mammary glands.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examination. Examination of the nervous system. Methemoglobin level. CBC. Liver function tests.

First Aid: *Skin Contact*:[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use SCBA.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place or a refrigerator. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1709 2,4-Toluylenediamine, solid or 2,4-Toluenediamine, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3814 2,4-Toluylenediamine, solution or 2,4-Toluenediamine, solution, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N, Xi; Risk phrases: R45; R14; R19; R26; R29; R36/37/38; R42/43; R52/53; R61; R62; Safety phrases: S1/2; S23; S29/35; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Toluene diisocyanate is a colorless, yellow, or dark liquid or solid. It has a sweet, fruity, pungent odor. Toluene diisocyanate (technical, 26471-62-5) is an 80: 20 mixture of 2,4-and 2,6-isomers. A solid above 71/F/22°C. The Odor Threshold is 0.4−2.14 ppm. Molecular weight = 174.16; Specific gravity (H_2O:1) = 1.22 @ 25°C; Boiling point = 251°C @ 760 mmHg; Free zing/Melting point = 19.5°C−22°C; Vapor pressure = 0.025 mmHg @ 25°C; 1 mmHg @ 80°C; Relative vapor density (air = 1) = 6.1; Flash point = 121°C; Autoignition temperature = > 149°C; 620°C. Explosive limits: LEL = 0.9%; 9,000 ppm; UEL: 9.5%. Hazard Identification (based on NFPA-704 M Rating System *for 2,4 isomer, CAS 584-84-9*): Health 3, Flammability 1, Reactivity 2₩. Insoluble in water; reacts exothermically, releasing heat and toxic fumes.

Potential Exposure: Toluene diisocyanate is used in the production of polyurethane flexible foams, coatings, paints, and elastomers. It is more widely used than MDI (diphenylmethane diisocyanate). Polyurethanes are formed by the reaction of isocyanates with polyhydroxy compounds. Since the reaction proceeds rapidly at room temperature, the reactants must be mixed in pots or spray guns just before use. These resins can be produced with various physical properties, for example, hard, flexible, semirigid foams; and have found many uses, for example, upholstery padding; thermal insulation; molds, surface coatings; shoe inner soles; and in rubbers, adhesives, paints, and textile finishes. Because of TDI's high volatility, exposure can occur in all phases of its manufacture and use. MDI has a much lower volatility, and problems generally arise only in spray applications.

Incompatibilities: May form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, and ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acyl-chlorides may cause explosive polymerization. Attacks some plastics, rubber and coatings. Contact with metals may evolve flammable hydrogen gas. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 2.5 ppm, potential occupational carcinogen.

Conversion factor: 1 ppm = 7.13 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 0.4 to 2 ppm

OSHA PEL: 0.02 ppm/0.14 milligram per cubic meter Ceiling Concentration

NIOSH REL: Potential occupational carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: [2,4- or 2,6-isomer (or as a mixture)]: 0.001 ppm/0.007 milligram per cubic meter, measured as inhalable fraction and vapor TWA; 0.005 ppm/0.035 milligram per cubic meter, measured as inhalable fraction and vapor STEL, [skin]; dermal sensitizer [DSEN]; respiratory sensitizer [RSEN], not classifiable as a human carcinogen.

Russia has also set MAC values for ambient air in residential areas of 0.05 milligram per cubic meter on a momentary basis and 0.02 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for TDI in ambient air[60] ranging from 0.03−0.20 μ/m^3 (Rhode Island); to 0.13 μ/m^3 (New York); to 0.4 μ/m^3 (South Carolina); to 0.48 μ/m^3 (Massachusetts); to 0.70 μ/m^3 (Virginia); to 0.72 μ/m^3 (Connecticut and South Dakota); to 0.4−1.5 μ/m^3 (North Dakota); to 0.9 μ/m^3 (Nevada); to 4.8−16.0 μ/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #5521, Isocyanates, monomeric, #5522 Isocyanates, #2535, Toluene-2,4-diisocyanate, and OSHA Analytical Method #18, superseded by #42 and #33

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 0.2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor, ingestion and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritate the eyes, skin, and respiratory tract. Inhalation of the vapor may cause asthma tic reactions; chemical bronchitis, pneumonitis, and pulmonary edema. Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Note*: TDI is a strong sensitizer. Allergic individuals may experience symptoms at very low concentrations.

Inhalation: Causes irritation of nose, throat and lungs; insomnia, euphoria, difficulty in walking; loss of consciousness; poor memory; personality changes; irritability and depression. Allergic response is also possible. Sensitive individuals may react to 0.007 ppm or less. Exposure to high levels leads to chemical pneumonia. Levels of

0.01−0.03 ppm reportedly caused no symptoms. At 0.03−0.07 ppm, respiratory illness with continuous coughing, sore throat; difficulty in breathing; fatigue and nocturnal sweating were reported. In another study, 10 minutes at 0.5 ppm caused nose and throat irritation. Lung damage may be permanent. *Skin*: If not removed promptly, may cause redness, pain, swelling, and blistering. TDI is corrosive and may be absorbed through the skin. Repeated contact has caused skin sensitization in humans and allergic eczema. *Eyes*: May cause redness, pain; blurred vision; severe irritation, tears and damage to the cornea. Prolonged contact may cause permanent dam age. *Ingestion*: May cause sore throat, abdominal pain; diarrhea, and irritation of mouth and stomach.

Long-Term Exposure: May produce asthma-like allergy and chronic lungs disease; chronic obstructive bronchitis; emphysema, chemical bronchitis; asthmatic syndrome. May cause memory loss and concentration problems; psychological effects; CNS effects. May cause chest tightness (sometimes very severe), sneezing, cyanosis (blue coloration), blood changes; and collapse. Sensitization may occur after exposure to spills or other unusually high concentrations. Decreased lung function has been reported from estimated exposure to 0.02 ppm for two years. It has also been reported that excessive loss of pulmonary function occurs at 0.0035 ppm possibly to 0.002 ppm. Sensitization has been reported on the first exposure at concentration below 0.05 ppm and as late as 14 years (0.06 ppm) after first exposure. This substance is a probable carcinogen in humans. There is limited evidence that TDI may cause temporary impotence in males.

Points of Attack: Eyes, skin, respiratory system Cancer site in animals: pancreas, liver, mammary gland; circulatory system; and skin tumors.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Blood Gas Analysis; blood plasma; chest X-ray, EKG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 seconds); pulmonary function tests; pre- and post-shift; sputum cytology; urine (chemical/metabolite); white blood cell count/differential. Preplacement and periodic medical examinations should include chest rentgenography, pulmonary function tests; and an evaluation of any respiratory disease or history of allergy. Periodic pulmonary function tests may be useful in detecting the onset of pulmonary sensitization. See also "References."[4]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15(100). minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Toluene diisocyanates can react with cellulose-based absorbents, mineral-based and clay-based absorbents, dirt/earth. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon, Silvershield, Viton, polyethylene, nitrile, chlorinated polyethylene; and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool well-ventilated area away from amines, strong bases (such as sodium hydroxide) and alcohols. Toluene 2.4-diisocyanate should not be stored in contact with water, because they react and release CO_2 gas. Toluene 2,4-diisocyanate will polymerize and rupture containers at temperatures over 177°C/350°F. At normal temperatures (21°C/70°F) Toluene 2.4-diisocyanate levels quickly exceed the PEL and therefore proper ventilation must be in practice or personal protective equipment must be worn. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2078 Toluene diisocyanate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Combustible and a polymerization hazard. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. *Solid*: Water gently applied to surface or foam may cause frothing which will extinguish the fire (NFPA). If material is on fire or involved in fire do not extinguish fire unless flow can be stopped. Use water in flooding quantities as fog. Solid streams of water may be ineffective. Cool all affected containers with flooding quantities of water. Apply water from as far a distance as possible. Use "alcohol" foam, carbon dioxide or dry chemical. Use water spray to absorb vapor. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. *Liquid*: Combustible. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices). In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol *(95-53-4)*: T, N; Risk phrases: R45; R23/25; R36; R50; S62; S63 Safety phrases: S29/35; S53; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class) (*95-53-4*): 3-Severe hazard to water.

Description: *o*-Toluidine is a colorless to pale yellow liquid with a weak, pleasant, aromatic odor. Molecular weight = 107; Specific gravity (H_2O:1) = 1.01; Boiling point = 200°C; Freezing/Melting point = −14C; Vapor pressure = 0.3 mmHg @ 21°C; Flash point = 85°C (cc); Autoignition temperature = 482°C. Explosive limits: LEL = 1.5%; UEL-unknown. Slightly soluble in water; solubility = 2%.

Potential Exposure: *o*-Toluidine is used as an intermediate in the manufacture of dyes; as an intermediate in pharmaceutical manufacture; in textile printing; in rubber accelerators; in production of *o*-aminoazotoluene

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 ppm, potential occupational carcinogen.

Conversion factor: 1 ppm = 4.38 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 0.25 ppm

OSHA PEL: 5 ppm/22 milligram per cubic meter TWA [skin]

NIOSH REL: [skin] Potential occupational carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 2 ppm/8.8 mg/m TWA [skin], confirmed animal carcinogen with unknown relevance to humans; BEI_M issued as methemoglobin inducers

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 6 ppm

PAC-2: 8.2 ppm

PAC-3: 100 ppm

DFG MAK: [skin] Carcinogen Category 1; Germ Cell Mutation Category 3A

Australia: TWA 2 ppm (9 milligram per cubic meter), [skin], carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 2 ppm (8.8 milligram per cubic meter),

[skin], Carcinogen 1993; Denmark: TWA 2 ppm (9 milligram per cubic meter), [skin], 1999; Finland: TWA 5 ppm (22 milligram per cubic meter), STEL 10 ppm (44 milligram per cubic meter), [skin], carcinogen, 1999; France: VME 2 ppm (9 milligram per cubic meter), carcinogen, 1999; Carcinogen (salts), 1993; Japan; 1 ppm (4.4 milligram per cubic meter), [skin], 2B carcinogen, 1999; Norway: TWA 1 ppm (4.5 milligram per cubic meter), 1999; the Phillipines: TWA 5 ppm (22 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 3 milligram per cubic meter; MAC (STEL) 9 milligram per cubic meter, 1999; Russia: TWA 0.5 milligram per cubic meter, STEL 1 milligram per cubic meter, [skin], carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.1 ppm (0.5 milligram per cubic meter), [skin], carcinogen, 1999; Turkey: TWA 5 ppm (22 milligram per cubic meter), [skin], 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans.

Also, many states have set guidelines for ambient air.

Determination in Air: Use NIOSH Analytical Method #2002, amines, aromatic, #2017, #8317, OSHA Analytical Method ID-73.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient water goal of 304 μg/L based on health effects.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.32$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure may affect the blood causing cyanosis and formation of methemoglobin. Exposure to high concentrations may result in damage to kidneys and bladder.

Inhalation: Combines with blood cells to prevent binding of oxygen. Early symptoms are headache, nausea, vomiting, diarrhea, low blood pressure; increased salivation and loss of appetite. Causes cyanosis, lips, fingernails and tongue may turn blue. Symptoms may begin to appear @ 6 ppm after several hours, or @ 100 ppm after 1 hour. Continued exposure may lead to difficult breathing; dizziness, stupor, unconsciousness, and death. *Skin*: Causes irritation. May cause excessive drying of skin, and irritation. Absorption is significant and may increase severity of symptoms listed under inhalation. *Eyes*: Causes irritation, redness and chemical burns. *Ingestion*: Animal studies suggest that symptoms as listed under inhalation would occur, and that death may result from ingestion of about 2 ounces by a 150 lb person.

Long-Term Exposure: Skin and inhalation exposures may cause the formation of methemoglobin and cyanosis, mild Blue coloration of the skin due to lack of oxygen in the blood. Loss of appetite and weight, headache, dizziness may occur. Irritation of the kidneys and bladder may occur, with decreased functions and damage. *o*-Toluidine is A potential occupational carcinogen.

Points of Attack: Eyes, skin, blood, kidneys, liver, cardiovascular system. *Cancer site*: bladder cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: whole blood (chemical/metabolite), Methemoglobin; CBC; red blood cells/count; urine (chemical/metabolite); urine (chemical/metabolite) [Whole Blood (chemical/metabolite)]; urinalysis (routine). Before beginning employment and at regular times after that, the following is recommended: Urine exam for blood and abnormal cells (urine cytology) and blood. If symptoms develop or overexposure is suspected, the following may be useful: methemoglobin level every 3−6 hours for 18−24 hours. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Medical observation is recommended.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. *o*-Toluidine must be stored to avoid contact with strong oxidizers, (such as chlorine, bromine, and fluorine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where *o*-toluidine is used, handled, or stored in a manner that could create A potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1708 Toluidines, liquid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

California Proposition 65 Chemical[102]: Cancer, 1/1/1990, *Delisted 10/29, 1999*

Hazard Alert: Poison, Flammable, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

EPA hazardous waste number (RCRA No.): U353

RCRA Section 261 Hazardous Constituents.

EPCRA Section 304 Reportable Quantity (RQ): CERCLA, 100 lbs. (45.4 kgs.).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1% (hydrochloride).

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, N; Risk phrases: R40; R10; R23/24/25; R36; R43; R50/53; R62; Safety phrases: S28; S29/35; S36/37; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: *p*-Toluidine is a colorless solid. Molecular weight = 107.2; Specific gravity (H_2O:1) = 1.0 @ 20°C; Boiling point = 200.56°C; Freezing/Melting point = 44.5°C; Vapor pressure = 1 mmHg @ 42.2°C; Relative vapor density (air = 1) = 3.9; Flash point = 86.7°C (cc); Explosive limits: LEL: 1.1%, UEL: 6.6%; Autoignition temperature = 481.67°C; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Henry's Law constant = 2.8×10^{-10} atm-m^3/mol @ 25°C (est)[72]. Soluble in water; solubility = 0.7%[77]

Potential Exposure: *para*-Toluidine is used in dyes, and in organic chemical manufacturing

Incompatibilities: *para*-Toluidine is incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. p-Toluidine neutralizes acids to form salts plus water in exothermic reactions. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen is generated in combination with strong reducing agents, such as hydrides[101]. Hypergolic reaction with red fuming nitric acid[Kit and Evered, 1960, p. 239, 242].

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 6 ppm

PAC-2: 8.2 ppm

PAC-3: 30 ppm

Determination in Water: Octanol/water partition coefficient as log Pow: 1.39. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Dermal and eye contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: The substance irritates the eyes and the skin. Exposure to high concentrations may result in damage to kidneys and bladder. The effects may be delayed. Medical observation is indicated. Toxicity by Ingestion: Grade 3; LD_{50} (oral, mouse) = 330 mg/kg[136]

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. The substance may have effects on the blood, resulting in formation of methaemoglobin. The substance may cause effects on the blood, bladder and kidneys, resulting in tissue lesions and formation of methaemoglobin.

Points of Attack: Blood, bladder, kidneys.

Medical Surveillance: Preemployment and periodic examinations should be concerned particularly with a history of blood dyscrasias, reactions to medications; alcohol intake; eye disease; and skin; cardiovascular status. Liver and renal functions should be evaluated periodically as well as blood and general health. Blood methemoglobin levels should be followed until normal in all cases of suspected cyanosis. This chemical is a suspected carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Skin: Wear appropriate personal protective clothing to prevent skin contact. Eyes: Wear appropriate eye protection to prevent eye contact. Wash skin: The worker should immediately wash the skin when it becomes contaminated. The worker should wash daily at the end of each work shift. Remove: Work clothing that becomes wet or significantly contaminated should be removed and replaced. Change: Workers whose clothing may have become contaminated should change into uncontaminated clothing before leaving the work premise. Provide: Eyewash fountains should be provided in areas where there is any possibility that workers could be exposed to the substance; this is irrespective of the recommendation involving the wearing of eye protection. Facilities for quickly drenching the body should be provided within the immediate work area for emergency use where there is a possibility of exposure. [*Note:* It is intended that these facilities provide a sufficient quantity or flow of water to quickly remove the substance from any body areas likely to be exposed. The actual determination of what constitutes an adequate quick drench facility depends on the specific circumstances. In certain instances, a deluge shower should be readily available, whereas in others, the availability of water from a sink or hose could be considered adequate.][77].

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. *o*-Toluidine must be stored to avoid contact with strong oxidizers, (such as chlorine, bromine, and fluorine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where *o*-toluidine is used, handled, or stored in a manner that could create A potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3451 Toluidines, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B)
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, Xi, N; Risk phrases: R22; R33; R43; R50/53; R62; R63; Safety phrases: S2; S24; S29/35; S37; S41; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Trichlorfon is a white to pale yellow crystalline solid. Molecular weight = 257.44; Specific gravity (H_2O:1) = 1.73 @ 20°C; Boiling point = 100°C @ 1 mmHg; Freezing/Melting point = 83°C−84°C; Vapor pressure = 2×10^{-6} mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water; solubility = 15.4 g/100 mL @ 25°C.
Potential Exposure: Trichlorfon is used as an agricultural and forest insecticide.
Incompatibilities: This chemical may be characterized as an organo-phosphate or-chlorine compound. Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducin g agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101]. Alkaline materials: lime, lime sulfur, etc. Corrosive to iron, steel and possibly to other metals.
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: None
ACGIH TLV[1]: 1 milligram per cubic meter (intermittent) TWA, sensitizer, not classifiable as a human carcinogen; BEI_A issued for acetylcholinesterase inhibiting pesticides.
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 3 milligram per cubic meter
PAC-2: 13 milligram per cubic meter
PAC-3: 57 milligram per cubic meter
Poland: MAC (TWA) 0.5 milligram per cubic meter, MAC (STEL) 2 milligram per cubic meter, 1999; Russia: STEL 0.5 milligram per cubic meter, [skin] 1993. Russia[43] set a

MAC in residential areas of 0.04 milligram per cubic meter on a momentary basis and 0.02 milligram per cubic meter on a daily average basis.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.05 mg/L and in water bodies used for fishery purposes of zero.

Determination in Water: Fish Tox = 24.99773000 (ppb) (INTERMEDIATE). Octanol-water coefficient: Log $K_{ow} = < 0.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

In varying degrees, organochlorines are absorbed from the gut and also by the lung and across the skin[72].

Short-Term Exposure: Very toxic: probable oral lethal dose (human) 50−500 mg/kg, between 1 teaspoon and 1 ounce for 150 lb (70 kg) person. Toxicity is relatively low among organic phosphate insecticides, although it is a potent cholinesterase inhibitor. Skin sensitivity has been reported. Symptoms of exposure: muscle weakness; twitching, respiratory depression; sweating, vomiting, diarrhea, chest and abdominal distress; sometimes pulmonary edema; excessive salivation; headache, giddiness, vertigo and weakness; runny nose and sensation of tightness in chest (inhalation), blurring of vision; tearing, ocular pain; loss of muscle coordination; and slurring of speech.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in one to two weeks, while red blood cell levels may be reduced for one to three months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode. A/P2 filter respirator for organic vapor and harmful dust.

Escape: GmFOv 100 [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).****

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from alkaline materials. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.3/0.4

Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200

Then: Protect persons downwind (miles/kilometers)

Day 1.4/2.3

Night 2.8/4.5

Organophosphorus pesticide: stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean dry containers and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 10.

Fire Extinguishing: This material may burn, but does not ignite readily. Thermal decomposition products may include hydrogen chloride and oxides of phosphorus and carbon. For small fires, use dry chemical, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add a combustible solvent and burn in a furnace equipped with an afterburner and an alkali scrubber[22].In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal, Limited Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999; EPA: Possible Human Carcinogen. ACGIH: A3; Confirmed animal carcinogen with unknown relevance to humans. United States Environmental Protection Agency Gene-Tox Program, Inconclusive: Histidine reversion-Ames test.

California Proposition 65 Chemical[102]: Cancer, 9/13/2013

Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

United States National Primary Drinking Water Regulations: MCLG = 0.3 mg/L; MCL = 0.060 mg/L, trichloroacetic acid, as a haloacetic acid (HAA_5).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[192]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C, N; Risk phrases: R45; R35; R50/53; R62; R63; Safety phrases: S1/2; S26; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Trichloroacetic acid is a colorless crystalline solid which is used in liquid solutions. Molecular weight = 163; Specific gravity (H_2O:1) = 1.62 @ 20°C; Boiling point = 198°C; Freezing/Melting point = 58°C; Vapor pressure = 1 mmHg @ 51°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: This haloacetic acid can be a byproduct of drinking water disinfection and may increase the risk of cancer. Trichloroacetic acid is used as medication; in organic syntheses; as a reagent for albumin detection; as an intermediate in pesticide manufacture and in the production of sodium trichloroacetate which is itself a herbicide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, silver salts, strong acids, strong bases, moisture, iron, zinc, aluminum. Corrosive to iron, steel and other metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.68 milligram per cubic meter @ 25°C & 1 atm

OSHA PE L: None

NIOSH REL: 1 ppm/7 milligram per cubic meter TWA

ACGIH TLV[1]: 1 ppm/6.7 milligram per cubic meter TWA, confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.5 ppm

PAC-2: 16 ppm

PAC-3: 99 ppm

Austria: MAK 1 ppm (5 milligram per cubic meter), 1999; Belgium: TWA 1 ppm (6.7 milligram per cubic meter), 1993; Denmark: TWA 1 milligram per cubic meter, 1999; France: VME 1 ppm (5 milligram per cubic meter), 1999; Norway: TWA 0.75 ppm (5 milligram per cubic meter), 1999; Russia: STEL 5 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 1 ppm (7 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans.

EPA[32] suggests an ambient air limit of 162 μ/m^3 based on health effects.

Permissible Exposure Limits in Water: United States National Primary Drinking Water Regulations: MCLG = 0.3 mg/L; MCL = 0.060 mg/L, trichloroacetic acid, as a haloacetic acid (HAA_5).

Determination in Water: FishTox: 538434.64955000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Causes irritation to respiratory tract with choking, coughing, dizziness and weakness. Swelling of throat and lungs can occur. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin*: Corrosive to the skin. Burns and blisters may result if not removed promptly. May cause thickening of skin. *Eyes*: Corrosive to the eyes. Can cause extremely painful burns and sores on eyes, which can result in blindness. *Ingestion*: May cause intense burning of mouth, throat and stomach; vomiting, diarrhea and fatigue. Throat may swell to block airway. The estimated lethal dose is about 1 gm (1/30 oz).

Long-Term Exposure: Increased risk of cancer. Fumes may produce irritation of throat and lungs with persistent cough. Disturbances of the digestive tract may also be noticed. These should only be significant at levels above the recommended occupational exposure limit. Human Tox = 60.00 000 ppb (LOW).

Points of Attack: Eyes, skin, respiratory system; gastrointestinal tract.

Medical Surveillance: This chemical may increase the risk of cancer. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Lung function tests, kidney function tests. Examination of the nervous system. For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is

recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry, well-ventilated place away from strong oxidizers, strong bases. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN1839 (solid) & UN2564 (solution) Trichloroacetic acid, solid and Trichloroacetic acid, solution, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Wearing protective equipment and clothing, spread soda ash on spill and mop up with water. Shovel slurry into appropriate container. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 3

Fire Extinguishing: Thermal decomposition products may include chlorine, chloroform (trichloromethane), phosgene, hydrogen chloride and oxides of carbon. Extinguish fire using an agent suitable for type of surrounding fire. Trichloroactic acid itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Trichloroacetyl chloride is a clear liquid. Molecular weight = 182; Specific gravity (H_2O:1) = 1.63 @ 20°C; Boiling point = 118°C; Freezing/Melting point = −146°C; Vapor pressure = 21 mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1₩. Decomposes violently in water, forming hydrochloric acid and trichloroacetic acid.

Potential Exposure: Used in chemical syntheses.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, ethers and metal salts. Violent reaction with water, forming hydrochloric acid and trichloroacetic acid.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.055 ppm

PAC-2: 0.61 ppm

PAC-3: 2.8 ppm

Russia[43] set a MAC in workplace air[43] of 0.1 milligram per cubic meter.

Routes of Entry: Inhalation, ingestion, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Severe irritation to the eyes, skin and respiratory tract. Skin or eye contact may cause burns. Moderately toxic by ingestion and inhalation. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Highly irritating substances may affect the lungs; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. Where possible, automatically transfer material from other storage containers to pro cess containers.

Shipping: UN2442 Trichloroacetyl chloride, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials.

Spill Handling:

Trichloroacetyl chloride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2

Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 0.8/1.3

Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Material may burn but does not ignite readily. Material reacts violently with water. Thermal decomposition products may include phosgene, hydrogen chloride and oxides of carbon. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices) Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B) as trichlorobenzenes, liquid

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[192]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N; Risk phrases: R22; R38; R50/53; R62; R63; Safety phrases: S2; S37/39; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 1,2,4-Trichlorobenzene is a low-melting solid or liquid with a pleasant, aromatic odor. The Odor Threshold is 1.4 ppm. Molecular weight = 181.5; Specific gravity (H_2O:1) = 1.46 @ 20°C; Boiling point = 214°C; Freezing/Melting point 17°C; Vapor pressure = 0.5 mmHg @25°C; Flash point = 105°C; Autoignition temperature = 571°C. Explosive limits: LEL = 2.5%; UEL: 6.6%, both @ 150°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water; solubility = 0.003%.

Potential Exposure: 1,2,4-Trichlorobenzene is used as a dye carrier, herbicide intermediate; a heat transfer medium; a dielectric fluid in transformers; a degreaser; a lubricant; as an industrial chemical; solvent, emulsifier, and as a potential insecticide against termites. The other trichlorobenzene isomers are not used in any quantity.

Incompatibilities: Reacts violently with oxidants, acids, acid fumes; steam.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.42 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 5 ppm/40 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 5 ppm/37 milligram per cubic meter Ceiling Concentration

European OEL: 2 ppm/15.1 milligram per cubic meter TWA; 5 ppm, 37.8 milligram per cubic meter STEL [skin][2003].

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.45 ppm

PAC-2: 5 ppm

PAC-3: 20 ppm

DFG MAK: [skin] Carcinogen Category 3B

Australia: TWA 5 ppm (40 milligram per cubic meter), 1993; Austria: MAK 5 ppm (40 milligram per cubic meter), 1999; Belgium: STEL 5 ppm (37 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (40 milligram per cubic meter), 1999; Finland: TWA 5 ppm (40 milligram per cubic meter), STEL 10 ppm (74 milligram per cubic meter), [skin], 1999; France: VME 5 ppm (40 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 15.1 milligram per cubic meter, [skin], 2003; Switzerland: MAK-W 5 ppm (40 milligram per cubic meter), 1999; United Kingdom: TWA 1 ppm (7.6 milligram per cubic meter), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 5 ppm

Several states have set guidelines or standards for 1,2,4-trichlorobenzene in ambient air[60] ranging from 133 μ/m^3 (New York); to 350 μ/m^3 (Virginia); to 400 μ/m^3 (North Dakota and South Carolina); to 800 μ/m^3 (Connecticut); to 952 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5517, Polychlorobenzenes.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.07 mg/L; MCLG, 0.7 mg. To protect human health-no criterion developed due to insufficient data[6]. Several states have set guidelines or standards for 1,2,4-trichlorobenzene in drinking water[61]. These include a guideline of 13 μg/L (Kansas) and a standard of 8 μg/L (New Jersey). Russia [43] set a MAC for water bodies used for domestic purposes of 30 μg/L.

Determination in Water: Methylene chloride extraction followed by concentration, gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log $K_{ow} = \sim 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: May cause irritation to the nose and throat, nervousness, restlessness, tremors, increased heart rate and blood pressure; weakness, digestive disturbances; weight loss; and headache.

Skin: May cause severe irritation. Prolonged contact may cause skin burns.

Eyes: Causes irritation. Levels greater than 5 ppm may cause severe irritation.

Ingestion: Animal studies suggest that a dose of 2 ounces may cause liver damage and death.

Long-Term Exposure: Changes to the adrenal glands. May cause liver and kidney damage. Removes the skin's natural oils, causing drying and cracking. Possible teratogenic effects.

Points of Attack: Eyes, skin, respiratory system; liver, reproductive system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function test. Urinary 2,5-dichlorophenol excretion test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon, Neoprene , and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,2,4-Trichlorobenzene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where 1,2,4-trichlorobenzene is used, handled, or stored in a manner that could create A potential fire or explosion hazard.

Shipping: UN2321 Trichlorobenzenes, liquid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phosgene, chlorine, hydrogen chloride and oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22].

Trichloro(chloromethyl)silane T:0710

Formula: CH_2Cl_4Si; $Si(CH_2Cl)Cl_3$
Synonyms: (Chloromethyl)trichlorosilane; Chloromethyl (trichloro)silane; Trichloro(chloromethyl)silane
CAS Registry Number: 1558-25-4
HSDB Number: 6419
RTECS Number: VV2200000
UN/NA & ERG Number: (PIH) UN3389 (Inhalation Hazard Zone A)/154; UN1295(trichlorosilane)/139;
EC Number: 216-316-9

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Combustible, Extremely Flammable; may ignite spontaneously, Corrosive, Violently reactive with water.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 100 lb (45 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45 kg)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, F, C; Risk phrases: R10; R14; R15/29; R26; R27/28; R34; R50/53; Safety phrases: S7/8; S13; S17; S26; S28; S30; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Trichloro(chloromethyl)silane is a colorless liquid. Sharp, biting odor. Molecular weight = 184; Specific gravity (H_2O:1) = 1.5 @ 20°C; Boiling point = 118°C; Freezing/Melting point = 111°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1 ₩. Reacts violently with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: Used in the synthesis of polysiloxane (silicone polymers).

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)* Ver. 29[138]
PAC-1: $\mathbf{0.60_A}$ ppm
PAC-2: $\mathbf{7.3_A}$ ppm
PAC-3: $\mathbf{33_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact with the eyes causes irritation, pain, swelling; corneal erosion and blindness may result. Contact with the skin causes dermatitis (red, inflamed skin), severe burns; pain, and shock generally follow dermal exposure. Acute inhalation exposure may result in sneezing, choking, laryngitis, dyspnea (shortness of breath), respiratory tact irritation; and chest pain. Bleeding of nose and gums, ulceration of the nasal and oral mucosa; pulmonary edema; chronic bronchitis; and pneumonia may also occur. If ingested, symptoms include increased salivation; intense thirst; difficulty in swallowing; chills, pain, and shock. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion.

Long-Term Exposure: Highly irritating substances may cause lung effects and damage.

Points of Attack: Lungs.

Medical Surveillance: Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Rush to a health care facility. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code-Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 meters or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. (2) Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (3) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3389 Toxic by inhalation liquid, corrosive, n.o.s. with an $LC_{50} \leq 200$ mL/m^3 and saturated vapor concentration ≥ 500 Hazard Class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material, Technical Name Required, Inhalation Hazard Zone A. UN1295 Trichlorosilane, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 3-Flammable liquid, 8-Corrosive material.

Spill Handling:
Inhalation Hazard Zone A

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.6/0.9

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 600/180
Then: Protect persons downwind (miles/kilometers)
Day 1.0/1.5
Night 1.9/3.1

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. If water pollution occurs, notify appropriate authorities. Shut off ignition sources; no flares, smoking or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors do not get water inside container. *Small spills*: flush area with flooding amounts of water. *Large spills*: dike far ahead of sp ill for later disposal. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extremely flammable; may spontaneously ignite. Avoid sources of extreme heat or ignition including sparks or fire. Upon contact with water, trichloro (chloromethyl) silane will release hydrochloric acid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Use dry chemical, CO_2 or foam extinguishers. *Do not use water*. Vapor explosion hazard indoors, outdoors, or in sewers. Runoff to sewer may create fire or explosion hazard. Move container from fire area if you can do it without risk. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside container. Cool containers that are exposed to flames with water from the side until well after fire is out. Stay away from ends of tanks. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 1,1,1-Trichloroethane is a colorless liquid. It has an odor similar to chloroform. The Odor Threshold is 120 ppm (NJ) or 400 ppm (NY). Molecular weight = 133.4; Specific gravity (H_2O:1) = 1.34 @ 20°C; Boiling point = 74°C; Freezing/Melting point = −30°C; Vapor pressure = 100 mmHg @ 25°C; 75 mm Hg @ 14.2°C[138]; Flash point = none; Autoignition temperature = 537. Explosive limits: LEL = 7.5%; UEL: 12.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.4%. ₩ Reacts slowly with water forming hydrochloric acid.

Potential Exposure: 1,1,1-Trichloroethane is used as a cleaning solvent, chemical intermediate for vinylidene chloride. In liquid form it is used as a degreaser and for cold cleaning, dip-cleaning; and bucket cleaning of metals. Other industrial applications of 1,1,1-trichlroethane's solvent properties include its use as a dry-cleaning agent; a vapor degreasing agent; and a propellant. In recent years, 1,1,1-trichloroethane has found wide use as a substitute for carbon tetrachloride.

Incompatibilities: Not flammable under normal conditions. However, in close or closed spaces, it may form a dangerously explosive atmosphere. See also fireextinguishing section. Strong caustics; strong oxidizers; chemically active metals, such as aluminum, magnesium powder; sodium, potassium. Reacts slowly with water forming hydrochloric acid. Upon contact with hot metal or exposure to UV radiation, it will decompose to form hydrochloric acid, phosgene and dichloroacetylene. Forms shock-sensitive mixtures with potassium or its alloys. Attacks natural rubber.

Permissible Exposure Limits in Air

NIOSH IDLH = 700 ppm

Conversion factor: 1 ppm = 5.46 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 350 ppm/1900 milligram per cubic meter TWA

NIOSH REL: 350 ppm/1900milligram per cubic meter [15 min.] Ceiling Concentration. NIOSH considers methyl chloroform to be A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV[1]: 350 ppm /1910 milligram per cubic meter TWA, 450 ppm/2460 milligram per cubic meter STEL, not classifiable as a human carcinogen; BEI: 40 ppm methyl chloroform in end-exhaled air prior to last shift of workweek; 10 mg/L trichloroacetic acid in urine at end of work week; 30 mg/L total trichloroethanol in urine, end-of-shift at end-of-workweek; 1 mg/L total trichloroethanol in bolld, end-of-shift at end of workweek.

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{230}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{600}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{4200}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 200 ppm/1100 milligram per cubic meter TWA; Peak Limitation Category II(1) [skin], Pregnancy Risk Group: C; BAT: 550 μg]/L in blood after several shifts [for long-tme exposure]; at the beginning of next shift.

Australia: TWA 125 ppm (680 milligram per cubic meter), 1993; Austria: MAK 200 ppm (1080 milligram per cubic meter), 1999; Belgium: TWA 350 ppm (1910 milligram per cubic meter), STEL 450 ppm (2460 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (275 milligram per cubic meter), 1999; Finland: TWA 100 ppm (540 milligram per cubic meter), STEL 250 ppm (1400 milligram per cubic meter), 1999; France: VME 300 ppm (1650 milligram per cubic meter), VLE 450 ppm (2500 milligram per cubic meter), 1999; Hungary: TWA 100 milligram per cubic meter, STEL 300 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 555 milligram per cubic meter, 2003; Norway: TWA 50 ppm (270 milligram per cubic meter), 1999; the Phillipines: TWA 350 ppm (1900 milligram per cubic meter), 1993; Poland: MAC (TWA) 300 milligram per cubic meter; MAC (STEL) 1400 milligram per cubic meter, 1999; Russia: TWA 200 ppm, STEL 20 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (300 milligram per cubic meter), KTV 90 ppm (500 milligram per cubic meter), 1999; Switzerland: MAK-W 200 ppm (1080 milligram per cubic meter), KZG-W 1000 ppm, 1999; Turkey: TWA 350 ppm (1900 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (1110 milligram per cubic meter), STEL 400 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 450 ppm. Several states have set guidelines or standards for 1,1,1-Trichloroethane in ambient air[60] ranging from 1.3 milligram per cubic meter (Massachusetts); to 12.0−245.0 milligram per cubic meter (North Carolina); to 19.0 milligram per cubic meter (Indiana); to 19.0−24.5 milligram per cubic meter (North Dakota); to 32.0 milligram per cubic meter (Virginia); to 38.0 milligram per cubic meter (Connecticut, New York, South Dakota); to 45.238 milligram per cubic meter (Nevada). Russia set a MAC for ambient air[43] in residential areas of 2.0 milligram per cubic meter on a once-daily basis and 0.2 milligram per cubic meter on a daily average basis.

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated,[18]; OSHA Analytical Method 14. See also, NIOSH Analytical Method #2549, Volatile organic compounds

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.2 mg/L; MCLG, 0.20 mg/L. Federal Drinking Water Standards: EPA 200 μg/L; Federal Drinking Water Guidelines EPA 200 μg/L; State Drinking Water Standards: New Jersey 30 μg/L; State Drinking Water Guidelines: Arizona 200 μg/L; Connecticut 200 μg/L; Minnesota 9000 μg/L.

Determination in Water: Charcoal tube; CS2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1003, Halogenated hydrocarbons. Octanol-water coefficient: Log $K_{ow} = 2.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor, moderate skin adsorption, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation*: Exposure can cause headache, lassitude (weakness, exhaustion), CNS depressant/depression; poor equilibrium; cardiac arrhythmias; liver damage. May affect the heart and CNS; kidneys and liver; causing cardiac disorders and respiratory failure. Levels above 900 ppm can cause dizziness, mental confusion; drowsiness, loss of coordination and unconsciousness. Death may result. *Skin*: Contact can cause irritation and rash. Absorption is moderate; may contribute significantly to health hazard. *Eyes*: Contact causes irritation The vapor has caused irritation at levels of 450 ppm. *Ingestion*: May cause symptoms similar to inhalation. In addition, may cause mouth, throat and stomach irritation.

Long-Term Exposure: Liver, nervous system, or circulatory system problems. High exposures may damage the liver and kidneys. Prolonged contact can cause thickening and cracking of the skin. Repeated or prolonged contact at levels of 450 ppm or above may result in irritation and dry, scaley, fractured skin. Additionally, NIOSH recommends that this chemical be treated in the workplace with caution because of its structural similarity to other chloroethanes shown to be carcinogenic in animals.

Points of Attack: Eyes, skin, CNS; cardiovascular system, liver.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), During Exposure; whole blood (chemical/metabolite), end-of-shift; whole blood (chemical/metabolite), end-of-workweek; whole blood (chemical/metabolite), end-of-workweek, expired air, expired air, 16 Hours following end of exposure; expired air, end-of-workweek; expired air, prior to next shift; expired air prior to last shift of workweek; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), endo f-shift at end-of-workweek; urine (chemical/metabolite), end-of-workweek; urine (chemical/metabolite), prior to next shift. Consider the skin, liver function; cardiac status, especially arrythmias; in preplacement or periodic examinations. Expired air analyses may be useful in monitoring exposure. Persons with heart disease may be at an increased risk of irregular heartbeat from very high exposures.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin contact: **8 hours**: polyvinyl alcohol gloves; Viton gloves, suits; 4H and Silver Shield gloves; Barricade coated suits; CPF3 suits; Responder suits; Trychem 1000 suits; **4 hours**: Teflon gloves, suits, boots. Also, protective clothing of leather or Neoprene may offer some protection. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, head gear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 700 ppm*: Sa (APF = 10) (any supplied-air respirator);* or SCBA (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl chloroform must be stored to avoid contact with strong caustics (such as sodium and potassium hydroxide); acetone, strong oxidizers (such as chlorine, chlorine dioxide, and bromine); and chemically active metals (such as potassium aluminum, zinc, and magnesium); since violent reactions occur. Do not allow vapor near sources of UV light, such as arc welding, because poisonous gases may be produced. Store in tightly closed containers in a cool, well-ventilated area away from heat and moisture. Do not use aluminum containers.

Shipping: UN2831 1,1,1-Trichloroethane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 1,1,1-Trichloroethane's combustible mixtures with air do not readily ignite, but ignition may occur in conditions of excess oxygen or in the presence of a high-energy ignition sources, such as sparks, a furnace; or welding. Thermal decomposition products may include hydrogen chloride, chlorine, phosgene, dichloroacetylene and oxides of carbon. Use dry chemical, CO_2, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. As an alternative to disposal, trichloroethane may be recovered from waste gases and liquids from various processes and recycled.

Hazardous to aquatic life or environment, with possible long-lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xn; Risk phrases: R45; R20/21/22; R40; R50/53; R62; R66; Safety phrases: S2; S9; S36; S37; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 1,1,2-Trichloroethane is a colorless, nonflammable (must be pre-heated before ignition can occur) liquid Sweet, chloroform-like odor. Molecular weight = 133.40; Specific gravity (H_2O:1) = 1.44 @ 25°C; Boiling point = 114°C; Freezing/Melting point = −36°C. Vapor pressure = 19 mmHg @ 25°C; Flash point: None but material is combustible when preheated above 109/F/43°C. Ignition temperature = > 450°C. Explosive limits are: LEL = 6.0%; UEL: 15.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2−3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.4%.

Potential Exposure: 1,1,2-Trichloroethane is used as an intermediate in the production of vinylidine chloride, and a component of adhesives; as a solvent; but is not as widely used as is its isomer 1,1,1-Trichloroethane; it is an isomer of 1,1,1-Trichloroethane *but should not be confused with it toxicologically*. 1,1,2-Trichloroethane is comparable to carbon tetrachloride and tetrachloroethane in toxicity. Forms a flammable vapor−air mixture at 43°C and higher.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, strong caustics; chemically active metals;, such as aluminum, magnesium powders, sodium, potassium. Attacks some plastics, rubber, coatings, steel, and zinc.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 5.46 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/45 milligram per cubic meter TWA [skin]

NIOSH REL: 10 ppm/45 milligram per cubic meter TWA [skin], Potential occupational carcinogen; limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide* Appendix A & C.

ACGIH TLV[1]: 10 ppm TWA [skin], animal carcinogen with Unknown Relevance to Humans.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 30 ppm

PAC-2: 180 ppm

PAC-3: 500 ppm

DFG MAK: 10 ppm/55 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Carcinogen Category 3B

Arab Republic of Egypt: TWA 10 ppm (40 milligram per cubic meter), [skin], 1993; Australia: TWA 10 ppm (45 milligram per cubic meter), [skin], 1993; Austria: MAK 10 ppm (55 milligram per cubic meter), [skin], Suspected: carcinogen, 1999; Belgium: TWA 10 ppm (55 milligram per cubic meter), [skin], 1993; Denmark: TWA 10 ppm (54 milligram per cubic meter), [skin], 1999; Finland: TWA 10 ppm (54 milligram per cubic meter), STEL 20 ppm (110 milligram per cubic meter), [skin], 1999; Hungary: TWA 10 milligram per cubic meter, STEL 20 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 45 milligram per cubic meter, [skin], 2003; Norway: TWA 10 ppm (54 milligram per cubic meter), 1999; Russia: TWA 10 ppm, 1993; Switzerland: MAK-W 10 ppm (55 milligram per cubic meter), KZG-W 50 ppm (275 milligram per cubic meter), [skin], 1999; United Kingdom: LTEL 10 ppm (45 milligram per cubic meter), STEL 20 ppm, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for 1,1,2-trichloro ethane in ambient air[60] ranging from 0.00 μ/m^3 (Massachusetts); to 7.0 μ/m^3 (Rhode Island); to 27.0 μ/m^3 (Pennsylvania); to 107.143 μ/m^3 (Kansas); to 150.0 μ/m^3 (New York); to 225.0 μ/m^3 (Connecticut and Indiana); to 450.0 μ/m^3 (Florida and North Dakota); to 900.0 μ/m^3 (Virginia); to 1,071.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1003, Halogenated hydrocarbons, OSHA Analytical Method 11.

Permissible Exposure Limits in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.005 mg/L; MCLG, 0.003 mg/L. Federal Drinking Water Standards: EPA 5 μg/L; Federal Drinking Water Guidelines EPA 3 μg/L; State Drinking Water Standards: New Jersey 3 μg/L; State Drinking Water Guidelines: Arizona 0.61 μg/L; Maine 6 μg/L; Minnesota 3 μg/L.

Determination in Water: Unlikely to bioaccumulate in marine organisms. Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol-water coefficient: Log $K_{ow} = < 2$. Unlikely to bioaccumulate in marine organisms. Harmful to aquatic life in low concentrations[136].

Routes of Entry: Inhalation of vapor, absorption through the skin, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure may cause central nervous depression. May affect the kidneys and liver. *Inhalation*: Inhalation may produce headache, lassitude, dizziness, a lack of coordination; low blood pressure; irregular heart beat; coma and death from respiratory arrest.

Exposure to vapor concentrations near 2000 ppm for 5 minutes causes CNS depression and anesthetic effects. Symptoms are nasal irritation, drowsiness an equilibrium disturbances. Death may result from 13,600 ppm for 2 hours. *Skin*: Can cause irritation and chemical burns if allowed to remain on the skin for a prolonged period. May be absorbed through the skin to cause or increase the severity of symptoms listed above. *Eyes*: Can cause irritation. *Ingestion*: May cause effects similar to those listed under inhalation. Laboratory studies with animals suggest that the probable lethal dose for humans is about 12 ounces. Liver and kidney damage have occurred in animals.

Long-Term Exposure: Liver, kidney and/or immune system problems. Can destroy the skin's natural oils, causing drying and cracking. Inhalation may cause liver and kidney damage. NIOSH recommends this chemical be treated as A potential occupational carcinogen. Has caused cancer in laboratory animals.

Points of Attack: Eyes, respiratory system; CNS; liver, kidneys. Cancer site in animals: liver cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Expired Air. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: Liver and kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: special 24 hour EKG (Holter monitor), to look for irregular heart beat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and Teflon are recommended as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable (liquid or materials) storage ea or approved cabinet. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,1,2-Trichloroethane must be stored to avoid contact with strong oxidizers (such as chlorates, nitrates, peroxides, chlorine, and bromine); strong caustics; and chemically active metals (such as potassium, magnesium, zinc, and sodium); because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where 1,1,2-trichloroethane is used, handled, or stored in a manner that could create A potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable (must be pre-heated before ignition can occur) Containers may explode in fire. Not flammable under normal conditions but can be ignited by high-energy ignition sources, such as a furnace, or welding. Forms a flammable vapor−air mixture at >43°C. Thermal decomposition products may include hydrogen chloride, phosgene and oxides of carbon. Use dry chemical, CO_2, or foam extinguishers and water to keep fire-exposed containers cool. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R45; R36/38; R50/53; R61; R62; R63; R67; Safety phrases: S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Trichloroethylene, a colorless (often dyed blue), nonflammable, noncorrosive liquid that has the "sweet" odor characteristic of some chlorinated hydrocarbons. The Odor Threshold is 25−50 ppm. Molecular weight = 132; Specific gravity (H_2O:1) = 1.5 @ 20°C; Boiling point = 87°C; Freezing/Melting point = −85°C; Vapor pressure = 58 mmHg @ 25°C; 75 mmHg @ 27°C; Autoignition temperature = 410°C. Explosive limits: LEL = 8.0%; UEL: 10.5% @ 25°C; LEL = 7.8%; UEL: 52% @ 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.1%.

Potential Exposure: Trichloroethylene is used as a vapor degreaser of metal parts, as a solvent; and as a drug; It is also used for extracting caffeine from coffee, as a dry-cleaning agent; and as a chemical intermediate in the production of pesticides; in making waxes, gums, resins, tars, paints, varnishes, and specific chemicals; such as chloroacetic acid.

Incompatibilities: Contact with strong caustics causes decomposition and the production of highly toxic and flammable dichloroacetylene. Violent reaction with chemically active metals; powders, or shavings, such as aluminum, barium, lithium, sodium, magnesium, and titanium. Violent reaction with aluminum in the presence of dilute hydrochloric acid. Thermal decomposition of trichloroethylene, due to contact with hot metal or UV radiation, forms hazardous products including chlorine gas, hydrogen chloride; and phosgene. Keep this chemical away from high temperatures, such as arc welding or cutting, unshielded resistance heating; open flames; and high intensity UV light. Slowly decomposed by light in presence of moisture, with formulation of hydrochloric acid.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm [LEL]

Conversion factor: 1 ppm = 5.37 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 100 ppm TWA; 200 ppm; 300 ppm [5-min. maximum peak in any 2 hours.] Ceiling Concentration

NIOSH REL: 25 ppm TWA; 2 ppm [60 min. when used as a waste anesthetic gas] STEL; Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See the *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV[1]: 10 ppm TWA; 25 ppm STEL, Suspected Human Carcinogen. BEI: 100 mg[trichloroacetic acid]/g creatinine in urine, end-of-workweek; 300 mg[trichloroacetic acid and trichloroethanol]/g creatinine in urine, end-of-shift, end-of-workweek; 4 mg[trichloroethylene]/g in blood, end-of-shift, end-of-workweek

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: **130**$_{\mathbf{A}}$ ppm

PAC-2: **450**$_{\mathbf{A}}$ ppm

PAC-3: **3800**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category: 1; Germ Cell Mutagen Group: 3B; TRK: 5 mg[trichloroethanol]/L in blood, end of exposure, end-o f-shift; for long-term exposure, after several shifts; 100 mg[trichloro acetic acid]/L in urine, end of exposure, end-of-shift; for long-term exposure, after several shifts.

Australia: TWA 50 ppm (270 milligram per cubic meter), STEL 200 ppm, 1993; Austria: MAK 50 ppm (270 milligram per cubic meter), Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (269 milligram per cubic meter), STEL 200 ppm (1070 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (55 milligram per cubic meter), 1999; Finland: TWA 30 ppm (160 milligram per cubic meter), STEL 45 ppm (240 milligram per cubic meter), [skin], 1999; France: VME 75 ppm (405 milligram per cubic meter), VLE 200 ppm (1080 milligram per cubic meter), carcinogen, 1999; Hungary: TWA 10 milligram per cubic meter, STEL 40 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 190 milligram per cubic meter, 2003; Norway: TWA 20 ppm (110 milligram per cubic meter), 1999; the Phillipines: TWA 100 ppm (535 milligram per cubic meter), 1993; Poland: MAC (TWA) 50 milligram per cubic meter; MAC (STEL) 400 milligram per cubic meter, 1999; Russia: TWA 50 ppm, STEL

10 milligram per cubic meter, 1993; Sweden: NGV 10 ppm (50 milligram per cubic meter), KTV 25 ppm (140 milligram per cubic meter), carcinogen, 1999; Switzerland: MAK-W 50 ppm (260 milligram per cubic meter), KZG-W 250 ppm (1300 milligram per cubic meter), 1999; Thailand: TWA 100 ppm, STEL 200 ppm, 1993; Turkey: TWA 100 ppm (535 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (550 milligram per cubic meter), STEL 150 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 100 ppm. Russia has set MAC values for ambient air in residential areas of 4.0 milligram per cubic meter on a momentary basis and 1.0 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for trichloroethylene in ambient air[60] ranging from zero (North Carolina); to 0.25 μ/m^3 (Arizona); to 0.8 μ/m^3 (Michigan); to 2.43 μ/m^3 (Kansas); to 6.1 μ/m^3 (Massachusetts); to 900.0 μ/m^3 (New York); to 1,350.0 μ/m^3 (Connecticut), to 2,675.0 μ/m^3 (Indiana); to 2,700.0 μ/m^3 (Florida and South Dakota); to 4,500.0 μ/m^3 (Virginia); to 2,700.0 to 10,800.0 μ/m^3 (North Dakota); to 6,429 μ/m^3 (Nevada); to 6,750 μ/m^3 (South Carolina); to 6,840 μ/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method, #1022, Trichloroethylene, by portable GC. #3800; OSHA Analytical Method 1001.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.005 mg/L; MCLG, zero. Federal Drinking Water Standards: EPA 5 μg/L; State Drinking Water Standards: New Jersey 1 μg/L; Delaware 1 μg/L; Florida 3 μg/L; State Drinking Water Guidelines: Arizona 3.2 μg/L; Connecticut 5 μg/L; Maine 32 μg/L; Minnesota 5 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol-water coefficient: Log $K_{ow} = 2.4$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation percutaneous absorption, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure to the vapor irritates the eyes, skin, and respiratory tract. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Inhalation causes headache, sleepiness, nausea, vomiting, dizziness and coughing have been felt around 100 ppm. Unconsciousness can result @ 3,000 ppm. Exposure to 8,000 ppm can cause death. Can be absorbed through skin. Can cause skin irritation, burning or redness; blistering can occur. Can causeeye irritation; burning sensation; and/or watering, and can cause permanent damage. Ingestion can cause chemical pneumonitis and diminish kidney action. It can cause drunkenness, vomiting, diarrhea or abdominal pain. Unconsciousness, liver or kidney damage, vision distortion and death have been reported at large doses. Exposure to TCE may affect the CNS causing lightheadedness, dizziness, visual disturbances; feeling of excitement; nausea, and vomiting. High levels can cause irregular heartbeat; unconsciousness, and death.

Long-Term Exposure: Liver problems; increased risk of cancer. May affect kidneys. Contact with vapor levels near 100 ppm can cause giddiness, nervous exhaustion, increased sensitivity to alcohol including redness in the face (trichloroethylene blush); the ability to become addicted to the vapo; as well as effects of acute exposure listed above. Higher levels can cause irregular heartbeat. Repeated contact with hands can cause excessive dryness, cracking, burning, loss of sense of touch or temporary paralysis of fingers. Most of these effects seem to go away after exposure has stopped. Trichloroethylene is considered a cancer suspect agent because high levels cause liver cancer in mice.

Points of Attack: Eyes, skin, respiratory system; heart, liver, kidneys, CNS. Cancer site in animals: liver and kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; whole blood (chemical/metabolite), end-o f-shift-, end-of-workweek; whole blood (chemical/metabolite), end-of-workweek, expired air, Expired Air, end-of-workweek; Expired Air, prior to next shift; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), end-of-shift at end-of-workweek; urine (chemical/metabolite), end-of-workweek; urine (chemical/metabolite), prior to next shift. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: Liver function tests. If symptoms develop or overexposure is suspected, the following may be useful: exam of the nervous system. Consider nerve conduction tests. Urinary trichloroacetic acid level (for repeated exposures) or blood trichloroethylene levels (for acute exposure). Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: *Inhalation*: Bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon and Silvershield are among the recommended materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Trichloroethylene must be handled and stored away from operations which generate high temperatures, such as arc welding or cutting; unshielded resistance heating; open flames; and high intensity UV light. It must also be handled to avoid contact with hot metals. Thermal decomposition products may include toxic and corrosive phosgene, and hydrogen chloride. Prevent contact of trichloroethylene with strong alkalis, such as sodium hydroxide or potassium hydroxide, because a highly flammable, toxic liquid is produced. Also prevent contact with aluminum in the presence of dilute hydrochloric acid, because a violent reaction will occur. Prevent contact with chemically active metals; powders, or shavings, such as barium, lithium, sodium, or magnesium; and titanium powders or shavings, since an explosion can occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1710 Trichloroethylene, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride, chlorine, phosgene, and oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

An alternative to disposal for TCE is recovery and recycling.

WGK[100] (German Aquatic Hazard Class) (*2,4,6-*): No value assigned.

Description: Trichlorophenols exists as 6 isomers (2,4,5-; 3,4,5-; 2,4,6-; 2,3,4-; 2,3,5-and 2,3,6-). The most important (heavily regulated) are the 2,4,5-and 2,4,6-isomers. The 2,4,5-isomer is white powder or needles; 2,3,5-and 2,3,6-are colorless crystals; 2,4,5-is a gray crystalline solid or flakes; 2,4,6-is a colorless to light yellow crystalline solid. They have a phenolic odor. Molecular weight = 197−198; Specific gravity (H_2O:1) = 1.7 @ 20°C (*2,4,5-*); 1.5 @ 75°C (2,4,6-); Boiling point = 253°C (*2,3,5-*); 253°C (*2,3,6-*); 253°C (2,4,5-); 247°C (2,4,6-); Freezing/Melting point = 84°C (*2,3,4-*); 62°C (2,3,5-); 58°C (*2,3,6-*); 69°C (*2,4,5-*); 70°C (*2,4,6-*); Vapor pressure = 8×10^{-X} mmHg @ 25°C (2,4,5-); 0.75 mmHg @ 72C (2,4,6-); Flash point = 78°C (*2,3,6-*); 61°C (*2,4,6-*). Hazard Identification (based on NFPA-704 M Rating System): (*2,4,5-*; *2,4,6-*) Health 2, Flammability 1, Reactivity 0. All isomers are slightly soluble or practically insoluble in water.

Potential Exposure: 2,4,5-TCP is used as antifungal agent in adhesives and as preservative in polyvinylacetate emulsions. 2,4,6-T is used in manufacturing slime-control agents and as an effective germicide and preservative; to produce defoliant 2,4,5-T and related products. Also used directly as a fungicide, anti-mildew and preservative agent; algicide, bactericide. 2,4,6-TCP is used to produce 2,3,4,6-TCP and PCP. Used directly as germicide, bactericide, glue and wood preservative; and anti-mildew treatment. 2,3,6-TCP is used as intermediate in production of fungicides and plant growth regulators.

Incompatibilities: Perhaps the most notable incompatibility is the reaction of 2,4,5-trichlorophenol in alkaline medium at high temperatures to produce dioxin. (2,3,4-isomer) reacts with oxidizers, acid anhydrides; and acid chlorides. (2,3,5-isomer) Decomposes on heating, on burning and on contact with strong oxidants producing toxic and corrosive fumes of hydrogen chloride. The substance is a weak acid. (2,3,6-isomer); the substance is a weak acid. pH = 4.8/4.2-; (2,4,6-isomer); reacts violently with strong oxidants and is incompatible with acid chlorides and acid anhydrides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

933-75-5, 2,3,6-isomer

PAC-1: 1.8 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 120 milligram per cubic meter

95-95-4,2,4,5-isomer

PAC-1: 2.5 milligram per cubic meter

PAC-2: 27 milligram per cubic meter

PAC-3: 160 milligram per cubic meter

88-06-2, 2,4,6-isomer

PAC-1: 2.5 milligram per cubic meter

PAC-2: 27 milligram per cubic meter

PAC-3: 160 milligram per cubic meter

DFG MAK: No numerical value established. Data may be available.

Denmark: TWA 0.5 milligram per cubic meter, [skin] 1999 (2,4,5-and 2,3,6-isomers)

Sweden: MAC 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter. Russia set a MAC in ambient air in residential areas of 3.0 μ/m^3 for the 2,4,6-isomer on a once-daily basis. Several states have set guidelines or standards for the trichlorophenols in ambient air[60].

Massachusetts has set zero for the 2,4,6-isomer and 1.6 μ/m^3 for the 2,4,5-isomer. Pennsylvania has set 3,500 μ/m^3 for the 2,4,5-isomer on a one-year exposure basis.

Determination in Air: Use NIOSH: (*o*-chlorophenol) P&CAM Method #337 (chlorophenols).

Permissible Concentration in Water: Clean Water Act: Section 307(a)(1)Toxic Pollutants subject to effluent limitations as chlorinated ethanes. Federal Drinking Water Standards (*2,4,6-trichlorophenol*): EPA The levels which may result in incremental increase in cancer risk over the lifetime are estimated at 10^{-5}, 10^{-6}, and 10^{-7}. The corresponding criteria are 12 μg/L, 1.2 μg/L, and 0.12 μg/L, respectively. State Drinking Water Guidelines: Arizona 1.8 μg/L; Florida 10 μg/L; Maine 32 μg/L; Minnesota 30 μg/L; New Hampshire 3.0 μg/L; New Jersey 1 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604); or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact may be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Trichlorophenols irritates the eyes, skin, and the respiratory tract. A CNS depressant. High exposures can cause weakness, difficulty in breathing; tremors, convulsions, coma, and possible death. See also *chlorophenols*.

2,3,5-isomer: a mixture of trichlorophenols may cause irritation of the skin, eyes and respiratory tract. These substances may cause acute metabolic effects resulting in damage in several organs notably the CNS. Some technical products may contain highly toxic impurities including polychlorinated dibenzo-p-dioxins and-furans.

For the 2,4,5-isomer: [52] irritation of the skin, eyes, nose, and pharynx; redness and edema of the skin; dermatitis, corneal injury; iritis; sweating, thirst, nausea, vomiting, diarrhea, abdominal pain; cyanosis, hyperactivity, stupor, decreased activity and motor weakness; increase followed by decrease in respiratory rate and urinary output; fever; increased bowel action; lung, liver or kidney damage; convulsions, collapse, and coma.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis; drying and cracking. May affect the liver and kidneys. A related chemical, *phenol*, can cause liver and kidney damage. May be carcinogenic to humans. If any of the trichlorophenols is contaminated with 2,3,7,8-tetrachlorodibenzo-p-dioxin, the following effects may occur: acne-like skin rash; liver damage; nervous system damage with symptoms of weakness, pain in the legs, and numbness.

Points of Attack: *Inhalation*: Human (2,4,5-): lung, thorax, or respiration; structural or functional change in trachea or bronchi; lung, thorax, or respiration: other changes. Animal tests: change in liver weight, changes in spleen weight; other changes. Cancer site in animals (2,4,6-): liver and leukemia.

Medical Surveillance: Liver and kidney function tests. CBC.

First Aid: *Skin Contact*:[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a slurry of activated charcoal in water. If medical advice is not readily available, do not induce vomiting, and rush the victim to the nearest medical facility.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool dry place or a refrigerator away from oxidizing agents and other incompatible materials listed above. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2020 Chlorophenols, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Remove all sources of ignition and dampen spilled material with 60%−70% ethanol to avoid airborne dust, then transfer material to a sealed container. Ventilate the spill area and use absorbent dampened with 60%−70% ethanol to pick up remaining material. Wash surfaces well with soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Trichlorophenols are combustible, but are not easy to ignite. Poisonous and corrosive gases are produced in fire, including hydrogen chloride, chlorine and oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22].

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T; Risk phrases: R45; R10; R20/21/22; R60; R61; R62; R63; Safety phrases: S53; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: 1,2,3-Trichloropropane is a colorless liquid with a strong acid odor. Molecular weight = 147.4;

Specific gravity (H_2O:1) = 1.4 @ 20°C; Boiling point = 157°C; Freezing/Melting point = −15°C; Vapor pressure = 7.5 mmHg @ 37°C; Flash point = 71°C (cc); Autoignition temperature = 304°C. Explosive limits: LEL = 3.2% @ 120°C; UEL: 12.6% @ 150°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Poor solubility in water; solubility = 0.1%.

Potential Exposure: Trichloropropane dissolves oils, fats, waxes, chlorinated rubber; and numerous resins; it is used as a paint and varnish remover; a solvent; and a degreasing agent.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Violent decomposition with chemically active metals; strong bases. Keep away from chlorinated rubber, resins and waxes; and sunlight.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm [LEL]

Conversion factor: 1 ppm = 6.03 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 50 ppm/300 milligram per cubic meter TWA

NIOSH REL: 10 ppm/60 milligram per cubic meter TWA [skin], Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 10 ppm/60 milligram per cubic meter TWA [skin] confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.015 ppm

PAC-2: 170 ppm

PAC-3: 1000 ppm

DFG MAK: [skin] Carcinogen Category 2

Australia: TWA 10 ppm (60 milligram per cubic meter), [skin], 1993; Austria: MAK 50 ppm (300 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (60 milligram per cubic meter), [skin], 1993; Denmark: TWA 10 ppm (60 milligram per cubic meter), [skin], 1999; Finland: TWA 50 ppm (300 milligram per cubic meter), STEL 75 ppm (450 milligram per cubic meter), 1999; Norway: TWA 10 ppm (60 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.108 milligram per cubic meter, [skin], 2003; Russia: STEL 2 milligram per cubic meter, 1993; Switzerland: carcinogen, 1999; United Kingdom: TWA 50 ppm (306 milligram per cubic meter), STEL 75 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea; New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans.

Russia[43] set a MAC for ambient air in residential areas of 0.05 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for 1,2,3-trichloropropane in ambient air[60] ranging from 3.0−4.5 milligram per cubic meter (North Dakota); to 5.0 milligram per cubic meter (Virginia); to 6.0 milligram per cubic meter (Connecticut); to 7.143 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated; OSHA Analytical Method 7[18].

Permissible Concentration in Water: Russia[43] has set 0.07 mg/L as a MAC in water bodies used for domestic purposes.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 2.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Skin absorption; ingestion; inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Trichloropropane is highly toxic by inhalation and moderately toxic by skin absorption. It is a local irritant and produces a number of unpleasant sensory effects; irritates the eyes, skin, and respiratory tract. Human subjects exposed to trichloropropane @ 100 ppm found this to be an objectionable level of exposure, and all reported eye and throat irritation as well as an unpleasant odor. Also, according to NIOSH, skin irritation, CNS depression and liver injury may result. Exposure to high concentrations may result in unconsciousness.

Long-Term Exposure: Repeated contact can cause dermatitis; drying and cracking of the skin. May affect the heart and damage the liver. Although this chemical has not been adequately evaluated for brain and disturbed sleep; many solvents and petroleum-based products can cause these effects. Symptoms of exposure can include reduced memory; reduced ability to concentrate; personality changes; fatigue, sleep disturbance; reduced coordination; weakness, and/or feeling of "pins and needles" in extremities. A potential occupational carcinogen.

Points of Attack: Eyes, skin, respiratory system; CNS; liver, kidneys. Cancer site in animals: fore-stomach, liver, and mammary gland cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Expired Air. Liver function tests; EKG, Evaluation for brain effects and psychological changes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and PVC are among the recommended materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a refrigerator or a cool, dry place and keep away from chemically active metals; oxidizers, strong caustics. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride, phosgene, chlorine and oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA

1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

Harms public health and the environment by destroying ozone in the upper atmosphere, H420

Hazardous to aquatic life or environment, with possible long-lasting effects[192]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N, Xi; Risk phrases: R20/21/22; R23/24/25; R33; R36/38; R39; R43; R44; R49; R51/53; R59; R62; Safety phrases: S20/21; S26; S28; S29/35; S36/37/39; S45; S53; S45; S57; S59; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: TTE is a colorless liquid. Carbon tetrachloride-like odor at high concentrations. A gas above 48°C. Molecular weight = 187.4; Specific gravity (H_2O:1) = 1.56 @ 20°C; Boiling point = 48°C; Freezing/Melting point = −36°C; Vapor pressure = 285 mmHg @ 25°C. Noncombustible liquid at ordinary temperatures, but the gas will ignite and burn weakly @ 680°C (autoignition temperature). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 2. Practically insoluble in water; solubility = 0.02%.

Potential Exposure: TTE is used as a solvent and refrigerant; it is used in fire extinguishers; as a blowing agent and as an intermediate in the production of chlorotrifluoroethylene monomer by reaction with zinc.

Incompatibilities: Violent reaction with chemically active metals (such as powdered aluminum; beryllium, magnesium and zinc); calcium. Contact with alloys containing more than 2% magnesium causes decomposition, releasing hydrogen chloride, hydrogen fluoride; and carbon monoxide. May react exothermically with aluminum.

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 ppm

Conversion factor: 1 ppm = 7.67 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 45 to 68 ppm.

OSHA PEL: 1000 ppm/7600 milligram per cubic meter TWA

NIOSH REL: 1000 ppm/7600 milligram per cubic meter TWA; 1250 ppm/9500 milligram per cubic meter STEL

ACGIH TLV[1]: 1000 ppm/7670 milligram per cubic meter TWA; 1250 ppm/9590 milligram per cubic meter STEL, not classifiable as a human carcinogen.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1250 ppm

PAC-2: 3900 ppm

PAC-3: 4500 ppm

DFG MAK: 500 ppm/3900 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group D

Australia: TWA 1000 ppm (7600 milligram per cubic meter), STEL 1250 ppm, 1993; Austria: MAK 500 ppm (3800 milligram per cubic meter), 1999; Belgium: TWA 1000 ppm (7670 milligram per cubic meter), STEL 1250 ppm, 1993; Denmark: TWA 500 ppm (3800 milligram per cubic meter), 1999; Finland: TWA 1000 ppm (7600 milligram per cubic meter), STEL 1250 ppm, 1999; France: VME 1000 ppm (7600 milligram per cubic meter), VLE 1250 ppm, 1999; Hungary: STEL 40 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 1170 milligram per cubic meter, 2003; Norway: TWA 500 ppm (3800 milligram per cubic meter), 1999; the Phillipines: TWA 1000 ppm (7600 milligram per cubic meter), 1993; Russia: TWA 500 ppm, STEL 5000 milligram per cubic meter, 1993; Sweden: NGV 500 ppm (4000 milligram per cubic meter), KTV 750 ppm (6000 milligram per cubic meter), 1999; Switzerland: MAK-W 500 ppm (3800 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (7600 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (7790 milligram per cubic meter), STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 1250 ppm. Several states have set guidelines or standards for TTE in ambient air[60] ranging from 0.152 milligram per cubic meter (Connecticut); to 0.225 milligram per cubic meter (Indiana); to 76.0−95.0 milligram per cubic meter (North Dakota); to 180.952 milligram per cubic meter (Nevada); to 950.0 milligram per cubic meter (North Carolina).

Determination in Air: Use NIOSH Analytical Method #1020, 1,1,2-Trichloro-1,2,2-trifluoroethane, #2549, Volatile organic compound; OSHA Analytical Method 113.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and respiratory tract. May be a CNS depressant in high concentrations, causing headache, dizziness, loss of coordination and unconsciousness; asphyxiation can result. *Inhalation*: No effects may be felt below 1000 ppm. Irregular heartbeat (arrhythmia) can occur at levels above 2000 ppm; may cause unconsciousness and possible death. Levels above 2500 ppm may cause loss of concentration; tiredness and a feeling of heaviness of the head. Levels above 200,000 ppm may cause irritation of the nose and lungs, tremors and coma. *Ingestion*: No information is available on human ingestion. However, animal studies show that Freon 113 cause unresponsiveness, facial swelling; diarrhea, and bleeding lungs. *Skin*: May cause irritation and frostbite if TTE is cold from refrigeration

Long-Term Exposure: Skin contact can cause dermatitis; drying and cracking. Can accumulate in brain and kidneys from exposure below 2000 ppm. Will generally not produce noticeable effects at this level and may pass from the body within a week after exposure stops.

Points of Attack: Skin, heart, CNS; cardiovascular system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24 hour EKG (Holter monitor) to look for irregular heart beat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2000 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MS HA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. 1,1,2-Trichloro-1,2,2-trifluoroethane must be stored to avoid contact with chemically active metals, such as calcium, powdered aluminum; zinc, magnesium, and beryllium because violent reactions occur. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 1,1,2-Trichloro-1,2,2-trifluoroethane itself does not easily burn. Thermal decomposition products may include carbonyl fluoride; hydrogen chloride; hydrogen fluoride, phosgene, and oxides of carbon. Extinguish fire using agent suitable for type of surrounding fire. The gas will ignite and burn weakly when exposed to high heat or flame. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*o-o-o; o-o-m; o-o-p; o-m-m; o-m-p; o-p-p isomers*): Hazard Symbol: T, N; Risk phrases: R39; R23/24/25; R51/53; R62; R63; Safety phrases: S1/2; S20/21; S28; S41; S45; S6; *(m-m-m; m-m-p; m-p-p; p-p-p isomers)* Hazard Symbol: Xn, N; Risk phrases: R21/2251/53; R62; R63; Safety phrases: S2; S28; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*all isomers*).

Description: Tricresyl phosphates are available as the *o*-isomer (TOCP), the *m*-isomer (TMCP), and *p*-isomer (TPCP). The *ortho*-isomer is the most toxic of the three; the meta-and para-isomers are relatively inactive. The commercial product may contain the *ortho*-isomer as a contaminant unless special precautions are taken during manufacture. Pure tri-para-cresyl phosphate is a solid, and ortho-and meta-are liquids (see below). The *tri-o-cresyl phosphate* will be discussed here as the specific example of these compounds because it is the most toxic of the tricresyl phosphates and specifically regulated by OSHA. TOCP is a colorless to pale yellow, odorless liquid or solid (below 52/F/11°C). Molecular weight = 368.39; Specific gravity (H_2O:1) = 1.17 @ 20°C; Boiling point = 410°C (with decomposition); Freezing/Melting point = 11°C; Vapor pressure = 0.00002 mmHg @ 25°C; Flash point = 110°C−225°C; Autoignition temperature = 385°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1−2, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: Tricresyl phosphate is used as an additive in hydraulic fluids; as a plasticizer; pigment dispersant; flame retardant; as a plasticizer for chlorinated rubber; vinyl plastics; polystyrene, polyacrylic, and polymethacrylic esters; as an adjuvant in milling of pigment pastes; as a solvent and as a binder in nitrocellulose and various natural resins, and as an additive to synthetic lubricants and gasoline. It is also used in the recovery of phenol in coke-oven wastewaters.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with magnesium may cause explosion. Organophosphates, such as tricresyl phosphate, are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 40 milligram per cubic meter

OSHA PEL: 0.1 milligram per cubic meter TWA

NIOSH REL: 0.1 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.1 mg/m TWA [skin], not classifiable as a human carcinogen; BEI$_A$ issued for Acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC) Ver. 29[138]

78-30-8, o-isomer

PAC-1: 0.3 ppm

PAC-2: 13 ppm

PAC-3: 40 ppm

Australia: TWA 0.1 milligram per cubic meter, [skin], 1993; Austria: MAK 0.1 milligram per cubic meter, 1999; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; Finland: TWA 0.1 milligram per cubic meter, STEL 0.3 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, [skin], 1999; Hungary: TWA 0.1 milligram per cubic meter, STEL 0.2 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; the Phillipines: TWA 0.1 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.1 milligram per cubic meter; MAC (STEL) 0.3 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, 1999; United Kingdom: TWA 0.1 milligram per cubic meter, STEL 0.3 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for the compound in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota); to 2.0 μ/m^3 (Connecticut and Nevada); to 160.0 μ/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method (IV) #5037, Triorthocresyl phosphate.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact. The widespread epidemics of poisoning that have occurred have been due to ingested ortho-isomer as a contaminant of food-stuffs. Experimental human studies with labeled phosphorus derivatives show only 0.4% of the applied dose was absorbed.

Harmful Effects and Symptoms

Short-Term Exposure: May affect the central and peripheral nervous systems, causing impaired functions (paralysis). Exposure above exposure limits may cause permanent paralysis. The major effects from inhaling, swallowing, or absorbing tricresyl phosphate through the skin are on the spinal cord and peripheral nervous system; the poison attacking the anterior horn cells and pyramidal tract as well as the peripheral nerves. Gastrointestinal symptoms on acute exposure (nausea, vomiting, diarrhea, and abdominal pain) are followed by a latent period of 3−30 days with the progressive development of muscle soreness and numbness of fingers, calf muscles, and toes; with foot and wrist drop. In chronic intoxication, the gastrointestinal symptoms pass unnoticed, and after a long latent period, flaccid paralysis of limb and leg muscles appear. There are minor sensory changes and no loss of sphincter control.

Long-Term Exposure: May affect the nervous system; causing peripheral neuropathy; cramps in calves; paresthesia in feet or hands; weakness in the feet; wrist drop; muscular paralysis.

Points of Attack: Peripheral nervous system; CNS.

Medical Surveillance: Preplacement and periodic examinations should include evaluation of spinal cord and neuromuscular function, especially in the extremities; and a history of exposure to other organophosphate esters; pesticides, or neurotoxic agents. Periodic cholinesterase determination may relate to exposure, but not necessarily to neuromuscular effect.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Medical observation is recommended.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton, polyvinyl chloride, Nitrile + PVC, butyl rubber; and polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *0.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *1 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *2.5 milligram per cubic meter*: Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *5 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *40 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full-faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place away from oxidizing materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: UN2574 Tricresyl phosphate with >3% ortho (*o*-) isomer, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: *Solid* (below 52/F/11°C): Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of phosphorus and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Triethylamine is a colorless liquid. Strong ammonia odor. Molecular weight = 101.22; Specific gravity (H_2O:1) = 0.73 @ 20°C; Boiling point = 90°C; Freezing/Melting point = −115°C; Vapor pressure = 54 mmHg @ 25°C; Flash point = −7°C; Autoignition temperature = 249°C; also listed @ 230°C. Explosive limits: LEL = 1.2%; UEL: 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 2%.

Potential Exposure: Triethylamine is and aliphatic amine used as a solvent; corrosion inhibitor; in chemical synthesis; and accelerator activators; paint remover; base in methylene chloride or other chlorinated solvents. TEA is used to solubilize 2,4,5-T in water and serves as a selective extractant in the purification of antibiotics. It is used to manufacture quaternary ammonia compounds and octadecyloxymethyltriethylammonium chloride; an agent used in textile treatment.

Incompatibilities: A strong base. Violent reaction with strong acids; halogenated compounds; and strong oxidizers. Attacks some forms of plastics, rubber and coatings. Corrosive to aluminum, zinc, copper, and their alloys in the presence of moisture. Reaction with nitrosating agents (e.g., nitrites, nitrous gases, and nitrous acid) capable of releasing carcinogenic nitrosamines.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm

Conversion factor: 1 ppm = 4.14 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 0.48 ppm.

OSHA PEL: 25 ppm/100 milligram per cubic meter TWA

NIOSH REL: No established REL; See *NIOSH Pocket Guide*, Appendix D.

ACGIH TLV[1]: 0.5 ppm/2.05 milligram per cubic meter TWA; 1 ppm/6.2 milligram per cubic meter STEL, not classifiable as a human carcinogen [skin]

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1 ppm

PAC-2: 170 ppm

PAC-3: 1000 ppm (≥10% LEL, lower explosive limit but < 50% LEL)

DFG MAK : 1 ppm/4.2 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group D

Europe OEL: 2 ppm/8.4 milligram per cubic meter TWA; 3 ppm/12.6 milligram per cubic meter STEL [skin] 2002. Australia: TWA 10 ppm (40 milligram per cubic meter), STEL 15 ppm, 1993; Austria: MAK 2.5 ppm (10 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (41 milligram per cubic meter), STEL 15 ppm, 1993; Denmark: TWA 10 ppm (40 milligram per cubic meter), 1999; Finland: TWA 10 milligram per cubic meter, STEL 20 milligram per cubic meter, [skin], 1999; France: VLE 10 ppm (40 milligram per cubic meter), 1999; Hungary: TWA 20 milligram per cubic meter, STEL 40 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 20 milligram per cubic meter, [skin], 2003; Norway: TWA 10 ppm (40 milligram per cubic meter), 1999; the Phillipines: TWA 25 ppm (100 milligram per cubic meter), 1993; Russia: STEL 10 milligram per cubic meter, [skin], 1993; Sweden: NGV 2 ppm (8 milligram per cubic meter), KTV 10 ppm (40 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (40 milligram per cubic meter), KZG-W 20 ppm (80 milligram per cubic meter), 1999; Turkey: TWA 25 ppm (100 milligram per cubic meter), 1993; United Kingdom: TWA 10 ppm (42 milligram per cubic meter), STEL 15 ppm (63 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 3 ppm [skin]. Russia[43] set a MAC in ambient air of residential areas of 0.14 milligram per cubic meter both on a momentary and a daily average basis. Several states have set guidelines or standards for triethylamine in ambient air[60] ranging from 5.6 μ/m^3 (Massachusetts); to 20.0−200.0 μ/m^3 (Rhode Island); to 400.0−600.0 μ/m^3 (North Dakota); to 660.0 μ/m^3 (Virginia); to 800.0 μ/m^3 (Connecticut); to 952.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (II-3) #S-152, OSHA Analytical Method PV2060.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.45$. Unlikely to bioaccumulate in marine organisms.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 2.0 mg/L.

Routes of Entry: Inhalation, ingestion, skin absorption, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Triethylamine can affect you when breathed in and by passing through your skin. Corrosive to the eyes, skin, and respiratory tract. Contact can cause severe eye damage. Breathing the vapor can irritate the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. A CNS depressant.

Long-Term Exposure: Can irritate the lungs; repeated exposures may cause bronchitis to develop. May cause skin allergy. May damage the kidneys and liver. Similar compounds can cause an asthma-like allergy to develop. Once allergy develops, even very small future exposures can cause wheezing, chest tightness and shortness of breath. In animals: myocardial, kidney, liver damage.

Points of Attack: Eyes, skin, respiratory system; cardiovascular system, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: lung function tests; liver function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests; exam of the eyes and vision; evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. nitrile, Viton, and chlorinated polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Provide: eyewash (>1%), quick drench (>1%).

Respirator Selection: OSHA: *200 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Triethylamine must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); or oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where triethylamine is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of triethylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of triethylamine.

Shipping: UN1296 Triethylamine, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Dangerous decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

Trifluorobromomethane T:0820

Formula: $CBrF_3$

Synonyms: Bromofluroform; Bromotrifluormetano (Spanish); Bromotrifluoromethane; Carbon monobromide trifluoride; F 13 B1; FC 13 B1; Flugex 13 B1; Fluorocarbon 1301; Freon 13 B1; Halon 1301; Methane, bromotrifluoro-; R 13 B1; Refrigerant 1301; Trifluoromethyl bromide; Trifluoromonobromomethane

CAS Registry Number: 75-63-8

HSDB Number: 141 as bromotrifluoromethane

RTECSNumber: PA5425000

UN/NA & ERG Number: UN1009/126

EC Number: 200-887-6

Regulatory Authority and Advisory Information

Hazard Alert: Environmental danger (ozone depletion), Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, appendix A), Class I, Ozone Depletion Potential (ODP) = 10.0

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Harms public health and the environment by destroying ozone in the upper atmosphere.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi, N; Risk phrases: R5; R20; R21; R36/37/38; R58/59; Safety phrases: S9; S16; S23; S26; S33; S36/37/39; S38; S57; S59; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Trifluorobromomethane is a colorless gas with a slight ethereal odor. Shipped as a liquefied compressed gas. Molecular weight = 148.91; Specific gravity (H_2O:1) = 1.50 @ 20°C; Boiling point = −58°C; Freezing/Melting point = −172°C; Vapor pressure = 750 mmHg @ −58°C. Slightly soluble in water; solubility = 0.03%.

Potential Exposure: This material is used as a fire extinguishing agent, a chemical intermediate, and as a refrigerant.

Incompatibilities: Keep away from chemically active metals, such as calcium, powdered aluminum; zinc, magnesium. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 40,000 ppm

Conversion factor: 1 ppm = 6.09 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1000 ppm/6100 milligram per cubic meter TWA

NIOSH REL: 1000 ppm/6100 milligram per cubic meter TWA

ACGIH TLV[1]: 1000 ppm/6090 milligram per cubic meter TWA

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 3000 ppm

PAC-2: 4200 ppm

PAC-3: 40,000 ppm

DFG MAK: 1000 ppm/6200 milligram per cubic meter^{TWA}; Peak limitaiont Category (II(8); Pregnancy Group C

Australia: TWA 1000 ppm (6100 milligram per cubic meter), 1993; Austria: MAK 1000 ppm (6100 milligram per cubic meter), 1999; Belgium: TWA 1000 ppm (6090 milligram per cubic meter), 1993; Denmark: TWA 1000 ppm (6100 milligram per cubic meter), 1999; Finland: TWA 1000 ppm (6100 milligram per cubic meter), STEL 1250 ppm (7625 milligram per cubic meter), 1999; France: VME 1000 ppm (6100 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 6100 milligram per cubic meter, 2003; the Phillipines: TWA 1000 ppm (6100 milligram per cubic meter), 1993; Russia: STEL 3000 milligram per cubic meter, 1993; Switzerland: MAK-W 1000 ppm (6100 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (6100 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (6190 milligram per cubic meter), STEL 1200 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1000 ppm. Several states have set guidelines or standards for this compound in ambient air[60] ranging from 61.0 milligram per cubic meter (North Dakota); to 100 milligram per cubic meter (Virginia); to 122 milligram per cubic meter (Connecticut); to 145.238 milligram per cubic meter (Nevada).

Determination in Air: Absorption on charcoal, workup with methylene chloride; analysis by gas chromatography.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guide lines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol-water coefficient: Log K_{ow} = 1.86. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, eye and/or skin contact with the liquid.

Harmful Effects and Symptoms

Short-Term Exposure: Trifluorobromomethane can affect you when breathed in. Irritates the eyes. Contact with the liquid may cause frostbite. Exposure can cause CNS depression, causing lightheadedness, and trouble concentrating. Breathing high concentrations of the vapor may cause the heart to beat irregularly or to stop.

Long-Term Exposure: Unknown at this time. However, some related chemicals are known to cause liver damage with high or repeated exposure.

Points of Attack: CNS; heart.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: A special 24 hour EKG (Holter monitor) to look for irregular heartbeat; consider liver function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming

frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10,000 ppm*: Sa (APF = 10) (any supplied-air respirator). *Up to 25,000 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 40,000 ppm*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Trifluorobromomethane must be stored to avoid contact with chemically active metals (such as calcium, powdered aluminum; zinc and magnesium), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Outdoor, ventilated, fireproof storage preferred. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1009 Bromotrifluoromethane or Refrigerant gas, R-13B, Hazard Class: 2.2; Labels: 2.2-Nonflammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable gas. Thermal decomposition products may include toxic and corrosive gases including phosgene, hydrogen bromide; hydrogen fluoride and oxides of carbon. Extinguish fire using an agent suitable for type of surrounding fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

Regulatory Authority and Advisory Information
Hazard Alert: Extremely Flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Environmental hazard (ozone depletion).
40 CFR Part 98 Subpart A, Table A-1-Global Warming Potentials) As amended in 79 FR 73779, December 11, 2014; Effective date 1/1/2015: Global Warming Potential = 4470 (1,1,1-isomer); 353 (1,1,2-isomer)
Harms public health and the environment by destroying ozone in the upper atmosphere.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, N; Risk phrases: R5; R12; R21; R58/59; Safety phrases: S9; S16; S24; S33; S38; S45; S57; S59; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (*CAS*: *420-46-2*).
Description: 1,1,1-Trifluoroethane is a colorless gas or a liquid under pressure. Molecular weight = 84.04; Specific gravity (H_2O:1) = 0.942 @ 20 Boiling point = −48°C; Freezing/Melting point = −111°C; Autoignition temperature = 750°C; Explosive limits: LEL: 7.4%; UEL: 18.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 0. Low solubility in water.
Potential Exposure: The 1,1,1-isomer is used to make other chemicals and used as a refrigerant.
Incompatibilities: 1,1,1-Trifluoroethane forms an explosive mixture with air. Low molecular weight haloalkanes are highly flammable and can react with some metals to form dangerous products. Materials in this group are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.) and reducing agents such as hydrides, nitrides, alkali metals, and sulfides. Also, they are incompatible with many amines, nitrides, azo/diazo compounds, alkali metals, and epoxides[101].
Permissible Exposure Limits in Air
Russia: The 1,1,1-isomer has a MAC in workplace air of 3,000 milligram per cubic meter[43]
Protective Action Criteria (PAC) not available
Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short-Term Exposure: Trifluoroethane can affect you when breathed in. Inhalation may cause CNS depression. Higher levels may cause dizziness, lightheadedness, unconsciousness, and asphyxiation. Physical contact with the liquid may cause frostbite. Exposure may cause cardiac arrhythmia (irregular heart beat).
Long-Term Exposure: No chronic health effects are known at this time.
Points of Attack: Heart, CNS.
Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Holter monitor (a special 24 hour EKG to look for irregular heartbeats). Examination of the nervous system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.
Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquids, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues.
Respirator Selection: Where there is potential exists for exposure to trifluoroethane, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a

full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Outdoor or detached storage is recommended. Sources of ignition, such as smoking and open flames, are prohibited where trifluoroethane is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2035 1,1,1-Trifluoroethane, compressed or Refrigerant gas, R 143a, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Trifluoroethane is a flammable gas. Thermal decomposition products including hydrogen fluoride and oxides of carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. Use water spray to keep fire-exposed containers cool. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Trifluoroethane, Trenton, NJ (March 1987)

Trifluralin T:0840

Formula: $C_{10}H_9F_3N_3O_4$; $C_3H_7N\text{-}C_6H_2(NO_2)_2CF_3$

Synonyms: Agreflan; Agriflan 24; Autumn kite; Benzenamine, 2,6-dinitro-*N*,*N*-dipropyl-4-(trifluoromethyl-); Benzeneamine, 2,6-dinitro-*N*,*N*-dipropyl-4-(trifluoromethylaniline); Campbell's trifluron; Chandor; Crisalin; Devrinol T; Digermin; 2,6-Dinitro-*N*,*N*-dipropyl-4-(trifluoromethyl)aniline; 2,6-Dinitro-*N*,*N*-dipropyl-4-(trifluoromethyl)benzenamine; 2,6-Dinitro-*N*,*N*-di-*N*-propyl-α,α,α-trifluro-*p*-toluidine; 2,6-Dinitro-4-trifluormethyl-*N*,*N*-dipropylanilin (German); 4-(Di-*N*-propylamino)-3,5-dinitro-1-trifluoromethylbenzene; *N*,*N*-Di-*N*-propyl-2,6-dinitro-4-trifluoromethylaniline; *N*,*N*-Dipropyl-4-trifluoromethyl-2,6-dinitroaniline; Elancolan; Ethane, trifluoro-; Flint; Ipersan; Janus; L-36352; Lilly 36,352; Linnet; Marksman; Marksman 2, Trigard; M.T.F; NCI-C00442; Nitran; Olitref; Onslaught; Sinflowan; Solo; Suseguro carpidor; Synfloran; *p*-Toluidine, α,α,α-trifluoro-2,6-dinitro-*N*,*N*-dipropyl-; Trefanocide; Treficon; Treflan; Treflanocide elancolan; Trifarmon; α,α,α-Trifluoro-2,6-dinitro-*N*,*N*-dipropyl-*p*-toluidine; Trifluralina (Spanish); Trifluralina 600; Trifluraline; Triflurex; Trifurex; Trigard; Trikepin; Trilin; Trilin 10G; Trim; Trimaran; Tripart Trifluralin 48 EC; Tristar

CAS Registry Number: 1582-09-8; *(alt.)* 39300-53-3; *(alt.)* 52627-52-8; *(alt.)* 61373-95-3; *(alt.)* 75635-23-3

HSDB Number: 1003 (1582-09-8)

RTECS Number: XU9275000

UN/NA & ERG Number: UN2588 (Pesticides, solid, toxic, n.o.s.)/151; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 216-428-8 [*Annex I Index No*.: 609-046-00-1]

Regulatory Authority and Advisory Information

Carcinogenicity: EPA: Group C, Possible Human Carcinogen[193]. Basis for classification: Classification is based on the induction of urinary tract tumors (renal pelvis carcinomas and urinary bladder papillomas) and thyroid tumors (adenomas/carcinomas combined) in one animal species (F344 rats) in one study[USEPA]. GHS Classification: Suspected of causing cancer. IARC: Animal, Limited Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1991; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse; no evidence: rat. *aneuploidy*; Weakly Positive: S *cerevisiae-homozygosis*; Positive/limited: Carcinogenicity-mouse/rat; Negative: D *melanogaster* sex-linked lethal; Negative: *In vitro* UDS-human fibroblast; TRP reversion; Inconclusive: B *subtilis* rec assay; *E coli polA* without S9.

Hazard Alert: Poison, Combustible, Sensitization hazard, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

Banned or Severely Restricted (in United States) (UN)[13]

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Safe Drinking Water Act (47FR 9352): Priority List (55 FR 1470)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations *(containing <0.5 ppm NPDA)*: Hazard Symbol: T, N, Xi; Risk phrases: R45; R36; R43; R51; R60; R61; R62; R63; Safety phrases: S2; S24; S29/35; S37; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Trifluralin is an orange crystalline solid. Molecular weight = 335.32; Boiling point = 139°C; Freezing/Melting point = 49°C; Vapor pressure = 0.0001 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this selective, preemergence herbicide.

Incompatibilities: Trifluralin is a trifluoromethyl dinitroaniline derivative. Dinitroaniline has a record of industrial explosions. Nothing has been reported implicating trifluralin in any such accidents. This may be because of the trifluoromethyl substitution may mitigate the instability of the molecule. However, care should be taken in the extremes of heat, shock, and friction sources that may trigger an explosive release of energy[101]. Fluorocarbons can react violently with barium, potassium, sodium.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.2 milligram per cubic meter

PAC-2: 13 milligram per cubic meter

PAC-3: 78 milligram per cubic meter

The state of Pennsylvania has set a guideline for trifluralin in ambient air[60] of 1,150 μ/m^3.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg/L; State Drinking Water Guidelines: Arizona 2 μg/L; Florida 4.5 μg/L; Maine 45 μg/L; Wisconsin 7.5 μg/L. *Fluoride ion*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 5.1$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish Tox = 1.57645000 ppb MATC (HIGH).

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation can cause irritation of the respiratory tract with cough, phlegm, and/or tightness in the chest. The vapor can cause eye and skin irritation. Skin contact can cause irritation and rash which can be exacerbated by sunlight. The majority of reported trifluralin exposure cases were occupational in nature. Other reported symptoms include respiratory involvement, abdominal cramps; nausea, diarrhea, headache, lethargy, and parasthesia following dermal or inhalation exposure.

Long-Term Exposure: May cause skin sensitization. High or repeated exposure may affect the liver and kidneys and/or cause anemia. There is some dispute about the actual carcinogenic effect of trifluralin. NCI[9] reports clear evidence of carcinogenicity in mice but not in rats. Some authorities feel that dipropyl nitrosamine formed in trifluralin manufacture and contained in the technical material might be the actual culprit, and the purified trifluralin might not have this problem. Human Tox = 5.00000 ppb (HIGH).

Points of Attack: Skin, eyes, liver, kidneys, blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Kidney and liver function tests. CBC.

First Aid: *Skin Contact*:[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in temperatures above 4.4°C in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place and protect from prolonged exposure to light.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect waste material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 8000

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride and oxides of nitrogen and carbon. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Trifluralin does contain fluorine, and therefore incineration presents the increased hazard of HF in the off-gases. Prior to incineration, fluorine-containing compounds should be mixed with slaked lime plus vermiculite, sodium carbonate or sand-soda ash mixture (90-10).

RTECS Number: DC2050000

EC Number: 209-008-0 [*Annex I Index No.*: 607-097-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Sensitization hazard (skin, resp.).

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, Xi; Risk phrases: R37; R41; R42/43; Safety phrases: S2; S22; S26; S36/37/39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Trimellitic anhydride is a crystalline solid. It is the anhydride of trimellitic acid (1,2,4-benzenetricarboxylic acid). Molecular weight = 192.13; Boiling point = 245°C; Freezing/Melting point = 166.7°C; Vapor pressure = 0.000004 mmHg; Flash point = 227°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1~~W~~. Highly soluble; reacts with water.

Potential Exposure: TMA is used to produce trimellitate plasticizers, poly (amide-imide) polymers; in paints, enamels, and coatings; polymers, polyesters; as a curing agent for epoxy and other resins; in vinyl plasticizers; agricultural chemicals; dyes and pigments; pharmaceuticals, surface active agents; modifiers, intermediates, and specialty chemicals.

Incompatibilities: Dust can cause an explosion. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Reacts slowly with water, forming trimellitic acid. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.86 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.005 ppm/0.04 milligram per cubic meter TWA, Should be handled in the workplace as an extremely toxic substance.

ACGIH TLV[1]: 0.0005 milligram per cubic meter measured as inhalable fraction and vapor TWA; 0.002 milligram per cubic meter measured as inhalable fraction and vapor Ceiling Concentration; [skin]; danger of sensitization.

DFG MAK: 0.04 milligram per cubic meter TWA; Peak Limitation Category I(1); danger of sensitization of the airways

Australia: TWA 0.005 ppm (0.04 milligram per cubic meter), 1993; Austria: MAK 0.005 ppm (0.04 milligram per cubic meter), 1999; Belgium: TWA 0.005 ppm (0.059 milligram per cubic meter), 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; Finland: TWA 0.005 ppm, 1999; Norway: TWA 0.005 ppm (0.04 milligram per cubic meter), 1999; Russia: STEL 0.1 milligram per cubic meter, 1993; Sweden: NGV 0.04 milligram per cubic meter, TGV 0.08 milligram per cubic meter, 1999; Switzerland: MAK-W 0.005 ppm (0.04 milligram per cubic meter), KZG-W 0.01 ppm (0.08 milligram per cubic meter), 1999; United Kingdom: TWA 0.04 milligram per cubic meter, STEL 0.12 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.04 milligram per cubic meter. Several states have set guidelines or standards for trimellitic anhydride in ambient air[60] ranging from 0.4 μ/m^3 (North Dakota); to 0.7 μ/m^3 (Virginia); to 0.8 μ/m^3 (Connecticut); to 1.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5036, Trimellitic anhydride, OSHA Analytical Method 98.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Trimellitic anhydride can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. High exposure may cause runny nose; cough, wheezing and shortness of breath; malaise (vague feeling of discomfort), fever, muscle aches. "TMA-flu" with symptoms of cough, chills, shortness of breath; body aches; weakness, and coughing up blood may be delayed for 4–12 hours following overexposure. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated skin and/or inhalation exposure may cause sensitization asthma which may be delayed and may be aggravated by physical activity.

Allergic asthma occurs sometimes weeks or months after exposure. Trimellitic anhydride can also cause "Pulmonary Disease-Anemia Syndrome" with low blood count, and different lung changes.

Points of Attack: Eyes, skin, respiratory system; blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function test-these may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: special tests for trimellitic anhydride allergy (IgE antibodies against TM-HAS). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.005 ppm* exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN 149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid (no flash point can be found in the literature). Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water (anhydrous)
Description: Trimethylamine is compressed gas or liquid. Flammable gas. Shipped as a compressed gas, it may be present in an aqueous solution. It has a strong, fishy, ammoniacal odor. The Odor Threshold is 0.00011−0.87 ppm. *Warning*: The Odor Threshold range is so broad that odor alone should not be used as a warning of potentially hazardous exposures. Molecular weight = 59.13; Boiling point = 3°C; Specific gravity (H_2O:1) = 0.58 @ 25°C; Freezing/Melting point = −117°C; Vapor pressure = 1454 mmHg @ 21°C; Flash point = flammable gas; Autoignition temperature = 190°C. Explosive limits: LEL = 2.0 %; UEL: 11.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water; solubility = 48% @ 30°C.
Potential Exposure: Trimethylamine is used as a chemical intermediate in organic synthesis of quaternary ammonium compounds; as an insect attractant; as a warning agent in natural gas; flotation agent.
Incompatibilities: A medium strong base. Violent reaction with strong oxidizers (such as chlorine, bromine, fluorine), ethylene oxide; nitrosating agents, for example, nitrites, sodium nitrite, nitrous gases, nitrous acid) capable of releasing carcinogenic nitrosamines.); keep away from mercury, strong acids. Corrosive to many metals, for example, zinc, brass, aluminum, copper, tin, and their alloys.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 2.42 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 10 ppm /24 milligram per cubic meter TWA; 15 ppm /36 milligram per cubic meter STEL
ACGIH TLV[1]: 5 ppm/12 milligram per cubic meter TWA; 15 ppm /36 milligram per cubic meter STEL
Protective Action Criteria (PAC)* Ver. 29[138]
PAC-1: $\mathbf{8.0_A}$ milligram per cubic meter
PAC-2: $\mathbf{120_A}$ milligram per cubic meter
PAC-3: $\mathbf{380_A}$ milligram per cubic meter
DFG MAK: 2 ppm/4.9 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group C
Australia: TWA 10 ppm (24 milligram per cubic meter), STEL 15 ppm, 1993; Belgium: TWA 10 ppm (24 milligram per cubic meter), STEL 15 ppm, 1993; Denmark: TWA 10 ppm (24 milligram per cubic meter), 1999; France: VLE 10 ppm (25 milligram per cubic meter), 1999; Hungary: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter, 1993; Norway: TWA 10 ppm (24 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 15 ppm. Several states have set guidelines or standards for trimethylamine in ambient air[60] ranging from 57.143 μ/m^3 (Kansas); to 240−360.0 μ/m^3 (North Dakota); to 400.0 μ/m^3 (Virginia); to 480.0 μ/m^3 (Connecticut); to 952.0 μ/m^3 (Nevada).
Determination in Air: Use OSHA Analytical Method PV2060.
Determination in Water: Octanol-water coefficient: Log $K_{ow} = 0.2$. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation, ingestion (solution), skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Trimethylamine can affect you when breathed in. Exposure can irritate the eyes, skin and respiratory tract Very high levels may cause a buildup of fluid in the lungs (pulmonary edema). This can cause death. Contact can cause severe irritation and burns to the eyes and skin. May cause blurred vision, corneal necrosis. Contact may cause frostbite.
Long-Term Exposure: Long-term effects are not known at this time.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear gas-proof goggles, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 10* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Check oxygen content prior to entering storage area. Flammable gas. (1) Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. (2) Color code-Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Trimethylamine must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and mercury, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where trimethylamine is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of trimethylamine. Wherever trimethylamine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1083 Trimethylamine, anhydrous, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. UN1297 Trimethylamine, aqueous solutions with not >50% trimethylamine by mass, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. For a spill of a liquid solution of trimethylamine, absorb liquid with sodium bisulfate, sand, vermiculite, earth or a similar material. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Trimethylamine is an extremely flammable gas or liquid. Thermal decomposition products may include poisonous and irritating oxides of nitrogen and carbon, hydrocarbons (i.e., ethane and methane), and explosive hydrogen. For a small fire involving trimethylamine gas, use dry chemical or CO_2 extinguishers. For small water solution fires, use dry chemical, CO_2, water spray; or foam extinguishers. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If liquid or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

2,4,6-Trimethylaniline T:0870

Formula: $C_9H_{13}N$; $C_6H_2(CH_3)_3NH_2$

Synonyms: Aminomesitylene; 2-Amino-1,3,5-trimethylbenzene; Aniline, 2,4,6-trimethyl-; Mesidine; Mesitylamine; Mezidine; 2,4,6-Trimethylbenzenamine

CAS Registry Number: 88-05-1

HSDB Number: 2694

RTECS Number: BZ0700000

UN/NA & ERG Number: UN2810 (toxic liquid, organic, n.o.s.)/153

EC Number: 201-794-3

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1982. Suspect occupational carcinogen. (Nonspecific, aromatic amines)

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 500 lb (227 kg)

Canada, WHMIS, Classification D2B. On NDSL list.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; Risk phrases: R21/22; R23/24/25; R26; R33; R36/38; R50/53; Safety phrases: S26; S28; S36/37; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Aniline, 2,4,6-Trimethyl-is a clear liquid. Molecular weight = 135.23; Specific gravity (H_2O:1) = 0.96 @ 20°C; Boiling point = 232°C; Freezing/Melting point = −5°C; Flash point = 95.7°C. Insoluble in water.

Potential Exposure: Used on small scale in organic synthesis.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.26 milligram per cubic meter

PAC-2: 2.9 milligram per cubic meter

PAC-3: 10 milligram per cubic meter

Routes of Entry: Inhalation, dermal contact, Ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: This material is moderately toxic orally. It is also considered highly toxic by dermal contact and inhalation. Also, it is a skin and eye irritant. The danger of acute poisoning is represented by methemoglobinemia leading to adverse effects on the red cells. Some amines may act as skin sensitizers. Repeated exposure results in narrowing of peripheral vision, increase in size of blind spot and decrease in photosensitivity. The LC_{50} inhalation (mouse) is 0.29 mg/L/2 hours.

Long-Term Exposure: Suspect occupational carcinogen. This material is a suspect carcinogen on the basis of being an aromatic amine but unlike the 2,4,5-trimethyl-isomer, is not animal positive.

Points of Attack: Blood, skin, eyes, respiratory system.

Medical Surveillance: This chemical is a suspected human carcinogen (nonspecific, aromatic amines). Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Wear positive pressure breathing apparatus and special protective clothing. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. *Small fires*: dry chemical, carbon dioxide; water spray or foam. *Large fires*: water spray, fog or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. If water pollution occurs, notify appropriate authorities. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

95-63-6, 1,2,4-isomer

Hazard Alert: Poison, Flammable, Suspected of causing genetic defects (mixed isomers) Primary irritant (w/o allergic reaction).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%, 1,2,4-and 1,3,5-isomers; 1% 1,2,3- and mixed isomers. *Note*: Only the 1,2,4-isomer is regulated by the United States Environmental Protection Agency. All three isomers are "regulated" by NIOSH. The 1,3,5-isomer was dropped from the EPA's Extremely Hazardous Substance List (EPA-SARA) in 1988.

European/International Regulations (*95-63-6*): Hazard Symbol: F, Xn; Risk phrases: R10; R20; R36/37/38; R51; Safety phrases S2; S26; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters *95-63-6 (1,2,4-isomer)*

Description: Trimethylbenzenes exists in three isomeric forms. All isomers are clear, colorless liquids with a distinctive, aromatic odor. Molecular weight = 120.2; Specific gravity (H_2O:1) = 0.88 to 0.89 @ 20°C; Boiling point = 176°C (1,2,3-isomer); 169°C (1,2,4-isomer); 165°C (1,3,5-isomer); Freezing/Melting point = −25°C (1,2,3-isomer); −44°C (1,2,4-isomer); −45°C (1,3,5-isomer); Vapor pressure = 1 mmHg @ 17°C (1,2,3-); 1 mmHg @ 13°C (1,2,4-); Flash points = 44°C (1,2,3-& 1,2,4-isomers); 50°C (1,3,5-isomer); 53°C [1,2,3-isomer (90.5%)]; Autoignition temperature = 470°C (1,2,3-isomer); 479°C [1,2,3-isomer (90.5%)]; 500°C (1,2,4-isomer); 559°C (1,3,5-isomer). Explosive limits: LEL = 0.9%; UEL: 6.4% (1,2,4-isomer); LEL = 0.8%; UEL: 6.6% (1,2,3-isomer). NFPA 704M Hazard Identification (all isomers): Health 1, Flammability 2, Reactivity 0. Practically insoluble in water; solubility = 0.005% (1,2,3-isomer); 0.006% (1,2,4-isomer).

Potential Exposure: (1,2,3-and 1,2,4-isomers): These materials are used as solvents and in dye and perfume manufacture. The 1,2,3-isomer is used as raw material in chemical synthesis and as an UV stabilizer. The 1,2,4-isomer is used as the raw material for trimellitic anhydride manufacture. These compounds are found in diesel engine exhaust fumes.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air
Odor Threshold (for the class) = 0.55 ppm.

Several states have set guidelines or standard for Trimethyl benzenes in ambient air[60] ranging from 1.25−1.70 milligram per cubic meter (North Dakota); to 2.1 milligram per cubic meter (Virginia); to 2.5 milligram per cubic meter (Connecticut); to 2.976 milligram per cubic meter (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2091

Determination in Water: Octanol-water coefficient: Log K_{ow} = (1,2,3-) >3.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation percutaneous absorption, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Trimethyl benzene can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Exposure can cause you to feel dizzy, lightheaded, and to pass out. Symptoms of exposure can also include headache, drowsiness, fatigue, dizziness, nausea, a lack of coordination; vomiting, nervousness, tenseness, confusion. Liquid deposition in lungs causes bronchitis or chemical pneumonitis.

Long-Term Exposure: Repeated exposures can cause headaches, tiredness, and a feeling of nervous tension. Can affect the blood cells and the blood's clotting ability; hypochromic anemia. Delayed or chronic health hazard is possible including asthmatic bronchitis with coughing and/or shortness of breath. The use of alcoholic beverages enhances the effect. May cause liver damage. The liquid destroys the skin's natural oils, causing drying and cracking.

Points of Attack: Eyes, skin, respiratory system; CNS; blood, liver.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. CBC and platelet count. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. CBC and platelet count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: *Inhalation*: Bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 25* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Trimethylbenzene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN3295 Hydrocarbons, liquid, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid. UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required. 1,3,5-Trimethylbenzene; UN2325, Hazard Class: 3; Labels: 3-Flammable liquid. 1,2,4-Trimethylbenzene:

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. *Small fires*: dry chemical, carbon dioxide; water spray; or alcohol-resistant foam. *Large fires*: water spray, fog, or alcohol foam. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F+, C, Xn; Risk phrases: R11; R14; R19; R20/22; R21; R23/24/25; R34; R36/37/38; R39; R40; R41; R62; Safety phrases: S1; S7; S16; S21; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Trimethylchlorosilane is a colorless, fuming liquid. Irritating odor. Molecular weight = 108.66; Specific gravity (H_2O:1) = 0.85 @ 20°C; Boiling point = 57°C; Freezing/Melting point = −40°C; Flash point = −15°C (cc); Vapor pressure = 200 mmHg @ 18C; Autoignition temperature = 395°C. Explosive limits: LEL: 1.5%; UEL: >60%; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2, ~~W~~ Reacts violently with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: Trimethylchlorosilane is used as an intermediate to make silicone products, including lubricants.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture. Vigorous reaction with aluminum powder.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{1.8_A}$ ppm

PAC-2: $\mathbf{22_A}$ ppm

PAC-3: $\mathbf{100_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the respiratory tract causing coughing and wheezing. Contact can cause severe skin and eye irritation and burns with possible permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Can irritate the lungs; bronchitis may develop with coughing, phlegm, and/or shortness of breath. There is limited evidence that trimethylchlorosilane causes cancer in animals.

Points of Attack: Cancer site in animals: lungs.

Medical Surveillance. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear-splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved.

Storage: Color code-Red: Flammability Hazard: Store Store in temperatures below 21°C in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool (below 70/F/21°C), well-ventilated area away from moisture of any form and strong oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN1298 Trimethylchlorosilane, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material.

Spill Handling:

Trimethylchlorosilane when spilled in water

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (*From a small package or a small leak from a large package*)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.0/1.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. If water pollution occurs, notify appropriate authorities. Shut off ignition sources; no flares, smoking or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors do not get water inside container. *Small spills*: flush area with flooding amounts of water. *Large spills*: dike far ahead of spill for later disposal. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and oxides of silicon and carbon. Use dry chemical or carbon dioxide. Fire may restart after is has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Use a licensed disposal contractor to an approved landfill. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office for guidance on acceptable disposal practices. The most favorable course of action is to use an alternative chemical product with less inherent propensity for occupational exposure or environmental contamination. Recycle any unused portion of the material for its approved use or return it to the manufacturer or supplier. Ultimate disposal of the chemical must consider: the material's impact on air quality; potential migration in soil or water; effects on animal, aquatic, and plant life; and conformance with environmental and public health regulations[72].

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 220 (≥80.00% concentration).

Hazard Alert: Highly Flammable, Violent decomposition in water, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F+, Xi, Xn; Risk phrases: R11; R21/22; R23/24/25; R36/37/38; R29; R36/37/38; R39; R41; R46; R48/23/24/25; R60; R61; R62; R65; Safety phrases: S1; S3/7; S16; S21; S26; S36/37; S39; S45; S53; S62; R66; R67 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Trimethyl phosphite is a colorless liquid. Distinctive pungent, pyridine-like odor. The Odor Threshold is 0.0001 ppm. Molecular weight = 124.09; Specific gravity (H_2O:1) = 1.05 @ 20°C; Boiling point = 111°C; Freezing/Melting point = −78°C; Vapor pressure = 24 mmHg @ 25°C; Flash point = 28°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 1. ~~W~~ Practically insoluble in water; violent reaction.

Potential Exposure: Trimethyl phosphite is a flame retardant, and used as an intermediate in the manufacture of a number of pesticides, and organophosphorus additives.

Incompatibilities: Vaor May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Violent reaction with magnesium perchlorate[Allison, 1968/Cameo]. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Reacts (hydrolyzes) with water. Incompatible with air, moisture.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.08 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 2 ppm/10 milligram per cubic meter TWA

ACGIH TLV[1]: 2 ppm TWA

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: **6.1**$_{\mathbf{A}}$ ppm

PAC-2: **61**$_{\mathbf{A}}$ ppm

PAC-3: **310**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Australia: TWA 2 ppm (10 milligram per cubic meter), 1993; Belgium: TWA 2 ppm (10 milligram per cubic meter), 1993; Denmark: TWA 0.5 ppm (2.6 milligram per cubic meter), 1999; Finland: TWA 0.5 ppm (2.6 milligram per cubic meter), STEL 10 ppm (52 milligram per cubic meter), [skin], 1999; France: VME 2 ppm (10 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; United Kingdom: TWA 2 ppm (10 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 ppm. Several states have set guidelines or standards for Trimethyl phosphite in ambient air[60] ranging from 100 μ/m^3 (North Dakota); to 160 μ/m^3 (Virginia); to 200 μ/m^3 (Connecticut); to 238 μ/m^3 (Nevada).

Determination in Air

DFG MAK: No numerical value established. Data may be available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Trimethyl phosphite can affect you when breathed in and by passing through your skin. The vapor irritates the eyes, skin, and upper respiratory tract. Contact can severely irritate and may permanently damage the eyes. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Trimethyl phosphite can severely irritate the skin and can cause a rash and skin allergy. Exposure may damage the liver and kidneys.

Long-Term Exposure: Can cause lung irritation; bronchitis may develop. Exposure may cause emphysema. May damage the liver and kidneys. In animals: teratogenic effects

Points of Attack: Eyes, skin, respiratory system; reproductive system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy; and liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 2* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full facepiece powered-air purifying respirators. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-Red: Flammability Hazard: Store under a nitrogen blanket in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area away from magnesium diperchlorate. Sources of ignition, such as smoking and open flames, are prohibited where trimethyl phosphite in handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of trimethyl phosphite should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters.

Shipping: UN2329 Trimethyl phosphite, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include phosphine, and oxides of phosphorus and carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA 40CFR264, appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Explosive; mass explosion hazard, GHS H201.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: E, F +, T +, N, Xi; Risk phrases: R1; R2; R12; R23/24/25; R26/27/28; R33; R29/35; R36/37/38; R41; R43; R50/53; R63; Safety phrases: S1; S1; S13; S16; S23; S24/25; S27; S28; S35; S36/37; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Trinitrobenzene is a yellow crystalline solid. Molecular weight = 213.1; Vapor pressure = 1.45 mmHg @ 152°C; Boiling point = 315°C; Freezing/Melting point = 123°C. Hazard Identification (based on NFPA-704 M Rating System): (*wetted or with <30% water*) Health 2, Flammability 4, Reactivity 4; (wetted with >30% water) Health 2, Flammability 4, Reactivity 2. Insoluble in water.

Potential Exposure: *Trinitrobenzene is explosive when dry*. Used as an explosive; as a vulcanizing agent for natural rubber. Trinitrobenzene may be more powerful than TNT; and is reported to be less sensitive to impact than TNT. However it is difficult to produce, and is not used as widely as TNT.

Incompatibilities: Sensitive to shock and heat. Incompatible with initiating explosives, combustible materials. Aromatic nitro compounds, such as trinitrobenzene, range from slight to strong oxidizing agents. Keep away from strong reducing agents, including hydrides, alkali metals; aluminium and other metal powder; phosphorus; sulfides and nitrides, alkaline material, strong bases; contact may initiate vigorous reactions that culminates in a detonation. The aromatic nitro compounds may explode in the presence of a base such as sodium hydroxide or potassium hydroxide even in the presence of water or organic solvents[101]. The aromatic nitro compounds may explode in the presence of a base such as sodium hydroxide or potassium hydroxide even in the presence of water or organic solvents[101]. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 16 milligram per cubic meter

PAC-3: 54 milligram per cubic meter

Permissible Concentration in Water: Very Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. Russia[43] has set a MAC in water bodies used for domestic purposes of 0.4 mg/L.

Determination in Water: Log $K_{ow} = < 2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Risk of serious eye damage. LD_{50} = (oral-rat) <300 mg/kg.

Long-Term Exposure: Information on the carcinogenicity, mutagenicity, teratogenicity, or adverse reproductive effects of trinitrobenzene was not found in the available literature. Trinitrobenzene has been reported to produce liver damage, CNS damage; and methemoglobin formation in animals. Breathing difficulties have also been reported. Eye damage reported in the munitions industry. May cause skin sensitization. Methemoglobinemia may develop.

Points of Attack: Eyes, skin, liver, blood, CNS; respiratory system.

Medical Surveillance. Lung function tests. Liver function tests. Examination of the eyes by an ophthalmologist; nervous system. Evaluation by a dermatologist and a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBAs with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: UN0214 Explosive. UN1354 Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8-10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, explosives, oxidizable materials. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN0214 Trinitrobenzene, dry or wetted with <30% water, by mass, Hazard Class: 1.1D; Labels:1.1D-Explosives (with a mass explosion hazard); *D-Substances or articles which may mass detonate (with blast and/or fragment hazard) when exposed to fire*. UN1354 Trinitrobenzene, wetted with not <30% water, by mass, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an explosive solid. Rapid heating may cause explosion. Thermal decomposition products may include oxides of nitrogen and carbon. If material is on fire and conditions permit, do not extinguish. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Cool exposed containers from unattended equipment or remove intact containers if it can be done safely. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire-fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in a combustible solvent and spray into an incinerator equipped with afterburner and scrubber.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government. H201 Explosive; mass explosion hazard,.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: E, T, N, Xi; Risk phrases: R45; R2; R11; R23/24/25; R26/27/28; R33; R36/37/38; R41; R43; R51/53; R62; R63; Safety phrases: S1; S1; S13; S16; S23; S24/25; S27; S28; S29/35; S36/37; S41; S45; S53; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: TNT exists in five isomers; 2,4,6-trinitrotoluene is the most commonly used. It is a colorless to pale yellow odorless solid (pellets, cast blocks, and cast slabs) or crushed flakes. Molecular weight = 227.15; Specific gravity (H_2O:1) = 1.65 @ 25°C; Boiling point = (explodes) 240°C; Freezing/Melting point = 80°C; Vapor pressure = 0.0002 mmHg @ 25°C; Ionization Potential = 10.59 eV. It explodes @ 232°C (also reported @ 240°C and 297°C) but burns @ 295°C when not confined. TNT is a relatively stable high explosive. Practically insoluble in water; solubility = 0.01% @ 25°C.
Potential Exposure: TNT is used as an explosive, that is, as a bursting charge in military explosive shells, bombs, grenades, and mines; and an intermediate in dyestuffs and photographic chemicals.
Incompatibilities: Sensitive to shock and heat. Incompatible with initiating explosives, combustible materials. Aromatic nitro compounds, such as trinitrobenzene, range from slight to strong oxidizing agents. Keep away from strong reducing agents, including hydrides, alkali metals; aluminium and other metal powder; phosphorus; sulfides and nitrides, alkaline material, strong bases; contact may initiate vigorous reactions that culminates in a detonation. The aromatic nitro compounds may explode in the presence of a base such as sodium hydroxide or potassium hydroxide even in the presence of water or organic solvents[101]. The aromatic nitro compounds may explode in the presence of a base such as sodium hydroxide or potassium hydroxide even in the presence of water or organic solvents[101]. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions.
Permissible Exposure Limits in Air
NIOSH IDLH = 500 milligram per cubic meter
OSHA PEL: 1.5 milligram per cubic meter TWA [skin]
NIOSH REL: 0.5 milligram per cubic meter TWA [skin]
ACGIH TLV[1]: 0.1 milligram per cubic meter TWA [skin]
DFG MAK: 0.011 ppm/0.1 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Carcinogen Category 3B; Pregnancy Risk Gropup D
Arab Republic of Egypt: TWA 0.5 milligram per cubic meter, 1993; Australia: TWA 0.5 milligram per cubic meter, [skin], 1993; Austria: MAK 0.01 ppm (0.1 milligram per cubic meter), [skin], Suspected: carcinogen, 1999; Belgium: TWA 0.5 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter, [skin], 1999; Finland: TWA 0.5 milligram per cubic meter, STEL 3 milligram per cubic meter, [skin], 1999; France: VME 0.5 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; Norway: TWA 0.1 milligram per cubic meter, 1999; the Phillipines: TWA 1.5 milligram per cubic meter, [skin], 1993; Poland: MAC (TWA) 1 milligram per cubic meter; MAC (STEL) 3 milligram per cubic meter, 1999; Russia: TWA 0.1 milligram per cubic meter, STEL 0.5 milligram per cubic meter, [skin],

1993; Sweden: NGV 0.1 milligram per cubic meter, KTV 0.2 milligram per cubic meter, [skin], 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, [skin], 1999; Turkey: TWA 1.5 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.3 milligram per cubic meter, [skin]; TWA 0.2 ppm (0.89 milligram per cubic meter), [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 milligram per cubic meter [skin]. Several states have set guidelines or standards for TNT in ambient air[60] ranging from 5.0 μ/m^3 (North Dakota); to 8.0 μ/m^3 (Virginia); to 10.0 μ/m^3 (Connecticut); to 12.0 μ/m^3 (Nevada).

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 17 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter

Determination in Air: Use OSHA Analytical Method 44.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.60$. Unlikely to bioaccumulate in marine organisms.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Routes of Entry: Inhalation of dust, fume, or vapor; ingestion of dust; percutaneous absorption from dust, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure to trinitrotoluene may cause irritation of the eyes, nose, and throat with sneezing, cough, and sore throat. It may cause skin irritation; dermatitis, and may stain the skin, hair, and nails a yellowish color. Numerous fatalities have occurred in workers exposed to TNT from toxic hepatitis or aplastic anemia. TNT exposure may also cause methemoglobinemia with cyanosis, weakness, drowsiness, dyspnea, and unconsciousness. Ingestion may cause hallucinations or distorted perceptions, cyanosis (blue color to the skin, lips and fingertips), and gastrointestinal changes.

Long-Term Exposure: May affect the liver, causing hepatitis and jaundice. May affect the blood causing hemolysis, formation of methemoglobin. And cyanosis. May affect vision, causing cataracts. In addition, it may cause muscular pains, heart irregularities; renal irritation; menstrual irregularities; and peripheral neuritis.

Points of Attack: Blood, liver, eyes, cardiovascular system; CNS; kidneys, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: CBC; aplastic anemia; liver function tests; urine (chemical/metabolite); urinalysis (routine). Placement or periodic examinations should give special considerations to history of allergic reactions, blood dyscrasias; reactions to medications; and alcohol intake. The skin, eyes, blood, and liver and kidney function should be followed. Urine may be examined for TNT using the Webster test or for the urinary metabolite 2,6-dinitro-4-aminotuluene; however, both may be negative if there is liver injury.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl chloride is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. The Webster skin test (colorimetric tests with alcoholic sodium hydroxide) or indicator soap should be used to make sure workers have washed all TNT off their skins.

Respirator Selection: NIOSH: *Up to 5 milligram per cubic meter*: Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 milligram per cubic meter*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 25 milligram per cubic meter*: SCBAF (APF = 50) (any SCBA with a full facepiece; or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. TNT is an explosive. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a explosion-proof refrigerator and keep away from reducing agents[52]. Keep material wet with water or treat as an explosive. Keep away from heat, sources of ignition; metal, nitric acid; and reducing materials. Protect containers from shock. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1356 Trinitrotoluene, wetted with not <30% water, by mass, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN0209 Trinitrotoluene or TNT, dry or wetted with < 30% water, by mass, Hazard Class: 1D; Labels:1D-Explosive (with a mass explosion hazard); *D-Substances or articles which may mass detonate (with blast and/or fragment hazard) when exposed to fire.*

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect waste material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a dangerously explosive solid. Thermal decomposition products may include oxides of nitrogen and carbon. If material is on fire and conditions permit, do not extinguish. Evacuate area and let burn. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Cool exposed containers from unattended equipment or remove intact containers if it can be done safely. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: TNT is dissolved in acetone and incinerated. The incinerator should be equipped with an afterburner and a caustic soda solution scrubber.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[192]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi; Risk phrases: R36/37/38; R51/53; Safety phrases: S16; S26; S28; S29/35; S36/37/39; S41; S45, S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Triphenylamine is a colorless crystalline solid. Molecular weight = 245.34; Specific gravity (H_2O:1) =

0.77 @ 25°C; Boiling point = 365°C; also reported @ 195°C @ 10 mmHg; Freezing/Melting point = 127°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Triphenylamine is used as a primary photoconductor and in making photographic film coated on photographic film bases.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxo acids, epoxides, aldehydes, ketones.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: withdrawn due to insufficient data.

Australia: TWA 5 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter, [skin], 1999; France : VME 5 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; IN Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 milligram per cubic meter. Several states have set guidelines or standards for triphehylamine in ambient air[60] ranging from 8.0 μ/m^3 (Virginia); to 50.0 μ/m^3 (North Dakota); to 100.0 μ/m^3 (Connecticut).

Determination in Air: No method available.

Determination in Water: Log $K_{ow} = \sim 6$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Triphenylamine can affect you when breathed in and by passing through your skin. Contact can irritate the skin.

Long-Term Exposure: No known long-term effects are known, although some related aromatic amines can cause skin and lung allergies and have been shown to be carcinogenic to the human bladder, ureter, prostate, intestines, lung, and liver.

Points of Attack: Skin.

First Aid: *Skin Contact*:[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area away from aldehydes, ketones, nitrates, oxidizers, oxygen and peroxides. Where possible, automatically transfer material from storage containers to process containers.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. The powdered material may be dampened with 60%−70% acetone to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, Xn, N; Risk phrases: R20/21/22; R36/R37; R38; R40; R41; R48/20/22; R51/53; Safety phrases: S16; S22; S24/25; S26; S36/37/39; S38; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Triphenyl phosphate is a colorless crystalline powder with a faint, phenol-like odor. Molecular weight = 326.30; Specific gravity (H_2O:1) = 1.29 @ 25°C; Boiling point = 413.3°C; Freezing/Melting point = 49°C; Vapor pressure = 1 mmHg @ 193°C; Flash point = 220°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Practically insoluble in water; solubility 0.002% @ 54°C.

Potential Exposure: Triphenyl phosphate is used to impregnate roofing paper and as a fire-resistant plasticizer in plastics; for cellulose esters in lacquers and varnishes. Used in making adhesives, gasoline additives; flotation agents; insecticides, surfactants, antioxidants, and stabilizers. A substitute for camphor.

Incompatibilities: Incompatible with strong oxidizers; strong acids; nitrates may cause fire or explosions. Phosphates are incompatible with antimony pentachloride, magnesium, silver nitrate, zinc acetate.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 milligram per cubic meter

OSHA PEL: 3 milligram per cubic meter TWA

NIOSH REL: 3 milligram per cubic meter TWA

ACGIH TLV[1]: 3 milligram per cubic meter TWA, not classifiable as a human carcinogen

Australia: TWA 3 milligram per cubic meter, 1993; Belgium: TWA 3 milligram per cubic meter, 1993; Denmark: TWA 3 milligram per cubic meter, 1999; Finland: TWA 3 milligram per cubic meter, STEL 6 milligram per cubic meter, [skin], 1999; France: VME 3 milligram per cubic meter, 1999; Norway: TWA 3 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 3 milligram per cubic meter, 2003; Switzerland : MAK-W 3 milligram per cubic meter, 1999; United Kingdom: LTEL 3 milligram per cubic meter, STEL 6 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for triphenyl phosphate in ambient air[60] ranging from 1.6 μ/m^3 (Virginia); to 30.0 μ/m^3 (North Dakota); to 60.0 μ/m^3 (Connecticut); to 71.0 μ/m^3 (Nevada).

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 9 milligram per cubic meter

PAC-2: 360 milligram per cubic meter

PAC-3: 2100 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method (IV) #5038, Triphenyl phosphate.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Slowly absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Slowly absorbed by the skin. May cause eye and skin irritation.

Long-Term Exposure: Minor changes in blood enzymes. In animals: muscular weakness, paralysis. May be a cholinesterase inhibitor, but not a potent one.

Points of Attack: Blood, peripheral nervous system[77].

Medical Surveillance: Consider the blood in preplacement and periodic physical examinations. Examination of the peripheral nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth and get medical attention.

Personal Protective Methods: Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 15 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 30 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 75 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 150 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 1000 milligram per cubic meter*: SA: PD,PP (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place away from antimony pentachloride, magnesium, silver nitrate; zinc acetate.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include phosphine and oxides of nitrogen, phosphorus and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in furnace equipped with alkaline scrubber.

Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); no evidence: mouse, rat. United States Environmental Protection Agency Gene-Tox Program, Negative: Carcinogenicity-mouse/rat

Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects, Organometallic; Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B) as triphenyltin compounds

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%. (acetate and hydroxide); 1% (chloride)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*76-87-9*): Hazard Symbol: T + , N; Risk phrases: R10; R24/25; R26; R37/38; R40; R41; R48/23; R63; R50/53; Safety phrases: S1/2; S26; S28; S36/37/39; S45; S60; 61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (*fentin hydroxide*).

Description: *Triphenyltin acetate* is a white solid. Molecular weight = 409.07; Freezing/Melting point = 122°C. Practically insoluble in water. *Triphenyltin chloride* is a colorless to yellow crystalline solid with a characteristic odor. Molecular weight = 385.47; Boiling point = 240°C @ 13.5 mmHg; Freezing/Melting point = 106°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Hydrolyzes to hydroxide in water. *Triphenyltin hydroxide* is a white crystalline solid. Molecular weight = 367.03; Freezing/Melting point = 118°C−120°C (decomposes). Practically insoluble in water.

Potential Exposure: The hydroxide is used in vinyl products to protect against mildew growth and stiffening by bacteria and fungi. At risk are those engaged in the manufacture, formulation and application of insecticides used for fungus, algae and mollusk control; as a chemosterilant.

Incompatibilities: Triphenyltin chloride: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Keep away from moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[Sn]/m^3

OSHA PEL: 0.1 mg[Sn]/m^3 TWA

NIOSH REL: 0.1 mg[Sn]/m^3 TWA [skin]

hydroxide

Australia: TWA 0.1 mg[Sn]/m^3, [skin], 1993; Austria: MAK 0.1 mg[Sn]/m^3, [skin], 1999; Belgium: TWA 0.1 mg[Sn]/m^3, [skin], 1993; Denmark: TWA 0.1 mg[Sn]/m^3, [skin], 1999; Finland: TWA 0.1 mg[Sn]/m^3, STEL 0.3 mg[Sn]/m^3, 1999; France: VME 0.1 mg[Sn]/m^3, VLE 0.2 mg[Sn]/m^3, 1999; Hungary: STEL 0.1 mg[Sn]/m^3, [skin], 1993; Norway: TWA 0.1 mg[Sn]/m^3, 1999; the Phillipines: TWA 0.1 mg[Sn]/m^3, 1993; Switzerland: MAK-W 0.1 mg[Sn]/m^3, KZG-W 0.2 mg [Sn]/m^3, [skin], 1999; Thailand: TWA 0.1 mg[Sn]/m^3, 1993; United Kingdom: TWA 0.1 mg[Sn]/m^3, STEL 0.2 mg [Sn]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Not classifiable as a human carcinogen

Determination in Air: Use NIOSH Analytical Method (IV) #5504, Organotin compounds.

Permissible Concentration in Water: State Drinking Water Guidelines: Minnesota 4000 μg[Sn]/L.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: These chemicals are strong poisons. Toxic and irritating to the eyes, skin, and respiratory system. Dermal exposure may lead to severe skin burns as well as renal failure, and possible death in the case of the chloride. Symptom of exposure include headache, vertigo (an illusion of movement); psycho-neurologic disturbance; sore throat; cough; abdominal pain; vomiting, urine retention; paresis, focal anesthesia.

Long-Term Exposure: Exposure may affect the nervous system causing headache, nausea, vomiting, dizziness, decreased coordination; muscle weakness; and visual changes. Triphenyltin chloride can irritate the lungs; bronchitis may develop. In animals: hemolysis, hepatic necrosis; kidney damage.

Points of Attack: Kidneys, liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Kidney and liver function tests. Evaluation of the nervous system. Lung function tests.

First Aid: *For triphenyltin hydroxide*: *Skin Contact*:[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facep iece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *[Tin, organic compounds as (Sn)]* : *Up to 1 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full face piece). *Up to 25 milligram per cubic meter*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full-faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from incompatible materials. Where possible, automatically transfer material from storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored.

Shipping: UN3146 Organotin compounds, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2786 Organotin compounds, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2788 Organotin compounds, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk, Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, triphenyltin chloride and oxides of metal. Small fires: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area is you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Organic tin compounds may be disposed of in sealed containers in secured sanitary landfill. [organic tin compounds (as tin)]. *Chemical treatability of tin; Concentration Process*: Chemical precipitation; Chemical Classification: Metals; Scale of Study: Pilot scale; Type of Wastewater Used: Synthetic wastewater; Results of Study: At 600 ppm, 95.3% reduction with alum. At 500 ppm, 98% reduction with ferric chloride, 92% reduction with lime; (Three coagulants used: 200 mg of alum at pH = 6.4, 40 ppm of ferric chloride @ pH = 6.2, 41 ppm of lime @ pH = 11.5 Chemical coagulation was followed by dual media filtration)[134].

Description: HN-3, a nitrogen mustard blister agent (vesicants, is a colorless to pale yellow liquid. Pure material is odorless; otherwise, it has a faint fish-or soap-like odor. Density: 1.2347 @ 25°C; Molecular weight = 204.53; Boiling point = 256°C (HN-3 decomposes before its boiling point is reached or cond enses under all conditions; the reactions involved could generate enough heat to cause an explosion[77]); Freezing/Melting point = −3.9°C; Vapor Pressure = 0.0106 mmHg @20°C; 0.0109 mmHg @ 25°C. Volatility: 0.120 mg/L @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Sparingly soluble in water; solubility = 160 mg/L @ 25°C. Aqueous so lution is strongly basic.

Potential Exposure: Trichlorotriethylamine is a (slow-acting) vesicant but has never been used in military conflict. Is used as an antineoplastic agent. Has been tested as a fixing agent in textile dyes[193].

Incompatibilities: HN-3 is not stable; it undergoes slow but steady polymerization. Avoid contamination with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, bleaches and pool chemicalsetc); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Unstable in the presence of light and heat and forms dimers at temperatures above 50°C. HN-3 decomposes before its boiling point is reached or condenses under all conditions; the reactions involved could generate enough heat to cause an explosion. Polymerizes slowly, so munitions would be effective for several years. Heated to decomposition emits hydrogen chloride and nitrogen oxide. ***Note:*** Chlorinating agents destroy nitrogen mustards. Dry chlorinated lime and chloramines with a high content of active chlorine vigorously chlorinate nitrogen mustards to the carbon chain giving low toxicity products. In the presence of water this interaction proceeds less actively. They are rapidly oxidized by peracids in aqueous solution at weakly alkaline pH. In acid solution the oxidation is much slower.

Potential Exposure: Sulfur mustards were formerly used as a gas warfare agent. Nitrogen mustards have not previously been used in warfare[77]. Exposure to nitrogen mustard damages the eyes, skin, and respiratory tract and suppresses the immune system. Although the nitrogen mustards cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Exposure to large amounts can be fatal[77].

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 0.002 milligram per cubic meter

PAC-2: $\mathbf{0.022_A}$ milligram per cubic meter

PAC-3: $\mathbf{0.37_A}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

AEL (United States Military): 0.003 milligram per cubic meter

Determination in Water: A water contaminant. Octanol-water coefficient: Log K_{ow} = (estimated) 2.27[77] Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Nitrogen mustards are extremely toxic and may damage the eyes, skin, and respiratory tract and suppress the immune system. Although these agents cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Thus, patients/victims arriving immediately from the scene of nitrogen mustard exposure are not likely to have signs and symptoms. The sooner after exposure that symptoms occur, the more likely they are to progress and become severe [77]. Most toxic of the nitrogen mustards. The median lethal dose for inhalation is 1,500 mg-min/m3; for skin absorption (masked personnel) is 10,000 mg-min/m3. The medium incapacitating dose for eye injury is 200 mg-min/m3; for skin absorption is 2,500 mg-min/m^3[88].

Short-Term Exposure: Extremely toxic and may damage the eyes, skin, and respiratory tract and suppress the immune system. Although these agents cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Most toxic of the nitrogen mustards. The median lethal dose for inhalation is 1500 mg-min/m^3; for skin absorption (masked personnel) is 10,000 mg-min/m^3. The medium incapacitating dose for eye injury is 200 mg-min/m^3; for skin absorption is 2500 mg-min/m^3. Irritates the eyes in quantities which do not significantly damage the skin or respiratory tract, insofar as single exposures are concerned. After mild vapor exposure, there may be no skin lesions. After severe vapor exposures, or after exposure to the liquid, erythema may appear. Irritation and itching may occur. Later, blisters may appear in the erythematous areas. Effects on the respiratory tract include irritation of the nose and throat, hoarseness progressing to loss of voice, and a persistent cough. Fever, labored respiration, and moist rales develop. Bronchial pneumonia may appear after the first 24 hours. Following ingestion or systemic absorption, material causes inhibition of cell mitosis, resulting in depression of the blood-forming mechanism and injury to other tissues. Severe diarrhea, which may be hemorrhagic, occurs. Lesions are most marked in the small intestine and consist of degenerative changes and nercosis in the mucous membranes. Ingestion of 2−6 mg causes nausea and vomiting. The median incapacitating dose for the eyes is 200 mg/min/m^3 [76]. LC_{t50} (the product of concentration times time that is lethal to 50% of the exposed population by inhalation) approximately 1,500 mg.min/m^3 [76].

Long-Term Exposure: Chronic or repeated exposure to HN-3 may cause Bone marrow suppression resulting in damage to the blood forming (hematopoietic) system;, lymph node damage, weakening of the immune system, kidney damage, and reproductive system damage[77]. Early signs of bone marrow suppression include a low white blood cell count; an increased risk for developing infections; a tendency for easy bruising and bleeding. May cause lymph node damage and a weakened immune system. It also causes liver and kidney damage, damage to the reproductive systems of both men and women leading to decreased fertility. It is mutagenic, toxic to the developing embryo, and possibly carcinogenic.

Medical Surveillance: Nitrogen mustards are vesicants causing skin, eye, and respiratory tract injury.

First Aid: There is no antidote for nitrogen mustard toxicity. Because health effects due to nitrogen mustard may not occur until several hours after exposure, patients/victims should be observed in a hospital setting for at least 24 hours. Gastric lavage is contraindicated following ingestion of this agent due to the risk of perforation of the esophagus or upper airway. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents.

Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Other protective equipment: Wear TECP suit that provides protection against CBRN agents; Chemical-resistant inner and outer gloves; Chemical-resistant boots with a steel toe and shank; Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items. Take all necessary precutions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Decontamination: Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage[77]. Remove clothes and place contaminated clothes and personal belongings in a sealed double bag. Decontamination of mustard-exposed victims by either vapor or liquid should be performed within the first two minutes following the exposure to prevent tissue damage. If not accomplished within the first several minutes, decontamination should still be performed to ensure any residual liquid mustard is removed from the skin or clothes, or to ensure any trapped mustard vapor is removed with the clothing. Removing trapped mustard vapor will prevent vapor off-gassing or subsequent cross-contamination of other emergency responders/healthcare providers or the healthcare facility. Physical removal of the mustard agent, rather than detoxification or neutralization, is the most important principle in patient decontamination. Mustard is not detoxified by water alone and will remain in decontamination effluent (in dilute concentrations) if hydrolysis has not taken place.

(1) Patients exposed to vapor should be decontaminated by removing all clothing in a clean air environment and shampooing or rinsing the hair to prevent vapor off-gassing. (2) Patients exposed to liquid should be decontaminated by (a) Washing in warm or hot water at least three times. Use liquid soap (dispose of container after use and replace), large volumes of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged, because skin damage may occur which may enhance absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. The rapid physical removal of a chemical

agent is essential. If warm or hot water is not available, but cold water is, use cold water. Do not delay decontamination to obtain warm water. (b) Rinse the eyes, mucous membranes; or open wounds with sterile saline or water. (3) The healthcare provider should (a) Check the victim after the three washes to verify adequate decontamination before allowing entry to the medical treatment facility. If the washes were inadequate, repeat the entire process. (b) Be prepared to stabilize conventional injuries during the decontamination process. Careful decontamination can be a time consuming process. The healthcare provider may have to enter the contaminated area to treat the casualty during this process. Medical personnel should wear the proper PPE and evaluate the exposed workers.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Where a potential exposure to the chemical exists, use a A NIOSH-certified CBRN full facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. Military driver of HN-3 shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

Small spills (From a small package or a small leak from a large package)

HN-3, when used as a weapon

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.2/0.3

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid inhalation and skin contact. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the

containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R45; R20/22; R23/25; R33; R38; R50/53; R61; R62; R63; Safety phrases: S20/21; S26; S28; S29/35; S37; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: TDBP is a thick, clear to yellowish liquid. Odorless. Molecular weight = 697.67; Flash point ≥ 112°C. Stable in temperaturs from 200°C to 250°C[101]. Major decomposition begins at 307.8°C. Practically insoluble in water.

Potential Exposure: Tris-BP is used as a flame retardant additive for synthetic textiles and plastics. It was applied to fabrics used for children's clothes (sleepwear in particular) with some used as a flame retardant in other materials, such as urethane foams. Commercial preparations of tris-BP can be obtained in two grades, viz, HV (high in volatiles) and LV (low in volatiles). A typical LV sample has been reported to contain the following impurities:[1] 0.05% 1,2-dibromo-3-chloropropane ($BrCH_2CHBrCH_2Cl$); 0.05% 1,2,3-tribromopropane ($BrCH_2CHBrCH_2Br$); and

0.20% 2,3-dibromopropanol ($BrCH_2CHBrCH_2OH$). Use and expo sure has greatly decreased after a ruling by the Consumer Product Safety Commission in April 1977.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No numerical OELs have been set.

Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999

Routes of Entry: TDBP was added to fabrics used for children's garments to the extent of 5%−10% by weight. A child wearing such garment and chewing on a sleeve or collar could easily ingest some TDBP, particularly if the garment had not been laundered before use.

Harmful Effects and Symptoms

Short-Term Exposure: May cause nausea, vomiting, gastrointestinal irritation. May cause CNS depression; headaches, dizziness.

Long-Term Exposure: May cause skin sanitization and allergy; chronic lung disease; kidney damage, such as renal tubular necrosis; liver damage; testicular atrophy and sterility. Suspected mutagenesis and carcinogenesis.

Points of Attack: Lungs, kidneys, liver, CNS; reproductive system.

Medical Surveillance. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Lung function tests. Liver and kidney function tests. Examination of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place and keep away from acids and bases. Where possible, automatically transfer material from storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well, first with 60%−70% acetone, then with soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen bromide and oxides of phosphorus, bromine and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as naphthalenes

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xi, N; Risk phrases: R45; R10; R20, R22; R36/37/38; R41; R50; R61; R62; R63; Safety phrases: S23; S26; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Trypan Blue is a dark Blue crystalline solid or powder. Molecular weight = 964.88; 961[138]; Freezing/Melting point = 300°C; Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Used in dyeing textiles; leather and paper; as a biological stain.

Incompatibilities: Dust may form explosive mixture with air. Trypan Blue is incompatible with strong oxidizing agents[101]. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Azo compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acylhalides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combinations can occur with strong oxidizing agents, metal salts, peroxides, and sulfides. Trypan Blue is sensitive to prolonged exposure to heat.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 27; No value in Ver. 29[138]

PAC-1: 0.37 milligram per cubic meter

PAC-2: 41 milligram per cubic meter

PAC-3: 1200 milligram per cubic meter

Permissible Concentration in Water: Octanol-water coefficient: Log $K_{ow} = > 5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: No symptoms reported. *Skin*: may stain skin. *Eyes*: application of 0.2 mL (0.007 ounces) of a 1% solution caused no eye irritation. *Ingestion*: moderately toxic. Probable lethal dose between 1 ounce and 1 pound for a 150 pound person.

Long-Term Exposure: Chloramines can cause eye/nose irritation; stomach discomfort; anemia. A potential occupational carcinogen, mutagen, and teratogen. Has been shown to cause birth defects, cancer and liver injury in laboratory animals.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and

storage. Avoid creating dust. Where possible, automatically pump material from storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3143 dyes, solid, toxic, n.o.s. or dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguisher appropriate for burning material. Thermal decomposition products may include oxides of sodium, nitrogen, sulfur and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): Nonwater polluting agent, particle size >1 mm

Description: Tungsten is a hard, brittle, steel-gray to tin-white metal or fine powder. Molecular weight = 183.84; Specific gravity (H_2O:1) = 19.3 @ 20°C; Boiling point = 5555°C[138]; 5927°C; Freezing/Melting point = 3422°C. Insoluble in water.

Tungsten carbide is a gray powder. Cemented tungsten carbide is a mixture, generally consisting of 85%−95% tungsten carbide (WC) and 5%−15% cobalt (Co). Physical properties vary depending upon the specific mixture. Molecular weight = Specific gravity (H_2O:1) = 15.6 @ 20°C; 196; Boiling Point: 6000°C @ 760 mmHg; Freezing/ Melting point = 2730°C−2830°C; solubility in water = < 1 mg/mL @ 18°C[193]. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Tungsten is used in ferrous and nonferrous alloys, and for filaments in incandescent lamps. It has been stated that the principal health hazards from tungsten and its compounds arise from inhalation of aerosols during mining and milling operations. The principal compounds of tungsten to which workers are exposed are ammonium paratungstate, oxides of tungsten (WO_3, W_2O_5, WO_2); metallic tungsten; and tungsten carbide. In the production and use of tungsten carbide tools for machining, exposure to the cobalt used as a binder or cementing substance may be the most important hazard to the health of the employees. Since the cemented tungsten carbide industry uses such other metals as tantalum, titanium, niobium, nickel, chromium, and vanadium in the manufacturing process, the occupational exposures are generally to mixed dust.

Incompatibilities: *Tungsten*: The finely divided powder is combustible and may ignite spontaneously in air. Incompatible with bromine trifluoride; chlorine trifluoride; fluorine, iodine pentafluoride. *Tungsten carbide*: Incompatible with strong oxidizers: fluorine (may cause ignition), chlorine trifluoride; iodine pentafluoride; mercuric iodine; oxides of nitrogen; lead dioxide; strong acid mixtures (i.e., HNO_3/HCl mixture).

Permissible Exposure Limits in Air

tungsten and insoluble compounds

OSHA PEL: None

(metals and insoluble compounds) 5 mg[W]/m^3 TWA; 10 mg[W]/m^3 STEL; (soluble compounds) 1 mg[W]/m^3 TWA; 3 mg[W]/m^3 STEL. Hard metals containing tungsten carbide & cobalt as [Co]: 0.005 milligram per cubic meter.

7440-33-7, metal

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 10 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Denmark: TWA 5 mg[W]/m^3, 1999; Norway: TWA 5 mg [W]/m^3, 1999; Poland: MAC (TWA) fume and dust 5 mg [W]/m^3, 1999; Russia: STEL 2 mg[W]/m^3, 1993; Sweden: NGV 5 mg[W]/m^3, 1999; United Kingdom: TWA 5 mg [W]/m^3, STEL 10 mg[W]/m^3, 2000

tungsten soluble compounds

OSHA PEL: None

NIOSH REL: 1 mg[W]/m^3 TWA; 3 mg[W]/m^3 STEL

ACGIH TLV[1]: 1 mg[W]/m^3 TWA; 3 mg[W]/m^3 STEL

tungsten carbide containing $>2\%$ Co

NIOSH REL: 0.05 mg[W]/m^3 TWA; See *NIOSH Pocket Guide*, Appendix C.

tungsten carbide containing $> 0.3\%$ Ni

NIOSH REL: 0.015 mg[W]/m^3 TWA; Potential occupational carcinogen; Reduce exposure to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A & C.

tungsten carbide

NIOSH IDLH = 20 mg[Co]/m^3

Protective Action Criteria (PAC) Ver. 29[138]

12070-12-1, (92% W, 8% Co) (tungsten carbide)

PAC-1: 11 milligram per cubic meter

PAC-2: 120 milligram per cubic meter

PAC-3: 730 milligram per cubic meter

Cemented tungsten carbide (e.g., 85%: 15%) or *tungsten carbide, mixed with cobalt and titanium* (e.g., 78% W: 14% Co: 8% Ti) also known as "hard metal" refers to a mixture of tungsten carbide, cobalt, and sometimes metal oxides or carbides and other metals (including nickel). When the *cobalt* (Co) content exceeds 2%, its contribution to the potential hazard is judged to exceed that of tungsten carbide. Therefore, the NIOSH REL (10-hour TWA) for cemented tungsten carbide containing $>2\%$ Co is 0.05 mg [Co]/m^3; the applicable OSHA PEL is 0.1 mg[Co]/m^3 (8-hour TWA). *Nickel* (Ni) may sometimes be used as a binder rather than cobalt. NIOSH considers cemented tungsten carbide containing nickel to be A potential occupational carcinogen and recommends a REL of 0.015 mg [Ni]/m^3 (10-hour TWA). The OSHA PEL for *insoluble nickel*, 1 mg (Ni)/m^3 8-hour TWA applies to mixtures of tungsten carbide and nickel.

tungsten carbide

Australia: TWA 5 mg[W]/m^3, STEL 10 mg[W]/m^3, 1993; Austria: MAK 5 mg[W]/m^3, 1999; Belgium: TWA 5 mg [W]/m^3, STEL 10 mg[W]/m^3, 1993; Denmark: TWA 5 mg [W]/m^3, 1999; Finland: TWA 5 mg[W]/m^3, 1999; Norway: TWA 5 mg[W]/m^3, 1999; the Phillipines: TWA 1 mg [W]/m^3, 1993; Poland: MAC (TWA) 5 mg[W]/m^3, 1999; Sweden: NGV 5 mg[W]/m^3, 1999; Switzerland: MAK 5 mg[W]/m^3, 1999; United Kingdom: TWA 5 mg[W]/m^3, STEL 10 mg[W]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 mg[W]/m^3; STEL 10 mg[W]/m^3

For both tungsten and tungsten carbide, Russia[43] set a MAC in workplace air of 6.0 mg[W]/m^3. Several states have set guidelines and standards for tungsten in ambient air[60] ranging from 16.0 μ/m^3 (Virginia); to 20.0 μ/m^3 (Connecticut); to 24.0 μ/m^3 (Nevada).

Determination in Air: *For tungsten metal and tungsten soluble compounds*: Use NIOSH Analytical Method (IV) #7074, #7301, OSHA Analytical Method ID-213. See also Method # 7300, Elements. There is no specific method for *cemented tungsten carbide*.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 14 μg/L based on health effects. Russia[43] set a MAC in water bodies used for domestic purposes of 0.1 mg[W]/L.

Determination in Water: By neutron activation analysis.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Tungsten* can affect you when breathed in. Irritates the eyes, skin, and respiratory system. Some tungsten compounds can cause lung and skin problems. *Tungsten carbide* can affect you when breathed in. There is no health effects from exposure to pure tungsten carbide alone. However, tungsten carbide is often combined with nickel or cobalt to make cemented tungsten carbide (hard metal). Exposure to *tungsten carbide combined with cobalt or nickel* can cause skin irritation.

Long-Term Exposure: Long-term exposure to *tungsten metal* and *cemented tungsten carbide* may cause diffuse pulmonary fibrosis (lung scarring); loss of appetite; nausea, cough. May cause blood changes. Exposure to *tungsten carbide combined with cobalt or nickel* can cause skin sensitization, lung allergy, with wheezing, coughing, and shortness of breath. Repeated exposure can cause pulmonary fibrosis. Long-term exposure to *tungsten soluble compounds*: in animals: CNS disturbances; diarrhea; respiratory failure; behavioral, body weight, blood changes.

Points of Attack: *Metal* and *cemented tungsten carbides*: Eyes, skin, respiratory system; blood. *Soluble compounds*: Eyes, skin, respiratory system; CNS; gastrointestinal tract.

Medical Surveillance: If you are exposed to tungsten metal alone, no medical tests are necessary. If you are exposed to cemented tungsten carbide (hard metal), the following are recommended before beginning employment and at regular times after that: lung function tests; chest X-ray every two to three years after five or more years of exposure. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield when working with powders or dust unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH *(tungsten metal and insoluble compounds)*: *Up to 50 mg [W]/m^3*: 100XQ (APF = 10) [Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators.]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Respirator for Tungsten carbide (cemented) containing Cobalt.

NIOSH/OSHA, for cobalt metal dust and fume: *0.25 milligram per cubic meter*: *if not present as a fume* Qm* (APF = 25) (any quarter-mask respirator). *0.5 milligram per cubic meter*: 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *1.25 milligram per cubic meter*: Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respira tor with a full facepiece). *20 milligram per cubic meter*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

*Note**: Substance reported to cause eye irritation or damage; may require eye protection.

Respirator for Tungsten carbide (cemented) containing Nickel.

At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red Stripe: Flammability Hazard (4.2): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Tungsten must be stored to avoid contact with fluorine and chlorine compounds, since violent reactions occur. Store in a tightly closed container in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where tungsten is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Tungsten carbide must be stored to avoid contact with fluorine, chlorine trifluoride; iodine pentafluoride; lead dioxide; nitrous oxide; nitrogen dioxide; and mercurium iodine; since violent reactions occur. Store in tightly closed containers in a cool well ventilated area.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN3189 Metal powder, self heating, n.o.s., Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers; do not sweep in the case of tungsten carbide. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tungsten is a flammable powder. Use dry chemicals appropriate for extinguishing metal fires. In the case of tungsten carbide, extinguish fire using an agent suitable for type of surrounding fire. Tungsten carbide itself does not burn. Thermal decomposition products may include oxides of metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery of tungsten from sintered metal carbides, scrap and spent catalysts has been described as an alternative to disposal.

Tungsten Hexafluoride T:0990

Formula: F_6W; WF_6

Synonyms: Tungsten fluoride

CAS Registry Number: 7783-82-6

HSD B Number: 8038

RTECS Number: YO7720000

UN/NA & ERG Number: UN2196/125

EC Number: 232-029-1

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 45 (≥7.10% concentration).

Hazard Alert: Highly toxic gas with inadequate warning properties, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Corrosive, Lachrymator.

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, C; Risk phrases: R5; R21; R23/24/25; R34; R41; Safety phrases: S1; S9; S26; S28; S33; S36/37/39; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Tungsten hexafluoride is a toxic, colorless gas or a light yellow liquid. Molecular weight = 297.85; Specific gravity (H_2O:1) = 13.1 @ 20°C; Freezing/Melting point = 2.3°C. Boiling point = 17.5°C−19.5°C. Reacts with water (decomposes).

Potential Exposure: A strong halogenating agent. Used to apply tungsten coatings to other surfaces by vapor deposition process; making electronics and components; in the manufacture of other chemicals.

Incompatibilities: Decomposes on contact with water and moist air, forming highly corrosive hydrofluoric acid. Violent reaction on contact with methyl silicate (CAS 681-84-5).

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 4.9 milligram per cubic meter

PAC-2: 54 milligram per cubic meter

PAC-3: 320 milligram per cubic meter

Determination in Air: NIOSH Analytical Method (IV) #7074. See also Method #7300; NIOSH Analytical Method (IV) #7902, Fluorides.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guide lines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Harmful Effects and Symptoms

Short-Term Exposure: Tungsten hexafluoride is a corrosive chemical. Irritates the eyes, skin, and respiratory tract. Contact with liquid may cause frostbite. Tungsten hexafluoride can affect you when breathed in. Exposure to tungsten hexafluoride may expose you to both tungsten and fluorides. Exposure to very high levels of fluorides may cause symptoms of nausea, vomiting, abnormal pain; convulsions and kidney damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated high exposures may affect kidneys. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite; diarrhea or constipation. Nosebleeds and sinus problems can also occur.

Points of Attack: Eyes, respiratory system; CNS; skeleton, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Fluoride level in urine. (for fluoride in urine use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear gas-proof goggles and face shield, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-103: *Inorganic fluorides*.

Respirator Selection: *Fluorides*: NIOSH/OSHA *12.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter*: 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (any supplied-air respirator). *62.5 milligram per cubic meter*: Sa:Cf (APF = 25)*$^{+}$ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter*: 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent. As Tungsten (insoluble compounds): NIOSH *(tungsten metal)*: *Up to 50 milligram per cubic meter*: 100XQ (APF = 10) [Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators.]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). Escape: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code-White stripe: Contact Hazard; Store separately, not compatible with materials in solid white category. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed container in a cool well-ventilated area away from water. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN2196 Tungsten hexafluoride, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone B. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 2.0/3.2

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride, fluorine, and oxides of tungsten. Tungsten hexafluoride may burn, but does not readily ignite. This gas is under pressure; containers may rupture and explode when heated. For small fires use dry chemical or CO_2 extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Possible risk of forming tumors, Sensitization hazard (skin), Primary irritant (w/o allergic reaction), Environmental hazard, FDA-over the counter drug.

United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Canceled/New AI

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*8006-64-2*): Hazard Symbol: Xn, N, Xi; Risk phrases: R11; R20/21/22; R36/38; R43; R51/53; R65; Safety phrases: S2; S21; S29/35; S36/37; S46; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*CAS: 8006-64-2*)

Description: Turpentine is the oleoresin from species of Pinus Pinacea trees. The crude oleoresin (gum turpentine) is a yellowish, sticky, opaque mass and the distillate (oil of turpentine) is a colorless, volatile liquid with a characteristic odor. Chemically, it contains: *alpha*-pinene; *beta*-pinene; camphene, monocyclic terpene; and terpene alcohols. Molecular weight = 136−140 (approx); Specific gravity (H_2O:1) = 0.84−0.87 @ 20°C; Boiling point = 153.8°C−170°C; Freezing/Melting point = −50°C to −60°C; Vapor pressure = 4 mmHg; Flash point = 35°C (cc), also listed @ 30°C−46°C (cc); Autoignition temperature = 253°C, also listed @ 220°C−255°C. Explosive limit: LEL = 0.8%; UEL: 6%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Turpentines have found wide use as chemical feedstock for the manufacture of floor, furniture, shoe, and automobile polishes; camphor, cleaning materials; inks, putty, mastics, cutting and grinding fluids; paint thinners; resins, and degreasing solutions. Recently, *alpha*-and *beta*-pinenes, which can be extracted, have found use as volatile bases for various compounds. The components *d*-α-pinene and 3-carene, or their hydroperoxides, may be the cause of eczema and toxic effects of turpentine.

Incompatibilities: Forms an explosive mixture with air. Violent reaction with strong oxidizers, especially chlorine; chromic anhydride; stannic chloride; chromyl chloride.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm

Conversion factor: 1 ppm = 5.56 milligram per cubic meter (approx)@ 25°C & 1 atm

OSHA PEL (8006-64-2): 100 ppm/560 milligram per cubic meter TWA

NIOSH REL (8006-64-2): 100 ppm/560 milligram per cubic meter TWA (Intended change)

ACGIH TLV[1] (*terpentine and selected monoterpenes*): 20 ppm/112 milligram per cubic meter TWA, sensitizer; not classifiable as a human carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

8006-64-2, turpentine; 80-56-8, α & β-pinene

PAC-1: 60 ppm

PAC-2: 120 ppm

PAC-3: 1500 ppm

DFG MAK (8006-64-2): 100 ppm/560 milligram per cubic meter; danger of skin sensitization

Australia: TWA 100 ppm (560 milligram per cubic meter), 1993; Austria: MAK 100 ppm (560 milligram per cubic meter), 1999; Belgium: TWA 100 ppm (556 milligram per cubic meter), 1993; Denmark: TWA 25 ppm (140 milligram per cubic meter), 1999; Finland: TWA 100 ppm (560 milligram per cubic meter), STEL 150 ppm, [skin], 1999; France: VME 100 ppm (560 milligram per cubic meter), 1999; Hungary: TWA 300 milligram per cubic meter, STEL 600 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 560 milligram per cubic meter, 2003; the Phillipines: TWA 100 ppm (560 milligram per cubic meter), 1993; Poland: MAC (TWA) 300 milligram per cubic meter; MAC (STEL) 840 milligram per cubic meter, 1999; Russia: STEL 300 milligram per cubic meter, 1993; Sweden: NGV 25 ppm (150 milligram per cubic meter), KTV 50 ppm (300 milligram per cubic meter), [skin], 1999; Turkey: TWA 100 ppm (560 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (566 milligram per cubic meter), STEL 150 ppm, 2000; New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Russia[35][43] set a MAC for ambient air in residential areas of 2.0 milligram per cubic meter on a momentary basis and 1.0 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for turpentine in ambient air[60] ranging from 5.6−8.4 milligram per cubic meter (North Dakota); to 9.3 milligram per cubic meter (Virginia); to 11.2 milligram per cubic meter (Connecticut and New York); to 13.333 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #1551, Terpentine, #2549, Volatile organic compound[18].

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.2 mg/L.

Routes of Entry: Inhalation of vapor and percutaneous absorption of liquid are the usual paths of occupational exposure. However, symptoms have been reported to develop from percutaneous absorption alone. Ingestion and/or skin and/or eye contact are also routes of entry.

Harmful Effects and Symptoms

Short-Term Exposure: Turpentine can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose and throat. Higher levels can affect the CNS, causing headache, vertigo, dizziness, abdominal pain; nausea, vomiting, diarrhea confusion and rapid pulse. Swallowing the liquid may cause chemical pneumonia to develop. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Still higher levels can cause hematuria (blood in the urine), albuminuria, kidney damage; convulsions, and death.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. The liquid destroys the skin's natural oils, causing dryness and cracking. May damage the kidneys, bladder, and the nervous system. Can irritate the lungs; bronchitis may develop. Various kinds of products are in use as turpentine oil. Their respective toxicities and tendency to cause eczema, which probably arise from their content of δ-α-pinene and 3-carene, vary considerably. However, systematic comparative investigations for these products are lacking.

Points of Attack: Eyes, skin, respiratory system; CNS; kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Examination of the nervous system. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, give plenty of water to drink and get medical attention. Do not induce vomiting. Medical observation is recommended for

24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *800 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Sources of ignition, such as smoking and open flames, are prohibited where turpentine is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of turpentine should be grounded and bonded. Drums must be equipped with self-closing values, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of turpentine.

Shipping: UN1299 Turpentine, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Carcinoenicity: NIOSH (*uranium, insoluble and soluble compounds*): Potential occupational carcinogen.

United States National Primary Drinking Water Regulations: MCLG = 0 mg[U]/L; MCL = 30 μg[U]/L; MCLG = 0 pCi/L; MCL = 15 pCi/L (U-$_{238}$) as *alpha*-proton emitter.

Hazard Alert: Radioactive, Strong reducing agent, Pyrophoric hazard, Neurotoxic.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPC RA 40 CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

European/International Regulations *(uranium and compounds*): Hazard symbol: T+; risk phrases: R45; R17; R26/28; R33; R53; safety phrases: S1/2; S20/21; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (*uranyl acetate dihydrate*)

Description: Uranium is a silver-white, malleable, ductile, lustrous solid. Weakly radioactive but must be handled with caution. A combustible solid in the form of powder or turnings. Insoluble in water. Molecular weight = 238.00; specific gravity (H_2O:1) = 19.05 @ 25°C (metal); boiling point = 3813°C; freezing/melting point = 1147°C; autoignition temperature = 20°C (dust cloud); ignition temperature of dust cloud = 20°C; minimum explosive concentration = 0.060 oz/ft^3. Relative explosion hazard of dust: Severe. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0; minimum explosive concentration (MEC) = 60 g/m^3.

In the natural state, uranium consists of three isotopes: ^{238}U (99.28%), ^{234}U (0.006%), and ^{235}U (0.714%).

There are over 100 uranium minerals; those of commercial importance are the oxides and oxygenous salts. The processing of uranium ore generally involves extraction then leaching either by an acid or a carbonate method. The metal may be obtained from its halides by fused salt electrolysis. *Uranium(IV)oxide* is a black to brown crystalline solid or powder. Molecular weight = 270.03; freezing/melting point = 2865°C. Insoluble in water. *Uranium trioxide* (1344-58-7) molecular weight = 286.03; specific gravity (H_2O:1) = 7.3. *Uranyl chloride* (7791-26-6) is a bright yellow crystalline solid. Molecular weight = 349.90; freezing/melting point = 578°C. Highly soluble in water (unstable). *Uranyl nitrate, solid* (10102-06-4) is a yellow crystalline solid. Molecular weight = 394.02; boiling point = 118°C; freezing/melting point = 60°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 2 (Oxidizer). *Uranyl sulfate:* Molecular weight = 420.2. Soluble in water.

Potential Exposure: The primary use of natural uranium is in nuclear energy as a fuel for nuclear reactors, in plutonium production, and as feeds for gaseous diffusion plants. It is also a source of radium salts. Uranium compounds are used in staining glass, glazing ceramics; and enameling; in photographic processes; for alloying steels; and as a catalyst for chemical reactions; radiation shielding; and aircraft counterweights. Uranium presents both chemical and radiation hazards, and exposures may occur during mining, processing of the ore, and production of uranium metal.

Incompatibilities: *Uranium:* Metal powder is radioactive, pyrophoric (ignites spontaneously in air), and a strong reducing agent. Keep away from chlorine, fluorine, nitric acid; nitric oxide; selenium, sulfur, carbon dioxide; carbon

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00020-X

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.

tetrachloride. Complete coverage of uranium metal scrap or turnings with oil is essential for prevention of fire. *Uranium(IV)oxide:* May spontaneously ignite on contact with air when heated above 700°C. *Uranium hydride:* Keep away from strong oxidizers, water, halogenated hydrocarbons. *Uranyl chloride*: Aqueous solutions are chemically unstable. *Uranyl nitrate(s):* Keep away from combustible materials; reducing agents; Uranium hexafluoride: water.

Permissible Exposure Limits in Air

NIOSH IDLH = 10 mg[U]/m^3

OSHA PEL: (*natural & insoluble compounds*) 0.25 mg[U]/m^3 TWA; (*soluble*) 0.05 mg[U]/m^3 TWA

NIOSH REL: (*natural & insoluble compounds*) 0.2 mg[U]/m^3 TWA; 0.6 mg[U]/m^3 STEL; (*soluble*) 0.05 mg[U]/m^3 TWA; Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.2 mg[U]/m^3 TWA; 0.6 mg[U]/m^3 STEL, Confirmed Human Carcinogen; BEI issued.

DFG MAK (uranium compounds): 0.25 mg[U]/m^3, measured as the, inhalable fraction

Australia: TWA 0.2 mg[U]/m^3, STEL 0.6 mg[U]/m^3, 1993; Belgium: TWA 0.2 mg[U]/m^3, STEL 0.5 mg[U]/m^3, 1993; Belgium: TWA 0.2 mg[U]/m^3, STEL 0.6 mg[U]/m^3, 1993; Denmark: TWA 0.2 mg[U]/m^3, 1999; Finland: TWA 0.2 mg[U]/m^3, 1999; Norway: TWA 0.2 mg[U]/m^3, 1999; the Netherlands: MAC-TGG 0.2 mg[U]/m^3, 2003; the Philippines: TWA 0.25 mg[U]/m^3, 1993; Poland: MAC (TWA) 0.015 mg[U]/m^3; MAC (STEL) 0.12 mg[U]/m^3, 1999; Poland: MAC (TWA) 0.075 mg[U]/m^3, 1993; Russia: STEL 0.015 mg[U]/m^3, 1993; Russia: STEL 0.075 mg[U]/m^3, 1993; Switzerland: MAK-W 0.2 mg[U]/m^3, 1999; Turkey: TWA 0.05 mg[U]/m^3, 1993; United Kingdom: LTEL 0.2 mg[U]/m^3, STEL 0.6 mg[U]/m^3, 1993

Uranium, soluble compounds

NIOSH IDLH = 10 mg[U]/m^3

OSHA PEL: 0.05 mg[U]/m^3 TWA

NIOSH REL: TWA 0.05 mg[U]/m^3, Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.2 mg[U]/m^3 TWA; 0.6 mg[U]/m^3 STEL, Confirmed Human Carcinogen

DFG MAK (uranium compounds): 0.25 mg[U]/m^3, measured as the, inhalable fraction

Several states have set guidelines or standards for uranium in ambient air[60] ranging from 2.0 to 6.0 μ/m^3 (North Dakota); to 3.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (Connecticut); to 5.0 μ/m^3 (Nevada).

EPA Limits and advisory levels:

United States, annual radiation exposure limits are found in Title 10, part 20 of the Code of Federal Regulations, and in equivalent state regulations.

Public dose limits due to licensed activities (NRC) 100 mRem (0.01 Sv)/year

Indoor Air (advisory "action level"): 4 pCi/L radon (Rn)

*Both the air and water standards limit the increased lifetime cancer risk to about 2 in 10,000.

Guidance Matrix for Radiological Dispersal Device (RDD) Incidents

Rem (Sv)/calendar quarter

OSHA Occupational Exposure Limits for Ionizing Radiation 29 CFR 1910.1096	
Whole Body; Head and Trunk; Active Blood-Forming Organs; Lens of Eye or gonads	1.25 (0.0125 Sv)
Hands and Forearms; Feet and Ankles	18.75 (0.1875 Sv)
Skin of Whole Body	7.5 (0.075 Sv)
Minors (under age 18 workers)	10% of above limits
Over age 18 workers	Rem (0.3 Sv) may be permitted under conditions specified in 29 CFR 1910.1096(b)(2)

Determination in Air: No method is available.

Permissible Concentration in Water: Safe Drinking Water Act: MCLG = 0 mg[U]/L; MCL = 30 μg[U]/L; MCLG = 0 pCi/L; MCL = 15 pCi/L (U-$_{238}$), as *alpha*-proton emitter. Federal Drinking Water Guidelines: EPA 30 μg [U]/L; State Drinking Water Guidelines: Arizona 30 μg[U]/L; Mass. 20 μg[U]/L; Maine 20 μg[U]/L. Runoff from spills or fire control may cause water pollution. No criteria set, but EPA[32] has suggested a permissible ambient goal of 3 μg/L based on health effects. Several states have set guidelines and standards for uranium in drinking water ranging from 10 μCi/L (Massachusetts); to 30 μCi/L (California); to 35 μCi/L (Arizona); to 15 μg/L (Colorado).

Routes of Entry: Inhalation of fume, dust, or gas, ingestion; skin and/or eye contact. The following uranium salts are reported to be capable of penetrating intact skin: uranyl nitrate, $UO_2(NO_3)_2 \cdot 6H_2H$; uranyl fluoride, UO_2F_2; uranium pentachloride, UCl_5; uranium trioxide (uranyl oxide), UO_3; sodium diuranate [sodium uranate (VI), $Na_2U_2O_7$]; uranium hexafluoride, UF_6.

Harmful Effects and Symptoms

Short-Term Exposure: Prolonged contact with skin should be avoided to prevent radiation injury. Uranium and its compounds are highly toxic substances. The compounds which are soluble in body fluids possess the highest toxicity. Poisoning has generally occurred as a result of accidents. Acute chemical toxicity produces damage primarily to the kidneys. Kidney changes precede in time and degree the effects on the liver. Chronic poisoning with prolonged exposure gives chest findings of pneumoconiosis, pronounced blood changes; and generalized injury.

It is difficult to separate the toxic chemical effects of uranium and its compounds from their radiation effects. The chronic radiation effects are similar to those produced by ionizing radiation. Reports now confirm that carcinogenicity is related to dose and exposure time. Cancer of the lung, osteosarcoma, and lymphoma has all been reported.

For *soluble compounds*: lacrimation, conjunctivitis, shortness of breath; coughing, chestrales; nausea, vomiting, skin burns; casts in urine; albuminuria, high blood urea nitrogen (BUN); lymphatic cancer. For *insoluble compounds:* dermatitis; cancer of lymphatic and blood-forming tissues.

For tellurium compounds: Tellurium compounds are both an oral and dermal toxic hazard. The material is toxic by ingestion. Oral ingestion of tellurium compounds is generally regarded as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 70 kg (150 pound) person. Tellurium com pounds are regarded as super toxic for skin exposures.

Long-Term Exposure: Kidney toxicity; increased risk of cancer. Uranium can cause dermatitis, kidney damage; blood changes. A potential occupational carcinogen. Potential for cancer is a result of *alpha*-emitting properties and radioactive decay products (e.g., radon).

Points of Attack: For *soluble compounds*: respiratory system, blood, liver, kidneys, lymphatic system; skin, bone marrow. *Cancer site:* lung cancer. For *metal* and *insoluble compounds*: skin, kidneys, bone marrow; lymphatic system. *Cancer site:* lung cancer.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); complete blood count; chest X-ray; urine (chemical/metabolite); urinalysis (routine). Special attention should be given to the blood, lung, kidney, and liver in preemployment physical examinations. In periodic examinations, tests for blood changes; changes in chest X-rays, or for renal injury and liver damage are advisable. Uranium excretion in the urine has been used as an index of exposure. Whole body counting may also be useful. BUN for soluble compounds.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Soluble compounds*, especially UF_6: Wear appropriate clothing to prevent any possibility of skin contact with UF_6. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated with UF_6 and daily at the end of each work-shift. Work clothing should be changed daily if it is possible that clothing is contaminated with UF_6. Remove nonimpervious clothing immediately if wet or contaminated UF_6. Provide emergency showers and eyewash if UF_6 is involved.

Insoluble compounds: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Soluble Uranium compounds*: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape (halides):* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Escape (non-halides):* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Insoluble Uranium compounds: At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Radioactive. (1) Color code—Red Stripe: Flammability Hazard: Store in a secure, locked facility separate from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8—10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2979 Uranium metal, pyrophoric, requires a shipping label of "RADIOACTIVE, SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard Class 7. UN2909 Radioactive material, excepted package-articles manufactured from natural uranium or depleted uranium or natural thorium, Hazard class: 7-Radioactive material; Labels: None. Uranyl nitrate, solid, requires a shipping label of "RADIOACTIVE, OXIDIZER." It falls in Hazard Class 7. Uranyl nitrate hexahydrate solution, requires a shipping label of "CORROSIVE." It falls in Hazard Class 7.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Uranium chips or turnings should be covered with oil to prevent fires, and collected in sealed containers for later disposal. *Liquid:* Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team, Edison, NJ. Telephone 24-hour hotline: 908-548-8730.

Fire Extinguishing: Uranium is an explosion hazard as dust or solid when exposed to flame. Thermal decomposition products may include oxides of metal. In case of fire, contact the local, state, or department of energy radiological response team. *Do not use water.* Use graphite, soda ash; powdered sodium chloride, or suitable dry powder. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disposal of wastes containing uranium (uranium and compounds) should follow guidelines set forth by the nuclear regulatory commission. Contact the nuclear regulatory commission regarding disposal notification. Recovery for reprocessing is the preferred method. Processes are available for uranium recovery from process wastewaters and process scrap. Burial at an authorized radioactive burial site.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, Xi; risk phrases: R36/37/38; R40; R61; R62; R63; safety phrases: S16; S24/25; S26; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Urea is a white crystalline so lid. Molecular weight = 60.1; specific gravity (H_2O:1) = 1.3 @ 20°C; boiling point = (decomposes); freezing/melting point = (decomposes) 133°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Urea is used in ceramics, cosmetics, paper processing; resins, adhesives, in animal feeds; in the manufacture of isocyanurates; resins, and plastics; as a stabilizer in explosives; in medicines; anticholelithogenic, and others.

Incompatibilities: Violent reaction with strong oxidizers, chlorine, permanganates, dichromates, nitrites, inorganic chlorides; chlorites, and perchlorates. Contact with hypochlorites can result in the formation of explosive compounds.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 280 milligram per cubic meter

PAC-3: 1700 milligram per cubic meter

The state of New York[61] has set a guidelines for urea in ambient air of 0.03 μ/m^3.

Russia set an MAC in ambient air in residential areas of 0.2 milligram per cubic meter on a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 80.0 mg/L.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Causes irritation of the respiratory tract. Dust may cause difficult breathing especially if the person has asthma. *Skin:* May cause irritation, burning or stinging. *Eyes:* Causes irritation. *Ingestion:* There have been no reported cases of human toxicity. However, some toxic effects have been seen in sheep with impaired liver function.

Long-Term Exposure: Prolonged skin contact may cause dermatitis.

Points of Attack: Skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from storage containers to process containers.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products ($>130°C$) may include isocyanic acid, ammonia and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration in equipment containing a scrubber or thermal unit to reduce nitrogen oxide emissions.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Urethane is a colorless, almost odorless crystalline solid or powder. Molecular weight = 89.11; specific gravity (H_2O:1) = 1.11 @ 20°C; boiling point = 183°C; freezing/melting point = 49°C; vapor pressure = 0.36 mmHg @ 25°C; flash point = 92°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Slightly soluble in water.

Potential Exposure: Urethane is used as a chemical intermediate in manufacture of pharmaceuticals; pesticides, and fungicides; in the preparation of amino resins. It may be reacted with formaldehyde to give cross-linking agents which impart wash-and-wear properties to fabrics. It has also been used as a solubilizer and cosolvent in the manufacture of pesticides, fumigants, and cosmetics. It was formerly used in the treatment of leukemia. It occurs when diethylpyrocarbonate, a preservative used in wines, fruit juices, and soft drinks, is added to aqueous solutions.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, gallium, perchlorate.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 5.4 milligram per cubic meter

PAC-2: 60 milligram per cubic meter

PAC-3: 360 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutation Category 3A, *as carbamic acid ethyl ester*

Austria: carcinogen, 1999; Finland: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999.

Several states have set guidelines or standards for urethane in ambient air[60] ranging from zero (North Dakota); to 0.03 μ/m^3 (New York); to 5000.0 μ/m^3 (South Carolina).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.15$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Urethane can affect you when breathed in and by passing through your skin. High exposures may affect the CNS, causing dizziness, lightheadedness, and unconsciousness. Very high exposures can cause damage to the liver, brain, and blood forming organs.

Long-Term Exposure: Urethane is a carcinogen and may be a teratogen. Handle with extreme caution. Repeated exposures can damage the liver, brain, and blood forming organs.

Points of Attack: Liver, brain, blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment, and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: liver function tests. Complete blood count. If symptoms develop or overexposure suspected, the following may be useful: exam of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Urethane must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric); strong bases; camphor, menthol, salol, or thymol; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25 m/ 75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

EC Number: 203-784-4

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; Risk phrases: R11; R20/21/22; R36/37/38; R41; R61; R62; Safety phrases: S6; S16; S21; S26; S27; S33; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Valeraldehyde is a colorless liquid with a strong acrid, pungent odor. The odor threshold is 0.028 ppm. Molecular weight = 86.15; specific gravity (H_2O:1) = 0.81 @ 25°C; boiling point = 103°C; freezing/melting point = −92°C; vapor pressure = 26 mmHg; flash point = 12°C (oc); autoignition temperature = 222°C. Explosive limits in air = LEL = 1.4%; UEL: 7.2%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 0. Moderately soluble in water; solubility = 1.4% @ 20°C.

Potential Exposure: Valeraldehyde is used in food flavorings; in resin chemistry. It is also used in the acceleration of rubber vulcanization.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, caustics, amines.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.53 milligram per cubic meter @ 25°C & 1 atm.

OSHA PEL: None

NIOSH REL: 50 ppm/175 milligram per cubic meter TWA, See Appendix C (Aldehydes) of the *NIOSH Pocket Guide*. Limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde

ACGIH TLV[1]: 50 ppm/176 milligram per cubic meter TWA

Protective Action Criteria (PAC) not available

Australia: TWA 50 ppm (175 milligram per cubic meter), 1993; Belgium: TWA 50 ppm (176 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (175 milligram per cubic meter), 1999; Finland: TWA 50 ppm (175 milligram per cubic meter), STEL 75 ppm (265 milligram per cubic meter), 1999; France: VME 50 ppm (175 milligram per cubic meter), 1999; Norway: TWA 0.3 milligram per cubic meter, 1999; Switzerland: MAK-W 50 ppm (175 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 175 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH TLV: TWA 50 ppm. Several states have set guidelines or standards for valeraldehyde in ambient air[60] ranging from 1.75 milligram per cubic meter (North Dakota); to 2.9 milligram per cubic meter (Virginia); to 3.5 milligram per cubic meter (Connecticut); to 4.167 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV), #2018, #2536, valeraldehyde, OSHA Analytical Method 85.

Determination in Water: See NIOSH (IV) #2539, aldehydes, screening. Octanol−water coefficient: Log K_{ow} = 1.31. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Valeraldehyde can affect you when breathed in. Contact can severely irritate the eyes, skin, nose, and throat. Exposure to very high levels can cause you to feel dizzy and lightheaded. Poisonous if swallowed.

Long-Term Exposure: Testing has not been completed to determine the carcinogenicity of *n*-valeraldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: See Long-term Exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00021-1

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 50 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full facepiece-powered air-purifying respirators. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area (under argon) or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where valeraldehyde is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of valeraldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Valeraldehyde.

Shipping: UN2058 Valeraldehyde, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazard symbols, risk, & safety statements: Hazard symbol (dust and powders): Xi; risk phrases: R45, R17; R36/37/38; safety phrases: S7; S16; S26; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): (Vanadium and compounds) 3-Severe hazard to water, unless water solubility is <4 μg[V]/L.

Description: Vanadium is a light-gray or silver-white, ductile solid, lustrous powder, or fused hard lump. Molecular weight = 50.94; specific gravity (H_2O:1) = 5.99 @ 20°C; boiling point = 3380°C; freezing/melting point = 1917°C. Explosive limits (dust, powder, fume): LEL = 73,300 ppm, UEL: unknown[138]. Hazard identification (based on NFPA-704 M Rating System) (*Fume and dust*): Health 3, flammability 0, reactivity 0. Practically insoluble in water. It is produced by roasting the ores, thermal decomposition of the iodide; or from petroleum residues; slags from ferro vanadium production; or soot from oil burning.

Vanadium carbide (CV) is a dark gray powder. Insoluble in water. Freezing/Melting point = 2750−2810°C.

Potential Exposure: Vanadium is used as a catalyst in the production of synthetic rubber and sulfuric acid. Most of the vanadium produced is used in ferrovanadium and of this the majority is used in high speed and other alloy steels with only small amounts in tool or structural steels. It is usually combined with chromium, nickel, manganese, boron, and tungsten in steel alloys. Vanadium carbide is used in cutting tool bits. Finely divided form (of vanadium) favors rapid or explosive reactions with oxidizing agents such as air or oxygen. Reacts exothermically with compounds having active hydrogen atoms (such as acids and water) to form flammable hydrogen gas and caustic products. The reactions are much less vigorous than the similar reactions of alkali metals. Can catalyze polymerization reactions in several classes of organic compounds; these polymerizations sometimes proceed rapidly or even explosively[101].

Incompatibilities: Dust may form explosive mixture with air. Dust, fume, and powders are a strong reducing agent; incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, bromine trifluoride, lithium, nitryl fluoride, chlorine trifluoride.

Permissible Exposure Limits in Air

NIOSH IDLH = 35 mg[V]/m^3

Metal

PAC Ver. 29[138]

Dust and fume: see vanadium pentoxide V:0120

Determination in Air: Use NIOSH Method (vanadium): #7300, #7301; #7303 Elements, #7504, #7504 (vanadium oxides); OSHA Method #185 (Vanadium tetrachloride)

Permissible Concentration in Water: State Drinking Water Guidelines: California: 50 μg[V]/L Arizona 7 μg[V]/L; Florida: 49 μg[V]/L; Minnesota: 50 μg[V]/L; Wisconsin: 30 μg[V]/L. Runoff from spills or fire control may cause water.

Routes of Entry: *For dust and fume:* Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Vanadium can affect you when breathed in. Exposure may irritate the eyes, nose, throat, and air passages; with cough and phlegm. Eye contact may cause irritation. See also "Vanadium Pentoxide." *Ingestion:* acute poisoning in animals of vanadium compounds has been shown to cause nervous disturbances; leg paralysis; respiratory failure; convulsions, bloody diarrhea; coma, and death.

Long-Term Exposure: Can cause greenish-black coloration of the tongue and metallic taste. May cause eczema. Dust and/or fume may cause respiratory irritation; bronchitis may develop; cough, fine rales; wheezing, dyspnea (breathing difficulty).

See also "Vanadium Pentoxide"

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for vanadium. An EEC guideline recommends the following based on vanadium urine levels: an every-4-month control at the work-place if a 50 μg/L is reached and an annual control if the 5 μg/L urine level is reached. In case levels exceed 50 μg/L urine, workers should be temporary removed from risk. See also "Vanadium Pentoxide."

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 milligram per cubic meter:* 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators); or SA* (any supplied-air respirator). *1.25 milligram per cubic meter:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprHie* (APF = 25)* (any powered, air-purifying respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

* *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Vanadium must be stored to avoid contact with oxidizers (such as chlorates, nitrates, chlorine and bromine trifluoride), since violent reactions occur. Store the powder in tightly closed containers in a cool, well-ventilated area away from heat and sparks. Use only nonsparking tools and equipment, especially when opening and closing containers of the powder.

Shipping: UN3285* Vanadium compound, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. *This number includes vanadium fume or dust.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Large pieces of vanadium are not combustible. The fine powder is flammable. Use dry chemicals appropriate for extinguishing metal fires. *Do not use water*. Thermal decomposition products may include metal oxides of vanadium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xn; risk phrases: R45; R20/22; R37; R40; R48/23; R50/53; R62; R63; R68; safety phrases: S1/2; S22; S26; S29/35; S36/37/39; S38; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): (Vanadium and compounds) 3-Severe hazard to water, unless water solubility is <4 μg[V]/L.

Description: Vanadium pentoxide dust is an odorless, yellow to red crystal, or powder; or fume (when vanadium is heated). Vanadium pentoxide fume is a finely divided particulate dispersed in air. Molecular weight = 181.88; specific gravity (H_2O:1) = 3.4 @ 25°C; boiling point = 1750°C (decomposes); freezing/melting point = 681°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Practically insoluble in water; solubility = 0.8%.

Potential Exposure: (*dust*); Suspected reprotoxic hazard, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), (fume) Possible risk of forming tumors, Vanadium pentoxide [V_2O_5] is an industrial catalyst in oxidation reactions; is used in glass and ceramic glazes; is a steel additive; and is used in welding electrode coatings.

Incompatibilities: Strong acids; lithium, chlorine trifluoride; peroxyformic acid; combustible substances.

Permissible Exposure Limits in Air

NIOSH IDLH = 35 mg[V]/m^3

OSHA PEL: 0.5 mg[V_sO_5]/m (*dust*), respirable fraction; 0.1 mg[V_sO_5]/m^3 (fume) Ceiling Concentration

NIOSH REL: 0.05 mg[V]/m^3 Ceiling Concentration [15 min, except vanadium metal and vanadium carbide]

ACGIH TLV[1]: withdrawn

PAC Ver. 29[138]

PAC-1: 0.64 milligram per cubic meter

PAC-2: 7 milligram per cubic meter

PAC-3: 70 milligram per cubic meter

DFG MAK: Carcinogen Category: 2; Germ cell mutagen group: 2 (DFG 2005).

Listed under "dust"

Austria: MAK 0.05 milligram per cubic meter, 1999; Denmark: TWA 0.03 mg[V]/m^3, 1999; Japan; 0.5 mg [V_2O_5]/m^3, 1999; Poland: MAC (TWA) 0.05 milligram per cubic meter; MAC (STEL) 0.5 milligram per cubic meter, 1999; Switzerland: MAK-W 50 ppm (175 milligram per cubic meter), 1999; United Kingdom: TWA 0.5 mg[V]/m^3, total inhalable (*dust*); TWA 0.04 mg[V]/m^3 (fume and respirable dust), 2000.

Listed under "fume"

Austria: MAK 0.05 milligram per cubic meter, 1999; Japan; 0.1 mg [V_2O_5]/m^3, 1999; Poland: MAC (TWA) 0.05 milligram per cubic meter; MAC (STEL) 0.1 milligram per cubic meter, 1999; Sweden: NGV 0.2 mg[V]/m^3, 1999; Switzerland: MAK-W 50 ppm (175 milligram per cubic meter), 1999; United Kingdom: TWA 0.04 mg[V]/m^3, (fume and respirable dust); TWA 5 milligram per cubic meter, 2000. Russia[43] set a MAC in ambient air in residential areas of 0.002 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for vanadium pentoxide in ambient air[60] ranging from 0.14 μ/m^3 (Massachusetts); to 0.8 μ/m^3 (Virginia); to 1.0 μ/m^3 (Connecticut and Nevada); to 5.0 μ/m^3 (North Dakota).

Determination in Air: Use NIOSH Method #7504 (vanadium oxides); (vanadium): #7300, #7301; #7303 Elements, #7504.

Permissible Concentration in Water: State Drinking Water Guidelines: California: 50 μg[V]/L Arizona 7 μg[V]/L; Florida: 49 μg[V]/L; Minnesota: 50 μg[V]/L; Wisconsin: 30 μg[V]/L. Runoff from spills or fire control may cause water.

Determination in Water: Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Vanadium pentoxide is irritating to the skin, eyes, and mucous membranes. Blindness and epistaxis (bloody nose) are further complications. Headache, dry mouth; dizziness, nervousness, insomnia, and tremor may be found. Probable oral lethal dose for humans is between 5 and 50 mg/kg or between 7 drops and 1 tsp for a 70 kg (150 lb) person. Toxicity is about the same magnitude as pentavalent arsenic. Acute exposure to vanadium pentoxide may result in pulmonary irritation, bronchospasm, hemoptysis (coughing up of blood), emphysema, anorexia, black stools; and pulmonary edema. Pulmonary edema is a medical emergency that can be delayed for several hours, and can cause death.

Long-Term Exposure: May cause dermatitis; eczema, skin allergy. Lungs may be affected by repeated inhalation of dust or fumes; bronchitis may develop with cough; fine rales; wheezing, dyspnea (breathing difficulty). May cause a green staining of the tongue and skin.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure. Test for urine level of vanadium. An EEC guideline recommends the following based on vanadium urine levels: an every-4-month control at the workplace if a 50 μg/L is reached and an annual control if the 5 μg/L urine level is reached. In case levels exceed 50 μg/L urine, workers should be temporary removed from risk.

An OSHA specifically regulated substance. See NIOSH Publication No. 2005-110, December 2004.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 milligram per cubic meter:* 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators); or SA* (any supplied-air respirator). *1.25 milligram per cubic meter:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprHie* (APF = 25)* (any powered, air-purifying respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full face piece). *Emergency or planned entry in to unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

* *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Vanadium pentoxide must be stored to avoid contact with chlorine trifluoride; lithium and peroxyformic acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: UN2862 Vanadium pentoxide, nonfused form, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled materials; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible but will increase the intensity of an existing fire. Extinguish fire using an agent suitable for type of surrounding fire. Vanadium pentoxide itself does not burn but decomposing dust containing oxygen may increase intensity of fire when in contact with combustible materials. Thermal decomposition products may include metal oxides of vanadium and oxygen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Vanadium pentoxide may be salvaged or disposed of in a sanitary landfill.

WGK[100] (German Aquatic Hazard Class): (Vanadium and compounds) 3-Severe hazard to water, unless water solubility is <4 μg[V]/L.

Description: Vanadium tetrachloride is a thick, reddish-brown liquid that gives off fumes on exposure to moist air. Molecular weight = 192.74; specific gravity (H_2O:1) = 1.8 @ 20°C; boiling point = 148°C @ 75 mmHg; freezing/melting point = −28 ± 2°C; vapor pressure = 7.6 mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System) (*Fume and dust*): Health 3, flammability 0, reactivity 2₩. Decomposes in water; reaction is violent.

Potential Exposure: Vanadium tetrachloride is used as a fixative in textile dyeing and in the manufacture of other vanadium compounds.

Incompatibilities: Vanadium tetrachloride is chemically unstable, highly reactive with all forms of moisture, including humidity, releasing corrosive hydrogen chloride and/or chloride fumes. Keep away from light, UV, water, steam, lithium, chlorine, trifluoride, alcohols, organic, and combustible materials. Vanadium tetrachloride is a reactive chemical and is an explosion hazard. See storage and handling section. Corrosive to metals and may release flammable hydrogen gas. Vanadium tetrachloride decomposes by the action of light with the formation of Cl_2 gas. Reacts as an acid to neutralize bases. These neutralizations generate heat. Usually does not react as either oxidizing agents or reducing agents but such behavior is not impossible. May catalyze organic reactions[101].

Permissible Exposure Limits in Air

Determination in Air: Use NIOSH Method OSHA Method #185 (Vanadium tetrachloride); (vanadium): #7300, #7301; #7303 Elements, #7504.

Permissible Concentration in Water: State Drinking Water Guidelines: California: 50 μg[V]/L; Arizona 7 μg[V]/L; Florida: 49 μg[V]/L; Minnesota: 50 μg[V]/L; Wisconsin: 30 μg[V]/L. Runoff from spills or fire control may cause water.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Vanadium tetrachloride can affect you when breathed in and by passing through your skin. Vanadium tetrachloride is a corrosive chemical and eye contact can cause irritation and possible damage. Exposure can irritate the eyes, nose, throat, and lungs, with cough and shortness of breath. Higher exposures can cause pneumonia or pulmonary edema (fluid in the lungs). Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated exposure can cause lung irritation; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for vanadium. Test for urine level of vanadium. An EEC guideline recommends the following based on vanadium urine levels: an every-4-month control at the work-place if a 50 μg/L is reached and an annual control if the 5 μg/L urine level is reached. In case levels exceed 50 μg/L urine, workers should be temporary removed from risk.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 milligram per cubic meter:* 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators); or SA* (any supplied-air respirator). *1.25 milligram per cubic meter:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprHie* (APF = 25)* (any powered, air-purifying respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:

ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
* *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Vanadium tetrachloride must be stored to avoid contact with water, since violent reactions occur, including heat and poisonous gases. Store in tightly closed containers in a cool, well-ventilated area away from radiant heat and flammable and combustible materials; lithium, chlorine, and trifluoride. Vanadium tetrachloride decomposes slowly to vanadium trichloride and chloride. Open containers in dry oxygen-free atmosphere or in inert gas, wearing appropriate personal protective equipment. Chill to below 20°C before opening.

Shipping: UN2444 Vanadium tetrachloride, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Do not use water* or wet method. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep out of sewers because of the possibility of fire and explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Vanadium tetrachloride itself does not burn, but it may increase the intensity of a fire since it is an oxidizer. Use dry chemical or CO_2 extinguishers on surrounding fire. *Do not use water* on this material. Thermal decomposition products may include hydrogen chloride; chlorine, and metal oxides of vanadium. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Use water spray to keep fire-exposed containers cool and to reduce vapors but do not get water inside containers of vanadium tetrachloride or on spilled material. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN2931/151

EC Number: 248-652-7

Regulatory Authority and Advisory Information

Carcinogenicity: DFG MAK: Carcinogen Category 2, Vanadium and inorganic compounds, inhalable fraction. Germ cell mutagen group: 2.

Hazard Alert: Poison, Corrosive, Suspected of damaging fertility or the unborn child, Primary irritant (w/o allergic reaction)

United States National Primary Drinking Water Regulations: SMCL = 250 mg[SO_4^{-2}]/L as Sulfate

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40 CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, C, N, Xn, Xi; risk phrases: R45; R20/21/22; R34; R35; R36/37/38; R37; R41; R50/53; safety phrases: S16; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): (Vanadium and compounds) 3-Severe hazard to water, unless water solubility is <4 μg[V]/L.

Description: Vanadyl sulfate is a pale blue crystalline powder. Odorless. Molecular weight = 163; freezing/melting point = (decomposes) 105°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Highly soluble in water.

Potential Exposure: Vanadyl sulfate is used as a fixative for textile dyes, a colorant for glass and ceramics; a reducing agent and a catalyst.

Incompatibilities: Vanadyl sulfate has weak oxidizing or reducing powers. Redox reactions can however still occur[101]. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Vanadyl sulfate may attack metals; sulfates react with aluminum, magnesium.

Permissible Exposure Limits in Air

NIOSH IDLH = 35 mg[V]/m^3

PAC Ver. 29[138]

27774-13-6

PAC-1: 0.015 milligram per cubic meter

PAC-2: 0.16 milligram per cubic meter

PAC-3: 110 milligram per cubic meter

12439-96-2, sulfate oxide hydrate

PAC-1: 0.023 milligram per cubic meter

PAC-2: 0.25 milligram per cubic meter

PAC-3: 170 milligram per cubic meter

DFG MAK: inhalable fraction, Carcinogen Category: 2; Germ cell mutagen group: 2 (DFG 2005).

Determination in Air: Use NIOSH Method (vanadium): #7300, #7301; #7303 Elements, #7504.

Permissible Concentration in Water: State Drinking Water Guidelines: California: 50 μg[V]/L Arizona 7 μg[V]/L; Florida: 49 μg[V]/L; Minnesota: 50 μg[V]/L; Wisconsin: 30 μg[V]/L. Runoff from spills or fire control may cause water.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Toxic when ingested. Vanadyl sulfate can affect you when breathed in. Contact can irritate the skin. Exposure can irritate the eyes, nose, throat, and lungs with cough and phlegm. Higher exposures can cause pneumonia and/or pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Lungs may be affected by repeated inhalation; bronchitis may develop. May cause a greenish-black discoloration of the tongue and skin.

Points of Attack: Lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. For those with frequent or potentially high exposure (half the TLV or grater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for vanadium. An EEC guideline recommends the following based on vanadium urine levels: an every-4-month control at the work-place if a 50 μg/L is reached and an annual control if the 5 μg/L urine level is reached. In case levels exceed 50 μg/L urine, workers should be temporary removed from risk. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus). NIOSH/OSHA (as V): *0.5 milligram per cubic meter:* 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators); or SA* (any supplied-air respirator). *1.25 milligram per cubic meter:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprHie* (APF = 25)* (any powered, air-purifying respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry in to unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

* *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—Blue: Health Hazard/Toxics/ Poisons: Store in a secure poison location. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2931 Vanadyl sulfate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Use water spray to reduce vapors. Thermal decomposition products may include oxides of sulfur and vanadium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F+; risk phrases: R45; R11; R17; R19; R36/37/38; R51/53; R61; R62; R63; safety phrases: S1; S2; S16; S21; S23; S29; S33; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Vinyl acetate is a colorless, flammable liquid. The odor threshold is 0.12 ppm[41] 0.3 ppm (NY, NJ). Molecular weight = 86.1; specific gravity (H_2O:1) = 0.93 @ 25°C; boiling point = 73°C; freezing/melting point = −93°C; vapor pressure = 83 mmHg @ 25°C; flash point = −8°C (cc); autoignition temperature = 402°C. Explosive limits: LEL = 2.6%; UEL: 13.4%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 2. Slightly soluble (2%) in water.

Potential Exposure: Vinyl acetate is used primarily in polymerization processes to produce polyvinyl acetate; polyvinyl alcohol, and vinyl acetate copolymer. The polymers, usually made as emulsions, suspensions, solutions, or resins, are used to prepare adhesives, paints, paper coatings, and textile finishes. Low molecular weight vinyl acetate is used as a chewing gum base.

Incompatibilities: Vinyl acetate may undergo spontaneous exothermic polymerization on exposure to light[101]. Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, strong light and UV. The vapor may react vigorously with silica gel or aluminum, acids, bases, silica gel; alumina, oxidizers, azo compounds. Ozone readily polymerizes in elevated temperatures, under the influence of light, or peroxides. Usually contains a stabilizer [e.g., hydroquinone (limit to 2 months) or diphenylamine for longer term] to prevent polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.52 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 4 ppm/15 milligram per cubic meter [15-min] Ceiling Concentration

ACGIH TLV[1]: 10 ppm/35 milligram per cubic meter TWA; 15 ppm/53 milligram per cubic meter STEL, confirmed animal carcinogen with unknown relevance to humans.

PAC* Ver. 29[138]

PAC-1: **6.7**$_{\mathbf{A}}$ ppm

PAC-2: **36**$_{\mathbf{A}}$ ppm

PAC-3: **180**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category 3A, Substances which are proved or possibly carcinogenic and give reason for concern

Australia: TWA 10 ppm (30 milligram per cubic meter), STEL 20 ppm, 1993; Austria: MAK 1 ppm (35 milligram per cubic meter), Suspected: carcinogen, 1999; Belgium: TWA 10 ppm (35 milligram per cubic meter), STEL 20 ppm, 1993; Denmark: TWA 10 ppm (30 milligram per cubic meter), 1999; Finland: TWA 10 ppm (35 milligram per cubic meter), STEL 20 ppm (70 milligram per cubic meter), 1993; France: VME 10 ppm (30 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 18 milligram per cubic meter, 2003; Poland: MAC (TWA) 10 milligram per cubic meter; MAC (STEL) 30 milligram per cubic meter, 1999; Sweden: NGV 5 ppm (18 milligram per cubic meter), KTV 10 ppm (35 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (35 milligram per cubic meter), KZG-W 20 ppm (70 milligram per cubic meter), 1999; Turkey: TWA 10 ppm (30 milligram per cubic meter), 1993; United Kingdom: TWA 10 ppm (36 milligram per cubic meter), STEL 20 ppm (72 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 15 ppm

Russia[43] set a MAC in ambient air in residential areas of 0.15 milligram per cubic meter both on a momentary and a daily average basis. Several states have set guidelines or standards for vinyl acetate in ambient air[60] ranging from 5.0 μ/m^3 (Virginia); to 9.6 μ/m^3 (Massachusetts); to 300.0–600.0 μm^3 (North Dakota); to 600.0 μ/m^3 (Connecticut); to 714.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1453, vinyl acetate; OSHA Analytical Method 51.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 0.8$. Unlikely to bioaccumulate in marine organisms.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.2 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract causing hoarseness, cough; loss of smell. A CNS depressant; high levels of exposure can cause fatigue, dizziness, lightheadedness and disturbed sleep. *Inhalation:* Irritates the nose and throat, causing coughing and/or shortness of breath. Levels of 19 ppm for 4 hours have caused slight throat irritation. The characteristic odor may not be recognized after about 2 hours. Levels of 71 ppm for 1/2 hour may cause definite throat irritations. May cause lesions of the lung tissue. *Skin:* Contact can cause irritation, dryness. Prolonged contact can cause rash, burns, and blisters. *Eyes:* Levels of 22 ppm and above may produce eye reddening and irritation. Contact can cause burns.

Long-Term Exposure: May affect the heart, central nervous system and liver. Levels above 22 ppm for 1 year may cause reversible irritation to eyes, throat and lungs, sometimes accompanied by skin irritation or rash. Vinyl acetate has been related to reproductive abnormalities. Exposure caused gradual deterioration of heart muscles.

Points of Attack: Liver, eyes, heart, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. For those with frequent or potentially high exposure (half the TLV or greater), the following is recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Exam of the nervous system. EKG. Specific engineering controls are recommended for this chemical. Refer to NIOSH Criteria Document #78-205, Occupational Exposure to Vinyl Acetate.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon, polyethylene and ethylene vinyl alcohol are recommended as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *40 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *200 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *400 ppm:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Vinyl acetate must be stored to avoid contact with oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and direct sunlight. Sources of ignition, such as smoking and open flames are prohibited where vinyl acetate is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of vinyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of vinyl acetate. Wherever vinyl acetate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1301 Vinyl acetate, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include harmful oxides of carbon. Water may be ineffective. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water; possibly 3-Severe hazard to water. (est.)]

Description: Vinyl bromide is a colorless gas or liquid at low ambient temperature. Pleasant odor. Shipped as a liquefied compressed gas with 0.1% phenol added to prevent polymerization. Molecular weight = 106.95; specific gravity (H_2O:1) = 1.49 (liquid @ 20°C; boiling point = 16°C; freezing/melting point = −140°C; vapor pressure = 750 mmHg @ 15°C; relative vapor density (air = 1) = 3.97; flash point = flammable gas; autoignition temperature = 530°C. Explosive limits: LEL = 9.0%; UEL: 15.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 4, reactivity 1. Insoluble in water.

Potential Exposure: Vinyl bromide is used as an intermediate in organic synthesis and for the preparation of plastics by polymerization and copolymerization; as a comonomer with acrylonitrile and other vinyl monomers in modacrylic fibers; in the production of flame-retardant synthetic fibers.

Incompatibilities: Vinyl bromide is a dangerous chemically unstable compound that may polymerize spontaneously in heat, sunlight and possibly exposure to UV. Dangerously reactive with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, acetylene, strong acids, strong bases, copper compounds. Add 0.1% phenol to gas to prevent polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.38 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.5 ppm/2.2 milligram per cubic meter TWA, Suspected Human Carcinogen

PAC Ver. 29[138]

PAC-1: 39 ppm

PAC-2: 430 ppm

PAC-3: 2600 ppm

Australia: TWA 5 ppm (20 milligram per cubic meter), carcinogen, 1993; Belgium: TWA 5 ppm (22 milligram per cubic meter), Carcinogen 1993; Denmark: TWA 5 ppm (20 milligram per cubic meter), 1999; Finland: TWA 5 ppm (20 milligram per cubic meter), STEL 10 ppm (40 milligram per cubic meter), carcinogen, 1999; Norway: TWA 1 ppm (4 milligram per cubic meter), 1999; Switzerland: MAK-W 5 ppm (22 milligram per cubic meter), 1999; United Kingdom: LTEL 5 ppm (20 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 0.012 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. Several states have set guidelines or standards for vinyl bromide in ambient air[60] ranging from 0 (North Dakota); to 2.0 μ/m^3 (Virginia); to 44.0 μ/m^3 (Connecticut); to 48.07 μ/m^3 (Pennsylvania); to 66.7 μ/m^3 (New York); to 100.0 μ/m^3 (South Carolina); to 200.0 μ/m^3 (Florida); to 476.0 μ/m^3 (Nevada).

Determination in Air: Charcoal tube; Ethanol; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1009, Vinyl bromide, OSHA Analytical Method 08.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.6. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion (liquid), skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Vinyl bromide can affect you when breathed in. Contact can irritate the eyes. A nervous system depressant; exposures may cause dizziness, lightheadedness, confusion, a lack of coordination; narcosis, nausea, vomiting. Contact with the liquid can cause frostbite.

Long-Term Exposure: Potential occupational carcinogen.

Points of Attack: Eyes, skin, central nervous system; liver. Cancer site in animals: liver and lymph node tumors.

Medical Surveillance: There are no special tests. However medical attention is recommended if overexposure is suspected.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is NO REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Vinyl bromide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and heat or flame, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where vinyl bromide is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1085 Vinyl bromide, stabilized, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Vinyl bromide is an extremely flammable gas. For small fires, use dry chemical, CO_2, water spray; or foam extinguishers. Thermal decomposition products may include toxic fumes of hydrogen bromine and oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Vinyl chloride is a flammable gas at room temperature, and is usually encountered as a cooled liquid. The colorless liquid forms a vapor which has a pleasant, ethereal odor. The odor threshold is variously given as 260 ppm[41], 3,000 ppm (NJ fact sheet), 4000 ppm (NY fact sheet) in air and 3.4 ppm in water (EPA Toxicological profile). Shipped as a liquefied compressed gas. Molecular weight = 62.5; specific gravity (H_2O:1) = 0.91 (Liquid) @ 20°C; boiling point = −14°C; freezing/melting point = −154°C; relative vapor density (air = 1) = 2.21; vapor pressure = 750 mmHg @ −14°C; flash point = flammable gas @ −75°C (cc); autoignition temperature = 472°C. Explosive limits: LEL = 3.6%; UEL: 33.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 4, reactivity 2. Insoluble in water; 0.1% @ 25°C.

Potential Exposure: Vinyl chloride is used as a vinyl monomer in the manufacture of polyvinyl chloride (vinyl chloride homopolymer) and other copolymer resins. It is also used as a chemical intermediate and as a solvent.

Incompatibilities: Copper, oxidizers, aluminum, peroxides, iron, steel. Polymerizes in air, sunlight, heat, and on contact with a catalyst, strong oxidizers; and metals, such as aluminum and copper unless stabilized by inhibitors, such as phenol. Attacks iron and steel in presence of moisture.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.56 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 ppm/2.56 milligram per cubic meter TWA; 5 ppm [Avg not exceeding any 15 min period STEL

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 1 ppm/2.6 milligram per cubic meter TWA, Confirmed Human Carcinogen

PAC* Ver. 29[138]

PAC-1: $\mathbf{250_A}$ ppm

PAC-2: $\mathbf{1200_A}$ ppm

PAC-3: $\mathbf{4800_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category 1; TRK: 2 mL/m^3/5.2 milligram per cubic meter; 2.4 mg [thioglycolic acid]/24 hours, in urine; after several shifts.

Arab Republic of Egypt: TWA 2.5 milligram per cubic meter, 1993; Australia: TWA 5 ppm (10 milligram per cubic meter), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 5 ppm (13 milligram per cubic meter), Carcinogen 1993; Denmark: TWA 1 ppm (3 milligram per cubic meter), [skin], 1999; Finland: TWA 5 ppm (15 milligram per cubic meter), STEL 10 ppm (30 milligram per cubic meter), carcinogen, 1993; Hungary: STEL 10 milligram per cubic meter, carcinogen, 1993; Japan 2.5 ppm (6.5 milligram per cubic meter), carcinogen, 1999; the Netherlands: MAC-TGG 7.77 milligram per cubic meter, 2003; Norway: TWA 1 ppm (3 milligram per cubic meter), 1999; the Philippines: TWA 50 ppm (100 milligram per cubic meter), 1993; Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 30 milligram per cubic meter, 1999; Russia: TWA 1 milligram per cubic meter, STEL 2.5 ppm (5 milligram per cubic meter), 1993; Sweden: NGV 1 ppm (2.5 milligram per cubic meter), KTV 5 ppm (13 milligram per cubic meter), [skin], carcinogen, 1999; Switzerland: MAK-W 2 ppm (5.2 milligram per cubic meter), carcinogen, 1999; Thailand: TWA 1 ppm (2.8 milligram per cubic meter), 1993; Turkey: TWA 500 ppm (1300 milligram per cubic meter), 1993; United Kingdom: TWA 7 ppm, Carcubigen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. MAC values have been set for ambient air in residential areas[35] by Russia at 0.005 milligram per cubic meter on a momentary basis and by The Czech Republic at 0.3 milligram per cubic meter on a momentary basis and 0.1 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for vinyl chloride in ambient air[60] ranging from 0 (North Dakota); to 0.038 μ/m^3 (North Carolina); to 0.4 μ/m^3 (Michigan and New York); to 1.0 μ/m^3 (Virginia); to 3.846 μ/m^3 (Kansas); to 3.9 μ/m^3 (Massachusetts); to 5.0 μ/m^3 (Pennsylvania); to 50.0 μ/m^3 (Connecticut, South Carolina, South Dakota); to 238.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1007, vinyl chloride, OSHA Analytical Method 04.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.002 mg/L; MCLG, zero. For the protection of human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 20 μg/L[6]. A long-term health advisory for vinyl chloride of 46 μg/L has been set by EPA[48]. Several states have set guidelines or standards for vinyl chloride in drinking water[61] ranging from 0 (Rhode Island); to 0.15 μg/L (Minnesota); to 1.0 μg/L (Arizona, Florida, Kansas, Massachusetts, New Mexico, Vermont); to 2.0 μg/L (California, Maine, New Jersey, Colorado); to 5.0 μg/L (New York).

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{ow} = 0.6$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin, and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May affect the central nervous system. High exposures can cause dizziness, lightheadedness, sleepiness. Even higher levels can cause headaches, nausea, weakness, unconsciousness, and possible death. Exposure @ 8000 ppm for 5 minutes can cause a feeling of intoxication, tiredness, drowsiness, abdominal pain; numbness and tingling in fingers and toes; pains in joints; coughing, sneezing, irritability; loss of appetite and weight. *Skin:* Contact with liquid may cause frostbite; contact with vapor may cause irritation and rash. Absorption is possible through the skin. *Eyes:* Can cause severe and immediate irritation. Contact with the liquid may cause frostbite. *Ingestion:* Moderately toxic.

Long-Term Exposure: Increase of cancer risk. May cause "scleroderma" a disease that causes the skin to become smooth, tight and shiny and causes the bones in the fingers to erode (resulting in club-like swelling and shortening of finger tips) and damage the blood vessels in the hands (Raynauds syndrome). This causes the hands or feet to turn numb, pale, or blue with even mild cold exposure. Connective tissue, bones, and joints of arms and legs may suffer damage. Repeated exposure can permanently damage the liver; spleen, kidneys, nervous system; and blood cells. Vinyl chloride can cause symptoms, such as stomach ulcers and skin allergy. Not all symptoms disappear after exposure stops. Vinyl chloride has caused liver cancer in occupationally exposed individuals. It may damage the developing fetus, and there is limited evidence that it is a teratogen in animals. An excess of spontaneous abortions has been reported among spouses of workers who have been exposed to vinyl chloride. Increased rates of birth defects have been reported in areas where vinyl chloride processing plants are located. Vinyl chloride's role in this increased risk is unknown at this time.

Points of Attack: Liver, central nervous system; blood, respiratory system; lymphatic system. Cancer site in humans: liver. Cancer site in animals: liver, brain, lung.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. OSHA mandates the following tests: blood serum; alkaline phosphatase; bilirubin, *gamma*-glutamyl transpeptidase; serum glutamic oxalacetic transaminase; serum glutamic pyruvic transaminase. NIOSH lists the following tests: alkaline phosphatase; blood serum: lactic dehydrogenase; chest X-ray; expired air; liver function tests: alkaline phosphatase, bilirubin, *gamma*-glutamyl transpeptidase, serum glutamic oxalacetic transaminase, serum glutamic pyruvic transaminase; pulmonary function tests; pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); red blood cell count; urine (chemical/metabolite); urinalysis (routine): albumin, whole blood (chemical/metabolite), ultrasonography of the liver. Complete exam of the skin and nervous system. If symptoms develop or overexposure is suspected, the following may be useful: X-rays of the fingers. Test for “urinary thiodiglycolic acid” (normal level is usually less than 2 mg/L). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton, Silvershield, and chlorinated polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Vinyl chloride (1910.1017): < or = 10 ppm (parts per million): (1) Combination Type C supplied-air respirator, demand type, with half facepiece, and auxiliary self-contained air supply; (2) Type C supplied-air respirator, demand type, with half facepiece; or (3) Any chemical cartridge respirator with an organic vapor cartridge which provides a service life of at least 1 hour for concentrations of vinyl chloride up to 10 ppm. < or = 25 ppm: (1) Powered air-purifying respirator with hood, helmet, full or half facepiece, and a canister which provides a service life of at least 4 hours for concentrations of vinyl chloride up to 25 ppm; or (2) Gas mask with front-or back-mounted canister which provides a service life of at least 4 hours for concentrations of vinyl chloride up to 25 ppm. < or = 100 ppm: (1) Combination Type C supplied-air respirator, demand type, with full facepiece, and auxiliary self-contained air supply; or (2) Open-circuit self-contained breathing apparatus with full facepiece, in demand mode; or (3) Type C supplied-air respirator, demand type, with full facepiece. < or = 1000 ppm: Type C supplied-air respirator, continuous-flow type, with full or half facepiece, helmet, or hood. < or = 3600 ppm: (1) Combination Type C supplied-air respirator, pressure demand type, with full or half facepiece, and auxiliary self-contained air supply; or (2) Combination type continuous-flow supplied-air respirator with full or half facepiece and auxiliary self-contained air supply. >3600 ppm or unknown concentration Open-circuit self-contained breathing apparatus, pressure-demand type, with full facepiece.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Vinyl chloride must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where vinyl chloride is handled, used, or stored. Metal containers involving the transfer of 5 gal of vinyl chloride should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of vinyl chloride. Wherever vinyl chloride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1086 Vinyl chloride, stabilized, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of leak to disperse the gas. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the op en air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Vinyl chloride is a flammable gas. Thermal decomposition products may include phosgene, hydrogen chloride; and oxides of carbon. Use dry chemical or CO_2 extinguishers. Fire may restart after it has been extinguished. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assured to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22]. A variety of techniques have been described for vinyl chloride recovery from PVC latexes.

4-Vinyl-1-Cyclohexene V:0180

Formula: C_8H_{12}; $C_6H_9CH{=}CH_2$

Synonyms: Butadiene dimer; Cyclohexenylethylene; 1-Ethenylcyclohexene; 4-Ethenyl-1-cyclohexene; NCI-C54999; 1,2,3,4-Tetrahydrostyrene; 1-Vinylcyclohex-3-

ENE; 1-Vinylcyclohexene-3; 4-Vinyl-1-cyclo hexene; 4-Vinylcyclohexene; 4-Vinylcyclohexene-1

CAS Registry Number: 100-40-3

HSDB Number: 2872

RTECS Number: GW 6650000

UN/NA & ERG Number: UN1993 (flammable liquids, n.o.s.)/128 (P)

EC Number: 202-848-9

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1994; NCI: Carcinogenesis Studies (gavage); clear evidence: mouse; inadequate study: rat.

California Proposition 65 Chemical[102]: Cancer 2/27/1987; Developmental/Reproductive toxin, female 8/7/2009

Hazard Alert: Highly flammable, Polymerization hazard, Aspiration hazard, Tumorogen; Suspected of causing genetic defects.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xn; risk phrases: R45; R11; R19; R20; R36/37/38; R38; R40; R51/53; R62; R65; R67; safety phrases: S16; S21; S22; S24/25; S26; S33; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: 4-Vinyl-1-cyclohexene, a cyclic alkene, is a highly flammable liquid. Molecular weight = 108.2; specific gravity (H_2O:1) = 0.82 @ 25°C; boiling point = 130.3°C; freezing/melting point = −101°C; vapor pressure = 25 mmHg @ 38°C; flash point = 16−21°C; autoignition temperature = 269°C. Explosive limits: LEL = 26,000 ppm, UEL: unknown; Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 2. Hydrolyzes in water.

Potential Exposure: 4-Vinyl-1-cyclohexene is used as an intermediate for the production of vinylcyclohexene dioxide, which is used as a reactive diluent in epoxy resins. Previous uses of 4-vinyl-1-cyclohexene include comonomer in the polymerization of other monomers and for halogenation to polyhalogenated derivatives which are used as flame retardants.

Incompatibilities: Vapor may form explosive mixture with air. Hydrolyzes in water. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, amines, alcohols.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: None

ACGIH TLV[1]: 0.1 ppm/0.44 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 0.3 ppm

PAC-2: 210 ppm

PAC-3: 340 ppm

DFG MAK: [skin] Carcinogen Category: 2

Poland: MAC (TWA) 10 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.4 milligram per cubic meter, 2003

Determination in Water: Octanol−water coefficient: Log K_{ow} = > 3.9. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Vapors cause irritation and smarting of the eyes and respiratory system if present in high concentrations. Aspiration hazard; may be fatal if swallowed and enters airways. Causes skin irritation.

Long-Term Exposure: Workers exposed to 4-vinyl-1-cyclohexene experienced keratitis (inflammation of the cornea), rhinitis, headache, hypotonia, leucopenia (decrease in the number of white blood cells), neutrophilia, lymphocytosis; and impairment of pigment and carbohydrate metabolism. A confirmed carcinogen; and may damage fertility. Prolonged exposure to oxygen-containing gases leads to discoloration and gum formation[193].

Points of Attack: Blood, eyes.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Complete eye examination. Complete blood count and hematocrit.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSH A- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in an explosion-proof refrigerator. Protect from exposure to oxidizers, alcohols, amines, air, and light. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Water may be ineffective due to the low flash point. Water spray may be used however. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 203-437-7 [*Annex I Index No.:* 603-066-00-4]
Regulatory Authority and Advisory Information
Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen (4-Vinyl-1-cyclohexene diepoxide); IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1994; NCI: Carcinogenesis Studies (gavage); clear evidence: mouse, rat
California Proposition 65 Chemical[102]: Cancer 7/1/1990; Developmental/Reproductive toxin, female 8/1/2008
Hazard Alert: Poison, Combustible, Polymerization hazard, Reproductive toxin: possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).
Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R45; R19; R23/24/25; R36/37/38; R68/20/21; R61; R62; R63; safety phrases: S1/2; S23; S24; S36/37; S45; S63 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Vinyl cyclohexene dioxide is a colorless liquid. Molecular weight = 140.2; specific gravity (H_2O:1) = 1.10 @ 20°C; boiling point = 227°C; freezing/melting point = −109°C; vapor pressure = 0.1 mmHg @ 25°C; flash point = 110°C; autoignition temperature = 392°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Highly soluble in water; reacts slowly, hydrolyzed.
Potential Exposure: This material is used as a monomer in the production of epoxy resins for coatings and adhesives; as a chemical intermediate and as a reactive diluent.
Incompatibilities: When heated or in contact with catalysts, epoxides may cause violent polymerization. Epoxides are incompatible with reducing agents and oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May react, possibly violently, with water in the presence of acid and other catalysts. Reacts with alcohols, amines and other active hydrogen compounds. Slowly hydrolyzes in water.
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: 10 ppm/60 milligram per cubic meter TWA [skin]; Potential occupational carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A
ACGIH TLV[1]: 10 ppm/57 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.
PAC Ver. 29[138]
PAC-1: 0.3 ppm
PAC-2: 5.9 ppm
PAC-3: 35 ppm
DFG MAK: [skin], Carcinogen Category: 2
Australia: TWA 10 ppm (60 milligram per cubic meter), [skin], carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 10 ppm (57 milligram per cubic meter), [skin], carcinogen, 1993; Denmark: TWA 10 ppm (60 milligram per cubic meter), 1999; Finland: TWA 10 ppm (60 milligram per cubic meter), STEL 20 ppm (120 milligram per cubic meter), carcinogen, 1999; Norway: TWA 10 ppm (60 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 60 milligram per cubic meter, 2003; United Kingdom: LTEL 10 ppm (60 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for vinyl cyclohexene dioxide in ambient air[60] ranging from 0 (North Dakota); to 6.0 μ/m^3 (Virginia); to 150.0 μ/m^3 (Pennsylvania); to 600.0 μ/m^3 (Connecticut); to 1,429 μ/m^3 (Nevada).
Determination in Air:
No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.
Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.32. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Vinyl cyclohexene dioxide can affect you when breathed in and by passing through your skin. Irritates the eyes, skin and severely irritates the nose, throat, and lungs, causing coughing and wheezing. Prolonged contact can cause severe burns and blisters.
Long-Term Exposure: Vinyl cyclohexene dioxide may cause a skin allergy to develop. If this happens, very small future exposure can cause itching and a rash. It can cause lung irritation; bronchitis may develop. A potential occupational carcinogen and a mutagen; handle with extreme caution. It may also damage the testes (male reproductive system). In animals: irritation of the eyes, skin, respiratory system; testicular atrophy; leukopenia (reduced blood leukocytes), necrosis thymus; skin sensitization.
Points of Attack: Eyes, skin, respiratory system; blood, thymus, lungs, reproductive system. Cancer site in animals: skin.
Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or grater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop

or overexposure is suspected, the following may be useful: White blood cell count. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately.

Skin Contact: Quickly remove contaminated clothing. Immediately wash contaminated skin with large amounts of water. Seek medical attention.

Breathing: Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSHR EL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat or flames, water, alcohols, amines. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides: discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides: perforation of a container of the waste from a safe distance followed by open burning.

National Institute for Occupational Safety and Health (NIOSH), Information Profiles on Potential Occupational Hazards: Vinyl Cyclohexene Dioxide, pp 54−57, Report PB-276,678, Rockville, MD (October 1977)

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Vinyl Cyclohexene Dioxide, Trenton, NJ (August 2005).

Vinyl Fluoride V:0210

Formula: C_2H_3F; $CHF{=}CH_2$

Synonyms: Ethene, fluoro-; Ethylene fluoro-; Fluorethylene; Fluoroethene; Fluoruro de vinilo (Spanish); Monofluroethylene; Vinyl fluoride monomer

CAS Registry Number: 75-02-5

HSDB Number: 807

RTECS Number: YZ7351000

UN/NA & ERG Number: UN1860 (stabilized)/116 (P)

EC Number: 200-832-6

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal, Sufficient Evidence; Human, Inadequate Evidence, Group 2A, 1995.

California Proposition 65 Chemical[102]: Cancer 5/1/1997

Hazard Alert: Extremely flammable gas, Asphyxiation hazard, Contact with liquid may cause frostbite, Polymerization hazard, Possible risk of forming tumors, Suspected of causing genetic defects.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xn; risk phrases: R2; R12; R19; R20/21/22; R40; R62; safety phrases: S1; S9; S16; S23; S36/37/39; S41; S45 (see Appendix 4)

Description: Vinyl fluoride is a colorless gas. Molecular weight = 46.1; specific gravity (H_2O:1) = 0.63.5 @ 20°C; boiling point = −72°C; freezing/melting point = −161°C; relative vapor density (air = 1) = 1.60; vapor pressure = 25.2 atm; flash point = flammable gas; autoignition temperature = 385°C. Explosive limits: LEL = 2.6%; 26,000 ppm; UEL: 21.7%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 4, reactivity 2. Insoluble in water.

Potential Exposure: Vinyl fluoride's primary use is as a chemical and polymer intermediate; used to make polyvinyl fluoride (Tedlar) film. Polyvinyl fluoride film is characterized by superior resistance to weather, high strength; and a high dielectric constant. It is used as a film laminate for building materials and in packaging electrical equipment. Polyvinyl fluoride film poses a hazard, so it is not recommended for food packaging. Polyvinyl fluoride evolves toxic fumes upon heating.

Incompatibilities: May polymerize. Inhibited with 0.2% terpenes to prevent polymerization. Violent reaction with oxidizers. May accumulate static electrical charges.

Permissible Exposure Limits in Air

NIOSH IDLH = Not determined; suspected occupational carcinogen

Conversion factor: 1 ppm = 1.82 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 1 ppm TWA; 5 ppm Ceiling Concentration/15 min, CFR 1910.1017

ACGIH TLV[1]: 1 ppm, Suspected Human Carcinogen

PAC Ver. 29[138]

PAC-1: 570 ppm

PAC-2: 6200 ppm (≥10% LEL, lower explosive limit but <50% LEL)

PAC-3: 37,000 ppm (LEL, lower explosive limit)

The state of South Carolina has set a guideline for vinyl fluoride in ambient air[60] of 19.0 μm^3.

Determination in Air: There is no method listed by NIOSH. However, the following method is listed for gaseous fluorides: NIOSH Analytical Method 7902[18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware

2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: A CNS depressant, causing headache, dizziness, confusion, a lack of coordination; nausea, vomiting, narcosis, unconsciousness. In industrial use, inhalation of dusts of decomposed fluorocarbon polymers may cause polymer fume fever characterized by headache, aching joints; general feeling of discomfort; cough, shivering, chills, fever, rapid heartbeat and chest discomfort. Animal data indicate that concentrations at and above 30% (300,000 ppm) vinyl fluoride may cause symptoms of intoxication. Contact with the liquid may cause frostbite of the skin or eyes.

Long-Term Exposure: May be a human carcinogen. Repeated high exposures may affect kidneys. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite; diarrhea or constipation. Nosebleeds and sinus problems can also occur.

Points of Attack: Central nervous system; skeleton, kidneys.

Medical Surveillance. Lung function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof or splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *50 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *200 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentration or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a well-ventilated area away from sources of ignition. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN1860 Vinyl fluoride, inhibited, Hazard Class: 2.1; Labels: 2.1-Flammable gas.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak

until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include hydrogen fluoride gas and oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F+, N, Xn; risk phrases: R45; R5; R12; R19; R20; R21; R40; R50/53; R61; R62; R63; safety phrases: S1; S2; S7; S9; S16; S29; S33; S36/36; S38; S41; S45; S46; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Vinylidene chloride is a volatile liquid. Mild, sweet odor resembling chloroform. The odor threshold in air is 500 ppm. Molecular weight = 96.94; specific gravity (H_2O:1) = 1.21 @ 25°C; boiling point = 27.2 to 31.7°C @ 760 mm; freezing/melting point = −122.8°C; vapor pressure = 500 mmHg @ 25°C; flash point = −18.9°C (cc); autoignition temperature = 570°C. Explosive limits: LEL = 6.5%; UEL: 15.5%. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 4, reactivity 2. Practically insoluble in water; solubility = 0.04%.

Potential Exposure: Vinylidene chloride is used in the manufacture of 1,1,1-trichloroethane (methyl chloroform). However, the manufacture of polyvinylidene copolymers is the major use of VDC. The extruded films of the copolymers are used in packaging and have excellent resistance to water vapor and most gases. The chief copolymer is Saran (polyvinylidene chloride/vinyl chloride), a transparent film used for food packaging. The films shrink when exposed to higher than normal temperatures. This characteristic is advantageous in the heat-shrinking of overwraps on packaged goods and in the sealing of the wraps. Applications of VDC latexes include mixing in cement to produce high-strength mortars and concretes, and as binders for paints and nonwoven fabrics providing both water resistance and nonflammability. VDC polymer lacquers are also used in coating films and paper. VDC is also used to produce fibers. Monofilaments, made by extruding the copolymer, are used in the textile industry as furniture and automobile upholstery; drapery fabric; outdoor furniture; venetian-blind tape; and filter cloths.

Incompatibilities: Readily forms explosive peroxides; violent polymerization from heat or on contact with oxidizers, chlorosulfonic acid; nitric acid; or oleum; or under the influence of oxygen, sunlight, alkali metals; aluminum, copper. Explosive on heating or on contact with flames. Inhibitors, such as the monomethyl ether of hydroquinone are added to prevent polymerization.

Permissible Exposure Limits in Air OSHA PEL: None

NIOSH PEL: None

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 5 ppm/20 milligram per cubic meter TWA; A4-Not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 45 ppm

PAC-2: $\mathbf{500_E}$ ppm

PAC-3: $\mathbf{1000_E}$ ppm

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

DFG MAK: 2 ppm/8.0 milligram per cubic meter; Peak Limitation Category II(2); Carcinogen Category 3B; Pregnancy Risk Group C.

Australia: TWA 5 ppm (20 milligram per cubic meter), STEL 20 ppm, 1993; Austria: MAK 2 ppm (8 milligram per cubic meter), Suspected: carcinogen, 1999; Belgium: TWA 5 ppm (20 milligram per cubic meter), STEL 20 ppm (79 milligram per cubic meter), 1993; Denmark: TWA 2 ppm (8 milligram per cubic meter), 1999; Finland: TWA 10 ppm (40 milligram per cubic meter), STEL 20 ppm (80 milligram per cubic meter), carcinogen, 1999; France: VME 5 ppm (20 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 20 milligram per cubic meter, 2003; Poland: MAC (TWA) 50 milligram per cubic meter; MAC (ST EL) 80 milligram per cubic meter, 1999; Russia: STEL 50 milligram per cubic meter, 1993; Sweden: NGV 5 ppm (20 milligram per cubic meter), KTV 10 ppm (40 milligram per cubic meter), 1999; Switzerland: MAK-W 2 ppm (8 milligram per cubic meter), KZG-W 4 ppm (16 milligram per cubic meter), 1999; United Kingdom: TWA 10 ppm (40 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for Vinylidene chloride in ambient air[60] ranging from 0.2 μ/m^3 (Massachusetts); to 0.238 μ/m^3 (Kansas); to 3.5 μ/m^3 (Virginia); to 24.0 μ/m^3 (Pennsylvania); to 66.7 μ/m^3 (New York); to 120.0 μ/m^3 (North Carolina); to 200.0 μ/m^3 (Indiana); to 400.0 μ/m^3 (Connecticut); to 476.0 μ/m^3 (Nevada); to 200.0−10,000 μ/m^3 (North Dakota).

Determination in Air: NIOSH Analytical Method (IV) #1015, Vinylidene chloride, OSHA Analytical Method 19.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 7 μg/L; Federal Drinking Water Guidelines: EPA 7 μg/L; State Drinking Water Standards: California 6 μg/L; New Jersey 2 μg/L; State Drinking Water Guidelines: Arizona 7 μg/L; Maine 0.6 μg/L; Minnesota 200 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA

Method 624). Octanol—water coefficient: Log $K_{ow} = 1.32$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly poisonous; this chemical has lethal potential. Vinylidene chloride can affect you when breathed and by passing through skin. Exposure can irritate the eyes, nose and throat. Contact can irritate and burn the eyes and skin. High levels may affect the CNS, causing dizziness, headache, nausea, dyspnea (breathing difficulty), a "drunken" feeling; unconsciousness. Swallowing the liquid may cause chemical pneumonitis.

Long-Term Exposure: Handle with extreme caution. A potential occupational carcinogen. Repeated or prolonged contact with skin may cause dermatitis with drying and cracking. Repeated exposure may damage the liver, kidneys and/or lungs. It may damage the developing fetus and cause reproductive damage in males.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys. Cancer site in animals: liver and kidney tumors; skin.

Medical Surveillance: This chemical is a suspected human carcinogen, with conflicting data. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that. Lung function tests. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Note to Physician: Inhalation: bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Check oxygen content prior to entering storage area. Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not present. Vinylidene chloride must be stored to avoid contact with oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates; and strong acids; such as hydrochloric, sulfuric, and nitric, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames are prohibited where vinylidene chloride is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of vinylidene chloride should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of vinylidene chloride. Wherever vinylidene chloride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101

and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1303 Vinylidene chloride, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include phosgene, hydrogen chloride, chlorine, and oxides of carbon. Do not extinguish fire unless flow can be stopped. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22].

Vinylidene Fluoride V:0230

Formula: $C_2H_2F_2$; $CH_2{=}CF_2$

Synonyms: 1,1-Difluoroethylene; Ethene, 1,1-difluoro-; Fluoruro de vinilideno (Spanish); Genetron; Halocarbon 1132A; NCI-C60208; R1132A; Refrigerant gas, R 1132a; VDF; Vinylidene difluoride

CAS Registry Number: 75-38-7

HSDB Number: 5206

RTECS Number: KW0560000

UN/NA & ERG Number: UN1959/116 (P)

EC Number: 200-867-7

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq$1.00% concentration).

Carcinogenicity: IARC: Animal, Inadequate Data; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1999

Hazard Alert: Extremely flammable gas, Polymerization hazard (high), Possible risk of forming tumors, Suspected of causing genetic defects, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R5; R12; R19; R21; R61; R62; safety phrases: S1; S7/9; S14; S16; S33; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Vinylidene fluoride is a colorless gas. Faint ethereal odor. Shipped as a liquefied compressed gas. Molecular weight = 64; boiling point = −85.6°C; freezing/melting point = −144°C; vapor pressure = 35.2 atm; flash point (flammable gas) ≤ −65°C; autoignition temperature = 640°C. Explosive limits: LEL = 5.5%; 30,000[138]; UEL: 21.3%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 4, reactivity 0. Slightly soluble in water.

Potential Exposure: Vinylidene fluoride is used in the formulation of many polymers and copolymers, such as chlorotrifluoroethylene-vinylidene fluoride (Kel F), perfluoropropylene-vinylidene fluoride (Viton, Fluorel); polyvinylidene fluoride; and hexafluoropropylene-*tetra*-fluoroethylene-vinylidene fluoride; elastomeric copolymers. It is also used as a chemical intermediate in organic synthesis. NIOSH has estimated 32,000 workers are exposed annually.

Incompatibilities: Severe polymerization hazard. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, aluminum chloride. Capable of forming unstable peroxides, which can cause explosive polymerization. It can re act violently with hydrogen chloride. Alkyl boron and alkyl hyponitrite compounds initiate polymerization. It will form peroxides on exposure to pure oxygen[193]. May accumulate static electricity, and cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = Not determined; suspected occupational carcinogen

Conversion factor: 1 ppm = 2.62 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 1 ppm TWA; 5 ppm Ceiling Concentration [15 min], use 29CFR1910.1017

ACGIH TLV[1]: 500 ppm/1310 milligram per cubic meter TWA, Not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 1500 ppm

PAC-2: 5600 ppm

PAC-3: 11,000 ppm (=>10% LEL, lower explosive limit but <50% LEL)

DFG MAK: Carcinogen Category 3B

Austria: Suspected: carcinogen, 1999; Finland: carcinogen, 1993

Determination in Air: NIOSH Analytical Method #3800[18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Harmful Effects and Symptoms

Short-Term Exposure: Irritating to skin and pulmonary tract. May affect the CNS, causing dizziness, disorientation, headache, a lack of coordination; narcosis, dizziness, nausea, vomiting. Contact with the liquid or gas can cause burns or frostbite. Vinylidene fluoride is considered toxic by inhalation.

Long-Term Exposure: Repeated high exposures may affect kidneys. Repeated high exposures may cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability, and mottling of the teeth.

Points of Attack: Eyes, respiratory system; central nervous system; skeleton, kidneys, skin.

Medical Surveillance. Lung function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton, and butyl rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 50 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF(APF = 50) (any supplied-air respirator with a full facepiece); *Up to 200 ppm:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode) *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. May form peroxides in storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store gas cylinders in a cool, dry place and use the safety precautions necessary with all compressed gases. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1959 Vinylidene fluoride shipped as 1,1-Difluoroethylene or Refrigerant gas R-1132a, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include hydrogen fluoride, fluorine, and fluorides. Extinguish with CO_2, or dry chemical to allow access to valves to shut off supply if necessary. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier.

Hazard Alert: Combustible, Polymerization hazard >30°C, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected repro toxic hazard, Primary irritant (w/o allergic reaction); (*m*-isomer) Possible risk of forming tumors, Suspected repro toxic hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn; risk phrases: R10; R19; R20; R22; R36/37/38; R41; R51/53; R62, R63, R65; safety phrases: S7; S23; S26; S36; S39; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (Lit.)

Description: Vinyl toluene is a colorless liquid. Strong disagreeable odor. It consists of mixed *meta*-and *para*-isomers. The odor threshold is 50 ppm. Molecular weight = 118.19; specific gravity (H_2O:1) = 0.89 @ 25°C; boiling point = 170.6°C; freezing/melting point = −76.7°C; flash point = 54.4°C; autoignition temperature = 538°C; also listed @ 489−515°C. Explosive limits: LEL = 0.8%; UEL: 11.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 2. Practically insoluble in water; solubility = 0.009%.

Potential Exposure: (mixed isomers): Vinyl toluene is used in copolymers and as specialty monomer for paint, varnish, and polyester preparations; as a solvent and an organic intermediate.

Incompatibilities: Vapors may form explosive mixture with air. Violent reaction with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, catalysts for vinyl polymerization, such as peroxides, strong acids; iron or aluminum salts. Usually inhibited with *tert*-butylcatechol to prevent polymerization.

Permissible Exposure Limits in Air

NIOSH IDLH = 400 ppm

Conversion factor: 1 ppm = 4.83 milligram per cubic meter @ 25°C & 1 atm

methyl styrene, all isomers

Determination in Air: Use NIOSH Analytical Method (IV) #1501, aromatic hydrocarbons, OSHA Analytical Method 7.

Determination in water: Octanol−water coefficient: Log $K_{ow} => 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Vinyl toluene can affect you when breathed in. Exposure can irritate the eyes, nose, and upper respiratory system. A CNS depressant; very high levels can cause you to become dizzy, lightheaded, and drowsy. In animals: narcosis.

Long-Term Exposure: Repeated exposure may affect the liver, kidneys, and nervous system. There is limited evidence that vinyl toluene may damage the developing fetus.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: Liver and kidney function tests. Evaluation of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *400 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Vinyl toluene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); strong acids and aluminum chloride, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN2618 Vinyltoluenes, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be app lied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid and a polymerization hazard >30°C. Containers may explode in fire. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g.

Carcinogenicty: VX is not listed by the International Agency for Research on Cancer (IARC, American Conference of Governmental Industrial Hygienists (ACGIH); Occupational Safety and Health Administration (OSHA); or National Toxicology Program (NTP) as a carcinogen.

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Dangerous nerve agent, Combustible liquid, Suspected reprotoxic hazard, Environmental hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical *Note:* Army Regulation, AR 50-6, deals specifically with the shipment of chemical agents; must be escorted in accordance with Army Regulation, AR 740-32.

Description: VX, a sulfinated organophosphorus compound, is a nerve agent, and the most toxic of all known chemical warfare agents. VX can cause death in minutes. As little as one drop of VX on the skin can be fatal. VX is a colorless, to straw to amber-colored, odorless liquid. Looks like motor oil. Molecular weight = 267.4; boiling point = 298°C (decomposition); freezing/melting point = −51°C; volatility = 8.9−10.5 milligram per cubic meter @ 25°C; vapor density (air = 1): 9.2; vapor pressure = 0.0007 mmHg @ 25°C; vapor density (air = 1) = 9.2; flash point = 159°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0. Slightly to moderately soluble in water below 9.4°C; 30 g/L @ 25°C. See “Medical Surveillance” below for odor detection.

Potential Exposure: VX is a quick-acting, military chemical nerve agent. VX is the most potent of all chemical warfare agents. It attacks the nervous system, causing the muscles to convulse uncontrollably. The nerve agent works similarly to pesticide and was originally developed in the early 1950s. Highly persistent, it can be dangerous for weeks and remains a liquid for more than 24 hours. It poses little vapor hazard. The least volatile of the nerve agents, VX, is very slow to evaporate; about as slowly as motor oil. VX is highly efficient at skin penetration, more than any other of the "G" agents. It is used in the M-23 land mine. VX was never used in combat by the United States and all stockpiles of approximately 4400 t of the Agent were destroyed in 2008 by the United States Army Chemical Materials Agency (CMA).

Persistence of Chemical Agent: Agent VX: Summer: 2 days to a week; Winter: 2 days to weeks.

Incompatibilities: Relatively stable at room temperature. Unstabilized VX of 95% purity decomposed at a rate of 5% a month @ 71°C. Relatively stable at room temperature. Unstabilized VX of 95% purity decomposes at a rate of 5% a month @ 71°C. At pH 12, the toxic by-product has a half-life of about 14 days and in 90 days there is about a 64-fold reduction. Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101] Contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air

Conversion factor: 0.09145 ppm = 1 milligram per cubic meter

PAC VX*

PAC-1: **0.000016_A ($1.60E-05_A$)** ppm

PAC-2: **0.00027_A ($2.70E-04_A$)** ppm

PAC-3: **$9.10E-04_A$** ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

WPL (worker population limit): 0.000001 milligram per cubic meter

The suggested permissible airborne exposure concentration of VX for an 8 hour work-day or a 40 hour work week is an 8 hour time weighted average (TWA) of 0.00001 milligram per cubic meter (9×10^{-7} ppm). This value is based on the TWA of VX as proposed in the USAEHA Technical Guide No. 169, *Occupational Health Guidelines for the Evaluation and Control of Occupational Exposure to Nerve Agents GA, GB, GD, and VX.*

GPL (general population limit): 0.0000006 milligram per cubic meter

Determination in Air: Available monitoring equipment for agent VX is the M8/M9 detector paper, (ACADA), detector ticket; M256/M256A1 kits; bubbler. Depot Area Air Monitoring System (DAMMS); automated Continuous Air Monitoring System (ACMS); Real-Time Monitor (RTM); Demilitarization Chemical Agent Concentrator (DCAC); M8/M43, M8A1/M43A1, CAM-M1, Hydrogen Flame Photometric Emission Detector (HYFED); and the Minature Chemical Agent Monitor (MINICAM)

Determination in Water: Octanol−water coefficient: Log K_{ow} (estimated) = 2.06. Unlikely to bioaccumulate in marine organisms. VX is hydrolyzed only slowly, and the hydrolysis products include EA2192, which is nearly as toxic as VX and is hydrolyzed over 1000 times more slowly. Oxidation using common bleach (Na(OCl) and superchlorinated bleach ($Ca(OCl)_2$)-calcium hypochlorite (HTH), will decontaminate.

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Cholinesterase inhibitor. Lowest toxic oral dose (TD_{LO}) (humans) = 4 mg/kg; lowest lethal skin dose to humans (LD_{LO}) = 86 mg/kg. Death within 15 minutes after fatal dose is absorbed[101].

Summary: Exposure can result in loss of consciousness, convulsions, paralysis, and respiratory failure resulting in death.

Short-Term Exposure: VX. Acts as a cholinesterase inhibitor. Lowest toxic oral dose (TD_{LO}) to humans is 4 mg/kg; lowest lethal skin dose to humans (LD_{LO}) is 86 mg/kg. Death occurs within 15 minutes after fatal dose is absorbed. *Also reported:* VX is a lethal anticholinergic agent with the median dose in humans being: LC_{50} (skin) = 0.135 mg/kg; ID LC_{50} (Skin)-0.07−0.71 mg/kg; LCt_{50} (inhalation) = 30 mg min/m^3; LCt_{50} (inhalation)-30 mg min/m^3; LCt_{50} (inhalation)-24 mg min/m^3.

One to several minutes after overexposure to airborne VX the following acute symptoms appear: *Local effects* (lasting 1−15 days, increases with dose). *Eyes*: Miosis (constriction of pupils); redness, pressure sensation on eyes. *Inhalation*: Rhinorrhea (runny nose), nasal congestion; tightness in chest; wheezing, salivation, nausea, vomiting. *Systemic effects* (increases with dose): *Inhalation*-excessive secretion causing coughing/breathing difficulty; salivation and sweating; vomiting, diarrhea, stomach cramps; involuntary urination/defecation; generalized muscle twitching/muscle cramps; CNS depression including anxiety, restlessness, giddiness, insomnia, excessive dreaming and nightmares. With more severe exposure, also headache, tremor, drowsiness, concentration difficulty; memory impairment; confusion, unsteadiness on standing or walking; and progressing to death.

After exposure to liquid VX, the following acute symptoms appear: Local Effects: Eyes: Miosis, redness, pressure sensation on eyes. *Ingestion*: salivation, anorexia, nausea, vomiting, abdominal cramps; diarrhea, involuntary defecation; heartburn. *Skin:* Sweating, muscle twitching. Systemic Effects: Similar to generalized effects from exposure to airborne material.

Long-Term Exposure: Chronic overexposure to VX causes forgetfulness, thinking difficulty; vision disturbances; muscular aches/pains. Although *cer*-organophosphate pesticides have been shown to be teratogenic in animals, these effects have not been documented in carefully controlled toxicological evaluations for VX[United States Army].

Medical Surveillance: A CAM can detect VX at 0.1 milligram per cubic meter. The United States military also has the following detectors for VX and other chemical agents: *M256A1 Chemical Agent Detector Kit*; *M8A1 Automatic Chemical Agent Alarm.* Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: Immediate decontamination of the smallest drop is essential. For decontamination, the *M291 Skin Decontamination Kit* should be used.

Inhalation: Hold breath until respiratory protective mask is donned. If severe signs of agent exposure appear (chest tightens, pupil constriction; lack of coordination, etc.), immediately administer, in rapid succession; all three Nerve Agent Antidote Kit(s), *Mark 1* injectors (or atropine if directed by the local physician). Injections using the Mark I kit injectors may be repeated @ 5 to 20 minute intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. If breathing has stopped, give artificial respiration. Mouth-to-mouth resuscitation should be used when approved mask-bag or oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. If breathing is difficult, administer oxygen. Seek medical attention *immediately*.

Eye contact: Immediately flush eyes with water for 10−15 minutes, then don respiratory protective mask. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection will not be administered when miosis is the only sign present. Instead, the individual will be taken immediately to the medical treatment facility for observation.

Skin contact: Don respirator with protective mask and remove contaminated clothing. Immediately wash contaminated skin with a solution of 5% household bleach. Rinse well with water to remove excess bleach followed by copious soap and water wash. Administer nerve agent antidote kit, Mark I, only if local sweating and muscular twitching symptoms are present. Seek medical attention *immediately*.

Ingestion: do not induce vomiting. First symptoms are likely to be gastronintestinal. Immediately administer nerve agent antidote kit, Mark I. Seek medical attention *immediately*. Medical observation recommended.

***Medical treatment*:** Electrocardiogram, and adequacy of respiration and ventilation, should be monitored. Supplemental oxygenation, frequent suctioning of secretions, insertion of a tube into the trachea (endotracheal intubation), and assisted ventilation may be required. Diazepam (5 to 10 mg in adults and 0.2 to 0.5 mg/kg in children) may be used to control convulsions. Lorazepam or other benzodiazepines may be used, but barbiturates, phenytoin, and other anticonvulsants are not effective. Administration of atropine (if not already given) should precede the administration of benzodiaze pines in order to best control seizures. Patients/victims who have inhalation exposure and who complain of chest pain, chest tightness, or cough should be observed and examined periodically for 6 to 12 hours to detect delayed-onset inflammation of the large airways (bronchitis), inflammatory lung disease (pneumonia), accumulation of fluid in the lungs (pulmonary edema), or respiratory failure.

Decontamination: This is very important. The rapid physical removal of a chemical agent is essential. If you don't have the equipment and training, don't enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim can't move, decontaminate without touching and without entering the hot or the warm zone. Nerve gasses stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a sealed double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Don't wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 minutes. Use caution to avoid hypothermia in children and the elderly. Wash−strip−wash−evacuate up wind and uphill: Patients exposed to nerve agent by vapor only should be decontaminated by removing all clothing in a clean-air environment and shampooing or rinsing the hair to prevent vapor-off gassing; Patients exposed to liquid nerve agent should be decontaminated by washing in available clean water at least three times. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. Decontaminate with diluted household bleach* (0.5%, or one part bleach to 200 parts water), but don't let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Remember that the water you use to decontaminate the victims is dangerous. Be sure you've decontaminated the victims as much as you can before they are released from the area, so they don't spread the nerve gas. Rinse the eyes, mucous membranes; or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction.

**Note*: The following can be used in addition to household bleach: (1) solids, powders and solutions containing various types of bleach (NaOCl or $Ca(OCl)_2$); (2) DS2 (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether); (3) towelettes moistened with sodium hydroxide (NaOH) dissolved in water, phenol, ethanol, and ammonia.

Note: Use 5% solution of common bleach (sodium HTH) or calcium HTH solution (48 oz per 5 gal of water) to decontaminate scissors used in clothing removal, clothes and other items.

Personal Protective Methods: *General information*: first responders should use a NIOSH-certified chemical, biological, radio logical, nuclear (CBRN) self-contained breathing apparatus (SCBA) with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (RED ZONE): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2.

A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents.

Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight.

A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

For emergency situations, wear a "moon suit" consisting of a positive-pressure, pressure-demand, full facepiece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator SCBA with escape cylinder in combination with a fully encapsulating, chemical resistant suit capable of maintaining a positive air pressure within the suit. *Protective gloves*: butyl glove M3 and M4; Norton chemical protective glove set. *Eye protection*: Chemical Goggles. For splash hazards use goggles and face shield.

Other protective equipment: Full protective clothing will consist of M9 mask and hood; M3 butyl rubber suit; M2A1 butyl boots; M3 and M4 gloves; unimpregnated underwear; or demilitarization protective ensemble (DPE). For laboratory operations; wear lab coats and have a protective mask readily available. In addition, daily clean smock, foot covers, and head covers will be required when handling contaminated lab animals.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Less than 0.00001 milligram per cubic meter:* M9, M17, or M40 series mask shall be available for escape as necessary. 0.00001 *milligram per cubic meter* to 0.02 *milligram per cubic meter:* M9, or M40 series mask with Level A or Level B ensemble. *Greater than 0.02 milligram per cubic meter:* or DPE or TAPES used with prior approval from AMC Field Safety Activity. *Note:* When DPE or TAPES is not available the M9 or M40 series mask with Level A protective ensemble can be used. However, use time shall be restricted to the extent operationally feasible, and may not exceed one hour. As an additional precaution, the cuffs of the sleeves and the legs of the M3 suit shall be taped to the gloves and boots respectively to reduce aspiration.

Local Exhaust: Mandatory. Must be filtered or scrubbed to limit exit conc. to <0.00001 *milligram per cubic meter* (averaged over 8 hour/day, indefinitely).

Special: Chemical laboratory hoods shall have an average inward face velocity of 100 linear feet per minute (lf/m) + 10% with the velocity at any point not deviating from the average face velocity by more than 20 percent. Laboratory hoods shall be located such that crossdrafts do not exceed 20% of the inward face velocity. A visual performance test utilizing smoke-producing devices shall be performed in assessing the ability of the hood to contain agent VX. Emergency back-up power necessary: Hoods should be tested semiannually or after modification or maintenance operations. Operations should be performed 20 cm inside hood face. *Other:* Recirculation of exhaust air from agent areas is prohibited. No connection between agent areas and other areas through ventilation system is permitted.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. *Precautions to be taken in handling and storing:* in handling, the buddy system will be incorporated. No smoking, eating or drinking in areas containing agent is permitted. Containers should be periodically inspected for leaks (either visually or by a detector kit). Stringent control over all personnel practices must be exercised. Decontamination equipment shall be conveniently located. Exits must be designed to permit rapid evacuation. Chemical showers, eyewash stations, and personal cleanliness facilities shall be provided. Wash hands before meals and each worker will shower thoroughly with special attention given to hair, face, neck, and hands, using plenty of soap before leaving at the end of the work-day. *Other precautions:* agent must be double-contained in liquid and vapor-tight containers when in storage or when outside of the ventilation hood.

Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, Technical Name Required. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32. Packing Group: 1.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

VX, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.2/0.3

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. See Medical Surveillance section for decontamination kit. If kit is not available when needed, decontaminants include bleach slurry and hot soapy water.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of nitrogen and sulfur. When heated, vapors may form explosive mixture with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. Use moon suit/respirator protection. *Extinguishing media*: Water mist, fog, foam, CO_2-Avoid using extinguishing methods that will cause splashing or spreading of the VX. *Special firefighting procedures*: All persons not engaged in extinguishing the fire should be immediately evacuated from the area. Fires involving VX should be contained to prevent contamination to uncontrolled areas. When responding to a fire alarm in buildings or areas containing nerve agents, firefighting personnel should wear full firefighter protective clothing (without TAP clothing) during chemical agent firefighting and fire rescue operations. Respiratory protection is required. Positive pressure, full facepiece, NIOSH-approved self-contained breathing apparatus (SCBA) will be worn where there is danger of oxygen deficiency and when directed by the fire chief of chemical accident/ incident (CAI) operations officer. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a CAI for rescue/reconnaissance purposes they will wear appropriate levels of protective clothing. Do not breathe fumes. Skin contact with V-agents must be avoided at all times. Although the fire may destroy most of the agent, care must still be taken to assure the agent or contaminated liquids do not further contaminate other areas or sewers. Contact with VX or VX vapors can be fatal. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Principles and methods for destruction of chemical weapons: "Destruction of chemical weapons" means a process by which chemicals are converted in an essentially irreversible way to a form unsuitable for production of chemical weapons, and which in an irreversible manner renders munitions and other devices unusable as such. Each/nation/shall determine how it shall destroy chemical weapons, except that the following processes may not be used: dumping in any body of water, land burial or open-pit burning. It shall destroy chemical weapons only at specifically designated and appropriately designed and equipped facilities. Each nation shall ensure that its chemical weapons destruction facilities are constructed and operated in a manner to ensure the destruction of the chemical weapons; and that the destruction process can be verified under the provisions of this Convention[Organization for the Prohibition of Chemical Weapons; Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and Their Destruction]. Recommended field procedures (for quantities greater than 50 g): *NOTE:* These procedures can only be used with the approval of a qualified expert or safety officer. An alcoholic calcium HTH mixture is prepared by adding 100 mL of denatured ethanol to a 900 mL slurry of 10% calcium HTH in water. This mixture should be made just prior to use since the HTH can react with the ethanol. Fourteen grams of alcoholic calcium HTH solution is used for each gram of VX. Agitate the contamination mixture as the VX is added. Continue the agitation for a minimum of 1 hour. This reaction is reasonable exothermic and evolves substantial off gassing. The evolved reaction gases should be routed through a decontaminate filled scrubber prior to release through filtration systems. After completion of the one hour minimum agitation, 10% sodium hydroxide is added in a quantity equal to that necessary to assure that a pH of 12.5 is maintained for a period not less than 24 hours. Hold the material at a pH between 10 and 12 for a period not less than 90 days to ensure that a hazardous intermediate material is not formed. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW EPA and DOT regulations. Conduct general area monitoring to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If the alcoholic calcium HTH mixture is not available then the following decontaminates may be used instead and are listed in the order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], Supertropical Bleach Slurry (STB), and sodium HTH. Open pit burning or burying of VX or items containing or contaminated with VX in any quantity is prohibited. The detoxified VX (using procedures above) can be thermally destroyed by incineration in an EPA approved incinerator in accordance with appropriate provisions of federal, state and local RCRA regulations. Note: Several states define decontaminated surety material as a RCRA Hazardous Waste.

Recommended laboratory procedures (for quantities less than 50 g): If the active chlorine of the calcium HTH is at least 55%, then 80 g of a 10% slurry is required for each gram of VX. Proportionally more HTH is required if the chlorine activity of the HTH is lower than 55%. The mixture is agitated as the VX is added and the agitation is maintained for a minimum of one hour. If phasing of the VX/deconsolution continues after 5 minutes, an amount of denatured ethanol equal to a 10 wt.% of the total agent/decon shall be added to assist miscibility. *Note:* Ethanol should be minimized to prevent the formation of a hazardous waste. Upon completion of the one hour agitation the decon mixture shall be adjusted to a pH between 10 and 11. Conduct general area monitoring to confirm that the atmospheric concentrations do not exceed the airborne exposure limit.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.
European/International Regulations (*81-81-2*): Hazard symbol: T+; risk phrases: R48/25; R61; R62; R63; safety phrases: S1/2; S3; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Warfarin sodium:
Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.
European/International Regulations (*81-81-2*): Hazard symbol: T+, N; risk phrases: R61; R48/25; R52/53; safety phrases: S29/35; S45; S53; S61 (see Appendix 4).
Description: Warfarin is a colorless, odorless crystalline solid. Molecular weight = 308.35; 330.33 (sodium salt). Combustible. Although warfarin is usually available commercially as the sodium salt. Except where noted, the following physical properties refer to the pure substance: freezing/melting point = (decomposes) 161°C; 159−161 (sodium salt); vapor pressure = 0.09 mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System) (*Fume and dust*): Health 4, flammability 0, reactivity 0. Practically insoluble in water; solubility = 0.002%.
Potential Exposure: Warfarin is used as an oral anticoagulant and as a rodenticide or rat poison.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Dust mixtures with air may cause explosion.
Permissible Exposure Limits in Air
Warfarin 81-81-2
NIOSH IDLH = 100 milligram per cubic meter
OSHA PEL: 0.1 milligram per cubic meter TWA
NIOSH REL: 0.1 milligram per cubic meter TWA
ACGIH TLV[1]: 0.1 milligram per cubic meter TWA
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 1.8 milligram per cubic meter
PAC-2: 20 milligram per cubic meter
PAC-3: 350 milligram per cubic meter
129-06-6, sodium salt
PAC-1: 0.82 milligram per cubic meter

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00022-3

PAC-2: 9 milligram per cubic meter

PAC-3: 83 milligram per cubic meter

DFG MAK 0.5 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(2).

Australia: TWA 0.1 milligram per cubic meter, 1993; Austria: MAK 0.1 milligram per cubic meter, 1999; Belgium: TWA 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; Finland: TWA 0.1 milligram per cubic meter, STEL 0.3 milligram per cubic meter, 1999; France: VME 0.1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Norway: TWA 0.1 milligram per cubic meter, 1999; the Philippines: TWA 0.1 milligram per cubic meter, 1993; Russia: STEL 0.001 milligram per cubic meter, 1993; Switzerland: MAK-W 0.1 milligram per cubic meter, KZG-W 0.5 milligram per cubic meter, 1999; Thailand: TWA 0.1 milligram per cubic meter, 1993; Turkey: TWA 0.1 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, STEL 0.3 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 milligram per cubic meter.

Determination in Air: Use NIOSH Analytical Method (IV) #5002.

Determination in water: Octanol−water coefficient: Log $K_{ow} = 2.6$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Skin absorption, ingestion, inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Warfarin is classified as very toxic, and may cause hemorrhage at even low levels. Probable oral lethal dose in humans is 50−500 mg/kg, between 1 teaspoon and 1 ounce for a 150 lb person. Material is an anticoagulant. Toxic effects other than hemorrhage are rarely seen in humans. Other symptoms of warfarin exposure begin a few days or weeks after ingestion. They include epistaxis (nose bleed), bleeding gums; pallor, and sometimes hematomas around joints and on buttocks; blood in urine and feces; hematoma arms, legs; bleeding lips; mucous membrane hemorrhage; petechial rash; abnormal/abnormalities hematologic indices. Later, paralysis due to cerebral hemorrhage, and finally, hemorrhagic shock and death may occur. Warfarin sodium is an anticoagulant. Hemorrhage is the most common sign and may be manifested by hemorrhagic skin rashes and lip, nose, and upper airway bleeding. Upper airway pain, difficulty in speaking and swallowing, and dyspnea (shortness of breath) may occur. Back pain may be noted.

Long-Term Exposure: Anemia can result from severe or repeated bleeding. Repeated exposure may affect the liver and kidneys. Material is believed to be teratogenic in humans. There is limited evidence that warfarin may decrease fertility in females. Animal tests indicate that warfarin may cause malformations in human babies.

Points of Attack: Blood, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: blood plasma: prothrombin time; complete blood count; urine (chemical/metabolite): whole blood (chemical/metabolite); urinalysis (routine): red blood cells/count. Persons taking "blood thinning" medications are at increased risk.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: *Up to 0.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 1 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter:* 100F (APF = 50) (any air-purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 100 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown* *concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3027 Coumarin derivative pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25 m/ 75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Do not touch spilled material. Eating and smoking should not be permitted in areas where it is handled, processed or stored. *Small spills:* sweep onto paper or other suitable material. Place in an appropriate container and burn in a safe place. *Large quantities:* may be destroyed by dissolving in a flammable solvent e.g., alcohol) and atomizing in a combustion chamber.

Fire Extinguishing: Warfarin is combustible; however, no flash point can be found. Thermal decomposition products may include oxides of sodium (warfarin sodium) and oxides of carbon for all forms. Extinguish fire using agent suitable for type of surrounding fire. Use alcohol foam, carbon dioxide; or dry chemical. Wear full protective clothing and self-contained breathing apparatus when engaged in firefighting. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*all isomers*)
Description: Xylene exists in three isomeric forms, *ortho*-, *meta*-, and *para*-xylene. Commercial xylene is a mixture of these three isomers and may also contain ethylbenzene as well as small amounts of toluene, trimethylbenzene, phenol, thiophene, pyridine, and other nonaromatic hydrocarbons. *m*-Xylene is predominant in commercial xylene. The physical properties of the three isomers are as follows:
Molecular weight = 106.2 (*m-, o-, & p-isomers*)*o*-; Specific gravity (H_2O:1) = 0.86 @ 20°C (*m-, & p-isomers*); 0.88 @ 20°C (*o-isomer*); Vapor pressure = 7.5 mmHg @ 23°C (*m-& p-isomers*); 7.5 mmHg @ 27°C (*o-isomer*)

Isomer	*Melt Point (°C)*	*Boiling Point (°C)*	*Flash Point (°C)*	*Lower Expl. (%)*	*Upper Expl. (%)*	*Auto-Temp (°C)*
meta-	−48	139	27	1.1	7.0	527
ortho-	−25	145	32	0.9	6.7	463
d*para-*	13	138	27	1.1	7.0	528

NFPA 704M Hazard Identification (all isomers): Health 2, Flammability 3, Reactivity 0. All isomers are practically insoluble in water.
Potential Exposure: Xylene is used as a solvent; as a constituent of paint, lacquers, varnishes, inks, dyes, adhesives, cements, cleaning fluids, and aviation fuels; and as a chemical feed-stock for xylidines, benzoic acid; phthalic anhydride; isophthalic, and terephthalic acids; as well as their esters (which are specifically used in the manufacture of plastic materials and synthetic textile fabrics). Xylene is also used in the manufacture of quartz crystal oscillators, hydrogen peroxide; perfumes, insect repellants; epoxy resins; pharmaceuticals; and in the leather industry. *m*-Xylene is used as an intermediate in preparation of isophthalic acid; *o*-xylene is used in manufacture of phthalic anhydride and in pharmaceutical and insecticide synthesis. *p*-xylene is used in pharmaceutical and insecticide synthesis and in production of polyester.

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00023-5

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Electrostatic charges can be generated from agitation or flow.

Permissible Exposure Limits in Air

NIOSH IDLH = 900 ppm

Conversion factor: 1 ppm = 4.34 milligram per cubic meter *(all isomers)*@ 25°C & 1 atm

Odor threshold = 0.081 to 40 ppm. Odor Threshold values is in quite a broad range. *Caution* is advised in relying on odor alone as a warning of potentially hazardous exposures.

OSHA PEL: 100 pp m/435 milligram per cubic meter TWA

NIOSH REL: 100 ppm/435 milligram per cubic meter TWA; 150 ppm/655 milligram per cubic meter STEL

ACGIH TLV[1]: 100 ppm /434 milligram per cubic meter TWA; 150 ppm/651 milligram per cubic meter STEL, not classifiable as a human carcinogen; BEI: (technical grade) 1.5 g[methylhippuric acids]/g creatinine in urine, end-of-shift.

Protective Action Criteria (PAC)* Ver. 29[138]

1330-20-7, xylenes

PAC-1: $\mathbf{130_A}$ ppm

PAC-2: $\mathbf{920_A}$ ppm

PAC-3: $\mathbf{2500_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a sub script "**A**" and correspond to 60 minute values.

DFG MAK: 100 ppm /440 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group D; BAT: 1.5 mg[xylene]/L in blood, end-of-shift; 2000 mg[methylhippuric (toluric)acid]/L in urine, end-of-shift.

European OEL: 50 ppm TWA; 100 ppm STEL [skin] (2000)

Austria: MAK 100 ppm (440 milligram per cubic meter), 1999; Denmark: TWA 35 ppm (150 milligram per cubic meter), [skin], 1999; France: VME 100 ppm (435 milligram per cubic meter), VLE 150 ppm (650 milligram per cubic meter), 1999; Japan; 100 ppm (430 milligram per cubic meter), 1999; Norway: TWA 25 ppm (108 milligram per cubic meter), 1999; Switzerland: MAK-W 100 ppm (435 milligram per cubic meter), KZG-W 200 ppm (870 milligram per cubic meter), 1999; United Kingdom: TWA 100 ppm (441 milligram per cubic meter), STEL 150 ppm, [skin], 2000. Russia[43] set a MAC value for ambient air in residential areas of 0.2 milligram per cubic meter (200 μ/m^3) both on a momentary and a daily average basis. Several states have set guidelines or standards for xylenes in ambient air[60] ranging from zero (Colorado); to 0.059 milligram per cubic meter (Massachusetts); to 0.073 milligram per cubic meter (Virginia); to 0.700 milligram per cubic meter (Rhode Island); to 1.45 milligram per cubic meter (New York); to 8.68 milligram per cubic meter (Connecticut); to 8.70 milligram per cubic meter (South Dakota); to 10.357 milligram per cubic meter (Nevada); to 2.6−65.5 milligram per cubic meter (North Carolina).

Determination in Air: Use NIOSH Analytical Method #1501, Hydrocarbons, aromatic, #3800, OSHA Analytical Method 1002.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 10 mg/L; MCLG, 10 mg/L as xylenes (total). Russia [43] set a MAC in water both for house-hold and fishery purposes of 0.05 mg/L (50 μg/L). The EPA has determined a lifetime health advisory of 400 μg/L[48]. Several states have set guidelines and standards for xylenes in drinking water[61], ranging from 44.0 μg/L (New Jersey); to 50.0 μg/L (New York); to 440.0 μg/L (Arizona, Kansas, Minnesota); to 620.0 μg/L (Massachusetts, Maine, New Mexico, Vermont, and Wisconsin).

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and /or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Exposure to vapor can be irritating to the nose and throat. Inhalation of vapor at concentrations *above 200 ppm* or 3−5 minutes can lead to xylene intoxication. Symptoms include headache, dizziness, nausea and vomiting. If exposure should continue, central nervous system depression characterized by shallow breathing and weak pulse can occur. Levels of 230 ppm for 15 minutes may cause lightheadedness without loss of equilibrium. Reversible liver and kidney damage in humans has followed exposure to sudden high concentrations of vapor. Such high levels may also give rise to lung congestion. Exposure to extremely high concentrations (10,000 ppm or more) of xylene vapors can lead to a strong narcotic effect, with symptoms of slurred speech, stupor fatigue; confusion, unconsciousness, coma, and possible death. *Skin:* Contact with vapor or liquid can cause defatting, which may lead to irritation, drying, and cracking. *Eyes:* Vapor and liquid may be irritating to the eye and eyelids at levels of 100 ppm for 15 minutes. *Ingestion:* Swallowing liquid xylene will bring about an immediate burning sensation in the mouth and throat. Irritation of the stomach and intestine can give rise to sharp stomach pains. Symptoms are the same as inhalation, except that lung congestion will not usually develop.

Long-Term Exposure: Inhalation of xylene vapor and skin contact with liquid are the two most probable routes of long-term exposure. Symptoms of inhalation are dizziness, headache, and nausea. Long-term exposure has been associated with liver and kidney damage, intestinal tract disturbances, and central nervous system depression. Prolonged contact with skin can lead to irritation, dryness, and cracking. Repeated exposure can cause poor memory, difficulty in concentration, and other brain effects. It can also cause damage to the eye surface.

Points of Attack: Eyes, skin, respiratory system; central nervous system; gastrointestinal tract; blood, liver, kidneys.

Medical Surveillance: Whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; Complete blood count; Complete blood count; hematopoietic Depression, expired air, urine (chemical/metabolite); urine (chemical/metabolite): End-of-shift; urine (chemical/metabolite): End-of-work-week; urine (chemical/metabolite): Last 4 Hours of 8-Hour Exposure; urinalysis (routine). For those with frequent or potentially high exposure (half the TLV or grater, or significant skin contact), the following is recommended before beginning work and at regular times after that: Exam of the eyes by slit lamp. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Urine concentration of *m-methylhippuric acid* (at the end-of-shift) as an index of overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. *Note to Physician:* May require supportive measures for pulmonary edema. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton, polyvinyl alcohol, and Teflon are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *900 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator); or SCB AF (APF = 50) (any self-contained breathing apparatus with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (A PF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Xylenes must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where xylenes are used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of xylenes. Protect storage containers from physical damage.

Shipping: UN1307 Xylenes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

EC Number: 216-032-5

Regulatory Authority and Advisory Information

Hazard Alert: Corrosive, Sensitization hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, C, Xi; Risk phrases: R21/22; R23/24/25; R34; R36/37/38; R39; R41; R43; R51/53; Safety phrases: S16; S26; S36/37/S39; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: m-Xylene-α,α′-diamine is a colorless liquid. Molecular weight = 136.22; Specific gravity (H_2O:1) = 1.032 @ 25°C; Boiling point = 273°C; Freezing/Melting point = 14.1°C; Vapor pressure = 0.03 mmHg @ 25°C; Flash point = 117°C; 139°C[101]. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: *m*-Xylene-α,α′-diamine is a source of *m*-xylene di-isocyanate and used as an intermediate in the manufacture of epoxy and polyamide resins.

Incompatibilities: Combustible; vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

OSHA PE L: None

NIOSH REL: 0.1 milligram per cubic meter Ceiling Concentration [skin]

ACGIH TLV[1]: 0.1 milligram per cubic meter Ceiling Concentration [skin]

Protective Action Criteria (PAC) not available

DFG MAK: [skin] Danger of skin sensitization

Australia: TWA 1 milligram per cubic meter, 1993; Belgium: STEL 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.02 ppm (0.1 milligram per cubic meter), [skin], 1999; Finland: TWA 0.1 milligram per cubic meter, [skin], 1999; France: VLE 0.1 milligram per cubic meter, 1999; Norway: TWA 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-0.1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.1 milligram per cubic meter [skin]

Several states have set guidelines or standards for MXDA in ambient air[60] ranging from 0.008 μ/m^3 (Virginia); to 1.0 μ/m^3 (North Dakota); to 2.0 μ/m^3 (Nevada); to 33.0 μ/m^3 (New York).

Determination in Air: Use OSHA Analytical Method 105

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and /or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *m*-Xylene-α,α′-diamine can affect you when breathed in and by passing through your skin. Contact can severely irritate and burn the skin and eyes. Exposure can irritate the nose and throat. Corrosive to the respiratory tract. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High levels may cause respiratory depression, tiredness, and unconsciousness. The LC_{50} (rat) = 700 ppm/1 hr.

Long-Term Exposure: *m*-Xylene-α,α′-diamine may cause skin and lung allergies. Once this happens, even very small future exposures may cause a skin rash to develop and/or may cause an asthma-like reaction with wheezing, coughing, and shortness of breath. May cause liver and kidney damage. In animals: Liver, kidney, lung damage.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if person is not having an attack at the time of test. If symptoms develop of overexposure is suspected, the following may be useful: Liver and kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for Exposures over *0.1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Color code-Blue: Health Hazard /Poison: Store in a secure poison location. Store separately in a corrosion-resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), and strong acids (such as hydro chloride, sulfuric, and nitric). Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN 2735A mines, liquid, corrosive, n.o.s, or Polyamines, liquid, corrosive, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3267 Corrosive liquid, basic, organic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *m*-Xylene-α,α′-diamine may burn, but does not readily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: m*-Xylene-2,2′-Diamine, Trenton, NJ (December 2006)

3,5-Xylenol X:0120

Formula: $C_8H_{10}O$; $C_6H_3(CH_3)_2OH$

Synonyms: AI3-01553; 3,5-Dimethylphenol; 3,5-DMP; 1-Hydroxy-3,5-dimethylbenzene; Phenol, dimethyl-; *sym, m*-Xylenol; 1,3,5-Xylenol

CAS Registry Number: 108-68-9; 1300-71-6 (mixed isomers)

HSDB Number: 5385

RTECS Number: ZE6475000

UN/NA & ERG Number: UN2261/153

EC Number: 203-606-5 [*Annex I Index No.:* 604-037-00-9]; 215-089-3 [*Annex I Index No.:* 604-006-00-X] (mixed isomers)

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Corrosive, Possible risk of forming tumors, Primary irritant (w/o allergic reaction), Environmental hazard.

Mixed isomers:

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CER CLA, see below).

Superfund/EPC RA 40 CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B) as xylenols

WHMIS Classifications, E, D2B.

European/International Regulations (*xylenols*): Hazard Symbol: T, C, N; Risk phrases: R10; R24/25; R34; R39/23/24/25; R51; Safety phrases: S1/2; S26; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*CAS: 108-68-9*)

Description: 3,5-Xylenol is a crystalline solid. Molecular weight = 122.17; Boiling point = 220°C (sublimes); Freezing/Melting point = 64°C; Flash point = 109°C; Autoignition temperature = ~600°C. Explosive limits: LEL: 1.4%; UEL: Unknown; Soluble in water. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 0.5%.

Potential Exposure: 3,5-Xylenol is used as an antioxidant, solvent, plasticizer, wetting agent; and in pharmaceuticals. Xylenols are also used in pesticides, fuel, and lubricant additives; as a rubber chemical; in dyestuff manufacture. There are actually six xylenol isomers.

Incompatibilities: A weak organic acid. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 2.4$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and /or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This compound is highly toxic by inhalation, ingestion, or skin absorption. It is corrosive and extremely destructive to tissue of the mucous membranes, upper respiratory tract, eyes, and skin[136]. Contact can severely burn the eyes and skin. LD_{50} = (oral-rat) 608 mg/kg. Inhalation may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated exposure may lead to vomiting, headaches, dizziness, and fainting. Chronic poisoning can cause digestive disturbances; nervous disorders; and skin eruptions. Closely related compounds can cause liver and kidney damage, and even collapse and death. Highly irritating substances can affect the lungs, although it is not known if xylenols cause lung damage.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: Medical observation and rest is recommended for 24 to 48 hours after breathing overexposure, as asthma symptoms may be delayed. If signs of allergy are detected, the exposed person(s) should avoid all further contact with this chemical. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, the following may be useful:

Urinary phenol test. Liver and kidney function tests. Lung function tests.

First Aid: Get medical attention at once following exposure to this com pound. *Inhalation:* Remove patient immediately to fresh air; irritation of nose or throat may be somewhat relieved by spraying or gargling with water until all odor is gone; 100% oxygen inhalation is indicated for cyanosis or respiratory distress; keep patient warm, but not hot. *Eyes:* Flood with running water for 15 minutes; if physician is not immediately available, continue irrigation for another 15 minutes; 2−3 drops of 0.5% pontocaine or equivalent may be instilled after first 15 minutes; do not use oils or oily ointments unless ordered by physician.

Skin: Wash affected areas with large quantities of water or soapy water until all odor is gone; then wash with alcohol or 20% glycerin solution and more water; keep patient warm, but not hot; cover chemical burns continuously with compresses wet with saturated solution of sodium thiosulfate; apply no salves or ointments for 24 hours after injury. *Ingestion:* Give large quantities of liquid (salt water, weak sodium bicarbonate solution, milk, or gruel) followed by demulcent, such as raw egg white or corn starch paste; if profuse vomiting does not follow immediately, give a mild emetic (such as 1 tbsp mustard in glass of water), or tickle back of throat. Repeat procedure until vomitus is free of the odor. Some demulcent should be left in stomach after vomiting. Keep patient comfortably warm.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to xylenols, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full-facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN 149 (Europe)-app roved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Blue: Health Hazard /Poison: Store in a secure poison location. (2) White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from chemical oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where xylenols is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN 2261 Xylenols, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

*the 2,6-isomer is the only xylidine specifically regulated by the United States EPA.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*87-62-7*): Hazard Symbol: T, F, N; Risk phrases: R10; R23/24/25; R33; R50/53; R60; R61; Safety phrases: S1/2; S28; S29/35; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (*mixed isomers, dimethylaniline, and 3,5-isomer*). 2-Hazard to waters (*2,6-, 2,3-, 2,4-, 2,5-, and 3,4-isomers*).

Description: There are six xylidine isomers. Xylidine, mixed isomers (principally made up of 2,4-, 2,5-, and 2,6-isomers) is a pale yellow to brown liquid with a weak, aromatic amine odor. Molecular weight = 121.2 (2,3-& 2,6-isomer; *o*-isomer); Specific gravity (H_2O:1) = 0.98 @ 25°C; Boiling point = 222°C (2,3-isomer); 216°C (2,6-isomer; *o*-isomer); 213−226°C (mixed isomers); Freezing/Melting point = 11.2°C (2,6-isomer; *o*-isomer); −36°C; Vapor pressure = 0.13 mmHg (2,6-isomer); <1 mmHg @ 25°C; Flash point (2,6-isomer; *o*-isomer) = 91°C; (mixed isomers) 96.7°C. Explosive limits (2,6-isomer): LEL = 1.0%; 9.000 (2,3-isomer); 11,000 ppm (2,6-isomer; *o*-isomer); UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System) (2,6-isomer; *o*-isomer): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Xylidines are used in dyestuff manufacture; as intermediates in the manufacture of pesticides, antioxidants, pharmaceuticals, and other organic com pounds.

Incompatibilities: Vapor may form explosive mixture with air. Contact with hypo chlorite salts and bleaches form explosive chloroamines. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. A chemical base: Will neutralize acids to form salts plus water with an exothermic reaction. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen is generated by amines in combination with strong reducing agents such as hydrides, nitrides, alkali metals, and sulfides.

Permissible Exposure Limits in Air

DFG MAK: [skin] Carcinogen Category 3A

Arab Republic of Egypt: TWA 5 ppm (25 milligram per cubic meter), [skin], 1993; Australia: TWA 2 ppm (10 milligram per cubic meter), [skin], 1993; Austria: MAK 5 ppm (25 milligram per cubic meter), [skin], 1999; Belgium:

TWA 2 ppm (9.9 milligram per cubic meter), [skin], 1993; Denmark: TWA 0.5 ppm (2.5 milligram per cubic meter), [skin], 1999; Finland: TWA 5 ppm (25 milligram per cubic meter), STEL 10 ppm (50 milligram per cubic meter), [skin], 1999; France: VME 2 ppm (10 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 2.5 milligram per cubic meter, 2003; Norway: TWA 1 ppm (5 milligram per cubic meter), 1999; the Philippines: TWA 100 ppm (435 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 10 milligram per cubic meter, 1999; Russia: STEL 3 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 2 ppm (10 milligram per cubic meter), [skin], 1999; Turkey: TWA 5 ppm (25 milligram per cubic meter), [skin], 1993; United Kingdom: TWA 2 ppm (10 milligram per cubic meter), STEL 10 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed animal carcinogen with unknown relevance to humans. The Czech Republic has set a TWA of 5.0 milligram per cubic meter. Several states have set guidelines or standards for xylidine in ambient air[60] ranging from 1.6 μ/m^3 (Virginia); to 33.3 μ/m^3 (New York); to 50.0 μ/m^3 (South Carolina); to 100.0 μ/m^3 (Connecticut, Florida and North Dakota); to 238.0 μ/m^3 (Nevada).

87-62-7 (2,6-xylidine)

Denmark: TWA 0.5 ppm (2.5 milligram per cubic meter), [skin], 1999; France: VME 2 ppm (10 milligram per cubic meter), [skin], 1999; Poland: MAC (TWA) 10 milligram per cubic meter, 1999; Switzerland: MAK-W 2 ppm (10 milligram per cubic meter), [skin], 1999; United Kingdom: TWA 2 ppm (10 milligram per cubic meter), STEL 10 ppm, [skin], 2000.

Determination in Air: Use NIOSH Analytical Method #2002, amines, aromatic.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient concentration of 345 μg/L.

Determination in Water: Octanol-water coefficient: Log K_{ow} = (estimated) <2.0 (mixed isomers). Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and /or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Xylidine can affect you when breathed in and by passing through your skin. The effects of exposure may be delayed in case of skin absorption. Irritates the eyes, skin, and respiratory tract. Exposure can cause the formation of methemoglobin causing interference with the ability of the blood to carry oxygen, causing headaches, dizziness, nausea, vomiting, and cyanosis (a bluish color to the skin and lips). Higher levels can cause trouble breathing, collapse, and even death. High or repeated exposure may damage the liver.

Long-Term Exposure: May cause anemia. Affects the kidneys, liver, and blood. 2,6-Xylidine has been shown to cause cancer in animals.

Points of Attack: Respiratory system, blood, liver, kidneys, cardiovascular system. Cancer site in animals: Nose.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend up on the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. United States DHHS PHS CDC NIOSH and United States DOL OSHA list the following tests: Whole blood (chemical/metabolite), methemoglobin; complete blood count. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine. If symptoms of serious cyanosis develop, *methylene* Blue may be given as an antidote (by a trained medical person only), over 5 minutes. Repeat in 1 hour if not improving. 100% oxygen can be given by a trained person only.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *20 ppm:* CCrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; Sa (APF = 10) (any supplied-air respirator). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CCrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with an organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:*

SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCB AE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Xylidine must be stored to avoid contact with strong oxidizers, (such as bromine, chlorine, or fluorine), since violent reactions occur. Contact with hypochlorite bleaches may form explosive chloroamines. Store in tightly closed containers in a cool, dry, well-ventilated area away from heat sources. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1711/Xylidines, solid or liquid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; oxides of nitrogen are removed from the effluent gas by scrubber, catalytic, or thermal device.

Regulatory Authority and Advisory Information

Hazard Alert: Pyrophoric (powder), Radioactive, Water reactive, Strong reducing agent, Irritant.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112), as Yttrium, radioactive

CERCLA *Reportable Quantities (RQs) for radionuclides of Yttrium, radioactive compounds*: Persons in charge of vessels or facilities are required to notify the National Response Center (NRC) immediately, when there is a release of this designated hazardous substance, in an amount equal to or greater than its RQ reported in curies (ci)/TBq (terabecquerel):

- Yttrium$_{86}$; Yttrium$_{87}$, Yttrium$_{88}$, Yttrium$_{90}$, Yttrium$_{91}$: RQ ≥ 10 ci/0.37 TBq
- Yttrium$_{90m}$, Yttrium$_{92}$, Yttrium$_{93}$: RQ ≥ 100 ci/3.7 TBq
- Yttrium$_{86m}$, Yttrium$_{90m}$, Yttrium$_{91m}$, Yttrium$_{94}$, Yttrium$_{95}$: RQ ≥ 1000 ci/37 Tbq

The toll free number of the NRC is (800) 424-8802. The rule for determining when notification is required is stated in 40 CFR 302.4 (Section IV. D.3.b).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%, elemental and compounds.

Hazard symbols, risk, & safety statements: Hazard symbol: C, F, Xi, Xn; risk phrases: R12 (powder); R17; R20/21/22; R34; R29; R36/37/38; R39; R40; R51; safety phrases: S16; S26; S27; S33; S36/37/39; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. (metal); (oxide) 1-Low hazard to water.

Description: Yttrium is a silvery-white to dark-gray, or black solid or gray powder. Odorless. An element in Group III-B of the Periodic Table. It is very similar to the rare earth metals. Molecular weight = 88.91 (metal); 104.9 (oxide); 225.8 (trioxide); 303.4 (chloride, hexahydrate); specific gravity (H_2O:1) = 4.5 @ 20°C (metal); 4.8 @ 20°C (trioxide); boiling point = 2927°C; 3345°C[138] (metal); freezing/melting point = 1509°C; 1522°C[138] (metal); 2410°C (trioxide). Autoignition temperature (dust and powder) = > 500°C. Explosive limits: LEL = 15,000 ppm (metal and oxide), UEL: unknown. ₩ Soluble in hot water; reacts forming flammable hydrogen gas.

Potential Exposure: Yttrium is used in iron and other alloys, in incandescent gas mantles, and as a deoxidizer for metals. Yttrium metal has a low cross section for neutron capture and is very stable at high temperatures. Further, it is very inert toward liquid uranium and many liquid uranium alloys. Thus, it may well have applications in nuclear power generation. The metal is usually prepared by reduction of the halide with an active metal, such as calcium. To identify and analyze this element, X-ray fluorescence spectroscopy is commonly employed.

Incompatibilities: Flammable in the form of dust; may form explosive mixture with air. A strong reducing agent; reacts violently with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, halogens. Yttrium nitrate is a combustible material.

Permissible Exposure Limits in Air

Note: applies to yttrium and compounds.

Determination in Air: Use NIOSH Analytical Method (IV)s #7300, #7301, #7303, #9102, OSHA Analytical Method ID-121.

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation of dusts, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Eye irritation in humans.

Long-Term Exposure: In animals: pulmonary irritation; eye injury; possible liver damage.

Points of Attack: Eyes, respiratory system; liver

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 5 milligram per cubic meter*: Q_m (APF = 25) (any quarter-mask respirator). *Up to 10 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 50 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (Any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from storage containers to process containers.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN3178 Flammable solids, inorganic, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid in bulk form; powder and shavings are pyrophoric/extremely flammable. Thermal decomposition products may include metal oxides. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water.* For large fires use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery is indicated wherever possible. Specifically, processes are available for yttrium oxysulfide recovery from color television tube manufacture.

Canada, WH MIS, Ingredients Disclosure List Concentration zinc metal not listed.
Hazardous to aquatic life or environment, with possible long-lasting effects[192] (dust). Do not allow release to the environment unless proper permits are obtained from the federal government.
European/International Regulations (dust, pyrophoric): Hazard symbol: F; risk phrases: R10; R15/29; R17; R18; safety phrases: S2; S7/8; S16; S21 (powder); S43 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*zinc, grain size = < 1 mm*); Nonwater polluting agent, metal ≥1 mm.
Description: Zinc is a soft silvery colored metal; the dust is odorless and gray. Molecular weight = 65.4 (metal); 189.4 (nitrate); specific gravity (H_2O:1) = 7.1 @ 20°C (metal); 2.1 @ 15°C (nitrate); boiling point = 907°C; freezing/melting point = 420°C; 43°C (nitrate); autoignition temperature = 460°C. Ignition temperature of dust cloud = 600°C; minimum explosive concentration = 0.48 oz/ft^3.[209] Relative explosion hazard of dust: Moderate. Hazard Identification (based on NFPA-704 M Rating System): Health 0, flammability 2, reactivity 0; (*powder*) Health 1, flammability 3, reactivity 2. The metal is insoluble in water. ₩The dust reacts with water releasing flammable hydrogen gas.
Potential Exposure: Zinc is used most commonly as a protective coating of other metals. In addition, it is used in alloys, such as bronze and brass, for electrical apparatus in many common goods; and in organic chemical extractions and reductions. Zinc chloride is a primary ingredient in smoke bombs used by military for screening purposes, crowd dispersal and occasionally in firefighting exercises by both military and civilian communities. In pharmaceuticals, salts of zinc are used as solubilizing agents in many drugs, including insulin.
Incompatibilities: Dust is pyrophoric and may self-ignite in air. A strong reducing agent. Violent reaction with oxidizers, chromic anhydride; manganese chloride; chlorates, chlorine and magnesium. Reacts with water and reacts violently with acids, alkali hydroxides; and bases forming highly flammable hydrogen gas. Reacts violently with sulfur, halogenated hydrocarbons and many other substances, causing fire and explosion hazard.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC) Ver. 29[138]

DFG MAK (*zinc & zinc inorganic compounds*): 0.1 milligram per cubic meter, respirable fraction; Peak Limitation Category I(4); 2 milligram per cubic meter, inhalable fraction (excluding zinc chloride) TWA; Peak Limitation Category II(2)

Arab Republic of Egypt: 0.1 milligram per cubic meter TWA, 1993.

Several states have set a standard for zinc metal in ambient air[60] ranging from 0.03 μ/m^3 (New York) to 6.55−39.29 μ/m^3 (Montana).

Determination in Air: Use NIOSH Analytical Method (IV)s #7300, Elements, #7030 Zinc and compounds (as Zn), #8005, Elements in blood or tissue, #8310 Metals in urine, OSHA Analytical Methods ID-121; ID-125G

Permissible Concentration in Water: Safe Drinking Water Act (47FR9352): United States National Primary Drinking Water Regulations: SMCL = 5 mg[Zn]/L.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Zinc can affect you when breathed in. Zinc dust particles can irritate the eyes. Exposure to solid zinc is not known to cause acute or chronic health effects, but heated zinc may give off zinc oxide fumes which can cause health effects. Metal fragments can scratch the eyes. When zinc is refined, cadmium is released. *Cadmium* is a cancer causing agent. Inhalation of the dust or fume may cause metal fume fever.

Long-Term Exposure: Repeated contact with the dust or fume may cause dermatitis. Ingestion of high levels of zinc can cause anemia, pancreas damage, and lower levels of high density lipoprotein cholesterol (HDL, the good form of cholesterol). It is not known if high levels of zinc affect human reproduction or cause birth defects. Rats that were fed large amounts of zinc became infertile or had small babies. Zinc is an essential element in our diet. Not enough zinc can cause a loss of appetite; a decrease in the sense of taste and smell; slow wound healing; and skin sores, or a damaged immune system. The recommended dietary allowance (RDA) for zinc is 15 mg/day for men; 12 mg/day for women; 10 mg/day for children; 5 mg/day for infants. Harmful health effects generally begin at levels from 10−15 times the RDA (in the 100−250 mg/day range).

Points of Attack: Skin, blood, pancreas.

Medical Surveillance: Zinc can be measured in the blood or feces.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning, do not use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from zinc or cadmium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact with the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to zinc dusts, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposure exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water; Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Store away from sources of moisture under inert gas. Do not store in a basement. Color code—Yellow Stripe (*powder is a strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Store away from moisture under inert gas. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Zinc must be stored to avoid contact with chromic anhydride, manganese chloride; chlorates, chlorine and magnesium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, acids and alkali hydroxides; because flammable hydrogen gas is produced. Sources of ignition, such as smoking and open flames are prohibited where zinc is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1436 Zinc powder or zinc dust, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 4.2-Spontaneously combustible material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Zinc is a combustible solid. Thermal decomposition products may include zinc oxides. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water.* Use dry chemical, sand, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Zinc powder should be reclaimed. Unsalvageable waste may be buried in an approved landfill. Leachate should be monitored for zinc content[22].

Zinc Bromide Z:0110

Formula: Br_2Zn; $ZnBr_2$

Synonyms: Anhydrous zinc bromide; Bromuro de zinc (Spanish); Zinc bromide, anhydrous; Zinc dibromide

CAS Registry Number: 7699-45-8

HSDB Number: 1047

RTECS Number: ZH1150000

UN/NA & ERG Number: UN3260/154; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 231-718-4

Regulatory Authority and Advisory Information

Hazard Alert: Suspected of causing genetic defects, Sensitization hazard (skin), Environmental hazard

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR401.15 Section 307 Toxic Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 1000 lb (454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard Symbol: C, N, Xi; risk phrases: R34; R43; R50/53; safety phrases: S29/35; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Zinc bromide is an odorless white crystalline solid. Molecular weight = 225.2; specific gravity (H_2O:1) = 4.3 @ 20°C; boiling point = 697°C; freezing/melting point = 394°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Zinc bromide is used in photography, rayon manufacturing and medicine.

Incompatibilities: Keep away from alkali metals. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, metallic sodium, or potassium. Store above 32°F/0°C.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 6 milligram per cubic meter

PAC-2: 66 milligram per cubic meter

PAC-3: 400 milligram per cubic meter

Neither ACGIH nor OSHA has set standards but the state of New York has set a guideline for ambient air of $3.0\mu/m^3$[60].

DFG MAK (*zinc & zinc inorganic compounds*): 0.1 milligram per cubic meter, respirable fraction; Peak Limitation Category I(4); 2 milligram per cubic meter, inhalable fraction (excluding zinc chloride) TWA; Peak Limitation Category II(2)

Permissible Concentration in Water: United States National Primary Drinking Water Regulations: SMCL = 5 mg[Zn]/L as Zinc

Determination in Water: Very Toxic to aquatic organisms. Octanol−water coefficient: Log $K_{ow} = -0.32$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Dust levels of 80 milligram per cubic meter may cause irritation of the mouth, nose and throat resulting in coughing, wheezing, and difficult breathing. *Skin:* Can cause irritation and burns. *Eyes:* Can cause irritation and burns. *Ingestion:* Dust or solution may cause irritation to the mouth, throat and digestive tract. Large doses can cause violent vomiting, severe stomach pain; diarrhea, shock and collapse. Scars may form in the throat and stomach. Long-lasting kidney irritation may occur. Less than an ounce may cause death. Repeated exposure can lead to bromine poisoning, with symptoms of personality changes (such as depression), poor appetite and confusion.

Long-Term Exposure: Can cause headache, personality changes; poor appetite; lethargy, and confusion. Skin rash can occur with repeated exposure. Can irritate the lungs; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: blood test for bromide.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Administer prompt and complete gastric lavage, and demulcents. Observe for gastric perforations and late complications, such as pyloric stenosis. For eye exposure rinsing with 0.05 molar neutral sodium edetate may help prevent or reverse corneal opacification.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to zinc bromide, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture, sources of oxygen and combustible materials.

Shipping: UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Zinc bromide itself does not burn. Thermal decomposition products may include hydrogen bromide and oxides of zinc. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, C, N; risk phrases: R22; R34; R50/53; R62; R63; safety phrases: S1/2; S26; S29; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Zinc chloride is a white hexagonal, deliquescent crystals or colorless solution. The fume is a white particulate dispersed in air. Molecular weight = 136.3; specific gravity (H_2O:1) = 2.9 @ 20°C; boiling point = 732°C; freezing/melting point = 290°C; vapor pressure = 1 mmHg @ 428°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1 ₩. Soluble in water; solubility = 435% @ 21°C. Reacts with water forming a strong acid.

Potential Exposure: Zinc chloride is used in iron galvanizing; as a wood preservative; for dry battery cells; as a soldering flux; in textile finishing; in vulcanized fiber; reclaiming rubber; in oil and gas well operations; oil refining; manufacturing of parchment paper; in dyes; activated carbon; in chemical synthesis; in adhesives; dentists' cement; deodorants, disinfecting and embalming solutions; and taxidermy. It is also produced by military screening-smoke.

Incompatibilities: Aqueous solutions are strongly acidic. Incompatible with bases and potassium. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Corrosive to metals.

Permissible Exposure Limits in Air

Fume

NIOSH IDLH = 50 milligram per cubic meter

OSHA PEL: 1 milligram per cubic meter TWA

NIOSH REL: 1 milligram per cubic meter TWA; 2 milligram per cubic meter STEL

ACGIH TLV[1]: 1 milligram per cubic meter TWA; 2 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 2 milligram per cubic meter

PAC-2: 800 milligram per cubic meter

PAC-3: 4800 milligram per cubic meter

DFG MAK (*fume*): 0.1 milligram per cubic meter, respirable fraction; Peak Limitation Category I(1); 2 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category I(4)

Arab Republic of Egypt: TWA 1 milligram per cubic meter (fume), 1993; Australia: TWA 1 milligram per cubic meter, STEL 2 milligram per cubic meter (fume), 1993; Belgium: TWA 1 milligram per cubic meter, STEL 2 milligram per cubic meter (fume), 1993; Denmark: TWA 0.5 mg[Zn]/m^3, 1999; Finland: TWA 1 milligram per cubic meter (fume), 1999; France: VME 1 milligram per cubic meter (fume), 1999; Norway: TWA 1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Poland: TWA 1 milligram per cubic meter, STEL 2 milligram per cubic meter, 1999; Sweden: NGV 1 milligram per cubic meter (resp. dust), 1999; Switzerland: MAK-W 1 milligram per cubic meter (fume), 1999; Thailand: TWA 1 milligram per cubic meter (fume), 1993; Turkey: TWA 1 milligram per cubic meter (fume), 1993; United Kingdom: TWA 1 milligram per cubic meter, STEL 2 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 2 milligram per cubic meter. Several states have set guidelines or standards for zinc chloride in ambient air[60] ranging from 0.16 μ/m^3 (Virginia) to 3.3 μ/m^3 (New York); to 10.0 μ/m^3 (Florida, North Dakota, South Dakota); to 20.0 μ/m^3 (Connecticut); to 24.0 μ/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method #ID-121, #ID-125G.

Permissible Concentration in Water: United States National Primary Drinking Water Regulations: SMCL = 5 mg[Zn]/L as Zinc

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Corrosive to the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Symptoms of exposure can include cough, copious sputum; dyspnea (breathing difficulty); chest pain; bronchopneumonia; pulmonary fibrosis;

cor pulmonale; fever; cyanosis, tachypne. No effects were reported from 30 minutes exposure to 0.07−0.04 milligram per cubic meter. Exposure to dust or fumes above 80 milligram per cubic meter for 2 minutes may cause nose and throat irritation, cough, chest pain; cyanosis (bluish skin), fever, nausea and vomiting; shortness of breath; difficult breathing and pneumonia. Breathing difficulties may not appear for several hours. Fume concentrations over 52 milligram per cubic meter may produce symptoms listed above. Fatal accidental exposures have occurred. *Skin:* Corrosive. Dust or solution can cause irritation and chemical burns particularly on areas where skin is broken. *Eyes:* Corrosive. Dust can cause burning irritation. Concentrated solutions are very dangerous to the eyes, causing extreme pain, redness and swelling. Eye damage may result. *Ingestion:* Dust or solution may be irritating and corrosive to the mouth, throat and digestive tract. Other symptoms may include stomach pain; nausea, vomiting, bloody diarrhea; swelling of the throat; blood in the urine; and shock. Less than an ounce has killed an adult, although recovery has been reported after ingestion of 4 oz.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. There is limited evidence that zinc chloride is a teratogen in animals. Repeated exposure can lead to delayed permanent lung damage. Prolonged contact can cause skin burns and ulcers.

Points of Attack: Eyes, skin, respiratory system; cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, Whole Blood (chemical/metabolite), biologic tissue/biopsy, chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1-second), sputum cytology, urine (chemical/metabolite), white blood cell count/differential.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or in haled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Inhalation: bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis. Ingestion-gastric lavage with 5% sodium bicarbonates; Dimercaprol has been suggested for treatment. *Eyes:* rinsing with 0.05 molar neutral sodium edetate may prevent or reverse corneal opacification.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and use a face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Wear splash-proof chemical goggles and use a face shield when working with liquid, unless full facepiece, respiratory protection is worn. Where the fume is present wear gas-proof goggles and use face shield, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50)* (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any sup plied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from potassium.
Shipping: UN2331 Zinc chloride, anhydrous, Hazard class: 8; Labels: 8-Corrosive material. UN1840 Zinc chloride, solution, Hazard class: 8; Labels: 8-Corrosive material.
Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Wash spill area with soap and water. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid:* Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is noncombustible. Thermal decomposition products may include hydrogen chloride and oxides of zinc. On large fires use agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Dump in water; add soda ash and stir, then neutralize and flush to sewer with water. Alternatively, zinc chloride may be recovered from spent catalysts and used in acrylic fiber spinning solutions.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%, zinc dichromate

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard Symbol: T, N, Xi; risk phrases: R45; R2; R8; R21; R25; R26; R34; R42/43; R46; R48/23; R50/53; R60; R61, R62; safety phrases: S1; S29/35; S53; S45; S60; S61; (*zinc chromates including zinc potassium chromate*): Hazard Symbol: T, N, Xi; risk phrases: R45; R8; R22; R43; R49; R50/53; R60, R61; safety phrases: S17; S29; S53; S45; S53, S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Zinc chromate is a yellow crystalline powder. Molecular weight = 181.4; freezing/melting point = 316°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Zinc chromate is used as an anticorrosion pigment in primers and as a coloring agent; as a pigment in surface coatings and linoleum; to impart corrosion resistance to epoxy laminates.

Incompatibilities: An oxidizer; reacts with reducing agents; combustibles, organic materials.

Permissible Exposure Limits in Air

NIOSH IDLH = 15 mg[Cr(VI)]/m^3

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 (*13530-65-9 only*) TWA; 0.1 mg[CrO^3]/m^3 (*11103-86-9 and 37300-23-5*) Ceiling Concentration. See 29CFR1910.1026

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendices A and C.

ACGIH TLV[1]: 0.015 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued

PAC Ver. 29[138]

13530-65-9, zinc chromate

PAC-1: 0.03 milligram per cubic meter

PAC-2: 9 milligram per cubic meter

PAC-3: 54 milligram per cubic meter

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; Pregnancy Risk Category 2; TRK: 0.05 mg [Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift

Australia: TWA 0.01 milligram per cubic meter, carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.01 milligram per cubic meter, carcinogen, 1993; Denmark: TWA 0.02 mg[Cr]/m^3, 1999; France: VME 0.05 mg[Cr]/m^3, 1999; Japan; 0.05 mg[Cr]/m^3, 1999; Norway: TWA 0.02 mg[CrO$_3$]/m^3, 1999; Poland: TWA 0.1 milligram per cubic meter, STEL 0.3 milligram per cubic meter, 1999; Sweden: TWA 0.02 mg[Cr]/m^3, carcinogen, 1999; Switzerland: MAK-W 0.01 mg[Cr]/m^3, carcinogen, 1999; United Kingdom: TWA 0.5 mg[Cr]/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. Several states have set guidelines or standards for zinc chromate in ambient air[60] ranging from 0.008 μ/m^3 (Virginia); to 0.5 μ/m^3 (Connecticut); to 1.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods #7600,#7604, #7605, #7703, #9101; OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: The EPA[6] has designated chromium as a priority toxic pollutant. State Drinking Water Guide lines: California 10 μg[Cr(VI)]/L; Maine 35 μg [Cr(VI)]/L. Since zinc chromate may consist of compounds with various ZnO/Cr$_2$O$_3$ rations, it is best simply to refer to the EPA water quality criteria cited in the sections of the volume dealing with "Chromium" and with "Zinc Chloride." United States National Primary Drinking Water Regulations: SMCL = 5 mg[Zn]/L as Zinc. *As a hexavalent chromium compound:* For the protection of freshwater aquatic life: *Hexavalent chromium:* 0.29 μg/L as a 24-hour average, never to exceed 21.0 μg/L. For the protection of saltwater aquatic life: *Hexavalent chromium:* 18 μg/L as a 24-hour average, never to exceed 1260 μg/L. *To protect human health:* hexavalent chromium 50 μg/L according to EPA[6]. United States EPA[49]. has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L[62]. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota. EPA Acceptable daily intake (ADI) = 0.175 mg/day/man for chromium(VI)[72].

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide); or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods[49].

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Zinc chromate can affect you when breathed in and may enter the body through the skin. Zinc chromate is a carcinogen; handle with extreme caution. Zinc chromate can irritate the skin, causing a rash or skin ulcers. It can also trigger a skin allergy.

Long-Term Exposure: Repeated exposure can cause a hole in the nasal septum (bone dividing the inner nose). Nose bleeds and sores are earlier signs. Zinc chromate is a human carcinogen. Repeated exposure may cause skin allergy with rash and itching.

Points of Attack: Skin. Cancer site in humans: Lung and throat.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests for chromates: Blood gas analysis, Complete blood count (CBC), chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Before beginning employment and at regular times after that, the following is recommended: Urine test for *chromates.* This test is most accurate shortly after exposure. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. (as chromic acid and chromates) **8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex coated suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129 [Chromium(VI)].

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from reducing agents. Where possible, automatically transfer material from other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable. Thermal decomposition products may include metal oxides of zinc and chromium. Use agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects.[192]

Hazard symbols, risk, & safety statements: Hazard Symbol: T2 +, N; risk phrases: R24/25; R26/27/28; R32; R37/38; R40; R41; R48/23; R63; R50/53; safety phrases: S1/2; S7; S26; S28; S29; S36/37/39; S45; S60; 61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Colorless crystalline solid or white powder. Slight, bitter almond odor. Sinks in water; insoluble. Molecular weight = 117.41; specific gravity (water = 1): 1.852 @ 20°C; melting/freezing point: (decomposes) ~800°C.

Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: Used in pharmaceuticals and medicine. Also used in metal plating, and as a laboratory chemical.

Incompatibilities: Releases hydrogen cyanide on contact with moisture including humidity in air. Tends to explosive instability; possible explosion when heated rapidly. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with acids and/or acid salts and alcohols will release highly toxic and flammable hydrogen cyanide gas. Incompatible with reducing agents, alcohols, glycols, combustible materials, ethers, hydrazines, organic substances, metal powders. Capable of violent oxidation under certain condition; fusion with metal chlorates, perchlorates, nitrates or nitrites can cause explosions[101].

Permissible Exposure Limits in Air

IDLH = 50 milligram per cubic meter (as cyanide)

OSHA PEL: 5 mg[CN]/m^3 TWA

NIOSH REL: 4.7 ppm/5 mg[CN]/m^3 [10 minutes] Ceiling Concentration

ACGIH TLV[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration (1993−94)

PAC Ver. 29[138]

PAC-114 milligram per cubic meter

PAC-2: 18 milligram per cubic meter

PAC-3: 110 milligram per cubic meter

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C

Australia: TWA 5 milligram per cubic meter, [skin], 1993; Austria: MAK 5 mg[CN]/m^3, [skin], 1999; Denmark: TWA 5 milligram per cubic meter, [skin], 1999; France: VME 5 mg[C N]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 milligram per cubic meter, KZG-W 10 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 5 milligram per cubic meter [skin]. Russia[43] has set MAC values for ambient air in residential areas of 0.009 milligram per cubic meter on a momentary basis and 0.004 milligram per cubic meter on an average daily basis. Several states have set guidelines or standards for cyanides in ambient air[60] ranging from 16.7 μ/m^3 (New York) to 50.0 μ/m^3 (Florida and North Dakota) to 80.0 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut and South Dakota) to 125 μ/m^3 (South Carolina) to 119.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides. See also Method #6010, Hydrogen Cyanide[18]. Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg[CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg [CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg [CN]/L. United States National Primary Drinking Water Regulations: SM CL = 5 mg[Zn]/L as Zinc

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid). Zinc is concentrated by some organisms but may not considered to be bioconcentrative in a spill situation.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Poison. Breathing the dust may cause permanent injury and possible death. Causes smarting of the skin and first-degree burns on short exposure; second-degree burns on long exposure. Eye irritant-severe; Respiratory irritant-acute, severe, or moderate but not mild irritant effects; Skin irritant-moderate; Central nervous system-acute effects; Narcotic; Nervous system toxin-acute effects; Respiratory toxin-acute effects other than severe or moderate irritation; Heart cardiovascular system-acute effects; Eye-acute effects other than irritation; Gastrointestinal tract-acute effects.[138] Grade 4; LD$_{50}$ = < 50 mg/kg.

Long-Term Exposure: Chronic exposure may cause headache, lack of appetite, weakness and inflammation of the skin with small pimples or blisters.

Points of Attack: Skin, kidneys, eyes, thyroid, CNS, heart.

Medical Surveillance: Preplacement and periodic examinations should include the cardiovascular and central nervous systems, liver and kidney function, blood, history of fainting and dizzy spells. Blood cyanide levels may be useful during acute intoxication. Urinary thiocyanate levels have been used but are nonspecific and are elevated in smokers.

First Aid: *SEEK MEDICAL ATTENTION. Dust: POISONO United States IF INHALED OR IF SKIN IS EXPOSED.* Move to fresh air. *IF BREATHING HAS STOPPED*, give artificial respiration; *avoid mouth-to-mouth resuscitation; use bag/mask apparatus*. IF breathing is difficult, administer oxygen. *Solid: POISONO United States IF SWALLOWED OR IF SKIN IS EXPOSED.* Irritating to eyes. Remove contaminated clothing and shoes. Flush affected areas with plenty of water. *IF IN EYES*, hold eyelids open and flush with plenty of water. *IF SWALLOWED* and victim is *CONSCIO United States AND ABLE TO SWALLOW*, have victim drink 4 to 8 oz of water and have victim induce vomiting. *IF SWALLOWED* and victim is *UNCONSCIO United States OR HAVING CONVULSIONS*, do nothing except keep victim warm. *Note to physician or authorized medical personnel*: Consider the use of amyl nitrite perles if symptoms of cyanide poisoning develop. If symptoms indicate, initial treatment includes the cyanide antidote kit. In all cases, break an amyl nitrite perle in a gauze pad and hold lightly under victim's nose for 15 seconds, repeating 5 times at about 15-second intervals; if necessary (and if sodium nitrite infusions will be delayed), repeat procedure every 3 minutes with fresh pearls until 3 or 4 have been used. Avoid breathing the vapor while administering it to the victim. Administer sodium nitrite IV, ASAP. The usual adult dose is 10 to 20 mL of a 3% solution infused over no less than 5 minutes; the average child dose is 0.15 to 0.20 mL/kg. Monitor blood pressure during administration, and slow the rate of infusion if hypotention develops. Next, infuse sodium thiosulfate IV. The usual adult dose is 50 mL of a 25% solution infused over 10 to 20 minutes; the average child dose is 1.65 mL/kg. Repeat with nitrite and thiosulfate as required.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH as cyanides *25 milligram per cubic meter:* SA (any supplied-air respirator); or SCBAF (any self-contained breathing apparatus with full facepiece) *EMERGENCY OR PLANNED ENTRY INTO UNKNOWN CONCENTRATIONS OR IDLH CONDITIONS:* SCBAF: PD,PP (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF:PD,PP:ASCBA (any sup plied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *ESCAPE:* GMFSHiE (any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having a high efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cacodylic acid you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents; chemically active metals; strong bases; moisture, fertilizers, seeds, insecticides, and fungicides.

Shipping: UN1713 Zinc cyanide, Hazard Class: 6.1; Labels: 6.1-Poisonous material.

Spill Handling: *Initial isolation and protective action distances:* As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line). Keep unauthorized personnel away. Evacuate persons not wearing protective equipment from area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind. Keep out of low areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confine d areas. Cover with plastic sheet to prevent spreading. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Use hypochlorite solution to destroy the cyanide. Avoid contact with solids, dusts or solutions. Wear chemical protective suit with self-contained breathing apparatus. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Do not allow this chemical to enter the environment. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: The substance itself does not burn. Thermal decomposition products may include toxic fumes of hydrogen cyanide and oxides of zinc and nitrogen. Containers may explode when heated. Runoff from fire control or dilution water may be corrosive and/or toxic and may cause pollution. Runoff may pollute waterways. If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Small Fire: Use dry chemical, CO_2 or water spray. *Large Fire*: Water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Add strong alkaline hypochlorite and react for 24 hours. Then flush to sewer with large volumes of water[22].

Regulatory Authority and Advisory Information

Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity; Inadequate Information to assess carcinogenic potential; Available data are inadequate for an assessment of human carcinogenic potential.

Hazard Alert: Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

FDA-over the counter drug

United States National Primary Drinking Water Regulations: SM CL = 5 mg[Zn]/L as Zinc

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard Symbol: N; risk phrases: R10; R51/53; R62; R63; safety phrases: S29; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Zinc oxide is an amorphous, white or yellowish-white powder. Odorless. Molecular weight = 81.4; specific gravity (H_2O:1) = 5.6 @ 20°C; freezing/melting point = 1974°C. Hazard identification (based on NFPA-704 M Rating System) (*powder*): Health 2, flammability 2, reactivity 0 Practically insoluble in water; zinc oxide undergoes slow decomposition; solubility = 0.0004% @ 18°C.

Potential Exposure: Zinc oxide is primarily used as a white pigment in rubber formulations and as a vulcanizing aid. It is also used as an antiinflammatory agent; in photo copying; paints, chemicals, ceramics, lacquers, and varnishes; as a filler for plastic; in cosmetics; pharmaceuticals, and calamine lotion. Exposure may occur in the manufacture and use of zinc oxide and products, or through its formation as a fume when zinc or its alloys are heated. HC may have been used as a Choking/Pulmonary Agent.

Incompatibilities: Incompatible with linseed oil, magnesium. Contact with chlorinated rubber (@ 215°C) may cause a violent reaction. Slowly decomposed by water.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 milligram per cubic meter

OSHA PEL: 15 mg[Zn]/m^3 TWA (*total dust*); 5 milligram per cubic meter TWA (*respirable fraction and fume*)

NIOSH IDLH = 500 mg[Zn]/m^3

NIOSH REL: (*dust only*): 5 mg[Zn]/m^3 TWA; 15 milligram per cubic meter Ceiling Concentration; (*fume*) 5 milligram per cubic meter TWA; 10 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 2 mg[Zn]/m^3, respirable fraction TWA; 10 milligram per cubic meter, respirable fraction STEL
PAC Ver. 29[138]
PAC-1: 10 milligram per cubic meter
PAC-2: 15 milligram per cubic meter
PAC-3: 2500 milligram per cubic meter
DFG MAK (*zinc oxide and fume*): 0.1 mg[ZnO]/m^3, respirable fraction TWA; Peak Limitation Category I(4); 2 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category I(2)
Arab Republic of Egypt: TWA 5 milligram per cubic meter, 1993; Australia: TWA 10 milligram per cubic meter, 1993; Australia: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter (fume), 1993; Belgium: TWA 10 milligram per cubic meter, 1993; TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter (fume), 1993; Denmark: TWA 4 mg[Zn]/m^3, 1999; Finland: TWA 5 milligram per cubic meter (fume), 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; France: VME (fume) 5 milligram per cubic meter, 1999; Hungary: TWA 5 milligram per cubic meter, 1993; Japan; 5 milligram per cubic meter (fume), 1999; Norway: TWA 5 milligram per cubic meter, 1999; the Philippines: TWA 1 milligram per cubic meter, 1993; Poland: MAC (TWA) fume 5 milligram per cubic meter; MAC (STEL) fume 10 milligram per cubic meter, 1999; Sweden: NGV 5 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, 1999; Thailand: TWA 5 milligram per cubic meter (fume), 1993; Turkey: TWA 5 milligram per cubic meter, 1993; United Kingdom: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter, fume, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 10 milligram per cubic meter. Russia[43] set a MAC in ambient air in residential areas of 0.05 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for zinc oxide fume in ambient air[60] ranging from 0.8 μ/m^3 (Virginia); to 16.7 μ/m^3 (New York); to 50.0 μ/m^3 (Florida); to 50.0–100.0 μ/m^3 (North Dakota); to 100.0 μ/m^3 (Connecticut); to 119.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7303, Elements by ICP, #7502, Zinc and compounds, OSHA Analytical Method #ID-121, #ID1-43.

Permissible Concentration in Water: United States National Primary Drinking Water Regulations: SMCL = 5 mg[Zn]/L as Zinc.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Note:* Symptoms of metallic or sweet taste and/or throat irritation or dryness may indicate overexposure. *Inhalation:* Irritates the respiratory tract. Exposure to fumes over 52 milligram per cubic meter can cause "metal fume fever." Onset of symptoms may be delayed 4–12 hours. Symptoms include irritation of the nose, mouth and throat, chills, muscle ache; nausea, fever, dry throat; cough; weakness, lassitude (weakness, exhaustion); metallic taste; headache, blurred vision; low back pain; vomiting, fatigue, malaise (vague feeling of discomfort); tightness in chest; dyspnea (breathing difficulty), rales, decreased pulmonary function; stomach pain; chills, fever, pains in the muscles and joints; thirst, bronchitis or pneumonia; and bluish tint to the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Skin: Dust may cause irritation which can result in rash. *Eyes:* No information available. *Ingestion:* May cause abdominal discomfort, watery diarrhea and cramps.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Repeated or prolonged inhalation exposure may cause asthma. There is limited evidence that zinc oxide may damage the developing fetus. Repeated overexposure may cause ulcer symptoms and affect the liver.

Points of Attack: Respiratory system, liver, skin.

Medical Surveillance: There are no special tests for this chemical. However, if overexposure is suspected or if illness occurs medical attention is recommended. Lung function tests. Liver function tests. GI series. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray or other inhalation therapy. If metal fume fever develops, it may last less than 36 hours. *Note to Physician:* In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 50 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 125 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a dust, mist, and fume filter). *Up to 250 milligram per cubic meter:* 100F (APF = 50) (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area away from chlorinated rubber, magnesium and linseed oil.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Zinc oxide does not burn. Thermal decomposition products may include metal oxides of zinc. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg). This material is a reactive solid. The TPQ does not default to 10,000 pounds for nonpowder, nonmolten, nonsolution form.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects.[291,292] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard Symbol: T+, F, N; risk phrases: R11; R15/29; R17; R28; R32; R50/53; safety phrases: S1/2; S21; S28; S30; S36/37; S43; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Zinc phosphide is a gray crystalline solid. Molecular weight = 258.05; boiling point = 1100°C; freezing/melting point = 420°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 2₩. Insoluble in water; slowly decomposes, releasing phosphine gas.

Potential Exposure: It is used as an acute single feeding rodenticide.

Incompatibilities: Dust may form explosive mixture with air. Heat and contact with water causes decomposition, producing toxic and flammable fumes of phosphorus, zinc oxides; and toxic and flammable phosphine gas. Reacts violently with strong acids, including nitric, hydrochloric acid or sulfuric acid with the evolution of spontaneously flammable phosphine gas. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact can cause fires or explosions. Keep away from alkaline materials, strong bases. carbon dioxide, halogenated agents.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: 0.091 ppm

PAC-2: $\mathbf{1_A}$ ppm

PAC-3: $\mathbf{1.8_A}$ ppm

*AEGLs are marked with a sub script "**A**" and correspond to 60 minute values.

Determination in Air: Use #7502, Zinc and compounds, OSHA Analytical Method #ID-121, #ID1-43.

Permissible Concentration in Water: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. United States National Primary Drinking Water Regulations: SMCL = 5 mg[Zn]/L as Zinc·

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the respiratory tract. Contact with the eyes can cause severe irritation, burns and permanent damage. Skin contact causes irritation. This chemical is a CNS depressant. Inhalation of zinc phosphide dust is followed in several hours by vomiting, diarrhea, cyanosis (bluing of skin), rapid pulse; fever and shock. The breath smells of phosphine. The compound is very caustic and may cause closing of the esophagus. Inhalation of phosphine (formed when zinc phosphide is exposed to flame, water or acids) can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Zinc phosphide is very caustic when ingested and forms phosphine. The probable oral lethal dose is 5−50 mg/kg, or between 7 drops and 1 teaspoonful for a 70-kg (150 lb) person. Most patients die after about 30 hours from peripheral vascular collapse secondary to the compound's direct effects. Extensive liver damage and kidney dam age can also occur. Ingestion of 4−5 g has produced death in human adults, but also doses of 25−50 g have been survived. The lowest oral lethal dose reported for women is 80 mg/kg. Symptoms of oral ingestion include nausea, abdominal pain; vomiting, tightness in chest; excitement, agitation and chills; faintness, weakness, dyspnea, fall in blood pressure; change in pulse rate; diarrhea, intense thirst; convulsions, paralysis, and coma. Early labored breathing; shock, halted urinary output; metabolic acidosis; muscle cramps and convulsions are grave prognostic signs.

Long-Term Exposure: The substance may cause effects on the liver, kidneys, heart and nervous system. Repeated exposure to low exposures cause chronic poisoning, anemia, bronchitis; and gastrointestinal, visual, speech, and motor disturbances.

Points of Attack: Lungs, liver, kidneys, heart, blood, nervous system.

Medical Surveillance: Liver and kidney function tests. EKG. Lung function tests. Consider chest X-ray following acute overexposure. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled get medical attention for phosphine, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention for phosphine poisoning. Give one tablespoonful of mustard in a glass of warm water; repeat until vomit fluid is clear; avoid use of all oils. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray or other inhalation therapy.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to zinc dusts, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposure exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA-or European Standard EN 149-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—Red Stripe: Store under inert gas away from all forms of moisture. Dangerous when wet materials release flammable gases on contact with water. See also "incompatibilities" section. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. (2) Color code—Blue: Health Hazard /Poison: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with this chemical, personnel should be trained on its proper hand ling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1714 Zinc phosphide, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 6.1-Poisono us materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. *Do not use water*. Keep sparks, flames, and other sources of ignition away. Keep material out of water sources and sewers. Keep material dry. Avoid breathing dusts and fumes from burning material. Keep upwind. Avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. For a land spill, dig a pit, pond, lagoon, or holding area to contain liquid or solid material. For water spill, neutralize with agricultural lime (slaked lime), crushed limestone, or sodium bicarbonate. Use mechanical dredges or lifts to remove immobilized wastes of pollutants and precipitates. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike spill for later disposal. Cover powder spill with plastic sheet or tarp to minimize spreading. Clean up only under supervision of an expert. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. UN1714, zinc phosphide is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water*. Dangerous from 0.5 to 10 km (0.3−6.0 mi) downwind.

Fire Extinguishing: Thermal decomposition products may include phosphine and metal oxides of zinc and phosphorus. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water. Small fires*: use dry chemical, soda ash or lime. *Large fires:* withdraw from area and let burn. *Do not use water* or any agent with an acid reaction (i.e., carbon dioxide or halogenated agents) as phosphine will be liberated. Wear boots, protective gloves, and goggles. Wear self-contained breathing apparatus when fighting fires involving this material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Move container from fire area if you can do so without risk.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Zirconium & Compounds Z:0160

Formula: Zr

Synonyms: Zirconium metal

Other zirconium compounds: Zirconium boride (12045-64-6); Zirconium carbide (12070-14-3); Zirconium chloride (10026-11-6); Zirconium fluoride (7783-64-4); Zirconium hydride (7704-99-6); Zirconium hydroxide (14475-63-9); Zirconium nitrate (13746-89-9); Zirconium nitride (25658-42-8); Zirconium oxide (1314-23-4); Zirconium phosphide (12037-80-8);(Zirconium oxychloride) 7699-43-6; Zirconyl chloride (10026-11-6); Zirconium sulfate tetrahydrate (7446-31-3)

CAS Registry Number: 7440-67-7 (metal)

HSDB Number: 2528

RTECS Number: ZH 7070000 (elemental)

UN/NA & ERG Number: UN2008 (metal powder, dry)/135; UN1358 [Zirconium powder, wetted with not $<$ 25% water (a visible excess of water must be present); (1) mechanically produced, particle size $<$53 μm; (2) chemically produced, particle size $<$840 μm]/170; UN1932 (metal scrap)/135; UN 2858 [dry, coiled wire, finished metal sheets, strip (thinner than 254 μm but not thinner than 18 μm)]/170; UN 2009 [dry, finished sheets, strip or coiled wire]/135

EC Number: 231-176-9 [*Annex I Index No.:* 040-001-00-3]

Regulatory Authority and Advisory Information

Hazard Alert: Pyrophoric (nonstabilized dust); Highly flammable (powder)

The FD A controls zirconium-containing drugs and/or cosmetic products

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard Symbol (*powder, pyrophoric*): F+; risk phrases: R12; R15; R17; safety phrases: S2; S7/8; S43; (*powder stabilized*) Risk phrases: R17; safety phrases: S2; S7/8; S43 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonwater polluting agent (*metal*, particle size $\geq$ 1 mm); 1-Low hazard to water. *(acetate, dichloride, dioxide, propionate)*

Description: Zirconium is a grayish-white, lustrous metal in the form of platelets, flakes, or a bluish-black, amorphous powder. Molecular weight = 91.22 (elemental); 123.2 (metal); specific gravity (H_2O:1) = 6.51 @ 25°C; boiling point = 3577°C; freezing/melting point = 1857°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 1. Insoluble in water. The powdered metal is an explosive hazard: it may ignite *spontaneously* and can continue burning under water.

Potential Exposure: Zirconium is never found in the free state; the most common sources are the ores zircon and baddeleyite. It is generally produced by reduction of the chloride or iodide. The metal is highly reactive; the process is usually performed under an inert gas blanket. Zirconium metal is used as a "getter" in vacuum tubes, a deoxidizer in metallurgy; a substitute for platinum; it is used in priming of explosive mixtures; flashlight powders; lamp filaments; flash bulbs; and construction of rayon spinnerets. Zirconium or its alloys (with nickel, cobalt, niobium, tantalum) are used as lining materials for pumps and pipes, for chemical processes, and for reaction vessels. Pure zirconium is a structural material for atomic reactor; and alloyed, particularly with aluminum, it is a cladding material for fuel rods in water-moderated nuclear reactors. A zirconium-columbium alloy is an excellent superconductor. Zircon ($ZrSiO_4$) is utilized as a foundry sand, an abrasive; a refractory in combination with zirconia; a coating for casting molds; a catalyst in alkyl and alkenyl hydrocarbon manufacture; a stabilizer in silicone rubbers; and as a gem stone; in ceramics it is used as an opacifier for glazes and enamels and in fritted glass filters. Both zircon and zirconia (zirconium oxide, ZrO_2) bricks are used as linings for glass furnaces. Zirconia itself is used in die extrusion of metals and in spout linings for pouring metals, as a substitute for lime in oxyhydrogen flam; as a pigment; and an abrasive; it is used, too, in incandescent lights; as well as in the manufacture of enamels, white glass; and refractory crucibles. Other zirconium compounds are used in metal cutting tools, thermocouple jackets; waterproofing textiles; ceramics, and in treating dermatitis and poison ivy.

Incompatibilities: Dust may form explosive mixture with air. Violent reactions with oxidizers, air, alkali hydroxides; alkali metal compounds (such as chromates, dichromates, molybdates, salts; sulfates, and tungstates); borax, carbon tetrachloride; lead, lead oxide; phosphorus, potassium compound s. Incompatible with boron, carbon, nitrogen, halogens, lead, platinum, potassium nitrate. Powder may ignite *spontaneously* and can continue burning under water. Explodes if mixed with hydrated borax when heated. Fine powder may be stored completely immersed in water.

Permissible Exposure Limits in Air
NIOSH IDLH = 50 mg[Zr]/m^3
OSHA PEL (compounds): 5 mg[Zr]/m^3 TWA
NIOSH REL: 5 mg[Zr]/m^3 TWA; 10 milligram per cubic meter STEL [The REL applies to all zirconium compounds (as Zr) except Zirconium tetrachloride]
ACGIH TLV[1] (*elemental & zirconium compounds*): 5 mg [Zr]/m^3 TWA; 10 milligram per cubic meter STEL; not classifiable as a human carcinogen
PAC Ver. 29[138]
7440-67-7, metal
PAC-1: 10 milligram per cubic meter
PAC-2: 83 milligram per cubic meter
PAC-3: 500 milligram per cubic meter
1314-23-4 (zirconium oxide)
PAC-1: 14 milligram per cubic meter
PAC-2: 110 milligram per cubic meter
PAC-3: 680 milligram per cubic meter
7446-31-3, Zirconium sulfate tetrahydrate
PAC-1: 39 milligram per cubic meter
PAC-2: 320 milligram per cubic meter
PAC-3: 1900 milligram per cubic meter
DFG MAK: (*elemental and insoluble compounds*): 1 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category I(1) danger of sensitization of the airways and skin; Pregnancy Risk Group; (*soluble compounds*): danger of sensitization of the airways and skin.

Arab Republic of Egypt: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Denmark: TWA 5 mg[Zr]/m^3, 1999; Finland: TWA 5 milligram per cubic meter, 1999; Hungary: STEL 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 10 milligram per cubic meter, 1999; Russia: STEL 6 milligram per cubic meter, 1993; the Netherlands: M AC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 10 milligram per cubic meter. Several states have set guidelines or standards for zirconium compounds in ambient air[60] ranging from 0.8 μ/m^3 (Virginia); to 50.0−100.0 μ/m^3 (North Dakota); to 100.0 μ/m^3 (Connecticut); to 119.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7300, Elements by ICP, #8005, Elements in blood or tissue. See also OSHA Analytical Method ID-121.

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation of dust or fume, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Zirconium can affect you when breathed in. The dust can irritate the lungs, causing coughing and/or shortness of breath.

Long-Term Exposure: Contact can cause an allergic skin reaction to develop with small nodules (granulomas). May cause change in chest X-ray; lung granulomas. In animals: irritation skin, mucous membrane; X-ray evidence of retention in lungs

Points of Attack: Skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. If breathing problems occur, lung function tests and a chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Skin protection is not generally necessary, but it is probably advisable especially where there is a history of zircon granuloma from deodorants. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *25 milligram per cubic meter:* Qm (APF = 25) (any quarter-mask respirator). *50 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or PaprHie (APF = 25) (any powered, air-purifying respirator with a dust, mist, and fume filter); 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or Sa (APF = 10) (any supplied-air respirator); or SCB AF (APF = 50) (any self-contained breathing apparatus with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Red Stripe: Flammability Hazard (4.2): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet. Zirconium must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable materials. Sources of ignition, such as smoking and open flames are prohibited where zirconium is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of zirconium should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of zirconium. Wherever zirconium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2008 Zirconium powder, dry, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material. UN1358 Zirconium suspended in a liquid, Hazard Class: 3; Labels: 3-Flammable liquid. UN1358 Zirconium powder, wetted with not $<25\%$ water (a visible excess of water must be present) (1) mechanically produced, particle size $<53\ \mu m$; (2) chemically produced, particle size $<840\ \mu m$, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN 1932 Zirconium scrap, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material. UN 2009 Zirconium, dry, finished sheets, strip or coiled wire, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material. UN2858 Zirconium, dry, coiled wire, finished metal sheets, strip (thinner than 254 μm but not thinner than 18 μm), Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep zirconium out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Zirconium powder is flammable Fire may restart after it has been extinguished. Containers may explode in fire. Thermal decomposition products may include metal oxides of zirconium. Use dry chemicals appropriate for extinguishing metal fires; dolomite; dry salt, dry sand. *Do not use water*. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

General Guide to Chemical Resistant Gloves

Material	**Generally Suitable for**
Butyl rubber	Aldehydes Carboxylic acids Glycols and ethers Hydroxyl compounds and alcohols peroxides
Latex	Limit use; see note below Acetone Alcohols Alkalies and caustics Ammonium fluoride Dimethyl sulfoxide (DMSO) Phenol
Natural rubber	Plating solutions Alcohols Alkalies and caustics Cellosolve Degreasing solvents Mineral acids Oils
Neoprene	Plating solutions
Nitrile rubber	Alcohols Ammonium fluoride Freons Hexane Hydrofluoric and hydrochloric acid Perchloric acid Perchloroethylene Phosphoric acid Potassium and sodium hydroxide Water soluble materials, dilute acids, and bases
Vinyl	General prevention of contamination Medical examination Nuisance materials

Important Note: Latex gloves present a risk of irritation, allergic reaction, or sensitization which, for susceptible individuals, can be significant. The latex protein can leach out of the gloves into the user's skin, or into the glove powdering, if powdered gloves are used. This can lead to allergic skin reaction or a potentially more serious reaction if latex protein-contaminated powder is released into the environment and breathed in. The use of any sort of latex gloves should be considered carefully, and they should only be used when no other glove is appropriate. You are strongly advised not to use powdered latex gloves. *Users at University of Oxford should be aware that University Safety Policy statement S3/02 prohibits the use of powdered latex gloves for any purpose and advises that, if use of latex is essential, only latex gloves with low levels of extractable latex protein may be used.*

Appendix 1: Oxidizing Materials

Notes: Best efforts have been made to ensure the information below is as accurate as possible. This list is not (and cannot be) comprehensive. Therefore, the absence of an oxidizing material from this list *does not* mean that it is not an oxidizer. The publisher or author cannot accept any responsibility for the use or misuse of this information. Generally, solid oxidizers include the following materials: bromates, chlorates, chlorites, chromates, dichromates, hypochlorites, iodates, nitrates, nitrites, perchlorates, permanganates, peroxides, persulphates, picrates, and chemical oxygen generators (such as potassium superoxide) Also, many fertilizers are oxidizing materials. The asterisk (*) denotes some of those materials with potential for spontaneous ignition.

Oxidizing Materials by Name and CAS

Aluminum nitrate	13473-90-0
Ammonium chloride	7446-70-0
Ammonium chromate	7788-98-9
Ammonium dichromate	7789-09-5
Ammonium nitrate	6484-52-2
Ammonium nitrate−phosphate mixture	57608-40-9
Ammonium nitrate−sulfate mixture	6484-52-2
Ammonium perchlorate	7790-98-9
Ammonium permanganate	13446-10-1
Ammonium persulfate	7727-54-0
Ammonium picrate (wet)	131-74-8
Amyl nitrate	463-04-7
Barium bromate	13967-90-3
Barium carbonate	513-77-9
Barium chlorate	13477-00-4
Barium hypochlorite	13477-10-6
Barium nitrate	10022-31-8
Barium perchlorate trihydrate	10294-39-0
Barium permanganate	7787-36-2
Barium peroxide	1304-29-6
Benzoyl peroxide	94-36-0
Beryllium nitrate	13597-99-4
Bromine	7726-95-6
Bromine chloride	13863-41-7
Bromine pentafluoride	7789-30-2
Bromine trifluoride	7787-71-5
t-Butyl peroxybenzoate	614-45-9
Cadmium nitrate	10325-94-7
Cadmium nitrate tetrahydrate	10022-68-1
Calcium chlorate	10137-74-3
Calcium chlorite	14674-72-7
Calcium hypochlorite*	7778-54-3
Calcium nitrate	10124-37-5
Calcium perchlorate	13477-36-6
Calcium permanganate	10118-76-0
Calcium peroxide	1305-79-9
Cesium nitrate	7789-18-6
Chloric acid solution	7790-93-4
Chlorine	7787-50-5
Chlorine oxide	10049-04-4
Chlorine trifluoride	7790-91-2
Chromic acid*	7738-94-5
Chromic anhydride	11115-74-5
Chromium nitrate	7789-02-8
Chromium trioxide, anhydrous	1333-82-0
Chromium oxychloride	14977-61-8
Cobalt nitrate	10141-05-6
Cobalt(II) chloride	7646-79-9
Cobalt(II) perchlorate, hexahydrate	13478-33-6
Cumene hydroperoxide	80-15-9
Cupric nitrate (copper nitrate)	3251-23-8
Cyclohexanone peroxide	12262-58-7
Diacetone alcohol peroxide	54693-46-8
Dimethylhexane dihydroperoxide	3025-88-5
Di-*t*-butyl peroxide	110-05-4
Dichloro isocyanuric acid	2782-57-2
Ferric nitrate	10421-48-4
Gallium(III) nitrate	13494-90-1
Guanidine nitrate	506-93-4
Hydrogen peroxide (27.5%−52% by weight)*	7722-84-1
Indium nitrate	13770-61-1
Iodine pentafluoride	7783-66-6
Iron(II) nitrate hexahydrate (1:2:6)	13520-68-8
Isopropyl nitrate	1712-64-7
Isopropyl peroxydicarbonate	105-64-6
Lanthanum nitrate	10099-59-9
Lead dioxide	1309-60-0
Lead nitrate	10099-74-8
Lead perchlorate	13637-76-8
Lithium bichromate	13843-81-7
Lithium chromate	14307-35-8
Lithium hypochlorite	13840-33-0
Lithium nitrate	7790-69-4
Lithium peroxide	12031-80-0
Magnesium bromate	7789-36-8
Magnesium chlorate	7791-19-7
Magnesium nitrate	10377-60-3
Magnesium perchlorate	10034-81-8
Magnesium peroxide	14452-57-4
Manganese dioxide	1313-13-9
Manganese nitrate	10377-66-9
Mercuric nitrate	10045-94-0
Mercurous nitrate	10415-75-5
Nickel nitrate	14216-75-2
Nickel nitrite	17861-62-0
Nickel perchlorate	13637-71-3

Nickel(II) nitrate	13138-45-9
Nitrogen dioxide	10102-44-0
Nitrogen trifluoride	7783-54-2
Nitro sylsulfuric acid	7782-78-7
Oxalic acid	6153-56-6
Ozone	10028-15-6
Palladium dinitrate	10102-05-3
Peracetic acid	79-21-0
Perchloric acid	7601-90-3
Perchloryl fluoride	7616-94-6
Potassium bromate*	7758-01-2
Potassium chlorate	1811-04-9
Potassium chromate(VI)	7789-00-6
Potassium dichloroisocyanurate	2244-21-5
Potassium dichromate	7778-50-9
Potassium nitrate	7757-79-1
Potassium nitrite	7758-09-0
Potassium perchlorate	7778-74-7
Potassium permanganate	7722-64-7
Potassium peroxide	17014-71-0
Potassium persulfate	7727-21-1
Potassium superoxide	12030-88-5
n-Propyl nitrate	627-13-4
Pyrosulfuryl chloride	7791-27-7
Silver nitrate	7761-88-8
Sodium dichloro-*s*-triazinetrione	2893-78-9
Sodium bromate	7789-38-0
Sodium chlorate	7775-09-9
Sodium chlorite (>40%)*	7758-19-2
Sodium chromate	7775-11-3
Sodium dichlorocyanurate*	2893-78-9
Sodium dichromate	10588-01-9
Sodium hypochlorite	7681-52-9
Sodium nitrate	7631-99-4
Sodium nitrite	7632-00-0
Sodium percarbonate	15630-89-4
Sodium perchlorate	7601-89-0
Sodium permanganate*	10101-50-5
Sodium peroxide*	1313-60-6
Sodium persulfate	7775-27-1
Sodium superoxide	12034-12-7
Strontium chlorate	7791-10-8
Strontium nitrate	10042-76-9
Strontium perchlorate	13450-97-0
Strontium peroxide	1314-18-7
Tetranitromethane	509-14-8
Thorium(IV) nitrate	13823-29-5
Trichloroisocyanuric acid*	87-90-1
Uranyl nitrate	10102-06-4
Urea peroxide	124-43-6
Vanadium pentoxide	1314-62-1
Ytterbium nitrate	13768-67-7
Yttrium(III) nitrate hexahydrate	13494-98-9
Zinc ammonium nitrite	63885-01-8
Zinc bichromate	7789-12-0
Zinc bromate	13517-27-6
Zinc chromate	13530-65-9
Zinc chlorate	10361-95-2
Zinc nitrate	7779-88-6
Zinc permanganate	23414-72-4
Zinc peroxide	1314-22-3
Zirconium nitrate	13746-89-9

Oxidizing Materials by CAS and Name

54693-46-8	Diacetone alcohol peroxide
13843-81-7	Lithium bichromate
7789-12-0	Zinc bichromate
79-21-0	Peracetic acid
80-15-9	Cumene hydroperoxide
87-90-1	*Trichloroisocyanuric acid
94-36-0	Benzoyl peroxide
105-64-6	Isopropyl peroxydicarbonate
110-05-4	Di-*t*-butyl peroxide
124-43-6	Urea peroxide
131-74-8	Ammonium picrate (wet)
463-04-7	Amyl nitrate
506-93-4	Guanidine nitrate
509-14-8	Tetranitromethane
513-77-9	Barium carbonate
614-45-9	*t*-Butyl peroxybenzoate
627-13-4	*n*-Propyl nitrate
1304-29-6	Barium peroxide
1305-79-9	Calcium peroxide
1309-60-0	Lead dioxide
1313-13-9	Manganese dioxide
1313-60-6	*Sodium peroxide
1314-18-7	Strontium peroxide
1314-22-3	Zinc peroxide
1314-62-1	Vanadium pentoxide
1333-82-0	Chromium trioxide, anhydrous
1712-64-7	Isopropyl nitrate
1811-04-9	Potassium chlorate
2244-21-5	Potassium dichloroisocyanurate
2893-78-9	Sodium dichlorocyanurate
2244-21-5	*Potassium dichloroisocyanurate
2782-57-2	Dichloroisocyanuric acid
2893-78-9	Sodium dichloro-*s*-triazinetrione
3025-88-5	Dimethylhexane dihydroperoxide
3251-23-8	Cupric nitrate (copper nitrate)
3597-99-4	Beryllium nitrate
6153-56-6	Oxalic acid
6484-52-2	Ammonium nitrate
6484-52-2	Ammonium nitrate−sulfate mixture
7446-70-0	Ammonium chloride
7601-89-0	Sodium perchlorate
7601-90-3	Perchloric acid
7616-94-6	Perchloryl fluoride
7631-99-4	Sodium nitrate
7632-00-0	Sodium nitrite
7646-79-9	Cobalt(II) chloride

7681-52-9	Sodium hypochlorite
7722-64-7	Potassium permanganate
7722-84-1	*Hydrogen peroxide (27.5%−52% by weight)
7726-95-6	Bromine
7727-21-1	Potassium persulfate
7727-54-0	Ammonium persulfate
7738-94-5	*Chromic acid
7757-79-1	Potassium nitrate
7758-01-2	*Potassium bromate
7758-09-0	Potassium nitrite
7758-19-2	*Sodium chlorite
7761-88-8	Silver nitrate
7775-27-1	Sodium persulfate
7775-11-3	Sodium chromate
7775-09-9	Sodium chlorate
7778-54-3	*Calcium hypochlorite
7778-50-9	Potassium dichromate
7778-74-7	Potassium perchlorate
7779-88-6	Zinc nitrate
7782-78-7	Nitrosyl sulfuric acid
7783-54-2	Nitrogen trifluoride
7783-66-6	Iodine pentafluoride
7787-36-2	Barium permanganate
7787-50-5	Chlorine
7787-71-5	Bromine trifluoride
7788-98-9	Ammonium chromate
7789-00-6	Potassium chromate(VI)
7789-02-8	Chromium nitrate
7789-09-5	Ammonium dichromate
7789-18-6	Cesium nitrate
7789-30-2	Bromine pentafluoride
7789-36-8	Magnesium bromate
7789-38-0	Sodium bromate
7790-69-4	Lithium nitrate
7790-91-2	Chlorine trifluoride
7790-93-4	Chloric acid solution
7790-98-9	Ammonium perchlorate
7791-10-8	Strontium chlorate
7791-19-7	Magnesium chlorate
7791-27-7	Pyrosulfuryl chloride
10022-31-8	Barium nitrate
10022-68-1	Cadmium nitrate tetrahydrate
10028-15-6	Ozone
10034-81-8	Magnesium perchlorate
10042-76-9	Strontium nitrate
10045-94-0	Mercuric nitrate
10049-04-4	Chlorine oxide
10099-59-9	Lanthanum nitrate
10099-74-8	Lead nitrate
10101-50-5	*Sodium permanganate
10102-05-3	Palladium dinitrate
10102-06-4	Uranyl nitrate
10102-44-0	Nitrogen dioxide
10118-76-0	Calcium permanganate
10124-37-5	Calcium nitrate
10137-74-3	Calcium chlorate
10141-05-6	Cobalt nitrate
10294-39-0	Barium perchlorate trihydrate
10325-94-7	Cadmium nitrate
10361-95-2	Zinc chlorate
10377-60-3	Magnesium nitrate
10377-66-9	Manganese nitrate
10415-75-5	Mercurous nitrate
10421-48-4	Ferric nitrate
10588-01-9	Sodium dichromate
11115-74-5	Chromic anhydride
12030-88-5	Potassium superoxide
12031-80-0	Lithium peroxide
12034-12-7	Sodium superoxide
12262-58-7	Cyclohexanone peroxide
13138-45-9	Nickel(II) nitrate
13446-10-1	Ammonium permanganate
13450-97-0	Strontium perchlorate
13473-90-0	Aluminum nitrate
13477-00-4	Barium chlorate
13477-10-6	Barium hypochlorite
13477-36-6	Calcium perchlorate
13478-33-6	Cobalt(II) perchlorate, hexahydrate
13494-90-1	Gallium(III) nitrate
13494-98-9	Yttrium(III) nitrate hexahydrate
13517-27-6	Zinc bromate
13520-68-8	Iron(II) nitrate hexahydrate (1:2:6)
13530-65-9	Zinc chromate
13637-71-3	Nickel perchlorate
13637-76-8	Lead perchlorate
13746-89-9	Zirconium nitrate
13768-67-7	Ytterbium nitrate
13770-61-1	Indium nitrate
13823-29-5	Thorium(IV) nitrate
13863-41-7	Bromine chloride
13840-33-0	Lithium hypochlorite
13967-90-3	Barium bromate
14216-75-2	Nickel nitrate
14307-35-8	Lithium chromate
14452-57-4	Magnesium peroxide
14674-72-7	Calcium chlorite
14977-61-8	Chromium oxychloride
15630-89-4	Sodium percarbonate
17014-71-0	Potassium peroxide
17861-62-0	Nickel nitrite
23414-72-4	Zinc permanganate
57608-40-9	Ammonium nitrate−phosphate mixture
63885-01-8	Zinc ammonium nitrite

Note: The asterisk (*) denotes some of those materials with potential for spontaneous ignition.

Appendix 2: Carcinogens

Carcinogen Index by Name and CAS

A-α-C (2-Amino-9*H*-pyrido [2,3-*b*]indole)	26148-68-5
Acetaldehyde	75-07-0
Acetamide	60-35-5
2-Acetylaminofluorene	53-96-3
Acifluorfen sodium	62476-59-9
Acrylamide	79-06-1
Acrylo nitrile	107-13-1
Actinomycin D	50-76-0
AF-2;[2-(2-furyl)-3-(5-nitro-2-furyl)] acrylamide	3688-53-7
Aflatoxins	Various CAS
Alachlor	15972-60-8
Alcoholic beverages, when associated with alcohol abuse [Note: see Etanol (E:0330; CAS: 64-17-5)]	See note
Aldrin	309-00-2
Allyl chloride (*delisted 1999*)	107-05-1
2-Aminoanthraquinone	117-79-3
p-Aminoazobenzene	60-09-3
o-Aminoazotoluene	97-56-3
4-Aminobiphenyl (4-Aminodiphenyl)	92-67-1
1-Amino-2,4-dibromo-anthraquinone	81-49-2
3-Amino-9-ethylcarbazole hydrochloride	6109-97-3
2-Aminofluorene	153-78-6
1-Amino-2-methylanthraquinone	82-28-0
2-Amino-5-(5-nitro-2-furyl)-1,3,4-thiadiazole	712-68-5
4-2-Nitrophenol	119-34-6
Amitrole	61-82-5
Amsacrine	51264-14-3
Analgesic mixtures containing phenacetin	Various CAS
Aniline	62-53-3
Aniline hydrochloride	142-04-1
o-Anisidine	90-04-0
o-Anisidine hydrochloride	134-29-2
Antimony oxide (antimony trioxide)	1309-64-4
Anthraquinone	84-65-1
Aramite	140-57-8
Areca nut	No CAS
Aristolochic acids	313-67-7 and Various CAS
Arsenic (inorganic arsenic compounds)	7440-38-2
List of Arsenic compounds, inorganic	
Arsanilic acid [arsonic acid, (4-aminophenyl)-]	98-50-0
Arsenic pentoxide [arsenic oxide(As_2O_5)]	1303-28-2
Arsenic sulfide [arsenic sulfide(As_2S_3)]	1303-33-9
Arsenic trioxide [arsenic oxide (As_2O_3)]	1327-53-3
Arsine	7784-42-1
Calcium arsenate [arsenic acid (H_3AsO_4), calcium salt (2:3)]	7778-44-1
Dimethylarsinic acid (arsinic acid, dimethyl-)	75-60-5
Lead arsenate [arsenic acid (H_3AsO_4), lead(2+) salt (1:1)]	7784-40-9
Methane arsonic acid, disodium salt (arsonic acid, methyl-, disodium salt)	144-21-8
Methane arsonic acid, monosodium salt (arsonic acid, methyl-, monosodium salt)	2163-80-6
Potassium arsenate [arsenic acid (H_3AsO_4), monopotassium salt]	7784-41-0
Potassium arsenite (arsenenous acid, potassium salt)	13464-35-2
Sodium arsenate, sodium salt	7631-89-2
odium arsenite	7784-46-5
Sodium cacodylate (arsinic acid, dimethyl-, sodium salt)	124-65-2
Asbestos	1332-21-4
Asbestos, amosite	12172-73-5
Asbestos, actinolite	77536-66-4
Asbestos, anthophylite	77536-67-5
Asbestos, anthophyllite	17068-78-9
Asbestos, chrysotile	12001-29-5
Asbestos, crocidolite	12001-28-4
Asbestos, tremolite	77536-68-6
Auramine	492-80-8
Azacitidine	320-67-2

2′,3,4-Trichlorobiphenyl	38444-86-9
2,4,4′-Trichlorobiphenyl	7012-37-5
2,4′,5-Trichlorobiphenyl	16606-02-3
Polychlorinated biphenyls (containing 60 or more % Cl by molecular weight)	Various CAS
Polychlorinated dibenzo-*p*-dioxins	Various CAS
Polychlorinated dibenzofurans	No CAS
Polygeenan	53973-98-1
Ponceau MX	3761-53-3
Ponceau 3R	3564-09-8
Potassium bromate	7758-01-2
Primidone	125-33-7
Procarbazine	671-16-9
Procarbazine hydrochloride	366-70-1
Procymidone	32809-16-8
Progesterone	57-83-0
Pronamide	23950-58-5
Propachlor	1918-16-7
1,3-Propane sultone	1120-71-4
Propargite	2312-35-8
β-Propiolactone	57-57-8
Propoxur	114-26-1

Propylene glycol mono-*t*-butyl ether	57018-52-7
Propylene oxide	75-56-9
Propylthiouracil	51-52-5
Pyridine	110-86-1
Quinoline and its strong acid salts	No CAS
Radionuclides	No CAS
Reserpine	50-55-5
Residual (heavy) fuel oils	No CAS
Resmethrin	10453-86-8
Riddelliine	23246-96-0
Saccharin (*delisted 2001*)	81-07-2
Saccharin, sodium (*delisted 2003*)	128-44-9
Safrole	94-59-7
Selenium sulfide	7446-34-6
Shale-oils	68308-34-9
Silica, crystalline (airborne particles of respirable size)	No CAS
Soots, tars, and mineral oils (untreated and mildly treated oils and used engine oils)	No CAS
Spirodiclofen	148477-71-8
Spironolactone	52-01-7
Stanozolol	10418-03-8
Sterigmatocystin	10048-13-2
Streptozotocin (streptozocin)	18883-66-4
Strong inorganic acid mists containing sulfuric acid	No CAS
Styrene-7,8-oxide	96-09-3
Sulfallate	95-06-7
Sulfasalazine (salicylazosulfapyridine)	599-79-1
Talc containing asbestiform fibers	No CAS
Tamoxifen and its salts	10540-29-1
Terrazole	2593-15-9
Testosterone and its esters	58-22-0
2,3,7,8-Tetrachlorodibenzo-*p*-dioxin (TCDD)	1746-01-6
1,1,2,2-Tetrachloroethane	79-34-5
Tetrachloroethylene (perchloroethylene)	127-18-4
p-a,a,a-Tetrachlorotoluene	5216-25-1
Tetrafluoroethylene	116-14-3
Tetranitromethane	509-14-8
Thioacetamide	62-55-5
4,4′-Thiodianiline	139-65-1
Thiodicarb	59669-26-0
Thiouracil	141-90-2
Thiourea	62-56-6
Thorium dioxide	1314-20-1
Tobacco, oral use of smokeless products	No CAS
Tobacco smoke	No CAS
Toluene diisocyanate	26471-62-5
o-Toluidine	95-53-4
o-Toluidine hydrochloride	636-21-5
p-Toluidine (*delisted 1999*)	106-49-0
Toxaphene (polychlorinated camphenes)	8001-35-2
Toxins derived from *Fusarium Moniliforme (Fusarium verticillioides)*	No CAS
Treosulfan	299-75-2
Trichlormethine (trimustine hydrochloride)	817-09-4

Trichloroethylene	79-01-6
2,4,6-Trichlorophenol	88-06-2
1,2,3-Trichloropropane	96-18-4
2,4,5-Trimethylaniline (and its strong acid salts)	137-17-7
Trimethyl phosphate	512-56-1
2,4,6-Trinitrotoluene	118-96-7
Triphenyltin hydroxide	76-87-9
Tris(aziridinyl)-*p*-benzoquinone (Triaziquone) (*delisted 2006*)	68-76-8
Tris(1-aziridinyl)phosphine Sulfide (thiotepa)	52-24-4
Tris(2-chloroethyl) phosphate	115-96-8
Tris(2,3-dibromopropyl)phosphate	126-72-7
Trp-*p*-1 (tryptophan-*p*-1)	62450-06-0
Trp-*p*-2 (tryptophan-*p*-2)	62450-07-1
Trypan blue (commercial grade)	72-57-1
Unleaded gasoline (wholly vaporized)	8006-61-9
Uracil mustard	66-75-1
Urethane (ethyl carbamate)	51-79-6
Vanadium pentoxide (orthorhombic crystalline form)	1314-62-1
Vinclozolin	50471-44-8
Vinyl bromide	593-60-2
Vinyl chloride	75-01-4
4-Vinylcyclohexene	100-40-3
4-Vinyl-1-cyclohexene diepoxide (vinyl cyclohexene dioxide)	106-87-6
Vinyl fluoride	75-02-5
Vinyl trichloride (1,1,2-trichloroethane)	79-00-5
Wood dust	No CAS
2,6-Xylidine (2,6-dimethylaniline)	87-62-7
Zalcitabine	7481-89-2
Zidovudine (AZT)	30516-87-1
Zileuton	111406-87-2
Zineb *(delisted 1999)*	12122-67-7

Carcinogen Index by CAS and Name

50-00-0	Formaldehyde (gas)
50-06-6	Phenobarbital
50-07-7	Mitomycin C
50-18-0	Cyclophosphamide (anhydrous)
50-28-2	Estradiol 17B
50-29-3	DDT (Dichlorodi-phenyltrichloroethane)
50-32-8	Benzo[*a*]pyrene
50-55-5	Reserpine
50-76-0	Actinomycin D
51-52-5	Propylthiouracil
51-75-2	Nitrogen mustard (mechlorethamine)
51-79-6	Urethane (ethyl carbamate)
52-01-7	Spironolactone
52-24-4	Tris(1-aziridinyl)phosphine Sulfide (Thiotepa)
52-76-6	Lynestrenol
53-16-7	Estrone
53-70-3	Dibenz[*a*,*h*]anthracene
53-96-3	2-Acetylaminofluorene
55-18-5	*N*-Nitrosodiethylamine
55-86-7	Nitrogen mustard hydrochloride (mechlorethamine hydrochloride)
55-98-1	1,4-Butanediol dimethanesulfonate (Busulfan)
56-04-2	Methylthiouracil
56-23-5	Carbon tetrachloride
56-49-5	3-Methylcholanthrene
56-53-1	Diethylstilbestrol (DES)
56-55-3	Benz[*a*]anthracene
56-75-7	Chloramphenicol
57-14-7	1,1-Dimethylhydrazine (UDMH)
57-41-0	Diphenylhydantoin (phenytoin)
57-57-8	β-Propiolactone
57-63-6	Ethinylestradiol
57-74-9	Chlordane
57-83-0	Progesterone
57-97-6	7,12-Dimethylbenz(*a*)anthracene
58-22-0	Testosterone and its esters
58-89-9	Lindane and other hexachlorocyclohexane isomers
59-87-0	Nitrofurazone
59-89-2	*N*-Nitrosomorpholine
59-96-1	Phenoxybenzamine
60-09-3	*p*-Aminoazobenzene
60-11-7	4-Dimethylaminoazobenzene
60-34-4	Methylhydrazine (and its salts)
60-35-5	Acetamide
60-57-1	Dieldrin
61-57-4	Niridazole
61-82-5	Amitrole
62-44-2	Phenacetin
62-50-0	Ethyl methane sulfonate
62-53-3	Aniline
62-55-5	Thioacetamide
62-56-6	Thiourea
62-73-7	DDVP (Dichlorvos)
62-75-9	*N*-Nitrosodimethylamine
63-25-2	Carbaryl
63-92-3	Phenoxybenzamine hydrochloride
64-17-5	Ehtanol associated with alcoholic beverage consumption
64-67-5	Diethyl sulfate
66-27-3	Methyl methanesulfonate
66-75-1	Uracil mustard
67-45-8	Furazolidone
67-66-3	Chloroform
67-72-1	Hexachloroethane
68-22-4	Norethisterone (norethindrone)
68-23-5	Norethynodrel
68-76-8	Tris(aziridinyl)-*p*-benzoquinone (triaziquone) (*delisted 2006)*
70-25-7	*N*-Methyl-*N*′-nitro-*N*-nitrosoguanidine
71-43-2	Benzene
71-58-9	Medroxyprogesterone acetate
72-33-3	Mestranol
72-54-8	DDD (dichlorodiphenyl-dichloroethane)
72-55-9	DDE (dichlorodi-phenyldichloroethylene)
72-57-1	Trypan blue (commercial grade)

74-88-4	Methyl iodide
74-96-4	Bromo ethane
75-00-3	Chloroethane (Ethyl chloride)
75-01-4	Vinyl chloride
75-02-5	Vinyl fluoride
75-07-0	Acetaldehyde
75-09-2	Dichloromethane (methylene chloride)
75-21-8	Ethylene oxide
75-25-2	Bromo form
75-27-4	Bromo dichloromethane
75-34-3	1,1-Dichloroethane
75-52-5	Nitromethane
75-55-8	2-Methylaziridine (propyleneimine)
75-56-9	Propylene oxide
75-60-5	Cacodylic acid
76-44-8	Heptachlor
76-87-9	Triphenyltin hydroxide
77-09-8; 5768-87-6	Phenolphthalein
77-78-1	Dimethyl sulfate
78-79-5	Isoprene
78-87-5	1,2-Dichloropropane
79-00-5	Vinyl trichloride (1,1,2-Trichloroethane)
79-01-6	Trichloroethylene
79-06-1	Acrylamide
79-34-5	1,1,2,2-Tetrachloroethane
79-43-6	Dichloroacetic acid
79-44-7	Dimethylcarbamoyl chloride
79-46-9	2-Nitropropane
81-07-2	Saccharin (*delisted* 2001)
81-49-2	1-Amin*o*-2,4-dibromo-anthraquinone
81-88-9	D&C Red No. 19
82-28-0	1-Amino-2-methylanthraquinone
84-17-3	Dienestrol
84-65-1	Anthraquinone
86-30-6	*N*-Nitrosodiphenylamine
86-74-8	Carbazole
87-29-6	Cinnamyl anthranilate
87-62-7	2,6-Xylidine (2,6-dimethylaniline)
87-86-5	Pentachlorophenol
88-06-2	2,4,6-Trichlorophenol
88-72-2	*o*-Nitrotoluene
90-04-0	*o*-Anisidine
90-43-7	*o*-Phenylphenol
90-94-8	Michler's ketone
91-20-3	Naphthalene
91-23-6	*o*-Nitro anisole
91-59-8	2-Naphthylamine
91-94-1	3,3′-Dichlorobenzidine
92-67-1	4-Aminobiphenyl (4-aminodiphenyl)
92-87-5	Benzidine (and its salts)
92-93-3	4-Nitrobiphenyl
93-15-2	Methyleugenol
94-58-6	Dihydrosafrole
94-59-7	Safrole
94-78-0	Phenazopyridine
95-06-7	Sulfallate
95-53-4	*o*-Toluidine
95-54-5	*o*-Phenylenediamine and its salts
95-69-2	*p*-Chloro-*o*-toluidine
95-80-7	2,4-Diaminotoluene
95-83-0	4-Chloro-*o*-phenylenediamine
96-09-3	Styrene-7,8-oxide
96-12-8	1,2-Dibromo-3-chloropropane (DBCP) (male)
96-13-9	2,3-Dibromo-1-propanol
96-18-4	1,2,3-Trichloropropane
96-23-1	1,3-Dichloro-2-propanol (1,3-DCP)
96-24-2	3-Monochloropropane-1,2-diol (3-MCPD)
96-45-7	Ethylene thiourea
97-56-3	*o*-Aminoazotoluene
98-07-7	Benzotrichloride
98-82-8	Cumene
98-95-3	Nitrobenzene
99-59-2	5-Nitro-*o*-anisidine (*delisted 2006*)
100-00-5	1-Chloro-4-nitrobenzene
100-40-3	4-Vinylcyclohexene
100-41-4	Ethylbenzene
100-44-7	Benzyl chloride
100-75-4	*N*-Nitrosopiperidine
101-14-4	4,4′-Methylene bis(2-chloroaniline)
101-61-1	4,4′-Methylene bis(*N,N*-dimethyl)benzenamine
101-77-9	4,4′-Methylenedianiline
101-80-4	4,4′-Diaminodiphenyl ether(4,4′-oxydianiline)
101-90-6	Diglycidyl resorcinol ether (DGRE)
103-33-3	Azobenzene
106-46-7	*p*-Dichlorobenzene
106-47-8	*p*-Chloroaniline
106-49-0	*p*-Toluidine (*delisted 1999*)
106-87-6	4-Vinyl-1-cyclohexene diepoxide (vinyl cyclohexene dioxide)
106-89-8	Epichlorohydrin
106-93-4	Ethylene dibromide
106-99-0	1,3-Butadiene
107-05-1	Allyl chloride (*delisted 1999*)
107-06-2	Ethylene dichloride (1,2-dichloroethane)
107-13-1	Acrylonitrile
107-30-2	Chloromethyl methyl ether (technical grade)
110-00-9	Furan
110-86-1	Pyridine
111-44-4	Bis(2-chloroethyl)ether
114-26-1	Propoxur
115-02-6	Azaserine
115-28-6	Chlorendic acid
115-96-8	Tris(2-chloroethyl) phosphate
116-14-3	Tetrafluoroethylene
117-10-2	Dantron (chrysazin;1,8-dihydroxy-anthraquinone)
117-79-3	2-Aminoanthraquinone
117-81-7	Di(2-ethylhexyl)phthalate (DEHP)
118-74-1	Hexachlorobenzene
118-96-7	2,4,6-Trinitrotoluene
119-34-6	4-Amino-2-nitrophenol
119-90-4	3,3′-Dimethoxybenzidine (*o*-Dianisidine)
119-93-7	3,3′-Dimethylbenzidine (*o*-Tolidine)

120-58-1	Isosafrole (*delisted 2006*)
120-71-8	*p*-Cresidine
120-80-9	Catechol
121-14-2	2,4-Dinitrotoluene
122-60-1	Phenyl glycidyl ether
122-66-7	Hydrazobenzene (1,2-diphenylhydrazine)
123-91-1	1,4-Dioxane
124-48-1	Chlorodibromomethane (*delisted 1999*)
125-33-7	Primidone
126-07-8	Griseofulvin
126-72-7	Tris(2,3-dibro mopropyl)phosphate
126-85-2	Nitrogen mustard *N*-oxide
126-99-8	Chloroprene
127-18-4	Tetrachloroethylene (perchloroethylene)
128-44-9	Saccharin, sodium (*delisted 2003*)
129-15-7	2-Methyl-1-nitro anthraquinone (of uncertain purity)
129-43-1	1-Hydroxyanthraquinone
132-27-4	*o*-Phenylphenate, sodium
133-06-2	Captan
133-07-3	Folpet
134-29-2	*o*-Anisidine hydrochloride
134-32-7	1-Naphthylamine
135-20-6	Cupferron
136-35-6	Diazoaminobenzene
136-40-3	Phenazopyridine hydrochloride
136-45-8	Di-*n*-propyl isocinchomeronate (MGK Repellent 326)
137-17-7	2,4,5-Trimethylaniline (and its strong acid salts)
137-41-7	Metam potassium
137-42-8	Metham sodium
139-13-9	Nitrilotriacetic acid
139-65-1	4,4′-Thiodianiline
139-91-3	5-(Morpholinomethyl)-3-[(5-nitrofurfuryl-idene)-amino]-2-oxazolidinone
140-57-8	Aramite
140-67-0	Estragole
140-88-5	Ethyl acrylate
141-90-2	Thiouracil
142-04-1	Aniline hydrochloride
143-50-0	Chlordecone (Kepone)
148-82-3	Melphalan
151-56-4	Ethyleneimine
153-78-6	2-Aminofluorene
154-93-8	Bischloroethyl nitrosourea (BCNU) (Carmustine)
156-10-5	*p*-Nitrosodiphenylamine
189-55-9	Dibenzo[*a*,*i*]pyrene
189-64-0	Dibenzo[*a*,*h*]pyrene
191-30-0	Dibenzo[*a*,*l*]pyrene
192-65-4	Dibenzo[*a*,*e*]pyrene
193-39-5	Indeno[1,2,3-*cd*]pyrene
194-59-2	7*H*-Dibenzo[*c*,*g*]carbazole
205-82-3	Benzo[*j*]fluoranthene
205-99-2	Benzo[*b*]fluoranthene
207-08-9	Benzo[*k*]fluoranthene
218-01-9	Chrysene
224-42-0	Dibenz[*a*,*j*]acridine
226-36-8	Dibenz[*a*,*h*]acridine
271-89-6	Benzofuran
298-81-7	8-Methoxypsoralen with ultraviolet A therapy
299-75-2	Treosulfan
301-04-2	Lead acetate
302-01-2	Hydrazine
302-70-5	Nitrogen mustard *N*-oxide hydrochloride
303-34-4	Lasiocarpine
303-47-9	Ochratoxin A
305-03-3	Chlorambucil
309-00-2	Aldrin
315-22-0	Monocrotaline
320-67-2	Azacitidine

331-39-5	Caffeic acid
366-70-1	Procarbazine hydrochloride
373-02-4	Nickel acetate
389-08-2	Nalidixic acid
434-07-1	Oxymetholone
443-48-1	Metronidazole
446-86-6	Azathioprine
484-20-8	5-Methoxypsoralen with ultraviolet A therapy
492-80-8	Auramine
494-03-1	*N*,*N*-Bis(2-chloroethyl)-2-naphthylamine (Chlornapazine)
505-60-2	Mustard Gas
509-14-8	Tetranitromethane
510-15-6	Ethyl-4,4′-dichlorobenzilate
512-56-1	Trimethyl phosphate
513-37-1	Dimethylvinylchloride
531-76-0	Merphalan
531-82-8	*N*-[4-(5-Nitro-2-furyl)-2-thiazolyl]acetamide
540-73-8	1,2-Dimethylhydrazine
542-56-3	Isobutyl nitrite
542-75-6	1,3-Dichloropropene
542-88-1	Bis(chloromethyl)ether
555-84-0	1-[(5-Nitrofurfurylidene)-amino]-2-imidazolidinone
556-52-5	Glycidol
563-47-3	3-Chloro-2-methylpropene
569-57-3	Chlorotrianisene
569-61-9	C.I. Basic Red 9 monohydrochloride
590-96-5	Methylazoxymethanol
592-62-1	Methylazoxymethanol acetate
593-60-2	Vinyl bromide
598-55-0	Methyl carbamate
599-79-1	Sulfasalazine (salicylazosulfapyridine)
602-87-9	5-Nitroacenaphthene
604-75-1	Oxazepam
606-20-2	2,6-Dinitrotoluene
607-57-8	2-Nitrofluorene
608-73-1	Hexachlorocyclohexane (technical grade)
612-82-8	3,3′-Dimethylbenzidine dihydrochloride
612-83-9	3,3′-Dichlorobenzidine dihydrochloride
613-35-4	*N*,*N*′-Diacetylbenzidine

615-05-4	2,4-Diaminoanisole
615-53-2	*N*-Nitroso-*N*-methylurethane
621-64-7	*N*-Nitro sodi-*n*-propylamine
630-93-3	Diphenylhydantoin (Phenytoin), sodium salt
631-64-1	Dibromoacetic acid
636-21-5	*o*-Toluidine hydrochloride
637-07-0	Clofib rate
671-16-9	Procarbazine
680-31-9	Hexamethylphosphoramide
684-93-5	*N*-Nitroso-*N*-methylurea
712-68-5	2-Amino-5-(5-nitro-2-furyl)-1,3,4-thiadiazole
759-73-9	*N*-Nitroso-*N*-ethylurea
764-41-0	1,4-Dichloro-2-butene
765-34-4	Glycidaldehyde
794-93-4	Panfuran S
817-09-4	Trichlormethine (trimustine hydrochloride)
822-36-6	4-Methylimidazole
838-88-0	4,4′-Methylene bis(2-methylaniline)
842-07-9	C.I. Solvent Yellow 14
924-16-3	*N*-Nitrosodi-*n*-butylamine
924-42-5	*N*-Methylolacrylamide
930-55-2	*N*-Nitrosopyrrolidine
1024-57-3	Heptachlor epoxide
1116-54-7	*N*-Nitrosodiethanolamine
1120-71-4	1,3-Propane sultone
1271-28-9	Nickelocene
1303-00-0	Gallium arsenide
1307-96-6	Cobalt[II] oxide
1309-64-4	Antimony oxide (antimony trioxide)
1313-99-1	Nickel oxide
1314-20-1	Thorium dioxide
1314-62-1	Vanadium pentoxide (orthorhombic crystalline form)
1332-21-4	Asbestos
1333-86-4	Carbon black (airborne, unbound particles of respirable size)
1335-32-6	Lead subacetate
1464-53-5	Diepoxybutane
1596-84-5	Daminozide
1615-80-1	1,2-Diethylhydrazine
1694-09-3	Benzyl violet 4B
1746-01-6	2,3,7,8-Tetrachlorodibenzo-*p*-dioxin (TCDD)
1836-75-5	Nitrofen (technical grade)
1897-45-6	Chlorothalonil
1918-16-7	Propachlor
1929-82-4	Nitrapyrin
1937-37-7	Direct Black 38 (technical grade)
2092-56-0	D&C Red No. 8
2312-35-8	Propargite
2385-85-5	Mirex
2425-06-1	Captafol
2429-74-5	C.I. Direct Blue 15
2439-01-2	Oxythioquinox (Chinomethionat)
2475-45-8	Disperse Blue 1
2593-15-9	Terrazole
2602-46-2	Direct Blue 6 (technical grade)
2646-17-5	Oil Orange SS
2784-94-3	HC Blue 1
2973-10-6	Diisopropyl sulfate
3068-88-0	β-Butyrolactone
3296-90-0	2,2-Bis(bromomethyl)-1,3-propanediol
3333-67-3	Nickel carbonate
3468-63-1	D&C Orange No. 17
3546-10-9	Phenesterin
3564-09-8	Ponceau 3R

5589-96-8	Bromochloroacetic acid
6055-19-2	Cyclophosphamide (hydrated)
6109-97-3	3-Amino-9-ethylcarbazole hydrochloride
6164-98-3	Chlordimeform
6358-53-8	Citrus Red No. 2
6459-94-5	C.I. Acid Red 114
7280-37-7	Estropipate
7439-92-1	Lead (and lead compounds)
7440-02-0	Nickel (metallic)
7440-38-2	Arsenic (inorganic arsenic compounds)
7440-41-7	Beryllium (and beryllium compounds)
7440-43-9	Cadmium (and cadmium compounds)
7440-48-4	Cobalt metal powder
7446-27-7	Lead phosphate
7446-34-6	Selenium sulfide
7481-89-2	Zalcitabine
7496-02-8	6-Nitrochrysene
7758-01-2	Potassium bromate
8001-35-2	Toxaphene (polychlorinated camphenes)
8006-61-9	Unleaded gasoline (wholly vaporized)
8018-01-7	Mancozeb
9004-66-4	Iron dextran complex
9006-42-2	Metiram
10026-24-1	Cobalt sulfate heptahydrate
10034-93-2	Hydrazine sulfate
10048-13-2	Sterigmatocystin
10124-43-3	Cobalt sulfate
10418-03-8	Stanozolol
10453-86-8	Resmethrin
10540-29-1	Tamoxifen and its salts
10595-95-6	*N*-Nitrosomethylethylamine
12035-72-2	Nickel subsulfide
12054-48-7; 12125-56-3	Nickel hydroxide
12122-67-7	Zineb *(delisted 1999)*
12174-11-7	Palygorskite fibers (>5 μm in length)

12427-38-2	Maneb
12510-42-8; 66733-21-9	Erionite
13010-47-4	1-(2-Chloroethyl)-3-cyclohexylnitrosourea (CCNU) (Lomustine)
13194-48-4	Ethoprop
13256-22-9	*N*-Nitrososarcosine
13463-39-3	Nickel carbonyl
13552-44-8	4,4′-Methylenedianiline dihydrochloride
13909-09-6	1-(2-Chloroethyl)-3-(4-methylcyclohexyl)-1-nitrosourea (Methyl-CCNU)
14901-08-7	Cycasin
15541-45-4	Bromate
15663-27-1	Cisplatin
15972-60-8	Alachlor
16071-86-6	Direct Brown 95 (technical grade)
16543-55-8	*N*-Nitrosonornicotine
16568-02-8	Gyromitrin (Acetaldehyde methylformylhydrazone)
18662-53-8	Nitrilotriacetic acid, trisodiumsalt monohydrate
18883-66-4	Streptozotocin (streptozocin)
19044-88-3	Oryzalin
19666-30-9	Oxadiazon
20265-96-7	*p*-Chloroaniline hydrochloride
20325-40-0	3,3′-Dimethoxybenzidine dihydrochloride (*o*-Dianisidine dihydrochloride)
20830-81-3	Daunomycin
21739-91-3	Cytembena
22398-80-7	Indium phosphide
22506-53-2	3,9-Dinitrofluoranthene
23103-98-2	Pirimicarb
23246-96-0	Riddelliine
23950-58-5	Pronamide
25013-16-5	Butylated hydroxyanisole
25316-40-9	Doxo rubicin hydrochloride (Adriamycin)
25321-14-6	Dinitrotoluene mixture, 2,4-/2,6-
25812-30-0	Gemfibrozil
26148-68-5	A-α-C (2-Amino-9*H*-pyrido [2,3-*b*]indole)
26471-62-5	Toluene diisocyanate
28407-37-6	C.I. Direct Blue 218
28434-86-8	3,3′-Dichloro-4,4′-diaminodiphenyl ether
30516-87-1	Zidovudine (AZT)
32809-16-8	Procymidone
34256-82-1	Acetochlor
34465-46-8	Hexachlorodibenzodioxin
36734-19-7	Iprodione
39156-41-7	2,4-Diamino anisole sulfate
42397-64-8	1,6-Dinitropyrene
42397-65-9	1,8-Dinitropyrene
50471-44-8	Vinclozolin
51264-14-3	Amsacrine
51338-27-3	Diclofop-methyl
53973-98-1	Polygeenan
54749-90-5	Chlorozotocin
55738-54-0	*trans*-2-[(Dimethylamino)methyl-imino]-5-[2-(5-nitro-2-furyl)vinyl]-1,3,4-oxadiazole
57018-52-7	Propylene glycol mono-*t*-butyl ether
57835-92-4	4-Nitropyrene
59669-26-0	Thiodicarb
59865-13-3; 79217-60-0	Ciclosporin (Cyclosporin A; Cyclosporine)
60153-49-3	3-(*N*-Nitro somethylamino)-propionitrile
60391-92-6	*N*-Carboxymethyl-*N*-nitrosourea
60568-05-0	Furmecyclox
62450-06-0	Trp-*p*-1 (Tryptophan-*p*-1)
62450-07-1	Trp-*p*-2 (Tryptophan-*p*-2)
62476-59-9	Acifluorfen sodium
64091-91-4	4-(*N*-Nitrosomethylamino)-1-(3-pyridyl) 1-butanone
67730-10-3	Glu-*p*-2(2-Aminodipyrido[1,2-*a*:3′,2′-d] imidazole)
67730-11-4	Glu-*p*-1(2-Amino-6-methyldipyrido [1,2-*a*:3′,2′-*d*]imidazole)
68006-83-7	Me-A-α-C (2-Amino-3-methyl-9*H*-pyrido[2,3-*b*]indole)
68308-34-9	Shale-oils
72490-01-8	Fenoxycarb
76180-96-6	IQ (2-Amino-3-methylimidazo[4,5-*f*] quinoline)
77094-11-2	MeIQ (2-Amino-3,4-dimethyl-imidazo[4,5-*f*] quinoline)
77439-76-0	MX (3-chloro-4-(dichloromethyl)5-hydroxy-2(5*H*)-furanone)
77500-04-0	MeIQx (2-Amino-3,8-dimethyl-imidazo [4,5-*f*]quinoxaline)
77501-63-4	Lactofen
79748-81-5	Fusarin C
82410-32-0	Ganciclovir
105650-23-5	PhiP (2-Amino-1-methyl-6-phenylimidazol [4,5-*b*]pyridine)
105735-71-5	3,7-Dinitrofluoranthene
108171-26-2	Chlorinated paraffins (Average Chain length, C12; approximately 60% chlorine by weight)
110235-47-7	Mepanipyrim
111406-87-2	Zileuton
113852-37-2	Cidofovir
116355-83-0	Fumonisin B1
140923-17-7 /140923-25-7	Iprovalicarb
141112-29-0	Isoxaflutole
148477-71-8	Spirodiclofen
177406-68-7	Benthiavalicarb-isopropyl
No CAS	Silica, crystalline (airborne particles of respirable size)
No CAS	Soots, tars, and mineral oils(untreated and mildly treated oils and used engine oils)
No CAS	Strong inorganic acid mists containing sulfuric acid
No CAS	Phenylhydrazine and its salts
No CAS	Toxins derived from *Fusarium Moniliforme (Fusarium verticillioides)*
No CAS	Nickel refinery dust from the pyrometallurgical process

No CAS	Oral contraceptives, combined
No CAS	Diesel exhaust particulates
No CAS	Wood dust
No CAS	Ceramic fibers (airborne particles of respirable size)
No CAS	Oral contraceptives, sequential
No CAS	Residual (heavy) fuel oils
No CAS	Radionuclides
No CAS	Certain combined chemotherapy for lymphomas
No CAS	Talc containing asbestiform fibers
No CAS	Aflatoxins
No CAS	Diaminotoluene (mixed)
No CAS	Alcoholic beverages, when associated with alcohol abuse
No CAS	Bracken fern
No CAS	Bitumens, extracts of steam-refined, and air efined
No CAS	Bis(2-chloro-1-methylethyl)ether, technical grade
No CAS	Tobacco smoke
No CAS	2,4-Hexadienal (89% *trans, trans* isomer; 11% *cis*, *trans* isomer)
No CAS	Tobacco, oral use of smokeless products
No CAS	Betel quid without tobacco
No CAS	5-Chloro-*o*-toluidine and its strong acid salts
No CAS	Herbal remedies containing plant species of the *genus Aristolochia*
No CAS	Hexachlorocyclohexane (other isomers)
No CAS	Creosotes
No CAS	Polychlorinated dibenzo furans
No CAS	Betel quid with tobacco
No CAS	Methylmercury compounds
No CAS	Conjugated estrogens
No CAS	Chromium (hexavalent compounds)
No CAS	Glasswool fibers (airborne particles of respirable size)
No CAS	Gasoline engine exhaust (condensates/extracts)
No CAS	Coke oven emissions
No CAS	Quinoline and its strong acid salts
No CAS	Areca nut
No CAS	Carbon-black extracts
No CAS	Benzidine-based dyes
No CAS	3,3′-Dimethoxybenzidine-based dyes metabolized to 3,3′-dimethylbenzidine
No CAS	3,3′-Dimethoxybenzidine-based dyes metabolized to 3,3′-dimethoxybenzidine
Various CAS	Nickel compounds
Various CAS	*p*-Chloro-*o*-toluidine, strong acid salts of
Various CAS	Analgesic mixtures containing phenacetin
Various CAS	Polybrominated biphenyls (PBBs)
Various CAS	Polychlorinated dibenzo-*p*-dioxins
Various CAS	Polychlorinated biphenyls (containing 60 or more percent Cl by molecular weight)
Various CAS	Polychlorinated biphenyls
Various CAS	Estrogens, steroidal

Appendix 3: Glossary

A

Absorbent material: Commercially packaged clay, kitty litter, or other material used to soak up liquid hazardous materials.

Absorption: Penetration of a substance across a biologic barrier (such as the skin) and into either the lymphatic system or bloodstream.

Acaricide: A chemical substance used to kill ticks and mites.

Accident: An unplanned energy transfer causing property damage and/or human injury. See also "incident."

Accumulative effect: The effect of a chemical substance on a biologic system when the substance is being absorbed at a rate that exceeds the body's ability to eliminate it from the system. Excessive accumulation of the substance in the system can lead to toxicity.

Acid: Any compound containing hydrogen replaceable by metals, and having a pH of 0–6. Strong acids in the pH range of 0–2 are corrosive and will cause chemical burns to the skin, eyes, and mucous membranes. Acids turn litmus red. See also "pH" and "strong acids."

Acid gas: A gas that forms an acid when dissolved in water.

Acidosis: A pathologic condition resulting from accumulation of acid in, or loss of base from, the body.

Acrid: Having a biting taste; sharp; pungent.

Active ingredient: The component that actually performs the primary function of a product. Products generally contain both active and inert ingredients, and both may be harmful. For example, insecticides in spray cans contain both chemicals having pesticidal action (active) and propellant gas (inert). Active ingredients are listed on product labels as percentage by weight or as pounds per gallon of concentrate.

Acute: The clinical term for a disease having a short and relatively severe course, measured in seconds, minutes, hours, or days, following expo sure to a health hazard. Also, in animal testing, pertains to administration of an agent in a single dose.

Acute effect: Refers to an adverse health effect that usually occurs rapidly, sometimes immediately, as a result of a single, short significant exposure to a health hazard, without implying a degree of severity. Acute effects may include irritation, corrosivity, narcosis, and death. See also "chronic."

Acute exposure: Refers to a single exposure to a toxic substance that results in death or severe biological harm. Acute exposures are characterized as lasting no longer than 1 day.

Acidosis: A pathologic condition resulting from accumulation of acid in, or loss of base from, the body.

Adrenal gland: A hormone-secreting organ located above each kidney.

AEGL: Acronym for Acute Emergency guideline Levels. Acute Emergency Guideline Levels (AEGLs) represent threshold airborne exposure limits for the general public and are applicable to emergency exposures ranging from 10 minutes to 8 hours. Three levels—AEGL-1, AEGL-2, AEGL-3—are developed for each of five exposure periods (10 minutes, 30 minutes, 1 hour, 4 hours, and 8 hours) and are distinguished by varying degrees of severity of toxic effects. The U.S. Department of Energy guidance is to use the 1 hour AEGL values, which appear in this database [138]. AEGL values are developed and published by the United States Environmental Protection Agency[88]. See also "How to Use this Book" in the front matter of this book.

Aerosol: A dispersed suspension of fine particles suspended in air (dispersed in a gas), the particle size often being in the 0.01–100 μm range. Natural aerosols include smoke (solid particles) and fog (liquid particles). Man-made aerosols are manufactured by filling a valved container, usually a can, with a suspension (e.g., paint, insecticides, cosmetics) in a gas under pressure.

Aliphatic: Pertaining to an open-chain hydrocarbon compound. Substances such as methane and ethane are typical aliphatic hydrocarbons.

Alkali: Any ACID destroying compound having a pH of 8–14. Strong alkalis (or bases) in the pH range of 12–14 are considered corrosive and will cause chemical burns to the skin, eyes, and mucous membranes. Alkalis turn litmus blue. Widely used industrial alkali substances include sodium hydroxide, sodium carbonate, potassium hydroxide and potassium carbonate. Common household products include DRANO and lye. See also "acid," "base," and "pH."

Alkaloid: An organic nitrogen base, of vegetable origin, usually toxic.

Allergen: A substance that causes the body to produce an antibody and which results in an allergy in hypersensitive people.

Allergy: A hypersensitive reaction of body tissues to specific substances. In similar concentrations and circumstances, these same substances do not affect other persons. Allergic reactions in the workplace tend to affect the skin (see dermatitis) and lungs (see asthma).

Ambient air concentration: The concentration of a material in environmental air outside of buildings, that is, air to which the general public is exposed.

Amine: An organic compound that may be derived from ammonia (NH_3) by the replacement of one or more hydrogen atoms (H) by hydrocarbon groups or other chemical moieties; replacing one, two, or three hydrogen atoms gives primary, secondary, or tertiary amines, respectively; if a fourth group is added to a tertiary amine (R_3N), the compound formed is called a quaternary amine (R_4N+) and the nitrogen carries a positive charge.

Anaerobic conditions: Refers to the absence of oxygen.

Amnesia: Total or partial memory loss.

Analgesia: A pain-relieving agent that causes insensibility to pain without loss of consciousness.

Analogue: A compound that resembles another in structure; may be an isomer, but not necessarily.

Analytical grade: The highest available purity of a chemical.

Anemia: A deficiency of the blood caused by reduced red blood cell count or a reduction in the amount of hemoglobin per unit volume of blood.

Anesthesia: Total or partial loss of sensation with or without loss of consciousness.

Angina pectoris: Pain in chest cause by inadequate supply of blood to the heart.

Anhydrous: Containing no water.

Anorexia: Loss or reduction of appetite for food.

Anosmia: Total or partial loss of the sense of smell.

Anoxia: A reduction in the quantity of oxygen sup plied by blood to cells or tissues.

Anticonvulsant: A substance that lessens the severity of convulsions.

Antidote: A remedy to relieve, prevent or counteract the effects of a poison; that which counteracts anything noxious.

Antiepileptic: A substance that lessens the severity of epileptic seizures.

Anuria: Absence of urine in the bladder caused by the failure of the kidneys to produce urine. This is a possible symptom of chlorate or inorganic mercury poisoning.

Apathy: Reduced emotions with lack of interest in outside stimuli.

Apnea: Temporary cessation of breathing. A possible symptom of poisoning.

Aquatic toxicology: A branch of toxicology that deals with water pollution and its ecological effects.

Aqueous: Watery or water like.

Aromatic compound: Pertaining to a molecular ring structure hydrocarbon compound, characterized by the presence of the benzene nucleus.

Aromatic hydrocarbon: An organic chemical compound formed primarily from carbon (C) and hydrogen (H) atoms with a structure based on benzene rings *and* resembling benzene in chemical behavior; substituents on the rings(s) may contain atoms other than C or H.

Arrhythmia: Disturbed heartbeat.

Arsenical: A compound containing arsenic.

Arylamine: An organic compound formed from an aromatic hydrocarbon that has at least one amine group joined to it.

Ataxia: Unsteady walk or shaky movements due to neurological problems. May be a symptom of poisoning.

Asphyxia: Difficulty in breathing or respiratory arrest; suffocation.

Asphyxiant: Refers to a substance, usually a vapor or gas, that can cause suffocation, unconsciousness or death by preventing the blood from carrying oxygen. Most simple asphyxiants (which have no inherent toxicity) are harmful to the body only when they become so concentrated that oxygen in the air is reduced (normally about 21%) to dangerous levels (18% or lower).

Asthenia: Reduced physical and psychological strength.

Asthma: Respiratory problem characterized by attacks of wheezing, shortness of breath, and/or coughing and resulting in difficult breathing due to contraction of air passages.

Ataxia: Loss or failure of muscular coordination, voluntary movement, or muscle control.

Atrophy: A loss of weight, volume, and activity of an organ, tissue, or cell; shrinkage.

Autoignition temperature: The minimum temperature at which a substance will ignite spontaneously, or cause self-sustained combustion in the absence of any heated element, spark, or flame. The closer the autoignition temperature is to room temperature, the greater the risk of fire.

Awareness level (trained): First responders at the awareness level are those persons who, in the course of their normal duties, may be the first on the scene of emergency involving hazardous materials. First responders at the awareness level are expected to recognize hazardous materials presence, protect themselves, call for trained personnel, and secure the area (ANSI/NFPA 472).

Azide: A compound that contains the monovalent $-N_3$ group.

Azo: A prefix denoting the presence in a molecule of the group $-N=N-$. See also diazo.

B

Bactericidal: Destructive to bacteria. An agent (e.g., heat, light, or osmotic pressure) or a chemical, such as a pesticide, that kills bacteria or inhibits their growth is called a bactericide.

Barbiturate: A drug used as a sedative or hypnotic.

Base: A substance that reacts with acids to form salts and water. All bases create solutions having a pH of more than 7.0, the neutral point, and may be corrosive to skin and other human tissue. The terms alkali and caustic are closely related in meaning. See also “acid,” “alkali,” and “pH.”

BEI: Biological Exposure Index. The maximum recommended value of a substance in blood, urine, or exhaled air, recommended by the ACGIH. See “Threshold Limit Values and Biological Exposure Indices,” published by the ACGIH, for an explanation.

Benign: Not harmful.

Bile: A yellow-green, bitter fluid secreted by the liver. Also called gall.

Bioaccumulation: The process by which a material in an organism’s environment progressively concentrates within the organism.

Bioassay: The determination of the potency or concentration of a compound by its effect upon animals, isolated tissues, or microorganisms, as compared with a chemical or physical assay.

Biodegradation: Biotransformation; the conversion within an organism of molecules from one form to another, a change often associated with change in pharmacologic activity.

Bld: Blood effects. A toxicology term describing the effect on all blood elements including oxygen carrying or releasing capacity, pH, protein, and electrolytes.

Blepharospasm: Abnormal contraction of eyelid muscles.

BOD: Bio logical oxygen demand. A test that measures the dissolved oxygen consumed by microbial life while assimilating and oxidizing the organic matter present in organic waste discharges. This test permits calculation of the effect of the discharges on the oxygen resources of the receiving water.

Boiling point: The temperature at which a product changes from a liquid to a vapor at normal atmospheric pressure (760 mmHg). Mixtures may not have a specific boiling point. As a general rule, material safety data sheets (MSDS) carry the initial boiling point or a boiling range for a mixture.

Bowel: The intestine, or the part of the digestive tract extending from the stomach to the anus.

Bradycardia: A decrease in the heartbeat rate to less than 60 beats per minute.

Breakthrough time: The time from initial chemical contact to detection.

Breathing zone sample: An air sample collected from the area around the nose of a worker to assess exposure to airborne contaminants.

Bronchoconstriction: Contraction with narrowing of bronchia.

Bronchospasm: Spasmodic contraction of the muscles surrounding the bronchia.

Bulk density: Mass of powdered or granulated solid material per unit of volume.

By-product: Any material, other than the principal pro duct, generated as a consequence of an industrial process.

C

C Symbol for Celsius or Centigrade, a unit of temperature in which the interval between the freezing point of water and the boiling point is divided into 100 units, or degrees, with 0°C representing the freezing point and 100°C the boiling point.

Cancer: A general term used to indicate any of various types of malignant neoplasms.

Canister: A personal air cleaning device usually worn by the user. The canister contains sorbents, catalysts, or other filter materials designed to remove gases, vapors, and liquid and so lid particles from air drawn through it.

Carcinogen: Any substance causing the promotion or initiation of malignant or benign neoplasia (cancer) in humans or animals. A material is considered carcinogenic if, (1) it has found to be a carcinogen or potential carcinogen by the International Agency for Research on Cancer (IARC); or, (2) if it is listed in the latest edition of the "Annual Report on Carcinogens," published by the National Toxicology Program (NTP); or, (3) it is regulated by OSHA as a carcinogen.

Carcinogenesis: The process by which normal tissue becomes cancerous.

Carcinogenicity: The power, ability, or tendency to produce cancerous tissue from normal tissue.

Carcinoma: A malignant neoplasm of the epithelium.

Carcinoma in situ: Noninvasive cancer.

Carcinoma: A malignant tumor; a type of cancer.

Cardio: A medical prefix that refers to the heart.

Cardiovascular: A medical term that refers to the heart and blood vessel system.

Catalyst: A substance that affects the rate of a chemical reaction, but that is neither changed nor consumed by the reaction.

Cataract: A disease of the eye in which the lens becomes gray-white and loses its clearness.

Cathartic: Substance that aids bowel movement and stimulates evacuation of the intestine.

Cation: An ion that carries a positive charge, e.g., sodium ($N+$), (calcium Ca_2+), and ammonium (NH_4+); the corresponding hydroxide is formed when combined with hydroxyl ($OH-$) ions.

Caustic: Any strongly alkaline substance that has a corrosive effect on living tissue. See also "alkali."

Ceiling limit: The concentration of a substance that should not be exceeded, even for an instant. Also called ceiling concentration.

Central nervous system (CNS): Refers to the brain and spinal cord, the main network of coordination and control for the entire body. Chemicals acting on the brain may cause CNS depression with symptoms of dizziness, headache, and drowsiness; higher exposure may cause unconsciousness, coma, and death.

Characteristic hazardous waste: An RCRA regulated waste classified as "hazardous" because of its ignitability, corrosivity, reactivity, or toxicity as determined by the Toxicity Characteristic Leachate Procedure (TCLP). It has an EPA Waste Code ranging from "D001" to "D043."

Chelation: A complex formation involving a metal ion and two or more polar groupings of a single molecule; chelation can be used to remove an ion from participation in biological reactions, as in the chelation of Ca^2+ in blood by EDTA.

Chemical: Any element, chemical compound, or mixture of elements and/or compounds.

Chemical burn: Similar to a thermal burn from heat or fire, but caused by contact with a chemical substance.

Chemical family: A group of single elements or groups of compounds having a common chemical structure and name. Also known as chemical class. As used on a Material Safety Data Sheet (MSDS), more than one chemical family may be used if applicable.

Chemical formula: The chemical makeup of a substance using accepted written symbols. Although several kinds of formulas are used to indicate chemical constitution and physical structure, the *molecular formula* showing the actual kinds and numbers of atoms that comprise a molecule of chemical substance is most commonly used in Material Safety Data Sheet (MSDS).

Chemical hygiene plan: A written action plan required by OSHA's regulation 29CFR1910, Occupational Exposures to Hazardous Chemicals in Laboratories.

Chemical intermediate A chemical formed or used during the process of producing another chemical.

Chemically active metals: Usually refers (but not restricted) to chemicals such as sodium, potassium, beryllium, calcium, powdered aluminum, zinc, and magnesium. These metals can cause violent reactions with certain other substances and materials.

Chemical name: The scientific designation of a chemical as outlined by the Chemical Abstract Service (CAS) rules of nomenclature and the nomenclature system developed by the International Union of Pure and Applied Chemistry. Also defined by the OSHA Hazard Communication Standard (HCS) as a name which will clearly identify the chemical for the purpose of conducting a hazard evaluation. By this definition, more than one valid name for many chemicals is permitted. However, when chemicals with more than one valid name appears on the OSHA (29CFR1910 Table Z-1) or CERCLA (40 CFR302.4) lists, this name is generally used as the chemical name on material safety data sheets (MSDS). If a chemical does not appear on these lists, then the most common chemical name should be used. Trade names that adequately identify a chemical may be used.

Chemical manufacturer: Defined in the OSHA Hazard Communication Standard (HCS) as an employer with a workplace where chemical(s) are produced for use or distribution.

Chemical reaction: Any chemical change, regardless of rate, or whether it occurs naturally or induced by man. There are many types of chemical reactions including decomposition, explosion, combustion, condensation, polymerization, neutralization.

Chemical resistance: The ability of a material to resist chemical reaction.

Chemosterilant: A chemical compound that causes an organism to become sterile after exposure to it.

Chlorofluorocarbons (CFCs): A group of chemicals that depletes the earth's protective ozone layer. Chemical substance often used as refrigerants, solvents, and propellants as propellants in spray cans. CFCs are not destroyed in the lower atmosphere; they drift into the upper atmosphere where their chlorine components are released and destroy the ozone layer.

Chloracne: A severe acne-like affliction of the skin resulting from excessive exposure to certain chlorinated or halogenated chemical compounds, such as carbon tetrachloride, chloroform, trichloroethylene, biphenyls, dioxins, napthalenes, and DDT.

Chronic: Refers to a change to an organism over a long period of time, measured in weeks, months, or years following repeated exposure to a health hazard.

Chronic effect of overexposure: Refers to an adverse health effect that develops slowly over a long period of time or from prolonged exposure to a health hazard without implying a degree of severity.

Chronic toxicity: Refers to permanent and irreversible health effects resulting from prolonged exposure to a toxic substance.

Circulatory system: The system consisting of the blood, blood vessels, lymph vessels, and heart; involved in circulating blood and lymph throughout the body.

Cirrhosis: Chronic progressive illness affecting the structure and function of the liver. Replacement of normal liver tissue with bands of fibrous tissue surrounding nodules of regenerating liver tissue.

Closed cup: Test for the flash point of a substance.

Coagulant: An agent that causes, stimulates, or accelerates coagulation, especially with reference to blood.

Cocarcinogen: Any substance, not itself carcinogenic, capable of enhancing the carcinogenic effect of another substance.

Code of Federal Regulations (CFR): A publication of the regulations promulgated under United States federal law. Changes to CFR are published in the "Federal Register" (FR). The CFR is divided into titles as follows:

Title 29: OSHA regulations, including the Hazard Communication Standard (HCS).

Title 40: EPA regulations, including TSCA.

Title 49: DOT regulations.

Colic: A sharp, crampy, and possibly painful disorder of the abdomen resulting from blockage, twisting, or muscle spasm.

Collapsus: Rapid decrease in strength or collapse of an organ.

Coma: A state of deep unconsciousness from which a victim cannot be wakened by external stimulants.

Combustible liquid: A material having a flash point at or above 37.8°C/100°F, but below 93.3°C/200°F, except that this term does not include any liquid mixture that has one or more components with a flash point above 93.3°C/200°F, which make up 99% or more of the total volume of the mixture as determined by tests listed in 49C FR173.115(d). Exceptions to this are found in 49C FR173.115(b).

Commercial grade: Less than the purest available form of a chemical; the purity normally produced for and adequate for commercial uses.

Common name: Any designation or identification such as a code name, code number, trade name, or generic name used to identify a chemical other than by its chemical name (OSHA).

Component: An ingredient or constituent part.

Compound: A substance consisting of two or more elements that have united chemically.

Compressed gas: Any material or mixture having in the container a pressure exceeding 40 psi at 70°F/21.1°C, or a pressure exceeding 104 psi at 130°F/54.4°C, regardless of the pressure at 70°F/21.1°C; or any liquid flammable material having a vapor pressure exceeding 40 psi absolute pressure at 100°F/37.8°C as determined by the American National Standard Method of Tests for Vapor Pressure of Petroleum Products (Reid Method) Z11.44-1973 (ASTM—American Society for Testing Materials D 323-72).

Congenital: A condition that begins to develop in the uterus and is existing at birth.

Congestion: Abnormal accumulation of blood in the vessels of tissue, an organ or other part of the body.

Conjugated: Bound together; in organic chemistry, conjugated refers to a molecular structure or substructure containing alternating double and single bonds between pairs of adjacent atoms.

Conjunctivitis: Irritation and inflammation of the conjunctiva, a part of the inner lining of the eyelids.

Container: Defined by OSHA as any bag, barrel, bottle, box, can, cylinder, drum, reaction vessel, storage tank, or the like that contains a hazardous chemical. Pipes and piping systems and engines, fuel tanks or other operating systems in a vehicle, are not considered containers (29CFR).

Contaminant: An impurity; in the environment, a chemical that is not ordinarily present and that may have deleterious effects.

Contraindication: Any condition that renders some particular treatment of disease improper or undesirable.

Convulsions: Violent, involuntary spasms or muscle contractions.

Copolymer: A chemical (polymer) made up of repetitive subunits (monomers) that are not all alike.

Corrosive material: Any liquid or solid with pH ranges of 2–6 or 12–14, and that cause visible destruction or irreversible alteration of living tissue, or a liquid that has a severe corrosion rate on steel. To determine whether a material is destructive or to cause irreversible alteration of human skin, refer to the method described in Appendix A of 49CFR173. A liquid is considered to have a severe corrosion rate if its corrosion rate exceeds

0.250 in. per year (IPY) on steel [Society of Automotive Engineers (SAE) 1020] at a test temperature of 130°F/54.4°C. Also see test described in NACE Standard TM-01-69.

Cryogenic liquid: Defined by DOT as a refrigerated liquefied gas having a boiling point colder than-130°F/-90°C at one atmosphere, absolute.

Cutaneous: Pertaining to the skin. See also "dermal."

Cyanosis: A bluish discoloration of the skin, lips, and mucous membrane, resulting from lack of oxygen in the blood hemoglobin, or excessive concentration of reduced hemoglobin in the blood.

Cytotoxic: Having a poisonous effect on cells.

D

Decomposition: Breakdown of a material or substance into parts, elements or simpler compounds that may be caused by heat, chemical reaction, electrolysis, decay, biodegradation, or other process.

Decontamination: The removal of hazardous substances from employees and their equipment to the extent necessary to preclude the occurrence of foreseeable adverse health effects.

Degradation: The destructive effect a chemical may have on chemical-protective clothing, reducing its strength and flexibility and permitting a direct route to skin contact.

Defoliant: A chemical spray or dust that causes leaves to drop off plants prematurely.

Dermal penetration: The act of entering the body by penetrating the layers of the skin.

Dermatitis: An inflammation of the skin.

Delayed hazard: The potential to cause an adverse effect which may not appear until after a long period of time. Carcinogenicity, teratogenicity and certain target organ/system effects are examples of delayed hazards.

Deliquescent: Substance which absorbs moisture from the air to the point of becoming liquid.

Delirium: A mental state of great excitement or confusion marked by confusion, speech disorders, anxiety, and often hallucinations.

Density: The mass (weight) per unit volume of a substance. For example, lead has much greater density than aluminum.

Dermal: Pertaining to the skin. See also "cutaneous."

Dermatitis: Inflammation of the skin from any cause.

Dermatosis: Generic name for all skin disorders.

Desquamation: Abnormal elimination of surficial layers of skin in small flakes.

Diabetes: A disease in which the body's ability to use sugar is impaired and which usually involves the abnormal appearance of sugar in the urine; characterized by excessive urination.

Diamine: An organic compound containing two amine groups, e.g., ethylenediamine, $H_2NCH_2CH_2NH_2$.

Diarrhea: Abnormally frequent discharge of loose, watery feces from the large intestine (colon). May be a symptom of poisoning.

Diazo: A prefix denoting a compound containing the $-N'N-$ or $-N.N+$ group. See also "azo-."

Dimer: A compound or unit produced by the combination of two like molecules.

Diuretic: That which increases volume of urine.

DL Used separately, prefixes of D—for dextrorotary (rotated to the right) and L—for levorotary (rotated to the left) before the same chemical name refer to designations for optically active isomers that are chemically identical but that rotate plane polarized light in opposite directions; the isomers are mirror images of each other; when used together, DL—designates a racemic mixture of the two isomers, whose optical activities cancel each other.

Dose: The amount of a chemical substance or drug to which a person has been exposed or absorbed into the body.

Dysplasia: Malformation; abnormal development.

Dyspnea: Difficulty or labored breathing. Shortness of breath. A possible symptom of poisoning.

Dysuria: Painful or difficulty in urinating.

E

Easily oxidized materials: A broad range of materials that includes combustible materials, organic materials, paper, wood, sulfur, aluminum, acetic acid, alcohols, fuels, oils, plastics, hydrazine, acetic anhydride, sulfuric acid, and many other chemicals. Easily oxidized materials can cause violent reactions with other substances and materials. See also "oxidizer," "strong oxidizers."

Eczema: Not a distinct disease but a general medical description for swelling of the skin, or rash of unknown cause. An inflammation of the outer layer of skin, characterized by redness, itching, crusting, and scaling.

Edema: Swelling caused by infiltration of fluid into the tissues or intercellular spaces.

Effluent: Wastewater discharged from a treatment plant, sewer, or industrial outfall into the environment, usually to surface waters.

Effluent guidelines (listed as a toxic pollutant): Under the Clean Water Act, pollutants that are subject to technology-based standards (application of best available techno logy) developed for selected groups of industries.

Electrolyte: A substance, such as sodium chloride (NaCl), that dissociates into ions when fused (melted) or in solution, thereby becoming capable of conducting an electric current.

EIS: Environmental Impact Statement. The results of a study to determine the probable effects of a proposed activity on the surrounding environment.

Element: The simplest form of a pure substance that cannot be broken down into simpler substances by chemical means.

Embryotoxic: Toxic effect on the embryo.

Emphysema: A condition of the lungs characterized by dilation or destruction of the pulmonary areola. An illness characterized by plugged passageways and a difficulty in exhaling.

Employer: Defined by OSHA as a person (including contractor or subcontractor) engaged in business, where chemicals are either used, distributed, or produced for use or distribution.

Encephalopathy: Generic name given to illnesses affecting the brain in general.

Environment: Includes water, air, and land and their interrelationship which exists among and between water, air, and land and all living things[88].

EP: Extraction Procedure toxicity characteristics. Toxicity test performed on RCRA wastes.

Environmental fate: The distribution and transformation of a chemical from its first release until its ultimate removal from or recycling through the environment.

Enzyme: A protein produced in organisms capable of accelerating a particular biochemical reaction; a biological catalyst.

Epidemiology: Science concerned with the study of disease in a general population. Determination of the incidence (rate of occurrence) and distribution of a particular disease (as by age, sex, or occupation), which may provide information about the cause of the disease.

Ergonomics: The activity dealing with interactions between workers and their total working environment and their stresses relating to the elements of the environment, their tools and equipment.

ERPG: Acronym for Emergency Response Planning Guidelines. Exposure limit values produced by the American Industrial Hygiene Association (AIHA). See also “Using this Book” in the front matter of this book.

Erythema: Abnormal flushing or redness of the skin due to increase in blood flow.

Etiologic agents: Airborne microorganisms capable of causing disease. These agents are the only nonchemical materials regulated by the United States Department of Transportation (DOT).

Etiology: The science and study of all the factors that contribute to the development of a disease.

Euphoria: Intense feeling of well-being or elation.

Evaporation rate: A measure of the time required for a given amount of a substance to evaporate, compared with the time required for an equal amount of butyl acetate or ether to evaporate.

Exothermic: Heat producing.

Expectoration: Expulsion from the mouth of secretions from the respiratory tract.

Explosive: Any chemical compound, mixture, or device that produces a sudden, almost instantaneous release of pressure, gas, and heat when subjected to sudden shock, ignition source, pressure, or high temperature.

Explosive limits: Defined by the NFPA as the boundary-line mixture of vapor or gas with air, which, if ignited will just propagate the flame. They are known as the “lower and upper explosive limits,” and are usually expressed in terms of percentage by volume of gas or vapor in air. Same as flammable limits. See also “LEL” and “UEL.”

Exposure: People, property or the environment that are subjected to the harmful effects of a hazardous material. Defined by OSHA as meaning an employee subjected to a hazardous chemical in the course of employment through a ROUTE OF ENTRY (e.g., ingestion, inhalation, skin contact or absorption) and includes potential (e.g., accidental or possible) exposure.

Exposure limits: Concentrations of substances and conditions under which it is believed that nearly all workers may be repeatedly exposed, day after day, without adverse effects. Standard limits are established by ACGIH and OSHA.

F

F: Degree Fahrenheit, a unit for measuring temperature. On the Fahrenheit scale, water boils at 100°C or greater.

Federal Register (FR): A daily publication of all United States government documents required by law. It is the daily supplement to the Code of Federal Regulations (CFR).

Fibrillation: Rapid and chaotic contractions of many individual muscle fibers of the heart in the area of the ventricles, capable of causing cardiac arrest.

Fibrosis: Chronic lung affliction or scarring of the lung caused by an unusual increase of fibrous tissue, causing progressive respiratory problems, and often occurring after exposure to certain chemical substances.

Fire diamond: A visual hazard rating system of the National Fire Protection Association (NFPA). Provides general information about inherent hazards of materials: Health, Flammability, Reactivity, and Special.

Flammable: Catches on fire and burns rapidly. The National Fire Protection Association and the United States Department of Transportation define a flammable liquid as having a flash point below 100°F/37.8°C.

Flammable aerosol: An aerosol that, when tested by the method described in 16CFR1500.45, yields a flame projection exceeding 18 in. at full valve opening, or a flashback (a flame extending back to the valve) at any degree of valve opening (29CFR).

Flammable limits: Range of gas or vapor concentrations (percent by volume) in air which will burn or explode if an ignition source is present. See also “LEL” and “UEL.”

Flash back: A phenomenon characterized by vapor ignition and flame traveling back to the source of the vapor.

Flash point: The minimum temperature at which a substance gives off flammable vapors that in contact with spark or flame will easily ignite and burn rapidly. The flash point is established by one of the two following methods: in a closed cup (see also “Pensky−Martens”), or inside its container; or in an open cup, or near the surface of the liquid. The lower the flash point of a liquid, the higher the risk of fire.

Flatulence: Accumulation of gas in the digestive tract.

Fluorosis: Characteristic chronic intoxication caused by fluorine and its derivatives.

Foreseeable emergency: Any potential occurrence such as, but not limited to, equipment failure, rupture of containers, or failure of control equipment, that could result in an uncontrolled release of a hazardous chemical into the workplace (OSHA).

Form R: Forms that must be completed annually for the EPA by reporting industrial facilities for chemicals used above the threshold amount.

Fume: A suspension of very fine solid particles in air, or vapors from a volatile liquid.

Fumigant: A pesticide in vapor or gaseous form used to kill pests or disinfect materials.

Fungicide: A pesticide used to control, prevent, or kill fungi.

Fungus: A lower plant that feeds on other organic matter and lacks the chlorophyll and tissue differentiation of higher plants.

G

Gas: An air-like, formless fluid having the property of uniformly distributing itself throughout a space in air. A state of matter.

Gastric lavage: Washing out the stomach.

Gastrointestinal (GI): Refers to the organs of stomach, intestines and/or other organs from mouth to anus.

Gene: Heredity-carrying material that is part of the chromosome.

Genotoxic: Causing genetic damage.

Gestation: The development of the fetus in the uterus from conception to birth; during pregnancy.

GHS: (Globally Harmonized System) a system for classification, labeling and packaging of chemicals. Adopted by UN in 2001 with a the goal to get all countries, worldwide, to implement the GHS system to insure uniform methods for evaluation and communication of chemical hazards.

Glycosuria: Abnormal presence of glucose in the urine.

Granulomatosis: Pulmonary lesion characterized by the formation of small nodules.

Granulometry: Indicates the size of powder, and usually expressed in microns (1 μm is 0.000001 m, or about 1000 times smaller than a grain of sand). Particles of less than 10 μm are capable of deep penetration and becoming deposited in the respiratory tract. Larger particles can deposit in the upper respiratory area such as the bronchia, and although they may be expulsed, they can be dissolved by the organism. Particle size makes it possible to deduce the method to be adopted for corrective action (e.g., ventilation, respirator).

H

Halogens: Refers to inorganic compounds containing astatine, bromine, chlorine, fluorine, and iodine.

Hazardous classes: A collection of terms established the United Nations Committee of Experts to categorize hazardous materials. The specific categories are: flammable liquids, explosives, gases, oxidizers, radioactive materials, corrosives, flammable solids, poisonous and infectious substances, and dangerous substances.

Hazardous constituent of waste: A list of chemicals which is referenced under certain Conservation and Recovery Act (RCRA) provisions to determine if a solid waste is a hazardous waste.

Hazardous materials: Refers generally to hazardous substances, petroleum, natural gas, synthetic gas, acutely toxic chemicals, and other toxic chemicals. Substances or materials which have been determined to be capable of posing an unreasonable risk to health, safety, and property.

Hazardous waste: Defined by RCRA as any solid or combination of solid wastes, which because of its physical, chemical or infectious properties, may pose a health hazard when improperly managed. It must possess at least one of four characteristics—ignitability, corrosivity, reactivity, or toxicity—or appears on special EPA lists.

Hazardous waste code: The number assigned to every hazardous waste listed under the Resource Conservation and Recovery Act (RCRA); the code is used for notification, record keeping, and reporting requirements.

Hazard warning: The OSHA definition means any words, pictures, symbols, or combination thereof appearing on a label or other appropriate form of warning that conveys the hazards of the chemical(s) in the container(s).

Health hazard: Evidence based on scientific data (human or animal) that acute or chronic effects may occur. (29CGR1910.1200).

Hematoma: Localized bleeding into tissue.

Hematuria: Presence of blood in the urine.

Heme: The prosthetic, oxygen-carrying, color-furnishing constituent of hemoglobin.

Hemoglobin: The red, respiratory protein of erythrocytes; transports oxygen from the lungs to the tissues.

Hemolysis: Destruction of red blood cells, releasing hemoglobin.

Hematopoietic system: System responsible for formation of blood cells (includes bone marrow and lymphatic organs).

Hemorrhage: Loss of a significant amount blood. Can be external or internal bleeding.

Hepatic: Referring to the liver.

Hepatitis: An inflammation of the liver.

Hepatoma: Tumor of the liver.

Hepatomegalia: Increase in liver volume.

Hepatotoxic: Refers to a substance that is toxic to the liver.

Hormone: Any of various chemical substances that are produced by the endocrine glands and that have specific regulatory effects on the activity of certain organs.

Hydrolysis: A chemical process whereby a compound is cleaved into two or more simpler compounds with the uptake of the H and OH parts of a water molecule on either side of the chemical bond cleaved.

Hydrolyze: To subject to hydrolysis.

Hydroxyl: The atom group or radical, OH.

Hypnotic: Sleep-inducing. Also, a drug that induces sleep.

Hot zone: The area immediately surrounding the incident site. Appropriate protective clothing and equipment must be worn by all personnel in the Hot Zone. AWARENESS LEVEL and OPERATIONAL LEVEL trained personel are not permitted in the Hot Zone.

Hydrate: Chemical substance combined with water in a specific proportion.

Hydrocarbons: Chemical compounds that consist entirely of carbon and hydrogen.

Hydrochlorofluorocarbons (HCFCs): A group of chemicals having a weaker negative impact on the ozone layer and developed as temporary substitutes for ozone-depleting chemicals, such as CFCs.

Hydrolysis: Chemical change to a substance in an aqueous environment leading to the formation of new products.

Hygroscopic: Substances with a tendency to absorb moisture from the air.

Hyperkeratosis: Increased thickness of the cornified layer of the epidermis such as a corn.

Hyperpigmentation: Excessive pigmentation of the skin.

Hyperplasia: Abnormal growth of normal tissue.

Hyperreflexia: Excessive reflexes.

Hypertension: Increased blood pressure.

Hypotension: Decreased blood pressure.

Hypothermia: Lowering of body temperature to below normal.

I

Icterus: Yellow coloration of the skin and mucosa.

Ignition temperature: The minimum temperature required to initiate or cause self-sustained combustion independent of a heat source.

Incident: An unplanned event that could have resulted in an accident or which diminishes efficiency or production. Also see accident.

Inhibitor: A chemical that is added to another substance to prevent unwanted chemical change from occurring.

Immediate hazard: A hazard with immediate effects. See "acute effect."

Immediate use: The hazardous chemical that will only be used by the individual who transfers it from a labeled container. (29CFR1910.1200)

Immunosuppression: Decrease in the immune response. Artificial prevention or diminution of the (natural) immune response, e.g., by irradiation or by administration of substances such as pharmaceutical antimetabolites or specific antibodies to prevent sensitization; immunosuppression or immuno-deficiency may also be used to describe the condition of acquired or congenital lowered immune response.

Incompatibility: Indicates whether a material can be placed in contact with certain other products or materials. The direct contact of incompatible materials can cause dangerous reactions and give off heat and toxic vapors.

Inflammation: The response of the tissues of the body to injury, infection or irritation. Its chief symptoms are redness, heat, swelling, and pain.

Ingestion: Taking in by the mouth; swallowing.

Inhalation: Breathing into the lungs of a (contaminated) substance in the form of a gas, vapor, fume, mist, or dust.

Initiator: A chemical that permanently alters a cell or group of cells and, in the case of carcinogens, is tumor-producing.

Inorganic chemical: Those chemical substances not containing carbon.

Insoluble: Products that cannot be dissolved in each other.

Interaction: Modification of the toxic effects of one substance by another. Depending on the substances involved, the effects of interaction can be amplified or mitigated.

Irritant: A substance or material capable of causing irritation to organs and body parts.

Irritating material: Any substance that upon contact with fire or air produces irritating fumes.

Invasive: Spreading beyond specific body tissues.

Isomer: One of two or more variations of a chemical, each of which has the same chemical formula but a different structural arrangement.

J

Jaundice: Yellowing of the skin or eyes caused by too much bilirubin in the blood, and indication of liver diseases, biliary obstructions, and hemolysis.

K

Keratitis: Inflammation of the cornea of the eye.

Keratoconjunctivitis: Inflammation of the cornea and the conjunctiva of the eye.

K_{ow} See "partition coefficient."

L

Laryngitis: Inflammation of the larynx.

Lacrimation: Production or discharge of excess tears from the eyes.

Lacrimator: A chemical substance that causes the secretion of excess tears from the eyes.

Latency period: A seemingly inactive period, as that between the exposure of tissue to an injurious agent and a manifest response; often used to identify the period between exposure to a carcinogen and development of a tumor.

LEL: Lower Explosive Limit of a vapor or gas; the lowest concentration (lowest percentage of the substance in air) that will produce a flash of fire when an ignition source (heat, arc, or flame) is present. At lower concentrations, the mixture is too "lean" to burn. Also see UEL.

Lethargy: Deep and prolonged sleep, or extreme indifference.

Leukemia: A cancer of the blood-forming tissues that is characterized by a marked increase in the number of abnormal white blood cells (leukocytes).

Listed hazardous waste: Under the Resource Conservation and Recovery Act (RCRA), wastes from generic industrial processes, wastes from certain sectors of industry, and unused pure chemical products that have been shown to generally contain toxic chemicals that could pose a threat to human health and the environment, or that generally exhibit one of the characteristics of ignitability, corrosivity, reactivity, or toxicity are considered hazardous and must adhere to RCRA provisions.

Lymph: A clear liquid that is collected from the tissues throughout the body and that flows in lymphatic vessels.

Lymphatic: A medical term describing a small sac or node in which lymph is stored; pertaining to the lymph, lymph nodes, or vascular channels that transport lymph to the lymph nodes.

M

Malaise: A feeling of general discomfort, distress or uneasiness; an out-of-sorts feeling.

Malignant: Tending to become progressively worse; life-threatening.

Manganism: Chronic intoxication caused by manganese and its derivatives.

Maximum contaminant levels (MCLs): The maximum level of a contaminant permissible in a public water system.

MCL: The Maximum Contaminant Level; the maximum allowable of a contaminant in public drinking water supplies under the Safe Drinking Water Act.

Melanoma: A neoplasm derived from cells that are capable of forming the pigment melanin.

Meta: In chemistry, a prefix denoting that a compound is formed by two substitutions in the benzene ring separated by one carbon atom, i.e., linked to the first and third, second and fourth, etc., carbon atoms of the ring; usually abbreviated *m*.

Metastasis: The appearance of a neoplasm in a part of the body remote from the site of its origin.

Methemoglobinemia: Presence of an abnormal concentration and form of hemoglobin which will not carry oxygen to the blood, resulting in anemia or cyanosis.

Miscible: Products capable of being completely mixed and staying mixed with each other (without separation into distinct components) under normal conditions.

Mist: Liquid droplets suspended in air.

Molecular weight: Weight (mass) of a molecule based on the sum of the atomic weights of the atoms that make up the molecule.

Mucous membranes: Membranes lining body cavities and covered by a viscous substance called mucus.

Myosis: Reduction in diameter of pupils of the eye.

Melting point: The temperature at which a product changes from the solid to liquid state at normal atmospheric pressure (760 mmHg).

Montreal protocol: A 1987 agreement made by 25 countries to reduce the production and consumption of ozone depleting chemicals. Since 1987, additional countries have joined this agreement.

Mutagen: A chemical substance or physical effect capable of inducing transmissible changes in the genetic material of a living cell that results in physical and functional changes in the descend ants. Depending on the type of cells affected, ova or spermazoids, both male and female can be affected. Mutations can lead to birth defects, miscarriage, or cancer.

Mutagenic Capable of causing mutations.

Mutagenicity The cap ability to induce mutation, or permanent change, in genetic material.

N

Narcosis: A stupor, drowsiness, arrested activity or unconsciousness produced by the influence of narcotics or other chemical substances. Artificially induced sleep.

Narcotic: Any substance that induces narcosis.

National Fire Protection Association (NFPA): This international membership organization promotes/improves fire protection and prevention and establishes safeguards against loss of life and property by fire. Best known in industry for the National Fire Codes. Among these codes is the NFPA 704M, the code for classifying substances according to their fire and explosion hazard (as they might be encountered under fire or related emergency conditions) using the familiar diamond -shaped label or placard with appropriate color, numbers, or symbols.

Nausea: The urge to vomit; a feeling of sickness in the stomach.

Necrosis: Cellular or tissue death.

Neonatal: Relating to or affecting the first four weeks after birth.

Neoplasm: Presence of a new growth of abnormal cells. A tumor.

Nephritis: Inflammation of the kidney.

Nephropathy: Any affliction of the kidneys.

Nephrotoxic: Toxic to the kidneys.

NESHAP (National Emission Standards for Hazardous Air Pollutants): Under the Clean Air Act, regulations set for industries that emit one of more of the listed hazardous air pollutants in significant quantities.

Neuropathy: Any affliction of the nervous system.

Neurotoxic: Toxic to nerve cells and the nervous system. The effect may produce emotional or behavioral abnormalities.

Neuritis: Inflammation of a nerve.

Neural: Refers to a nerve or the nervous system.

Neutralize: To eliminate potential hazards by inactivating strong acids, caustics, and oxidizers. For example, acid spills can be neutralized by adding an appropriate amount of caustic or alkali substances.

NIOSH: National Institute for Occupational Safety and Health. Tests equipment, evaluates and approves respirators, conducts studies of workplace hazards, and proposes standards to OSHA.

Nitrogen mustard: A substituted mustard gas in which sulfur is replaced by an amino nitrogen.

Nitrogen oxides (NO_x): Gasses associated with the breakdown of the earth's protective ozone layer that are released primarily from the burning of fossil fuels.

Nitroparaffin: An organic compound in which one or more hydrogen molecules of an alkane are replaced by a nitro group.

Nitrosamine: A class of organic compounds that contain a $-NH_2$ and a $-NO$ radical.

Nonliquefied compressed gas: DOT describes as a gas, other than gas in solution, which under the charged pressure is entirely gaseous at a temperature of 21°C. (Code of Federal Regulations, Title 49, Department of Transportation).

O

Oncogenicity: The capacity to induce tumors.

Operations level (trained): First responders at the operational level are those persons who respond to releases or potential releases of hazardous materials as part of the initial response to the incident for the purpose of protecting nearby persons, the environment, or property from the effects of the release. They shall be trained to respond in a defensive fashion to control the release from a safe distance and keep it from spreading (ANSI/NFPA 472).

Optic nerve: Nerve running from the eye to the centers of vision in the brain.

Oral: Used or taken into the body through the mouth.

Organic compound: A class of chemical compounds containing mainly carbon atoms.

Organic peroxide: An organic compound containing the bivalent −O−O− structure and which may be considered a structural derivative of hydrogen peroxide where one or more of the hydrogen atoms have been replaced by organic radicals (49CFR173.151).

Ortho: In chemistry, denoting that a compound has two substitutions on adjacent carbon atoms in a benzenering; usually abbreviated *o*.

Oxidant: The substance that is reduced and that, therefore, oxidizes the other component of an oxidation-reduction system.

Oxidase: One of a group of enzymes now termed oxidoreductases that bring about oxidation by the addition of oxygen to a metabolite or by the removal of hydrogen or of one or more electrons.

Oxidation: The act of combining or causing to combine with oxygen or to lose electrons.

Oxidize: Oxygenize; to combine or cause an element or radical to combine with oxygen or to lose electrons.

Oxidizing agent or oxidizer: A substance other than a blasting agent or explosive such as chlorate, permanganate, inorganic peroxide, or a nitrate, that yields oxygen or other gases readily, thereby causing fire of other, usually organic, materials. Perchlorates, peroxides, permanganates, chlorates and nitrates are examples of oxidizers.

Ozone layer: The protective layer of molecules surrounding the earth. The ozone layer reduces the amount of high-energy ultraviolet radiation that reaches the earth's surface.

P

PAC: Acronym for Protective Action Criteria exposure limits developed by the United States Department of Energy (DOE) for hazardous chemicals. These exposure limits include TEELs (Temporary Emergency Exposure Limits), AEGLs (Acute Emergency Guideline Levels), and ERPGs (Emergency Response Planning Guidelines). are used to estimate the consequence of uncontrolled releases of hazardous materials and to plan for emergency response. See also definitions elsewhere in the glossary.

Para: In chemistry, a prefix designating two substitutions in the benzene ring arranged symmetrically, i.e., linked to opposite carbon atoms in the ring; usually abbreviated *p*.

Particulate: Fine liquid or solid particles such as dust, smoke, mist, fumes, or smog suspended in air or atmospheric emissions.

Partition coefficient: The ratio of a substance's distribution between oil and water when they are in contact. A value of less than 1 indicates better solubility of the substance in oils and greases. Such a product is therefore likely to be absorbed by the skin. A value greater than 1 indicates a better solubility in water; and, therefore, be absorbed by the mucosa. This information can be useful in assessing first aid requirements, and can help in the selection of proper protective equipment. Also known as the coefficient of water/oil distribution. Usually abbreviated K_{ow}.

Palpitation: Perception of one's own heartbeat. A racing, irregular beat, or pounding of the heart.

Paralysis: The loss of function and/or feeling.

Pathology: The study of the nature of diseases, especially of the structural and functional changes in body tissues, organs, or fluids caused by disease, physical and biological agents, and toxic substances.

Pensky−Martens: A closed cup method for determining flashpoint.

Percutaneous absorption: Absorption through the skin.

Peritonitis: Inflammation of the peritoneum or the membrane lining the abdominal cavity and the organs contained within it.

Permissible exposure limit (PEL): A legal occupational limit of exposure established and defined by OSHA. The limit of allowable exposure to a chemical contaminant expressed as a Time-Weighted Average (TWA) concentration during a work-day of 8 hours within, or as a maximum concentration never to be exceeded either instantaneously (ceiling) or a Short Term Exposure Limit (STEL) during any maximum period of 15 minutes. The exposure, inhalation or dermal permissible exposure limit specified in 29C FR1910, Subparts G and Z. These concentrations are expressed in parts per million (ppm) and or milligrams of the product per cubic meter of air (mg/m^3) at 25°C. Exposure limits published in 29CFR1910.1000.

Peroxide: Compounds containing two oxygen atoms bound together. That oxide of any series that contains the greatest number of oxygen atoms; applied most correctly to compounds containing an −O−O− link, as in hydrogen peroxide (H−O−O−H).

Peroxy: Prefix denoting the presence of an extra O atom, as in peroxides, peroxy acids (e.g., hydrogen peroxide, peroxyformic acid).

Pesticide: As defined by the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA), a pesticide includes "any substance or mixture of substances intended for preventing, killing, repelling, or mitigating any pest, and any substance or mixture of substances intended for use as a plant regulator, defoliant, or desiccant."

Petroleum distillate: A material produced by a combination of vaporization and condensation of petroleum.

Personal protection equipment (PPE): Safety equipment designed to protect parts or all of the body from workplace hazards. Such protective equipment includes chemical resistant clothing, gloves, respirators, and eye protection.

pH: A symbol representing the concentration in hydrogen ions (H+) in aqueous solution. This logarithmic scale is expressed as a numerical value usually between 0 and 14. A pH of 7 indicates a neutral or noncorrosive substance. A pH between 0 and 7 indicates greater acidity. A pH between 7 and 14 indicates greater alkalinity. A pH of 0 (very acid), or 14 (very basic) are highly corrosive. The symbol is useful in the identification of the appropriate type of protective equipment necessary for handling a chemical material.

Pharyngitis: Inflammation of the throat or pharynx.

Phlegm: Thick mucus produced in the breathing passages.

Photophobia: Unpleasant to painful feeling in the eyes, caused by light.

Photosensitive: Substances that change in the presence of light.

Photosensitization: Abnormal reaction of the skin to sunlight.

Physical hazard: A chemical for which there is scientifically valid evidence that it is a combustible liquid, a compressed gas, explosive, flammable, an organic peroxide, an oxidizer, pyrophoric, unstable (reactive) or water-reactive.

Pituitary gland: A small gland at the base of the brain that secretes several important hormones.

Plasma: The fluid part of blood or lymph, as distinguished from suspended material.

Platelet: An irregularly shaped disk found in blood, containing granules in the central part and, peripherally, clear protoplasm, but no definite nucleus; it is about one-third to one-half the size of an erythrocyte, and contains no hemoglobin.

Pneumoconiosis: Chronic affliction of the lungs due to the inhaling of certain types of dust.

Pneumonia: Acute infection of the lung, characterized by inflammation.

Pneumonitis (chemical): Inflammation of the lungs, resulting from chemical irritation.

Pneumopathy: Any pulmonary affliction.

Point source contamination: Contamination to the environment from a specific source such as a smokestack or sewer pipe.

Polychlorinated biphenyl (PCBs): A pathogenic and teratogenic industrial compound used as a heat-transfer agent, primarily in transformers. PCBs may accumulate in human or animal tissue. PCBs are banned from production in the United States.

Polymer: A chemical formed by the joining together of similar chemical subunits.

Polymerization: A chemical reaction in which one or more small molecules combine to form larger molecules. A hazardous polymerization is a reaction that takes place at a rate that releases large amounts of energy. If hazardous polymerization can occur with a given material, the MSDS usually will list conditions that could start the reaction and—since the material usually will list conditions that could start the reaction, and since the material usually contains a polymerization inhibitor—the length of time during which the inhibitor will be effective. The heat given off or the expansion in volume, or both, caused by the polymerization reaction could cause the container holding the product to break and the unpolymerized residual product to be spilled.

Polyneuritis: Inflammation of several nerves.

Polyuria: Elimination of an abnormally large amount of urine over a given period.

Procarcinogen: Product that must be changed by the organism in order to become a carcinogen.

Promoter (of carcinogenesis): Substance capable of enhancing the carcinogenic effect of another substance.

Prostration: Extreme exhaustion, physical or mental.

Pulmonary: Pertaining to the lungs.

Pulmonary edema: A buildup of fluid in the lungs caused by congestive heart failure, lung damage, side effects of drugs, infections or kidney failure.

Pyrophoric: Any chemical substance or mixture that ignites spontaneously in dry or moist air at or below 130°F/54.4°C.

Pyrolysis: Thermal decomposition of a substance by heat in the absence of air.

Psychosis: A group of mental illnesses characterized by a change in personality and loss of contact with reality.

Q

Quaternary: In chemistry, the term used to describe a substance with four chemical groups attached to a central atom; when the central atom is a trivalent nitrogen atom (N), adding the fourth group places a positive charge on N; compounds thus formed are called quaternary ammonium compounds.

R

Racemate: A mixture of equal parts of isomers of opposite rotation.

Racemic: Denoting a mixture that is optically inactive, being composed of an equal number of dextro- and levorotary substances (see DL-), which are separable.

Radioactive: Having the property of emitting radiation (such as alpha, beta, or *gamma* rays) from an atomic nucleus.

Radioactive material: Any material, or combination of materials, that spontaneously emits ionizing, and having a specific activity greater than 0.002 μCi/g.

Radionuclides: Radioactive-decay particles emitted from natural and manufactured sources, including cosmic rays, X-rays, radon, and coal-fired utilities.

Radon: A colorless, naturally occurring, radioactive, inert gaseous element formed by radioactive decay of radium atoms in soil or rocks.

Reactive: Unstable.

Reactivity: Chemical reaction with the release of energy. Undesirable effects such as pressure buildup, temperature increase, formation of noxious, toxic or corrosive by-product, may occur because of the reactivity of a substance to heating, burning, direct contact with other materials, or other conditions in use or in storage.

Recommended Exposure Limit (REL): A 10-hour average exposure limit during a 40-hour work-week recommended by the National Institute for Occupational Safety and Health (NIOSH) for occupational exposures.

Reducing agent: In a reducing reaction (which occurs simultaneously with an oxidation reaction) the reducing agent is the chemical or substance which (1) combines with oxygen or (2) loses electrons to the reaction. Reducing agents react violently with oxidizing agents or oxidizers.

Registry of Toxic Effects of Chemical Substances (RTECS): Published by NIOSH, RTECS is a compendium of the known toxic and biological effects of many chemical substances.

Regulated material: A substance or material that is subject to regulations promulgated by any government agency.

Relative density: The ratio of the density of a material to the density of a standard material, such as water at a specified temperature.

Remedial action: The actual construction or implementation phase of a Superfund site cleanup that follows remedial design.

Renal: Pertaining to the kidney.

Reportable quantity (RQ): An amount of a hazardous substance or “extremely hazardous substance” that, if released, requires notification to the National Response Center (800/424-8802) under the emergency release reporting requirements of the Emergency Planning and Community Right-to-Know Act (EPCRA) or under those of CERCLA (Superfund). For the purposes of the Department of Transportation, RQ means the quantity specified for the substance in the Appendix to the Hazardous Materials Table. For the purposes of SARA Title III, RQ means, for any CERCLA hazardous substance the reportable quantity established therein for such a substance, for any other substance the RQ is one pound.

Respirator: A devise worn by a person to filter dust particles or gas out of surrounding air before inhalation of air.

Respiratory tract: The structures and organs involved in breathing; includes the nose, larynx, trachea, bronchi, bronchioli, and lungs.

Respiratory tract filters: Those anatomical structures that remove particles from inhaled air.

Responsible party: Someone who can provide additional information on the substance if needed. (29CFR1910.1200).

Rhinitis: Inflammation of mucosa of the nasal passages.

Rheumatoid arthritis: A chronic disease of the joints, marked by inflammatory changes of joint structures.

Rodenticide: Chemical substances used to kill mice, rats, and other rodents.

Route of entry: The means or natural route by which hazardous chemicals or other contaminants can penetrate the body. For example, the skin (by cutaneous absorption), the digestive system (by ingestion), or the respiratory system (by inhalation).

Routes of exposure: Also known as Routes of Entry, any one of the ways by which substances enters the body, such as through the skin, ingestion, eye contact, or by breathing.

S

Sensitization: Defense reaction by the organism following exposure to a contaminant, resulting in an allergy.

Sentitizer: A chemical that causes a substantial proportion of exposed people or animals to develop an allergic reaction in normal tissue after repeated exposure to the chemical.

Shock: An abnormal condition resulting from not enough blood flowing through the body causing reduced blood pressure and interference with bodily functions.

Short Term Exposure Limit (STEL): A 15-minute time-weighted-average exposure limit that should not be exceeded at any time during a work-day, recommended by the National Institute for Occupational Safety and Health (NIOSH) or a concentration that it is believed a worker can be exposed to continuously for a short period of time without suffering from irritation, chronic or irreversible tissue damage, or narcosis of sufficient degree to increase the likelihood of accidental injury, impair self-rescue, or materially reduce work efficiency, recommended by the American Conference of Governmental Industrial Hygienists (ACGIH).

Silicosis: Chronic disease of the lungs (fibrosis) provoked by inhaling dust of crystalline silica. See pneumoconiosis.

Solid waste: Any garbage, refuse or sludge, including solid, liquid, semi-solid, or contained gaseous material resulting from industrial, commercial, agricultural, and mining operations, and community activities (excluding material in domestic sewage); discharges subject to regulation as point sources under the Federal Water Pollution Control Act, or any nuclear material or by product regulated under the Atomic Energy Act of 1954.

Solubility: The property of a substance describing the degree to which one material may be completely mixed or dissolved in another material. The degree of solubility of most substances increases with the rise in temperature; however, in the case of organic salts of calcium the substance may be more soluble in cold than in hot solvents.

Solution: Any homogeneous liquid mixture of two or more chemical compounds or elements that will not undergo any segregation normal to transportation (CFR, Title 49, DOT).

Solvent: A chemical liquid, capable of dissolving another substance. A term generally used to describe organic solvents.

Spasm: Involuntary muscle contraction.

Specific gravity: The weight of a material compared to the weight of an equal volume of water is an expression of the density (or heaviness) of a material. Insoluble materials with specific gravity of less than 1.0 will float in (or on water). Insoluble materials with specific gravity greater than 1.0 will sink in water. Most (but not all) flammable liquids have specific gravity less than 1.0 and, if not soluble, will float on water—an important consideration for fire suppression.

Spill: Another name for a leak. The methods, equipment, and precautions that should be used to control or clean up a leak or spill.

Stability: Relates to a material's ability to resist change in form or chemical nature (e.g., xylene decomposes when strongly heated, and gives off toxic fumes). For MSDS purposes, a material is stable if it remains in the same form under expected and reasonable conditions of storage or use. Conditions that may cause instability (dangerous change) are stated; for example, temperature above 150°F/66°C; shock from dropping.

Stabilized: Containing a small amount of another substance included to keep the first material from changing form.

Stool: Discharge from the bowels.

Stratosphere: That part of the earth's atmosphere, located above the troposphere, containing the ozone layer.

Strong acids: Refers, but not restricted, to chemicals such as hydrochloric, sulfuric and nitric acids. Strong acids can cause violent reactions with certain other substances and materials.

Strong bases: Refers, but not restricted, to chemicals such as sodium hydroxide and potassium hydroxide. Strong bases can cause violent reactions with certain other substances and materials.

Strong oxidizers: Refers, but not restricted, to chemicals such as chlorine, bromine and fluorine and many of their compounds Strong oxidizers can cause violent reactions with certain other substances and materials. See also "oxidizers," "oxidizing agent," "easily oxidized materials."

Sublimate: To go directly from the solid to the gaseous state without passing through the liquid state.

Superfund Amendments and Reauthorization Act (SARA) Title III of SARA establishes the first national program of emergency planning for dealing with hazardous chemicals. Includes detailed provisions for community planning and annual submission of information about hazardous chemicals to the EPA, states and local communities.

Suspected carcinogen: A substance which is known to cause cancer in test animals, but is only suspected of causing cancer in humans. Also referred to as an experimental or potential carcinogen.

Systemic toxicity: Adverse effects caused by a substance that affects the body as a whole rather than local or individual parts or organs.

T

Tachycardia: Increased speed of heart beat.

Tachypnea: Abnormally rapid breathing.

Target organ: The body affected by a specific chemical in a specific species.

TCLP: (toxicity characteristics leaching procedure) Under the Resource Conservation and Recovery Act (RCRA), wastes are subject to this laboratory procedure to determine if they can be disposed of in Subtitle D landfills or if they require Subtitle C disposal (i.e., considered a hazardous waste).

Technical grade: A purity standard applied to a chemical that may contain multiple impurities.

TEEL: Acronym for Temporary Emergency Exposure Limit. Airborne exposure limits, TEELs are intended for use until AEGLs or ERPGs are adopted for chemicals. Temporary emergency exposure limit (TEEL) values developed by the Subcommittee on Consequence Assessment and Protective Actions (SCAPA) which provides the United States Department of Energy (DOE)/National Nuclear Security Administration (NNSA) and its contractors with technical information and recommendations for emergency preparedness to assist in safeguarding the health and safety of workers and the public. See also "How to Use this Book" in the front matter of this book.

Teratogen: A substance that has been demonstrated to cause birth defects by causing malformations in the fetus. Teratogenic contaminants can be qualified as being "proven" when an effect has been shown in humans, "possible" when an effect has been shown in animals, or suspected in humans, and "suspected" when an effect is suspected in animals.

Tetanic: Refers to persistence in a muscle contraction.

***Threshold Limit Value−Time-Weighted Average limit (TLV−*TWA*)** An 8-hour average exposure limit during a 40-hour work-week recommended by the American Conference of Governmental Industrial Hygienists (ACGIH) for occupational exposures.

Threshold Planning Quantity (): Under the Emergency Planning and Community Right-to-Know-Act, the presence of a chemical at or above this level requires certain emergency planning activities to be conducted. The quantity of a SARA extremely hazardous substance present at a facility above which the facility's owner/operator must give emergency planning notification to the SERC and LEPC.

Tier I or Tier II: Describes hazardous substances inventory forms required under SARA Title III. These forms report quantities and locations of hazardous substances to various state agencies and planning committees.

Time-Weighted Average (TWA): The average concentration of a substance in air over the total time of expo sure, usually expressed as an 8-hour day.

Tinnitus: Ringing in one or both ears. May be a sign of hearing injury.

Title III: The third part of SARA, also known as EPCRA, the Emergency Planning and Community Right-to-Know Act of 1986. Specifies requirements for organizing the planning process at the State and local levels for extremely hazardous substances; minimum plan content; requirements for fixed facility owners and operators to inform officials about extremely hazardous substances present at the facilities; and mechanisms for making information about extremely hazardous substances available to citizens.

Tolerance: Under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), the amount of pesticide residues allowed to remain in or on each treated food commodity.

Topical: Designed for direct application to a specific part of the body.

Toxic: Any substance capable of causing human injury or damage to living body tissue, impairment to the central nervous system, severe illness, and, in severe cases, death. A poison.

Toxicology: The branch of chemistry that deals with poisons.

Toxicologist: One who studies the nature, effects, and detection of poisons and the treatment of poisoning.

Toxic pollutant: Pollutants, that after discharge and upon exposure, cause adverse health effects.

Toxic Release Inventory (TRI): (listed substance subject to reporting requirements) An EPA database of release quantities by facilities of a growing list of chemicals and chemical categories into the nation's air, water, and land, and transfers to off-site locations for treatment or disposal, or for recycling and energy recovery. Under the Emergency Planning and Community Right-to-Know Act, certain industries are required on an annual basis to complete a Toxic Chemical Release Inventory Form for these chemicals.

Trade name: The manufacturer's commercial name for a chemical substance or product. A registered trade name contains the symbol "®."

Trade secret: Any confidential formula or information used to give the manufacturer, etc. an (economic) advantage over others who do not have the information (29CFR 1910.1200).

Tumor A neoplasm; a mass of new tissue that persists and grows independently of its surrounding structures and that has no physiological use; it may be benign or malignant.

Tumorigenic: That which causes or produces tumors.

U

UEL: Upper Explosive Limit of a vapor or gas; the highest concentration (highest percentage of the substance in air) that will produce a flash of fire when an ignition source (heat, arc, or flame) is present. At higher concentrations, the mixture is too "rich" to burn. See also "LEL."

UN identification number: An international four digit number assigned to all hazardous materials regulated by the United Nations. Used world-wide in transportation.

Unstable: A chemical in the pure state which will become self-reactive under conditions of shocks, pressure, or temperature (29CFR1910.1200).

UST: Underground Storage Tank regulated under RCRA. A tank used to store CERCL A-regulated chemicals or petroleum products, with 10% or more of its volume underground, having connected piping.

Ulceration: Creation of an ulcer.

Urban air toxics: Under the Clean Air Act, the 33 air toxics that have been identified as posing the greatest potential health threat in urban areas.

V

Vapor density: Indicator of the number of times that the vapors of a substance are heavier or lighter than air. Vapor density measurement is taken at the boiling point. If the vapor density is greater than 1, the vapor will tend to collect at floor level. If the vapor density is less than 1, the vapor will rise in air.

Vapor pressure: When a substance evaporates, its vapors create a pressure in the surrounding atmosphere; therefore, vapor pressure is a measurement of how readily a liquid or a solid mixes with air at its surface. This measurement is expressed in millimeters of mercury (mmHg), at 68°F/20°C and normal atmospheric pressure (760 mmHg). A vapor pressure above 760 mm indicates a substance in the gaseous state. The higher a product's vapor pressure, the more it tends to evaporate, resulting in a higher concentration of the substance in air and therefore increases the likelihood of breathing it in.

Vascular: Pertaining to vessels or ducts that convey fluids such as blood, lymph, or sap; in human or veterinary medicine, vascular pertains to blood vessels.

Vascular constriction: Constriction with narrowing of blood vessels.

Vascular dilation: Dilation of the blood vessels.

Vertigo: Dizziness; giddiness.

Volatiles: A substance, usually a liquid, that easily vaporizes or evaporates to form a gas or vapor.

W

Waste code: Identifier assigned by the EPA consisting of a single letter (D, F, P, U, K) and three numbers in the format "Dxxx." This code identifies the type of hazardous waste stream being reported.

Waste management: Describes activities undertaken by facilities to treat, recycle or otherwise manage generated waste, including disposal and energy recovery.

Waste stream: Under RCRA, solid or liquid materials containing hazardous materials and generated as waste.

Water reactive: A chemical which reacts with water to release flammable or hazardous gas (29CF R1910.1200).

Work area: A defined space where hazardous substances are produced or used when employees are present (29CFR 1910.1200).

Appendix 4: International Hazard Codes, Risk Phrases, and Safety Phrases

Note: **Followed by the GLOBALLY HARMONIZED SYSTEM OF CLASSIFICATION AND LABELING OF CHEMICALS (GHS)**

Hazard Codes

Explosive (E)
Oxidizing (O)
Highly flammable (F)
Extremely flammable (F +)
Toxic (T)
Very toxic (T +)
Harmful (Xn)
Irritant (Xi)
Corrosive (C)
Dangerous to the environment (N)

(List of R-phrases) Risk Precaution Codes and Statements

R1—Explosive when dry.
R2—Risk of explosion by shock, friction, fire, or other sources of ignition.
R3—Extreme risk of explosion by shock, friction, fire, or other sources of ignition.
R4—Forms very sensitive metallic compounds.
R5—Heating may cause an explosion.
R6—Explosive when mixed with combustible materials.
R7—May cause fire.
R8—Contact with combustible material may cause fire.
R9—Explosive when mixed with combustible material.
R10—Flammable.
R11—Highly flammable.
R12—Extremely flammable.
R13—Extremely flammable liquefied gas.
R14—Reacts violently with water.
R14/15—Reacts violently with water, liberating extremely flammable gases.
R14/15—Reacts violently with water, liberating highly flammable gases.
R14/15—Reacts violently with water, liberating extremely flammable gases.
R15—Contact with water liberates highly flammable gases.
R15/29—Contact with water liberates toxic, highly flammable gas.
R16—Explosive when mixed with oxidizing substances.
R17—Spontaneously flammable in air.
R18—In use, may form flammable/explosive vapor−air mixture.
R19—May form explosive peroxides.
R20—Harmful by inhalation.
R20/21—Harmful by inhalation and in contact with the skin.
R20/21/22—Harmful by inhalation, in contact with skin and if swallowed.
R20/22—Harmful by inhalation and if swallowed.
R21—Harmful in contact with skin.
R21/22—Harmful in contact with the skin and if swallowed.
R22—Harmful if swallowed.
R23—Toxic by inhalation.
R23/24—Toxic by inhalation and in contact with skin.
R23/24/25—Toxic by inhalation, in contact with skin and if swallowed.
R23/25—Toxic by inhalation and if swallowed.
R24—Toxic in contact with skin.
R24/25—Toxic in contact with skin and if swallowed.
R25—Toxic if swallowed.
R26—Very toxic by inhalation.
R26/27—Very toxic by inhalation and in contact with the skin.
R26/27/28—Very toxic by inhalation, in contact with the skin and if swallowed.
R26/28—Very toxic by inhalation and if swallowed.
R27—Very toxic in contact with skin.
R27/28—Very toxic in contact with skin and if swallowed.
R28—Very toxic if swallowed.
R29—Contact with water liberates toxic gas.
R30—Can become highly flammable in use.
R31—Contact with acids liberates toxic gas.
R32—Contact with acids liberates very toxic gas.
R33—Danger of cumulative effects.
R34—Causes burns.
R35—Causes severe burns.
R36—Irritating to eyes.
R36/37—Irritating to eyes and respiratory system.
R36/37/38—Irritating to eyes, respiratory system, and skin.
R36/38—Irritating to eyes and skin.
R37—Irritating to respiratory system.
R37/38—Irritating to respiratory system and skin.
R38—Irritating to skin.
R39—Danger of very serious irreversible effects.
R39/23—Toxic: danger of very serious irreversible effects through inhalation.
R39/23/24—Toxic: danger of very serious irreversible effects through inhalation and in contact with skin.
R39/23/24/25—Toxic: danger of very serious irreversible effects through inhalation, in contact with skin and if swallowed.

R39/23/25—Toxic: danger of very serious irreversible effects through inhalation and if swallowed.
R39/24—Toxic: danger of very serious irreversible effects in contact with skin.
R39/24/25—Toxic: danger of very serious irreversible effects in contact with skin and if swallowed.
R39/25—Toxic: danger of very serious irreversible effects if swallowed.
R39/26—Very toxic: danger of very serious irreversible effects through inhalation.
R39/26/27—Very toxic: danger of very serious irreversible effects through inhalation and in contact with skin.
R39/26/27/28—Very toxic: danger of very serious irreversible effects through inhalation, in contact with skin and if swallowed.
R39/26/28—Very toxic: danger of very serious irreversible effects through inhalation and if swallowed.
R39/27—Very toxic: danger of very serious irreversible effects in contact with skin.
R39/27/28—Very toxic: danger of very serious irreversible effects in contact with skin and if swallowed.
R39/28—Very toxic danger of very serious irreversible effects if swallowed
R40—Possible risks of irreversible effects.
R40/20—Harmful: possible risk of irreversible effects through inhalation.
R40/20/21—Harmful: possible risk of irreversible effects through inhalation and in contact with skin.
R40/20/21/22—Harmful: possible risk of irreversible effects through inhalation, in contact with skin and if swallowed.
R40/20/22—Harmful: possible risk of irreversible effects through inhalation and if swallowed.
R40/21—Harmful: possible risk of irreversible effects in contact with the skin.
R40/21/22—Harmful: possible risk of irreversible effects in contact with skin and if swallowed.
R40/22—Harmful: possible risk of irreversible effects if swallowed.
R41—Risk of serious danger to eyes.
R42—May cause sensitization by inhalation.
R42/43—May cause sensitization by inhalation and skin contact.
R43—May cause sensitization by skin contact.
R44—Risk of explosion if heated under confinement.
R45—May cause cancer.
R46—May cause heritable genetic damage.
R47—May cause birth defects.
R48—Danger of serious damage to health by prolonged exposure.
R48/20—Harmful: danger of serious damage to health by prolonged exposure through inhalation.
R48/20/21—Harmful: danger of serious damage to health by prolonged exposure through inhalation and in contact with skin.
R48/20/21/22—Harmful: danger of serious damage to health by prolonged through inhalation, in con tact with skin and if swallowed.
R48/20/22—Harmful: danger of serious damage to health by prolonged exposure through inhalation and in contact with skin.
R48/21—Harmful: danger of serious damage to health by prolonged exposure in contact with skin.
R48/21/22—Harmful: danger of serious damage to health by prolonged exposure in contact with skin and if swallowed.
R48/22—Harmful: danger of serious damage to health by prolonged exposure if swallowed.
R48/23—Toxic: danger of serious damage to health by prolonged exposure through inhalation.
R48/23/24—Toxic: danger of serious damage to health by prolonged exposure through inhalation and in contact with skin.
R48/23/24/25—Toxic: danger of serious damage to health by prolonged exposure through inhalation, in contact with skin and if swallowed.
R48/23/25—Toxic: danger of serious damage to health by prolonged exposure through inhalation and if swallowed
R48/24—Toxic: danger of serious damage to health by prolonged exposure in contact with skin.
R48/24/25—Toxic: danger of serious damage to health by prolonged exposure in contact with skin and if swallowed.
R48/25—Toxic: danger of serious damage to health by prolonged exposure if swallowed.
R49—May cause cancer by inhalation.
R50—Very toxic to aquatic organisms.
R50/53—Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.
R51—Toxic to aquatic organisms.
R51/53—Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.
R52—Harmful to aquatic organisms.
R52/53—Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment.
R53—May cause long-term adverse effects in the aquatic environment.
R54—Toxic to flora.
R55—Toxic to fauna.
R56—Toxic to soil organisms.
R57—Toxic to bees.
R58—May cause long-term adverse effects in the environment.
R59—Dangerous to the ozone layer.
R60—May impair fertility.
R61—May cause harm to the unborn child.
R62—Possible risk of impaired fertility.
R63—Possible risk of harm to the unborn child.
R64—May cause harm to breast-fed babies.
R65—Harmful: may cause lung damage if swallowed.
R66—Repeated exposure may cause skin dryness or cracking.

R67—Vapors may cause drowsiness and dizziness.
R68—Possible risk of irreversible effects.
R68/20/21—Harmful: possible risk of irreversible effects through inhalation and in contact with skin.
R68/20/22—Harmful: possible risk of irreversible effects through inhalation and if swallowed.
R68/20/21/22—Harmful: possible risk of irreversible effects through inhalation, in contact with skin and if swallowed.
R68/21/22—Harmful: possible risk of irreversible effects in contact with skin and if swallowed.

(List of S-phrases) Safety Precautions

S1—Keep locked up.
S1/2—Keep locked up and out of the reach of children.
S2—Keep out of the reach of children.
S3—Keep in a cool place.
S3/7—Keep container tightly closed in a cool place.
S3/7/9—Keep container tightly closed in a cool, well-ventilated place.
S3/9—Keep in a cool, well-ventilated place.
S3/9/14—Keep in a cool well-ventilated place away from __?__ (incompatible materials to be indicated by the manufacturer).
S3/9/14/49—Keep only in the original container in a cool, well-ventilated place away from __?__ (incompatible materials to be indicated by the manufacturer).
S3/9/49—Keep only the original container in a cool, well-ventilated place.
S3/14—Keep in a cool place away from __?__ (incompatible materials to be indicated by the manufacturer).
S4—Keep away from living quarters.
S5—Keep contents under __?__ (appropriate liquid to be specified by the manufacturer).
S6—Keep under __?__ (inert gas to be specified by the manufacturer).
S7—Keep containers tightly closed.
S7/8—Keep container tightly closed and dry.
S7/9—Keep in a container tightly closed and in a well-ventilated place.
S7/47—Keep container tightly closed and at temperature not exceeding __?__°C (*to be specified by the manufacturer*).
S8—Keep containers dry.
S8/10—Keep container wet, but keep the contents dry.
S9—Keep containers in a well-ventilated place.
S12—Do not keep container sealed.
S13—Keep away from food, drink and animal foodstuffs.
S14—Keep away from __?__ (incompatible materials to be indicated by the manufacturer).
S15—Keep away from heat.
S16—Keep away from sources of ignition-No smoking.
S17—Keep away from combustible material.
S18—Handle and open containers with care.
S20—When using do not eat or drink.
S20/21—When using do not eat, drink or smoke.
S21—When using do not smoke.
S22—Do not breathe dust.
S23—Do not breath gas/fumes/vapor/spray (appropriate wording to be specified by the manufacturer).
S24—Avoid contact with skin.
S24/25—Avoid contact with the kin or eyes.
S25—Avoid contact with eyes.
S26—In case of contact with the eyes, rinse immediately with plenty of water and seek medical advice.
S27—Take off immediately all contaminated clothing.
S27/28—After contact with skin, take off immediately all contaminated clothing, and wash immediately with plenty of __?__ (*to be specified by the manufacturer*).
S28—After contact with skin, wash immediately with plenty of __?__ (to be specified by the manufacturer).
S29—Do not empty into drains.
S29/35—Do not empty into drains; dispose of this material and its container in a safe way.
S29/56—Do not empty into drains, dispose of this material and its container at hazardous or special waste collection point.
S30—Never add water to this product.
S33—Take precautionary measures against static discharge.
S34—Avoid shock and friction.
S35—This material and its container must be disposed of in a safe way.
S36—Wear suitable protective clothing.
S36/37—Wear suitable protective clothing and gloves.
S36/37/39—Wear suitable protective clothing, gloves and eye/face protection.
S36/39—Wear suitable protective clothing and eye/face protection.
S37—Wear suitable gloves.
S37/39—Wear suitable gloves and eye/face protection.
S38—In case of insufficient ventilation, wear suitable respiratory equipment.
S39—Wear eye/face protection.
S40—To clean the floor and all objects contaminated by this material, use __?__ (appropriate wording to be specified by the manufacturer).
S41—In case of fire and/or explosion, do not breathe fumes.
S42—During fumigation/spraying wear suitable respiratory equipment (appropriate wording to be specified by the manufacturer).
S43—In case of fire, use __?__ (indicate in the space the precise type of fire-fighting equipment. If water increases the risk, add "Never use water").
S44—If you feel unwell, seek medical advice (show the label where possible).
S45—In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).

S46—If swallowed, seek medical advice immediately and show this container or label.
S47—Keep at temperature not exceeding °C (to be specified by the manufacturer).
S47/49—Keep only in the original container at temperatures not exceeding __?__°C (to be specified by the manufacturer).
S48—Keep wetted with __?__ (appropriate material to be specified by the manufacturer).
S49—Keep only in the original container.
S50—Do not mix with __?__ (to be specified by the manufacturer).
S51—Use only in well-ventilated areas.
S52—Not recommended for interior use on large surface areas.
S53—Avoid exposure-obtain special instructions before use.
S54—Obtain the consent of pollution control authorities before discharging to wastewater treatment plants.
S55—Treat using the best available techniques before discharge into drains or the aquatic environment.
S56—Do not discharge into drains or the environment, dispose to an authorized waste collection point.
S57—Use the appropriate containment to avoid environmental contamination.
S58—To be disposed of as a hazardous waste.
S59—Refer to manufacturer/supplier for information on recovery/recycling.
S60—This material and/or its container must be disposed of as hazardous waste.
S61—Avoid release to the environment. Refer to special instructions/safety data sheet.
S62—If swallowed, do not induce vomiting; seek medical advice immediately and show this container or label.
S63—In case of accident by inhalation; remove casualty to fresh air and keep at rest.
S64—If swallowed, rinse mouth with water (only if the person is conscious).

Globally Harmonized System of Classification and Labeling of Chemicals (GHS)

Hazard statements are an essential element under the globally harmonized system and will eventually replace the currently used R-phrases. In addition to hazard statements, containers and Material Safety Data Sheets (MSDS) will include, where necessary, the following: one or multiple pictograms, a signal word such as "Warning" or "Danger," and precautionary statements. The precautionary statements will indicate proper handling procedures aimed at protecting the user and other people who might come in contact with the substance during an accident or in the environment. The container and MSDS will also contain the name of the supplier, manufacturer, or importer.

Each hazard statement contains a four digit co de, starting with the letter H (Hxxx). Statements appear under various headings grouped together by code number. The purpose of the four digit code is for reference only; however, following the code is exact *phrase* as it should appear on labels and MSDS.

Hazard Statements

Physical Hazards Codes and Statements

H200—Unstable explosive.
H201—Explosive; mass explosion hazard.
H202—Explosive; severe projection hazard.
H203—Explosive; fire, blast, or projection hazard.
H204—Fire or projection hazard.
H205—May mass explode in fire.
H220—Extremely flammable gas.
H221—Flammable gas.
H222—Extremely flammable material.
H223—Flammable material.
H224—Extremely flammable liquid and vapor.
H225—Highly flammable liquid and vapor.
H226—Flammable liquid and vapor.
H227—Combustible liquid.
H228—Flammable solid.
H240—Heating may cause an explosion.
H241—Heating may cause a fire or explosion.
H242—Heating may cause a fire.
H250—Catches fire spontaneously if exposed to air.
H251—Self-heating; may catch fire.
H252—Self-heating in large quantities; may catch fire.
H260—In contact with water releases flammable gases which may ignite spontaneously.
H261—In contact with water releases flammable gas.
H270—May cause or intensify fire; oxidizer.
H271—May cause fire or explosion; strong oxidizer.
H272—May intensify fire; oxidizer.
H280—Contains gas under pressure; may explode if heated.
H281—Contains refrigerated gas; may cause cryogenic burns or injury.
H290—May be corrosive to metals.

Health Hazards

H300—Fatal if swallowed.
H301—Toxic if swallowed.
H302—Harmful if swallowed.
H303—May be harmful if swallowed.
H304—May be fatal if swallowed and enters airways.
H305—May be harmful if swallowed and enters airways.
H310—Fatal in contact with skin.
H311—Toxic in contact with skin.
H312—Harmful in contact with skin.
H313—May be harmful in contact with skin.
H314—Causes severe skin burns and eye damage.
H315—Causes skin irritation.
H316—Causes mild skin irritation.
H317—May cause an allergic skin reaction.

H318—Causes serious eye damage.
H319—Causes serious eye irritation.
H320—Causes eye irritation.
H330—Fatal if inhaled.
H331—Toxic if inhaled.
H332—Harmful if inhaled.
H333—May be harmful if inhaled.
H334—May cause allergy or asthma symptoms or breathing difficulties if inhaled.
H335—May cause respiratory irritation.
H336—May cause drowsiness or dizziness.
H340—May cause genetic defects.
H341—Suspected of causing genetic defects.
H350—May cause cancer.
H351—Suspected of causing cancer.
H360—May damage fertility or the unborn child.
H361—Suspected of damaging fertility or the unborn child.
H362—May cause harm to breast-fed children.
H370—Causes damage to organs.
H371—May cause damage to organs.
H372—Causes damage to organs through prolonged or repeated exposure.
H373—May cause damage to organs through prolonged or repeated exposure.

Environmental Hazards

H400—Very toxic to aquatic life.
H401—Toxic to aquatic life.
H4 02—Harmful to aquatic life.
H410—Very toxic to aquatic life with long lasting effects.
H411—Toxic to aquatic life with long lasting effects.
H412—Harmful to aquatic life with long lasting effects.
H413—May cause long lasting harmful effects to aquatic life.

Prevention Precautionary Codes and Statements

P201—Obtain special instructions before use.
P202—Do not handle until all safety precautions have been read and understood.
P210—Keep away from heat/sparks/open flames/hot surfaces—NO SMOKING.
P211—Do not spray on an open flame or other ignition source.
P220—Keep/Store away from clothing/. . ./combustible materials.
P221—Take any precaution to avoid mixing with combustibles.
P222—Do not allow contact with air.
P223—Keep away from any possible contact with water, because of violent reaction and possible flash fire.
P230—Keep wetted with __?__.
P231—Handle under inert gas.
P232—Protect from moisture.
P233—Keep container tightly closed.
P234—Keep only in original container.
P235—Keep cool.
P240—Ground/bond container and receiving equipment.
P241—Use explosion-proof electrical/ventilating/light/. . ./ equipment.
P242—Use only nonsparking tools.
P243—Take precautionary measures against static discharge.
P244—Keep reduction valves free from grease and oil.
P250—Do not subject to grinding/shock/. . ./friction.
P251—Pressurized container—Do not pierce or burn, even after use.
P260—Do not breathe dust/fume/gas/mist/vapors/spray.
P261—Avoid breathing dust/fume/gas/mist/vapors/spray.
P262—Do not get in eyes, on skin, or on clothing.
P263—Avoid contact during pregnancy/while nursing.
P264—Wash __?__ thoroughly after handling.
P270—Do not eat, drink, or smoke when using this product.
P271—Use only outdoors or in a well-ventilated area.
P272—Contaminated work clothing should not be allowed out of the workplace.
P273—Avoid release to the environment.
P280—Wear protective gloves/protective clothing/eye protection/face protection.
P281—Use personal protective equipment as required.
P282—Wear cold insulating gloves/face shield/eye protection.
P283—Wear fire/flame resistant/retardant clothing.
P284—Wear respiratory protection.
P285—In case of inadequate ventilation wear respiratory protection.
P231 + 232—Handle under inert gas. Protect from moisture.
P235 + 410—Keep cool. Protect from sunlight.

Response Precautionary Codes and Statements

P301—IF SWALLOWED –
P302—IF ON SKIN –
P303—IF ON SKIN (or hair) –
P304—IF INHALED –
P305—IF IN EYES –
P306—IF ON CLOTHING –
P307—IF exposed –
P308—IF exposed or concerned –
P309—IF exposed or you feel unwell –
P310—Immediately call a POISON CENTER or doctor/ physician.
P311—Call a POISON CENTER or doctor/physician.
P312—Call a POISON CENTER or doctor/physician if you feel unwell.
P313—Get medical advice/attention.
P314—Get Medical advice/attention if you feel unwell.
P315—Get immediate medical advice/attention.
P320—Specific treatment is urgent (see__ ?__ on this label).
P321—Specific treatment (see __?__ on this label).

P322—Specific measures (see __?__ on this label).
P330—Rinse mouth.
P331—Do NOT induce vomiting.
P332—If skin irritation occurs –
P333—If skin irritation or a rash occurs –
P334—Immerse in cool water/wrap in wet bandages.
P335—Brush off loose particles from skin.
P336—Thaw frosted parts with lukewarm water. Do not rub affected areas.
P337—If eye irritation persists –
P338—Remove contact lenses if present and easy to do continue rinsing.
P340—Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P341—If breathing is difficult, remove victim to fresh air and keep at rest in a position comfortable for breathing.
P342—If experiencing respiratory symptoms –
P350—Gently wash with soap and water.
P351—Rinse continuously with water for several minutes.
P352—Wash with soap and water.
P353—Rinse skin with water/shower.
P360—Rinse immediately contaminated clothing and skin with plenty of water before removing clothes.
P361—Remove/Take off immediately all contaminated clothing.
P362—Take off contaminated clothing and wash before reuse.
P363—Wash contaminated clothing before reuse.
P370—In case of fire –
P371—In case of major fire and large quantities –
P372—Explosion risk in case of fire.
P373—DO NOT fight fire when fire reaches explosives.
P374—Fight fire with normal precautions from a reasonable distance.
P375—Fight fire remotely due to the risk of explosion.
P376—Stop leak if safe to do so.
P377—Leaking gas fire—do not extinguish un less leak can be stopped safely.
P378—Use __?__ for extinction.
P380—Evacuate area.
P381—Eliminate all ignition sources if safe to do so.
P301 + 310—IF SWALLOWED—Immediately call a POISON CENTER or doctor/physician.
P301 + 312—IF SWALLOWED—Call a POISON CENTER or doctor/physician if you feel unwell.
P301 + 330 + 331—IF SWALLOWED—Rinse mouth. Do NOT induce vomiting.
P302 + 334—IF ON SKIN—Immerse in cool water/wrap in wet bandages.
P302 + 350—IF ON SKIN—Gently wash with soap and water.
P302 + 352—IF ON SKIN—Wash with soap and water.
P303 + 361 + 353—IF ON SKIN (or hair)—Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower.
P304 + 312—IF INHALED—Call a POISON CENTER or doctor/physician if you feel unwell.
P304 + 340—IF INHALED—Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P304 + 341—IF INHALED—If breathing is difficult, remove victim to fresh air and keep at rest in a position comfortable for breathing.
P305 + 351 + 338—IF IN EYES—Rinse continuously with water for several minutes. Remove contact lenses if present and easy to do—continue rinsing.
P306 + 360—IF ON CLOTHING—Rinse immediately contaminated clothing and skin with plenty of water before removing clothes.
P307 + 311—IF exposed—Call a POISON CENTER or doctor/physician.
P308 + 313—IF exposed or concerned—Get medical advice/attention.
P309 + 311—IF exposed or you feel unwell—Call a POISON CENTER or doctor/physician P332 + 313—If skin irritation occurs—Get medical advice/attention.
P333 + 313—If skin irritation or a rash occurs—Get medical advice/attention.
P335 + 334—Brush off loose particles from skin. Immerse in cool water/wrap in wet bandages P337 + 313—Get medical advice/attention.
P342 + 311—Call a POISON CENTER or doctor/physician.
P370 + 376—In case of fire—Stop leak if safe to do so.
P370 + 378—In case of fire—Use __?__ for extinction.
P370 + 380—In case of fire—Evacuate area.
P370 + 380 + 375—In case of fire—Evacuate area. Fight fire remotely due to the risk of explosion.
P371 + 380 + 375—In case of major fire and large quantities—Evacuate area. Fight fire remotely due to the risk of explosion.

Storage Precautionary Codes and Statements

P401—Store __?__.
P402—Store in a dry place.
P403—Store in a well-ventilated place.
P404—Store in a closed container.
P405—Store locked up.
P406—Store in a corrosive resistant/... container with a resistant inner liner.
P407—Maintain air gap between stacks/pallets.
P410—Protect from sunlight.
P411—Store at temperatures not exceeding __?__ °C/ __?__ °F.
P412—Do not expose to temperatures exceeding 50°C/ 122°F.
P420—Store away from other materials.
P422—Store contents under __?__.
P402 + 404—Store in a dry place. Store in a closed container.

P403 + 233—Store in a well-ventilated place. Keep container tightly closed.
P403 + 235—Store in a well-ventilated place. Keep cool.
P410 + 403—Protect from sunlight. Store in a well-ventilated place.
P410 + 412—Protect from sunlight. Do not expose to temperatures exceeding 50°C/122°F P411 + 235—Store at temperatures not exceeding __?__°C/ __?__ °F. Keep cool.

Disposal Precautionary Codes and Statements

P501—Dispose of contents/container to __?__.

CHEMISTRY/TOXICOLOGY

Sittig's Handbook of
Toxic and Hazardous Chemicals and Carcinogens
Volume 3: P – Z
SEVENTH EDITION

The definitive reference on hazardous chemical substances.
Comprehensive and convenient, *Sittig's Handbook* focuses on the most important hazardous chemicals in commercial use.

- The chemicals are presented alphabetically and classified as a carcinogen, hazardous substance, hazardous waste, or toxic pollutant.
- Find the chemical you are looking for quickly and reliably: entries have a full range of synonyms for each chemical, including trade names and CAS index.
- Relevant data for the United States and EU included throughout, along with the essential chemical hazard information applicable worldwide.
- The seventh edition includes more than 100 new chemical records.
- The trusted source of reliable information depended on by first-line responders (emergency services), industry, logistics companies, scientists, and environmental protection organizations.

For over 30 years, *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* has proven to be a reliable, accessible must-have reference work on hazardous materials. This updated and revised 7th edition is the most quickly accessible and comprehensive listing of the hazardous chemicals that are commonly used, transported, and regulated for use in the environment and the workplace. Information is the most vital resource anyone can have when dealing with potential hazardous substance accidents, spillages, fires, or acts of terror. It is also essential for the safe day-to-day operation of chemical processes and environmental protection. Sittig's handbook provides extensive data for over 2200 chemicals in a uniform format, enabling fast and accurate decisions in almost any situation. This new edition contains expanded and reviewed information for each chemical listed (including chemicals classified as WMDs) and has been updated to keep pace with world events, standards, and regulations.

Richard P. Pohanish is the author or co-author of 25 books and database product in the fields of hazardous material, environmental health, chemical safety, and engineering. Active in the publishing and information business for more than half a century, Mr. Pohanish, now retired, formerly held various executive positions with Van Nostrand Reinhold, including President, Information Division. His numerous published works include *Sittig's Handbook of Pesticides and Agricultural Chemicals*, 2nd Edition.
