WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Barium is a flammable, silver white or yellowish metal in various forms including powder. Barium may ignite spontaneously in air in the presence of moisture, evolving hydrogen. Molecular weight = 137.34; boiling point = 1640°C; freezing/melting point = 725°C; vapor pressure = 10 mmHg @ 1049°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 2 ₩ (dangerously water reactive).

Potential Exposure: Metallic barium is used for removal of residual gas in vacuum tubes and in alloys with nickel, lead, calcium, magnesium, sodium, and lithium. Barium compounds are used in the manufacture of lithopone (a white pigment in paints), chlorine, sodium hydroxide, valves, and green flares; in synthetic rubber vulcanization; X-ray diagnostic work, glassmaking, papermaking, beet-sugar purification; animal and vegetable oil refining. They are used in the brick and tile, pyrotechnics, and electronics industries. They are found in lubricants, pesticides, glazes, textile dyes and finishes; pharmaceuticals; in cements which will be exposed to saltwater; and barium is used as a rodenticide, a flux for magnesium alloys, a stabilizer and mold lubricant in the rubber and plastics industries, an extender in paints; a loader for paper, soap, rubber, and linoleum; and as a fire extinguisher for uranium or plutonium fires.

Incompatibilities: Barium powder may spontaneously ignite on contact with air. It is a strong reducing agent and reacts violently with oxidizers and acids. Reacts with water, forming combustible hydrogen gas and barium hydroxide. Reacts violently with halogenated hydrocarbon solvents, causing a fire and explosion hazard.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Ba]/m^3

OSHA PEL: 0.5 mg[Ba]/m^3 TWA

NIOSH REL: 0.5 mg[Ba]/m^3 TWA

ACGIH TLV[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 180 milligram per cubic meter

PAC-3: 1100 milligram per cubic meter

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2); Pregnancy Risk Group D.

Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: MAK 0.5 milligram per cubic meter, 1993; Belgium: TWA 0.5 milligram per cubic meter, 1993; Denmark: TWA 0.5 milligram per cubic meter, 1999; Finland: TWA 0.5 milligram per cubic meter, 1999; Hungary STEL 0.5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (time-weighted average) 0.5 milligram per cubic meter; MAC (STEL) 1.5 milligram per cubic meter, 1999; Sweden: TWA 0.5 milligram per cubic meter, 1999; Switzerland: MAK-week 0.5 milligram per cubic meter, 1999; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom LTEL 0.5 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 5.0 μ/m^3 (Florida and North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (IV) #7056, Barium, soluble compounds. Collection on a cellulose membrane filter, workup with hot water, analysis by atomic absorption. Use NIOSH Analytical Method #8310, Metals in urine. OSHA ANALYTICAL METHOD ID-121.

Permissible Concentration in Water: Safe Drinking Water act: MCLG = 2 mg[Ba]/L; MCL = 2 mg[Ba]/L as Barium. Federal Drinking Water Guidelines: EPA 2000 μg[Ba]/L; State Drinking Water Standards: California 1000 μg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 μg[Ba]/L; Minnesota 2000 μg[Ba]/L.

Determination in Water: Conventional flame atomization does not have sufficient sensitivity to determine barium in most water samples; however, a barium detection limit of 10 μg/L can be achieved if a nitrous oxide flame is used. A concentration procedure for barium uses thenoyltrifluoro-acetone-methylisobutylketone extraction at a pH of 6.8. With a tantalum liner insert, the barium detection limit of the flameless atomic absorption procedure can be improved to 0.1 μg/L according to NAS/NRC[46].

Routes of Entry: Ingestion or inhalation of dust or fume, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Alkaline barium compounds, such as the hydroxide and carbonate, may cause local irritation to the eyes, nose, throat, and skin. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Can cause a variety of cardiac, gastrointestinal, and neuromuscular effects. Associated with hypertension and cardio toxicity in animals[182]. Barium can cause an increase in blood pressure. Barium poisoning is virtually unknown in industry, although the potential exists when the soluble forms are used. When ingested or given orally, the soluble, ionized barium compounds exert a profound effect on all muscles and especially smooth muscles, markedly increasing their contractility. The heart rate is slowed and may stop in systole. Other effects are increased intestinal peristalsis; vascular constriction; bladder contraction, and increased voluntary muscle tension. The inhalation of the dust of barium sulfate may lead to deposition in the lungs in sufficient quantities to produce "baritosis" (a benign pneumoconiosis). This produces a radiologic picture in the absence of symptoms and abnormal physical signs. X-rays, however, will show disseminated nodular opacities throughout the lung fields, which are discrete, but sometimes overlap. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Heart, lungs, central nervous system; skin, respiratory system; eyes.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration With the aid of a pocket mask equipped with a one-way valve or other proper respiratory Medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician (poisoning from barium compounds): If ingested, there is are treatment considerations available including the following: Gastric emptying, a warm aqueous solution of 1% to 3% soluble sulfates of magnesium sulfate or sodium sulfate administered orally as a gastric lavage (forms insoluble barium sulfate). Atropine sulfate, 0.5 to 1.0 mg, to decrease colic. Small doses of morphine may be necessary to control abdominal pain. IV of potassium if hypokalemia is present [Cain].

Personal Protective Methods: Employees should receive instruction in personal hygiene and the importance of not eating in work areas. Good housekeeping and adequate ventilation are essential. Dust masks, respirators, or goggles may be needed where amounts of significant soluble or alkaline forms are encountered, as well as protective clothing.

Respirator Selection: *5 mg^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator (PAPR) with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination With an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: UN1400l Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Barium metal should be stored in a dry area, separated from halogenated solvents, strong oxidants, acids, in tightly closed containers under an inert gas blanket, petroleum or oxygen-free liquid. UN1564 Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked and cool, ventilated area. UN1854 Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Rubber gloves, rubber protective clothing and apron, goggles, and gas-filter mask should be worn when working in a barium storage area.

Shipping: UN1400 Barium, Hazard Class: 4.3; Labels: 4.3—Dangerous when wet material. UN1854 Barium alloys, pyrophoric, Hazard Class: 4.2; Labels: 4.2—Spontaneously combustible material. UN1564 Barium compound, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Small quantities of barium metal may be dissolved in large quantities of water. Soda ash is added and the solution then neutralized with HCl. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May decompose explosively in fire. Barium powder is a flammable solid. Containers may explode when heated. Reacts violently with fire extinguishing agents, such as water, bicarbonate, powder, foam, and carbon dioxide. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Barium in solution (see spill handling) may be precipitated with soda ash and the sludge may be landfilled.

Barium Azide B:0110

Formula: BaN_6; $Ba(N_3)_2$

Synonyms: Azida de bario (Spanish)

CAS Registry Number: 18810-58-7

RTECS Number: CQ8500000 (dry); CQ8510000 (wet)

UN/NA & ERG Number: UN1571 (Barium azide, wetted with not less than 50% water)/113; UN/NA0224 (Barium Azide dry or wetted with <50% water, by mass)/112 Explosive.

EC Number: 242-594-6

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (TQ) (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade).

Hazard Alert: Poison, Highly flammable, Explosive Substance (World Bank)[15], Environmental hazard.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents

United States National Primary Drinking Water Regulations: MCLG = 2 mg[Ba]/L; MCL = 2 mg[Ba]/L, as Barium.

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%. Form R, Toxic Chemical Category Code: N040.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As Barium, water-soluble compounds, n.o.s.

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Barium azide is a flammable, crystalline solid which can be used or transported in solution. Molecular weight = 221.4; boiling point = explodes; freezing/melting point = 120°C (decomposes, losing nitrogen). Highly soluble in water.

Potential Exposure: Barium Azide is used in high explosives.

Incompatibilities: Carbon disulfide. It can explode when heated or shocked.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Ba]/m^3

ACGIH TLV[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen

OSHA PEL: 0.5 mg[Ba]/m^3 TWA

NIOSH REL: 0.5 mg[Ba]/m^3 TWA

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2)

No PAC available.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 5.0 μ/m^3 (Florida and North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: No criteria set for barium azide. Use NIOSH Analytical Methods (IV) #7056, Barium, soluble compounds. Collection on a cellulose membrane filter, workup with hot water, analysis by atomic absorption. Use NIOSH Analytical Method #8310, Metals in urine. OSHA ANALYTICAL METHOD ID-121.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 2000 μg[Ba]/L; State Drinking Water Standards: California 1000 μg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 μg[Ba]/L; Minnesota 2000 μg[Ba]/L.

Routes of Entry: Inhalation, skin and/or eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Barium azide irritates the eyes, nose, and respiratory tract; with coughing. Overexposure can cause a drop in blood pressure, with dizziness; blurred vision; headaches; and unconsciousness. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Barium can cause an increase in blood pressure. Repeated exposure to the dust can cause spots on chest X-ray without lung scarring. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a Medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce

vomiting. Do not make an unconscious person vomit. If weakness or fainting is present, lay the person down flat with feet elevated. See also First Aid section in "Barium" entry.

Personal Protective Methods: Wear protective eye Protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- (for liquid) or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (as soluble barium compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: UN0224 Explosive. UN1571 Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Barium azide must be stored to avoid contact with carbon disulfide, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area from anything which could disturb or shock barium azide. Sources of ignition, such as smoking and open flames are prohibited where barium azide is handled, used, or stored. Keeping barium azide wet greatly reduces its fire and explosion hazard. Wherever barium azide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1571 Barium azide wetted with not <50% water, by mass, Hazard Class: 4.1; Labels: 4.1—Flammable solid, 6.1—Poisonous materials. UN0224 Barium Azide dry or wetted with <50% water, by mass, Hazard Class: 1.1A; Labels: 1.1A—Explosive (with a mass explosion hazard); A—Substances which are expected to mass detonate very soon after fire reaches them. Packing Group 1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Barium Azide will explode when heated or when shocked. Thermal decomposition products may include oxides of nitrogen and metal (barium). If fire or explosion occurs, evacuate the area. Fight the fire from an explosion-resistant location as containers may explode in fire. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Barium Bromate B:0120

Formula: $BaBr_2O_6$; $Ba(BrO_3)_2$
Synonyms: Bromato barico (Spanish); Bromic acid, barium salt
CAS Registry Number: 13967-90-3
RTECS Number: EF8715000
UN/NA & ERG Number: UN2719/141
EC Number: 237-750-5

Regulatory Authority and Advisory Information

Carcinogenicity: EPA: Likely to produce cancer in humans (inhalation, as bromates); Available data are inadequate for an assessment of human carcinogenic potential (oral route, as bromates); Limited evidence of carcinogenicity based on epidemiologic studies.

Hazard Alert: Poison, Strong oxidizer, Environmental hazard.

United States National Primary Drinking Water Regulations: MCLG = 2 mg[Ba]/L; MCL = 2 mg[Ba]/L; 0 mg[BrO_3^-]/L as barium; MCL = 0.010 mg[BrO_3^-]/L, as Bromates.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%. Form R, Toxic Chemical Category Code: N040.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As Barium, water-soluble compounds, n.o.s.

Hazard symbols, risk, & safety statements: Hazard symbol: O, Xn; risk phrases: R8; R20/22; safety phrases: S1; S17; S28; S41; (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Barium bromate is a white crystalline powder. Molecular weight = 411.2; Boiling point: explodes @ 300°C; freezing/melting point = 260°C (decomposes). Slightly soluble in water.

Potential Exposure: This material is used as an analytical reagent, oxidizer and corrosion inhibitor.

Incompatibilities: A strong oxidizer; keep away from reducing agents. Keep away from oxidizable materials; aluminum, arsenic, carbon, copper, metal sulfides; phosphorus, sulfur, organic, and combustible materials (such as wood, paper, oil, fuels), since violent reactions occur.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Ba]/m^3
ACGIH TLV[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen
OSHA PEL: 0.5 mg[Ba]/m^3 TWA
NIOSH REL: 0.5 mg[Ba]/m^3 TWA
DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2)
No PAC available.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 5.0 μ/m^3 (Florida and North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (IV) # 7056, Barium, soluble compounds. Collection on a cellulose membrane filter, workup with hot water, analysis by atomic absorption. Use NIOSH Analytical Method #8310, Metals in urine. OSHA analytical method ID-121.

Permissible Concentration in Water: United States Safe Drinking Water Act (47FR 9352): MCLG = 0 mg/L; MCL = 0.010 mg/L, as bromates. Federal Drinking Water Guidelines: EPA 2000 μg[Ba]/L; State Drinking Water Standards: California 1000 μg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 μg[Ba]/L; Minnesota 2000 μg [Ba]/L.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Barium bromate can affect you when breathed in or swallowed. Contact can irritate and even burn the eyes and skin. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes, causing cough and phlegm. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Barium can cause an increase in blood pressure. After repeated exposure, barium may show up as spots on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. Repeated exposure to Barium Bromate can cause bromine to build up in the body. Consult the sheet on "Bromine" entry. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Repeated skin contact can cause chronic dryness and cracking.

Points of Attack: Lungs, skin.

Medical Surveillance: serum bromide levels. Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. (1) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where barium bromate is handled, used, or stored. Avoid any possible contact with incompatible materials. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN2719 Barium bromate, Hazard Class: 5.1; Labels: 5.1—Oxidizer, 6.1—Poisonous materials.

Spill Handling: *Caution:* Incompatible absorbents: Cellulose-Based Absorbents, Expanded Polymeric Absorbents[101]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Barium bromate explodes @ 275–300°C. Thermal decomposition products may include hydrogen bromide and oxygen which can increase the activity of fire. Extinguish fire using an agent suitable for type of surrounding fire. Barium bromate itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Barium Bromate, Trenton, NJ (June 2005).

Barium Chlorate B:0130

Formula: $BaCl_2O_6$; $Ba(ClO_3)_2$
Synonyms: Barium chlorate (monohydrate); Chloric acid, barium salt; Clorato barico (Spanish)
CAS Registry Number: 13477-00-4 (monohydrate); 10326-27-7 (dihydrate)
HSDB Number: 405
RTECS Number: FN9770000; CQ 8751000 (dihydrate)
UN/NA & ERG Number: UN1445/151
EC Number: 236-760-7 [*Annex I Index No.:* 017-003-00-8] (monohydrate); dihydrate not found.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Strong oxidizer, Environmental hazard, Hematological changes.

United States National Primary Drinking Water Regulations: MCLG = 2 mg[Ba]/L; MCL = 2 mg[Ba]/L as Barium.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%. Form R, Toxic Chemical Category Code: N040.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As Barium, water-soluble compounds, n.o.s.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*monohydrate*): Hazard symbol: O, Xn, N; risk phrases: R8; R9; R20/22; R51/53; safety phrases: S2; S13; S27; S61.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Barium chlorate is a combustible, colorless to white crystalline solid or powder. Molecular weight = 304.24; 244.3 (dihydrate); freezing/melting point = monohydrate decomposes below 250°C; dihydrate @ 120°C (loss of water of crystallization). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 1 ₩, Oxidizer. Soluble in water; solubility = 27 g/100 mL.

Potential Exposure: It is used in fireworks and explosives manufacture; in textile dyeing and in the manufacture of other perchlorates.

Incompatibilities: A strong oxidizer. When heated above 250°C, it begins to give off oxygen and will increase risk of fire. Barium chlorate is a reactive chemical and is an explosion hazard. Violent reaction may occur with reducing materials; strong acids; powdered metals. Contact with combustible materials will increase activity in fire.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Ba]/m^3

ACGIH TLV[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen

OSHA PEL: 0.5 mg[Ba]/m^3 TWA

NIOSH REL: 0.5 mg[Ba]/m^3 TWA

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2)

No PAC available.

Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: MAK 0.5 milligram per cubic meter, 1993; Belgium: TWA 0.5 milligram per cubic meter, 1993; Denmark: TWA 0.5 milligram per cubic meter, 1999; Finland: TWA 0.5 milligram per cubic meter, 1999; Hungary STEL 0.5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (time-weighted average) 0.5 milligram per cubic meter; MAC (STEL) 1.5 milligram per cubic meter, 1999; Sweden: TWA 0.5 milligram per cubic meter, 1999; Switzerland: MAK-week 0.5 milligram per cubic meter, 1999; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom LTEL 0.5 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 5.0 μ/m^3 (Florida and North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (IV) #7056, Barium, soluble compounds. Collection on a cellulose membrane filter, workup with hot water, analysis by atomic absorption. Use NIOSH Analytical Method #8310, Metals in urine. OSHA analytical method ID-121.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 2000 μg[Ba]/L; State Drinking Water Standards: California 1000 μg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 μg[Ba]/L; Minnesota 2000 μg[Ba]/L.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may burn the eyes and skin. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes. Higher exposures can damage red blood cells. Symptoms include headache, weakness, abdominal pain, dark urine, and jaundice. The symptoms of paralysis may be delayed for several hours. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Barium can cause an increase in blood pressure. After repeated exposure, barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. See entry for "Silica quartz." Chlorates can damage red blood cells, leading to kidney damage, or cause methemoglobin to form in the blood, reducing oxygen supply to body organs. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Repeated skin contact can cause chronic dryness and skin cracking.

Points of Attack: Lungs, blood cells, skin.

Medical Surveillance: Lung function tests, complete blood count (CBC), test for methemoglobin. Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of paralysis do not become obvious until some hours have passed. Keep under medical observation for 24 to 48 hours. See also First Aid Section in "Barium" entry.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly immediately after exposure to barium chlorate. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of barium chlorate to potentially exposed workers.

Respirator Selection: (Ba soluble compounds) *5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. (1) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Barium chlorate must be stored to avoid contact with organic or combustible materials (such as wood, paper, oil, fuels, and starch) and other easily oxidizable materials (such as sulfur, aluminum, copper, metal sulfides; ammonium salts, etc.), since violent reactions occur. Store in tightly closed containers on nonwood floors in a cool, well-ventilated area. Wherever barium chlorate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1445 Barium chlorate, Hazard Class: 5.1; Labels: 5.1—Oxidizer, 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar nonorganic material and deposit in sealed containers. May also be covered with weak reducing agents; resulting sludge neutralized and flushed to sewer. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental

protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include chlorides and oxides of metal. May explode when heated. Contact with combustible, organic, or other easily oxidizable materials, such as paper, oil, fuels or sawdust can cause fires. Rubbing of these mixtures can cause explosions. Use water to extinguish the fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use large volumes of reducing agent (bisulfite or ferrous salt) solutions. Neutralize and flush to sewer with large volumes of water[24].

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

RCRA Land Ban Waste Restrictions

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%. Form R, Toxic Chemical Category Code: N040.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide compounds

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

United States National Primary Drinking Water Regulations: MCLG = 2 mg[Ba]/L; MCL = 2 mg[Ba]/L, as Barium; MCLG = 0.2 mg[CN^-]/L; MCL = 0.2 mg [CN^-]/L as cyanide.

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. As cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): X + CN-where X = H+ or any other group where a formal dissociation may occur. For example, KCN or Ca(CN)2; Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As Barium, water-soluble compounds, n.o.s. and Cyanide compounds, inorganic, n.o.s.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R17; R28; R32; R50/53; safety phrases: S1/2; S7/8; S23; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Barium cyanide is a white crystalline powder. Often used in solution. Molecular weight = 189.4; heat of combustion = -60.5×10^5 J/kg; heat of solution = (exothermic) = -6.19×10^5 J/kg. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0 ₩. Soluble in water; solubility = 80 g/100 cc @ 14°C. Slow reaction with water releases cyanide gas.

Potential Exposure: Barium cyanide is used in electroplating and in metallurgy.

Incompatibilities: Solution is basic. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, & acid salts (release toxic hydrogen cyanide gas), strong bases.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Ba]/m^3; 25 mg[CN]/m^3

ACGIH TLV[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen
OSHA PEL: 0.5 mg[Ba]/m^3 TWA
NIOSH REL: 0.5 mg[Ba]/m^3 TWA
PAC Ver. 29[138]
PAC-1: 44 milligram per cubic meter
PAC-2: 60 milligram per cubic meter
PAC-3: 360 milligram per cubic meter
DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2)
Australia: TWA 5 milligram per cubic meter, [skin], 1993; Austria: MAK 5 mg[CN]/m^3, [skin], 1999; Denmark: TWA 5 milligram per cubic meter, [skin], 1999; France: VME 5 mg[CN]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 milligram per cubic meter, KZG-W 10 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: ceiling concentration 5 milligram per cubic meter [skin]. Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 5.0 μ/m^3 (Florida and North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #7904; #6010, cyanides.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Barium cyanide is a deadly poison; can affect you when breathed and by passing through skin. Exposure can cause confusion, weakness, headaches, nausea, vomiting, gasping for air; collapse and even death from cyanide poisoning. On contact with acids, acid mists, or acid salts; flammable hydrogen cyanide gas is formed which can cause rapid poisoning. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Barium can cause an increase in blood pressure. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Can interfere with the normal functioning of the thyroid gland, causing goiter (enlarged thyroid).

Points of Attack: Thyroid, heart.

Medical Surveillance: Blood cyanide level. Thyroid function tests. Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *If cyanide poisoning is confirmed*, use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1–2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-(for liquid) or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (***as Ba soluble compounds***) *5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or

SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

NIOSH (***as cyanides***): *25 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Barium cyanide must be stored to avoid contact with acids; acid salt (such as potassium bisulfate, calcium biphosphate and calcium nitrate); carbon dioxide and strong oxidizers (such as nitrates, chlorates and chlorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN1565 Barium cyanide, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate the area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers.

Fire Extinguishing: Barium cyanide does not burn, but contact with acids, acid salts; or carbon dioxide in air may produce highly flammable hydrogen cyanide gas. Extinguish fire using an agent suitable for type of surrounding fire. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Precipitate barium with sulfate. Then add with stirring to alkaline calcium hypochlorite solution. Let stand 24 hours, then flush to sewer.

Barium Nitrate B:0160

Formula: BaN_2O_6; $Ba(NO_3)_2$

Synonyms: Barium dinitrate; Nitrate de baryum (French); Nitrato barico (Spanish); Nitrato de bario (Spanish); Nitric acid, Barium salt

CAS Registry Number: 10022-31-8

HSDB Number: 401

RTECS Number: CQ9625000

UN/NA & ERG Number: UN1446/141

EC Number: 233-020-5

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Strong oxidizer, Corrosive, Primary irritant (w/o allergic reaction), Environmental hazard.

United States National Primary Drinking Water Regulations: MCLG = 2 mg[Ba]/L; MCL = 2 mg[Ba]/L as Barium; MCLG = 10 mg[N]/L; MCL = 10 mg/L as Nitrates

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%. Form R, Toxic Chemical Category Code: N040.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: O, C, Xi, Xn risk phrases: R8; R20/21/22; R25; R26; R34; R36/38; safety phrases: S17; S23; S26; S28; 36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Barium Nitrate is a shiny, white crystalline solid. Molecular weight = 261.35; Specific gravity water = 1) = 3.24 @ 23°C; boiling point = 210°C (decomposes); freezing/melting point = 590°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 2 ₩, Oxidizer. Soluble in water.

Potential Exposure: Barium nitrate is used in making fireworks (in green fire pyrotechnics), signal lights, ceramics; and in the electronics industry; to make BaO_2. Once used in the vacuum tube industry.

Incompatibilities: A strong oxidizer. Decomposes in heat; may detonate if confined in elevating temperatures. Keep away from strong acids; reducing agents. Contact with organic and combustible materials (such as wood, paper, oil and fuels); and aluminum−magnesium alloys, since violent reactions occur. Contact with sulfur powder and finely divided metals can form shock-sensitive compounds.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Ba]/m^3

ACGIH TLV[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen

OSHA PEL: 0.5 mg[Ba]/m^3 TWA

NIOSH REL: 0.5 mg[Ba]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 2.9 milligram per cubic meter

PAC-2: 350 milligram per cubic meter

PAC-3: 2100 milligram per cubic meter

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2)

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 5.0 μ/m^3 (Florida and North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (IV) #7056, Barium, soluble compounds. Collection on a cellulose membrane filter, workup with hot water, analysis by atomic absorption. Use NIOSH Analytical Method #8310, Metals in urine. OSHA ANALYTICAL METHOD ID-121.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 2000 μg[Ba]/L; State Drinking Water Standards: California 1000 μg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 μg[Ba]/L; Minnesota 2000 μg[Ba]/L.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Barium nitrate can affect you when breathed in. Inhaling dust or mist can cause irritation of the respiratory system, causing cough and phlegm. Contact can irritate and even burn the eyes and skin. Exposure can irritate the eyes, nose, and throat. Very high exposure (such as swallowing or extremely high dust exposure) can cause barium poisoning with symptoms of vomiting and diarrhea; irregular heartbeat; paralysis, and death. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders. LD_{50} = (oral-rat) 355 mg/kg.

Long-Term Exposure: Barium can cause an increase in blood pressure. Repeated high exposure can irritate the lungs, causing cough and phlegm and may cause an abnormal chest X-ray. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs, nervous system; heart.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and Wash immediately with soap and Water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (Ba soluble compounds) *5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Oxidizer. Potentially explosive. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. (1) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store in tightly closed containers in a cool, well-ventilated area. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1446 Barium nitrate, Hazard Class: 5.1; Labels: 5.1—Oxidizer, 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and metal. Extinguish fire using an agent suitable for type of surrounding fire. Barium nitrate itself does not burn but heating causes decomposition and gives off oxygen, thereby increasing the intensity of an existing fire. Use flooding amounts of water in early stages of fire[17]; in large fires, the material may melt and water could scatter the molten material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve waste in 6-MHCl. Neutralize with NH_4OH. Precipitate with excess sodium carbonate. Filter, wash and dry precipitate and return to supplier.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 2000 μg[Ba]/L; State Drinking Water Standards: California 1000 μg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 μg[Ba]/L; Minnesota 2000 μg[Ba]/L.

Determination in Water: Harmful to the environment: aquatic organisms [NIOSH, ICSC:0778]

Routes of Entry: Inhalation, ingestion, skin or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Barium oxide can affect you when breathed in. Contact can irritate the skin and burn the eyes, causing loss of vision. Breathing the dust or mist can irritate the nose, throat and bronchial tubes, causing cough and phlegm. High exposure may cause pulmonary edema, a medical emergency, which can be delayed for several hours. The symptoms of pulmonary edema are aggravated by physical effort. This can cause death. Exposure to this chemical can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Barium can cause an increase in blood pressure. May cause lung irritation and bronchitis. After repeated exposure, barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs, nervous system, heart.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (Ba soluble compounds) *5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As Barium, water-soluble compounds, n.o.s.

Hazard symbols, risk, & safety statements: Hazard symbol: O, T; risk phrases: R8, R9, R20/22; R23/24/25; R26; R36/37/38; safety phrases: S8; S28; 36/37/39; S41; S45 (see Appendix 4)

Description: Barium permananganate is a brownish-violet, dark purple to black crystalline solid. Molecular weight = 375.2; specific gravity (H$_2$O:1) = 3.77 @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0 ₩. Soluble in water.

Potential Exposure: It is used to make dry cells and other permanganates, and as a disinfectant.

Incompatibilities: A strong oxidizer. May be explosive on contact with combustible and finely divided materials/metals. Keep away from sulfuric acid; possibly explosive. Explosions can occur when permanganates that have been treated with sulfuric acid come in contact with benzene, carbon disulfide, diethyl ether, ethyl alcohol, petroleum, or organic matter. Contact with acetic acid or acetic anhydride can cause explosion. if not kept cold [Von Schwartz 1918 p. 34][101]. Incompatible with acetic acid, acetic anhydride, and organic or combustible materials (such as wood, paper, oil, and fuels), since violent reactions can occur. When mixed with combustible materials, this material can ignite by friction or acids; may be spontaneously combustible.

Permissible Exposure Limits in Air

Manganese, inorganic compound

NIOSH IDLH = 500 mg[Mn]/m^3

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume)

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL

ACGIH TLV[1] 0.02 mg[Mn]/m^3, respirable fraction; 0.1 mg[Mn]/m^3, inhalable fraction; not classifiable as a human carcinogen.

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

Barium permananganate

PAC Ver. 29[138]

PAC-1: 20 milligram per cubic meter

PAC-2: 34 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

Determination in Air: *Barium:* Use NIOSH Analytical Methods (IV) #7056, Barium, soluble compounds. Collection on a cellulose membrane filter, workup with hot water, analysis by atomic absorption. Use NIOSH Analytical Method #8310, Metals in urine. OSHA ANALYTICAL METHOD ID; *Manganese:* Use NIOSH Analytical Method, Elements by ICP, #7300; #7301; #7303; #9102; Elements in blood or tissue, #8005; Metals in urine, #8310; OSHA Analytical Method, ID-125G or ID121.

Permissible Concentration in Water: *Manganese:* Federal Drinking Water Guidelines: EPA 50 µg[Mn]/L; State Drinking Water Standards: New York: 300 µg[Mn]/L; State Drinking Water Guidelines: California 500 µg[Mn]/L; Connecticut: 500 µg[Mn]/L; Maine: 500 µg[Mn]/L; Minnesota: 300 µg[Mn]/L; New Hampshire: 100 µg[Mn]/L World Health Organization (WHO) limit: 400 µg(Mn)/L

Barium: Federal Drinking Water Guidelines: EPA 2000 µg [Ba]/L; State Drin king Water Standards: California 1000 µg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 µg[Ba]/L; Minnesota 2000 µg[Ba]/L.

Routes of Entry: Inhalation.

Short-Term Exposure: Skin and eye contact can cause severe irritation and burns. Barium permanganate can affect you when breathed in. Breathing the dust or mist can irritate the nose, throat and bronchial tubes, causing cough and phlegm. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Barium can cause an increase in blood pressure. After repeated exposure, Barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with Silica, which scars the lungs. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Repeated contact may cause chronic drying and cracking skin.

Points of Attack: Lungs, skin.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles an d face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of Barium permanganate to potentially exposed workers.

Respirator Selection: (Ba soluble compounds) *5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. (1) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Store in tightly closed containers is a cool, well-ventilated area. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1448 Barium permanganate, Hazard Class: 5.1; Labels: 5.1—Oxidizer, 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: A strong oxidizing agent; my increase intensity of fire. Thermal decomposition products may include oxides of metal. Barium permanganate does not burn, but contact with organic and combustible materials may cause fires or explosions. In case of fire, evacuate the area and fight the fire from a safe, protected location. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number N450, must conform with USEP A regulations for storage, transportation, treatment, and disposal of waste. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Dispose of contents and container to an approved waste disposal plant. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. All federal, state, and local environmental regulations must be observed. Do not discharge into drains or sewers.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Oxidizer, Environmental hazard.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%. Form R, Toxic Chemical Category Code: N040.

United States National Primary Drinking Water Regulations: MCLG = 2 mg[Ba]/L; MCL = 2 mg[Ba]/L, as Barium.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As Barium, water-soluble compounds, n.o.s.

Hazard symbols, risk, & safety statements: Hazard symbol: O, Xn; risk phrases: R8; R20/22; safety phrases: S2; S13; S27; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Barium peroxide is a grayish-white powder. Molecular weight = 169.34; specific gravity (H_2O:1) = 4.97; boiling point = 800°C (decomposes below this point); freezing/melting point = 450°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 2 ₩, Oxidizer. Very slightly soluble in water.

Potential Exposure: Is used as a bleaching agent; in making hydrogen peroxide, oxygen; in aluminum welding; in textile dyeing and for bleaching fibers; animal substances.

Incompatibilities: A strong oxidizer. Keep away from organic and combustible materials (such as wood, paper, oil, fuels, and other easily oxidized materials) and peroxyformic acid, hydrogen sulfide and hydroxylamine solutions, since violent reactions occur.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 mg[Ba]/m^3

ACGIH TLV[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen

OSHA PEL: 0.5 mg[Ba]/m^3 TWA

NIOSH REL: 0.5 mg[Ba]/m^3 TWA

Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: MAK 0.5 milligram per cubic meter, 1993; Belgium: TWA 0.5 milligram per cubic meter, 1993; Denmark: TWA 0.5 milligram per cubic meter, 1999; Finland: TWA 0.5 milligram per cubic meter, 1999; Hungary STEL 0.5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (time-weighted average) 0.5 milligram per cubic meter; MAC (STEL) 1.5 milligram per cubic meter, 1999; Sweden: TWA 0.5 milligram per cubic meter, 1999; Switzerland: MAK-week 0.5 milligram per cubic meter, 1999; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom LTEL 0.5 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μ/m^3 (New York) to 5.0 μ/m^3 (Florida and North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: See entry under "Barium."

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 2000 μg[Ba]/L; State Drinking Water Standards: California 1000 μg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 μg[Ba]/L; Minnesota 2000 μg[Ba]/L.

Determination in Water: Environmental hazard for aquatic organisms.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Barium peroxide can affect you when breathed in. Contact can irritate and burn the eyes and skin. Breathing the dust or mist can irritate the nose, throat and bronchial tubes, causing cough and phlegm. Exposure to this chemical can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Barium can cause an increase in blood pressure. After repeated exposure, Barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. Repeated contact may cause chronic drying and cracking skin. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs, skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operational and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (Ba soluble compounds) *5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. (1) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture, and away from contact with the incompatible materials cited above. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1449 Barium peroxide, Hazard Class: 5.1; Labels: 5.1—Oxidizer, 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Cover material with sand/soda ash 9:1 mixture. Mix thoroughly and while stirring, add slowly to sodium bisulfite solution with plastic implements. Neutralize with dilute H_2SO_4. After setting, decant the solution with flushing water and transport the sand to a sanitary landfill[22]. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include barium oxide and pure oxygen. Barium peroxide does not burn, but mixtures of barium peroxide and combustible, organic, or easily oxidized materials, such as wood, fuels, paper, and charcoal will burn or explode if rubbed or contact a small amount of water. Use large amounts of water to extinguish the fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed. Contact your local or federal environmental protection agency for specific recommendations.

Determination in Air: Barium sulfate may be determined by filtration and gravimetric measurement.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 2000 μg[Ba]/L; State Drinking Water Standards: California 1000 μg[Ba]/L; State Drinking Water Guidelines: Arizona 1500 μg[Ba]/L; Minnesota 2000 μg[Ba]/L.

Routes of Entry: Inhalation of dust; ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes and respiratory tract. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long-Term Exposure: Barium can cause an increase in blood pressure. Lungs may be affected by repeated or prolonged exposure to dust particles, resulting in baritosis (a form of benign pneumoconiosis) (WHO). Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs, nervous system; heart.

Medical Surveillance: Consideration should be given to the skin, eyes, heart, and lung in any placement or periodic examination.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *12.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *25 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *50 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1564 Barium compounds, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include sulfur oxides. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information
Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Human evidence: inadequate; animal evidence: sufficient, possibly carcinogenic to humans, Group 2B, 1993
California Proposition 65 Chemical[102]: Cancer 6/1/1989.
Hazard Alert: Poison, Combustible Corrosive, Possible risk of forming tumors, Suspected reprotoxic hazard.
Hazard symbols, risk, & safety statements: Hazard symbol: F, T, Xn; risk phrases: R45; R40; R50/53; R61; R63; safety phrases: S16; 36/37/39; S41; S45; S53 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: C.I. Basic red 9 is a colorless to red crystalline solid or green powder. Molecular weight = 323.85; freezing/melting point = (decomposes) 268−270°C. Practically insoluble in water; solubility ≤ 0.1 mg/mL @ 20°C. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: Used as a dye for textiles, paper; printing, computer and photo imaging inks, leather, and many consumer products; as a microbiological/microscopy stain for bacilli, including tubercle and influenza.

Incompatibilities: May be combustible; powder or liquid may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:
No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \leq -0.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion, dermal contact

Harmful Effects and Symptoms

Short-Term Exposure: LD_{50} = (oral-mouse) 5 g/kg.

Long-Term Exposure: May cause tumors, cancer. May affect DNA of fetus.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Eyes: first check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20 to 30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: immediately flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, immediately call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation:* immediately leave the contaminated area; take deep breaths of fresh air. Immediately call a physician and be prepared to transport the victim to a hospital even if no symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA should be used; if not available, use a level of protection greater than or equal to that advised under protective clothing. Ingestion: do not induce vomiting. If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and immediately call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. *Do not induce vomiting*. Immediately transport the victim to a hospital. *Other:* since this chemical is a known or suspected carcinogen you should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician will depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

Personal Protective Methods: Wear positive-pressure, SCBA. Wear chemical protective clothing which is specifically recommended by the manufacturer. Structural firefighter's protective clothing provides only limited protection.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN 3143 Dyes, solid, toxic, n.o.s., or dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. All equipment used to handle this material must be grounded. IF material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. Wear positive-pressure, SCBA. Wear chemical protective clothing which is specifically recommended by the manufacturer. Structural firefighter's protective clothing provides only limited protection. *Release, no fire.* Prevent dust cloud. Small spill: Cover with sand or other noncombustible material and place in a container for later disposal. Cover powder spills with plastic sheet or tarp to minimize spreading and protect from wind, rain, or spray. Large spill: Stop the release if it can be done safely from a distance. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use large amounts of water well away from release to disperse vapors−contain runoff. Ventilate confined area if it can be done without placing personnel at risk.

Fire Extinguishing: Thermal decomposition products may include poisonous and toxic hydrogen chloride gas, and oxides of nitrogen and carbon. *Small fire*: Use *dry* chemical, CO$_2$, water spray, or regular foam. Large fire: Use water spray, fog, or regular foam. Do not scatter spilled material with high pressure water streams. Dike fire-control water for later disposal. If material is not leaking, cool exposed containers with large quantities of water from unattended equipment until fire is well out, or remove intact containers if it can be done safely. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Possible neurotoxic effects (methyl carbamate), Environmental hazard, Agricultural chemical.

FAO/WHO Acceptable Daily Intake (ADI): 0.004 mg/kg

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U278

Superfund/EPCRA [40CFR 302 and 355, FR: 8/16/06, Vol. 71, No. 158] RQ: 100 lb (45.4 kg)

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R21; R23/24/25; R50/55; safety phrases: S1/2; S22; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Bendiocarb is a white odorless crystalline powder. Molecular weight = 223.3; freezing/melting point = 129−130°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0 ₩. Soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this carbamate insecticide which is used against household pests, in agriculture in seed treatment, and as a foliar spray.

Incompatibilities: Carbamates are incompatible with reducing agents, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas. May react violently with bromine, ketones. Incompatible with azo dyes, caustics, ammonia, amines, boranes, hydrazines, strong oxidizers. Keep away from flammable materials and sources of heat and flame.

Permissible Exposure Limits in Air
No standards or PAC available.

Permissible Concentration in Water: Canada's Drinking Water Quality is 0.04 mg/L MAC.

Determination in Water: Fish Tox = 379.47332000 ppb MATC (LOW).

Routes of Entry: Inhalation, skin, contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Bendiocarb is a toxic carbamate chemical. Bendiocarb can affect you when inhaled. Exposure can cause rapid poisoning, with headaches, sweating, nausea and vomiting; diarrhea, loss of concentration and death. Eye contact can cause irritation and blurred vision.

Long-Term Exposure: Similar carbamates can affect the central nervous system. Human Tox: 35.00000 ppb Health advisory: (INTERMEDIATE).

Medical Surveillance: Within a few hours of exposure determine erythrocyte cholinesterase and/or the presence of metabolites of bendiocarb in urine. Before starting work, at regular times after that, and if symptoms develop or over exposure occurs, the following is recommended: Serum and RBC cholinesterase levels (a test for the body substance affected by bendiocarb). For this substance, these tests are accurate only if done within about two hours of exposure, and can return to normal before the person feels well.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with Bendiocarb. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. The Farm Chemicals Handbook recommends polyvinyl chloride or rubber as a protective material.

Eye Protection: Wear dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential exists for exposures to bendiocarb, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a pesticide cartridge. Increased protection is obtained from full facepiece air purifying respirators (APR). *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator for pesticides with a full facepiece operated in the positive pressure mode, or with a full facepiece hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with Bendiocarb all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from food, fertilizers, other pesticides, flammable materials and sources of heat and flame.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft. (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 570.

Fire Extinguishing: Bendiocarb may burn, but does not readily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, halon, water spray; or standard foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Dispose in accordance with 40CFR165 recommendations for the disposal of pesticides and pesticide containers.

EC Number: 217-465-2

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Group E Evidence of Noncarcinogenicity for humans

Hazard Alert: Poison, Combustible, Sensitization hazard (skin), Environmental hazard, Agricultural chemical.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R21; R23/25; R50/53; safety phrases: S1/2; S22; S24/25; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Yellowish-orange crystalline solid. Commercial product is available as an emulsifiable concentrate. Molecular weight = 335.31; Specific gravity (H_2O:1) = 1.278 @ 20°C; freezing/melting point = 66°C; vapor pressure = 1×10^{-5} mmHg @ 20°C; flash point =< 190°C. Slightly soluble in water: solubility = 70 mg/L @ 25°C; <1 mg/L @ 25°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Selective preemergence herbicide used to control of annual grasses and broad-leaf weeds. Used on alfalfa, red clover, seeded lettuce, trefoil; peanuts, certain tobaccos, vegetables such as endive, field and French beans, and lentils. A dinitroaniline derivative.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Moderate heat causes decomposition that produces toxic vapors that can form an explosive mixture with air.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg[F]/L, as Fluoride.

Determination in Water: Octanol−water coefficient: Log K_{ow} => 5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: High—3.08219 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Ingestion, dermal contact, absorbed through the skin, inhalation of the dust, or vapor when these materials are heated

Harmful Effects and Symptoms

Short-Term Exposure: Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, yellowish tint to skin and lips, anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmia is commonly noted. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. Severe exposure can cause death from heart failure Dinitrobenzene materials are toxic to the blood; prevents hemoglobin from carrying oxygen. May be more toxic than aniline. LD_{50} (oral, rat) => 5 g/kg; LD_{50} (dermal, rat) => 5 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. May damage the liver, kidneys, and blood cells. This chemical may stain yellow the skin, eyes, and fingernails. Repeated exposure may cause anxiety, fatigue, insomnia, excessive perspiration, unusual thirst, weight loss and cataracts in the eyes. May affect the thyroid gland. May cause skin sensitization in some persons. Human toxicity (long-term)[101]: Very low—2100.00 ppb, Health advisory.

Points of Attack: Skin, bones, liver, kidneys, lungs, peripheral nervous system, eyes, thyroid gland, blood. May cause reproductive and fetal effects.

Medical Surveillance: Before beginning employment, at regular times after that and if symptoms develop or overexposure has occurred, the following may be useful: Exam of eyes for cataracts. Exam of skin and nails for staining. Liver and kidney function tests. CBC. Blood methemoglobin levels. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested*. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Dinitroanilines react with cellulose-based and expanded polymeric absorbents[88]. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required. UN1596 Dinotoanilines, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: First, remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition product includes hydrogen fluoride fumes and oxides of nitrogen and carbon. This chemical is a combustible solid but does not readily ignite. Moderate heat causes decomposition that produces toxic vapors that form an explosive mixture with air. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Ultraviolet-radiation: This liquid herbicide is reported to be susceptible to decomposition by UV radiation[UN].

Benfuracarb B:0227

Formula: $C_{20}H_{30}N_2O_5S$

Synonyms: β-Alanine, *N*-[((((2,3-dihydro-2,2-dimethyl-7-benzofuranyl)oxy)carbonyl)methylamino)thio]-*N*-(1-methylethyl)-, ethyl ester; Aminofuracarb; Aminosulfulan; 2,3-Dihydro-2,2-dimethyl-7-benzofuranyl *N*-(*N*-2-(ethoxycarbonyl)ethyl-*N*-isopropylaminosulfenyl)-*N*-methylcarbamate; Ethyl*N*-(2,3-dihydro-2,2-dimethylbenzofuran-7-yloxycarbonyl(methyl)aminothio)-*N*-isopropyl-β-alaninate; Ethyl [((((2,3-dihydro-2,2-dimethyl-7-benzofuranyl)oxy)carbonyl)methylamino)thio]-*N*-(1-methylethyl)-β-alanine; furacon; OC-11588; OK 174; Oncol

CAS Registry Number: 82560-54-1

HSDB Number: 6664 accesses Furathiocarb (65907-30-4)

RTECS Number: AY5088000

UN/NA & ERG Number: UN2992 (Carbamate pesticides, liquid, toxic)/151

EC Number: Not available [*Annex I Index No.:* 006-088-007]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Possible neurotoxic effects (methylcarbamate), Combustible, Environmental hazard, Agricultural chemical.

Hazardous substance: OSHA29CFR1910.1200.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, N; risk phrases: R22; R23; R33; R50/53; R62; safety phrases: S1/2; S29; S36/37; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Benfuracarb is a thick liquid. Molecular weight = 410.55; specific gravity (H_2O:1) = 1.172; boiling point = 110°C; freezing/melting point = < 25°C; flash point = 114°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩. Partly soluble in water; solubility = 7.8 mg/L @ 20°C. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: A benzofuranyl methylcarbamate insecticide, nematicide. Not registered for use in the United States.

Incompatibilities: Carbamates are incompatible with reducing agents, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas. May react violently with bromine, ketones. Incompatible with azo dyes, caustics, ammonia, amines, boranes, hydrazines, strong oxidizers.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log K_{ow} => 4. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion and skin absorption

Harmful Effects and Symptoms

The signs and symptoms (of carbamate intoxication) can be categorized into the following three groups: (1) Muscarinic manifestations: increased bronchial secretion, excessive sweating, salivation, and lachrymation; pinpoint pupils, bronchoconstriction, abdominal cramps (vomiting and diarrhea); and bradycardia. (2) Nicotinic manifestations-fasciculation of fine muscles (in severe cases, diaphragm and respiratory muscles also involved); and tachycardia. (3) Central nervous system manifestations, including headache, dizziness, anxiety, mental confusion, convulsions, and coma; and depression of respiratory center. All these signs and symptoms can occur in different combinations and can vary in onset and sequence, depending on the chemical, dose, and route of exposure. Mild poisoning might include muscarinic and nicotinic signs only. Severe cases always show central nervous system (CNS) involvement; the clinical picture is dominated by the respiratory failure sometimes leading to pulmonary edema due to the combination of the above mentioned symptoms [WHO].

Short-Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes. LD_{50} (oral, rat) = 200 mg/kg; LD_{50} (dermal, rat) = 2 g/kg.

Long-Term Exposure: A potent acetylcholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase. Suspected of causing genetic defects.

Medical Surveillance: Comprehensive physical examination with emphasis on the genito-urinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be carried out if, in the opinion of the responsible physician, they are indicated. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting.* If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIO United States OR HAVING CONVULSIONS*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 g) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. DuPont Tychem suit fabrics[101] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin

is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as sodium hydroxide, sodium bicarbonate, etc.).

Shipping: UN 2992 Carbamate pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: For liquids, isolate spill or leak area in all directions for at least 50 m/150 ft. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. *On small fire*, use dry chemical powder, carbon dioxide, water spray, or foam. *On large fire*, use water spray, fog or regular alcohol-resistant foam. Do not scatter material using straight water jet streams. Dike fire control water for later disposal; do not scatter the material. Move containers from fire area if you can do it without risk. *If tank, rail car or tank truck is involved in a fire*, *isolate* for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package lab el directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (adjustable powder formulations containing a combination of: Benomyl @ or $>7\%$; carbofuran @ or $>10\%$; thiram @ or $>15\%$).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xi; risk phrases: R33; R46; R60; R61; R37/38; R43; R50/53; R61; R62; R63; safety phrases: S29; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)].

Description: Benomyl is a white crystalline solid. Faint acrid odor. Molecular weight = 290.36. Boiling point = decomposes without melting; freezing/melting point = (decomposes) $\geq 300°C$; vapor pressure = 1×10^{-5} mmHg @ 20°C. Autoignition temperature = 220°C; explosive limits: LEL: 0.05 g/L[101]; UEL: unknown; Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 2; reactivity 0 ₩. Slightly soluble in water; solubility = 0.002 g/L @ 25°C; decomposition Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: Benomyl is used as an agricultural chemical and pesticide, pharmaceutical, and veterinary drug.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides (forms toxic oxides of nitrogen). Decomposed in water or otherwise moist conditions.

Permissible Exposure Limits in Air

OS HA PE L: 15 milligram per cubic meter total dust, TWA; 5 milligram per cubic meter respirable fraction, TWA

NIOSH REL: None established. See Appendix D of the *NIOSH Pocket Guide*

ACGIH TLV[1]: 10 milligram per cubic meter TWA; not classifiable as a human carcinogen

No PAC available.

DFG MAK: [skin] possible sensitization of skin; Germ Cell Mutagen Group: 3A (2005).

Australia: TWA 0.8 ppm (10 milligram per cubic meter), 1993; Belgium: TWA 0.84 ppm (10 milligram per cubic meter), 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 0.8 ppm (10 milligram per cubic meter), STEL 2.4 ppm (30 milligram per cubic meter), [skin], 1993; France: VME 0.8 ppm (10 milligram per cubic meter), 1999; Switzerland: MAK-week 0.8 ppm (10 milligram per cubic meter), 1999; United Kingdom: TWA 10 milligram per cubic meter, STEL 15 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Colombia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[43] has set a limit in ambient air of 0.35 milligram per cubic meter on a once-a-day basis and 0.05 milligram per cubic meter on an average daily basis. Several states have set guidelines or standards for benomyl in ambient air[60] ranging from $100\ \mu/m^3$ (North Dakota and Virginia) to $200\ \mu/m^3$ (Connecticut) to $238\ \mu/m^3$ (Nevada).

Determination in Air: Determination in Air: Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601. Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500, total dust, #0600 (respirable)]

Permissible Concentration in Water: Russia set a MAC in surface water of 0.5 mg/L of benomyl[35].

Determination in Air: Fish Tox: 2.19089000 ppb MATC (HIGH)

Routes of Entry: Inhalation, dermal contact.

Harmful Effects and Symptoms

Benomyl is generally felt to have a low order of acute and chronic toxicity[53]. However, a rebuttable presumption against registration for benomyl was issued on December 6, 1978 by United States Environmental Protection Agency on the basis of reduction in nontarget species, mutagenicity, teratogenicity, reproductive effects, and hazard to wildlife. The ADI for man is 0.02 mg/kg[23].

***Short-Term Exposure*:** The substance irritates the skin, eyes, and upper respiratory system. Exposure could cause depression of the CNS and lack of muscular coordination. LD_{50} = 9590 mg/kg[77].

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Human mutation data reported. Also experimental and reproductive effect. May damage the male reproductive system; cause heritable genetic damage in humans. Animal tests show that this substance possibly causes birth defects in human babies, miscarriage, or cancer.

Points of Attack: Eyes, skin, respiratory system, reproductive system.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place or in a refrigerator[52] away from strong bases; strong acids, heat.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid dust, then transfer material to a suitable container. Use absorbent paper dampened with toluene to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal[52]. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 1900.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. Extinguish fires using an agent suitable for the type of surrounding fire; benomyl itself does not burn.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

HSDB Number: 393

RTECS Number: TE0250000

UN/NA & ERG Number: (PIH) UN3077 (environmentally hazardous substances, solid, n.o.s.)/171; UN3018 (organophosphorus pesticide, liquid, toxic)/152;

EC Number: 212-010-4 [*Annex I Index No.:* 015-083-00-9]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Not likely to be carcinogenic in humans.

Hazard Alert: Poison inhalation hazard, Combustible, Neurotoxin (cumulative), Environmental hazard. Listed for Tier 1 screening as an endocrine disruptor[88].

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, N; risk phrases: R22; R33; R50/R53; safety phrases: S2; S24; S36; S41; S60; S61 (see Appendix 4).

Description: Bensulide is and amber, viscous liquid, or forms colorless or white crystalline solid below 34.4°C. Combustible. Commercial product is available as an emulsifiable concentrate. Molecular weight = 397.49; specific gravity (H_2O:1) = 1.25 @ 22°C; molecular weight = 397.54; freezing/melting point = 34°C; vapor pressure = 8×10^{-7} mmHg; 0.53 mmHg @ 20°C. Flash point = 160°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 1 ₩. Practically insoluble in water; solubility = 0.0025 g/mL @ 20°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: A selective preemergence organophosphate herbicide used to control bluegrass, crabgrass and other annual grasses and broadleaf weed s in agriculture crops, cotton and turf. It is widely used on golf courses and home lawns. Target weeds also include barnyard grass, burning nettle, and canary grass.

Incompatibilities: Incompatible with oxidizers; chlorates nitrates, peroxides. Decomposes slowly in light and strong UV. Corrosive to copper, aluminum, magnesium, zinc. Slowly hydrolyzes in water, releasing ammonia gas and forming acetate salts. In the presence of strong reducing agents such as hydrides, organophosphates form highly toxic and flammable phosphine gas. Contact with oxidizers can cause the release of toxic oxides of phosphorus. Stable @ 80°C for 50 hours; decomposes @ 200°C in 18−40 hours.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV[18], Method #5600, Organophosphorus Pesticides

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: NIOSH Method 1657. The determination of organophosphorus pesticides in municipal and industrial wastewater by gas chromatography (GC). Detection limit = 6.0 ηg/L. Octanol−water coefficient: Log K_{ow} => 4.0. Values above 3.0 are likely to bioaccumulate in aqua tic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Intermediate—43.42721 ppb, MATC.

Routes of Entry: Inhalation, ingestion, dermal contact, passes through the skin

Harmful Effects and Symptoms

Organophosphates are highly toxic. Symptoms may develop rapidly, or there may be a delay of several hours following exposure before they become noticeable. The delay tends to be longer in the case of some compounds that dissolve fats, lipids, oils, and nonpolar solvents such as toluene. Symptoms may increase in severity for more than a single day and last for several days. In severe cases of organophosphate intoxication, respiratory failure may occur.

Short-Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. LD_{50} (oral, rat) = 270−360 mg/kg; LD_{50} (dermal, rat) = 3500−4000 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. May be a neurotoxin; may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver and/or kidney damage. May be a skin sensitizer. Human toxicity (long-term)[101]: Intermediate—46.20 ppb, Health advisory.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase. Liver, kidneys, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Routine biological monitoring of pesticide applicators and field workers includes testing of plasma and red blood cell acetylcholinesterase levels (for enzyme poisoned by this chemical). These tests are normally accurate only if done within about 2 hours of exposure. If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate pesticides is recommended until enzyme levels recover. Do not drink any alcoholic beverages before or during use as it promotes absorption of organophosphates. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: **Treatment for organophosphate poisoning consists of thorough decontamination, cardiorespiratory support, and administration of the antidotes atropine and pralidoxime. In cases of severe poisoning, diazepam, an anticonvulsant, should also be administered. Antidotes should be administered as prevention even if the diagnosis is in doubt.** Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. The removed, contaminated clothing and shoes should be double-bagged and left in Hot Zone for later disposal by hazardous materials experts. Skin may also be decontaminated with diluted hypochlorite solution. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. If victim is *unconscious or having convulsions,* do nothing except keep victim warm. Get medical aid. Transfer promptly to a medical facility. In cases of ingestion, **do not induce vomiting**. If the victim is alert and asymptomatic, administer a slurry of activated charcoal at a dose of 1 g/kg (infant, child, and adult dose). A soda can and straw may be of assistance when offering charcoal to a child. *In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water*. Do NOT give activated charcoal before or with ipecac syrup.

Note to physician or authorized medical personnel: Treat cases of respiratory compromise, coma, or excessive pulmonary secretions with respiratory support using protocols and techniques available and within the scope of training. Some cases may necessitate procedures such as endotracheal intubation or cricothyrotomy by properly trained and equipped personnel. When possible, atropine (see *Antidotes*, below) should be given under medical supervision. Patients who are comatose, hypotensive, or having seizures or cardiac arrhythmias should be treated according to advanced life support protocols. *Antidotes:* Two antidotes are administered to treat organophosphate poisoning. Artropine is a competitive antagonist of acetylcholine at muscarinic receptors and is used to control the excessive bronchial secretions which are often responsible for death. Pralidoxime relieves both the nicotinic and muscarine effects of organophosphate poisoning by regenerating acetylcholinesterase and can reduce both the bronchial secretions and the muscle weakness associated with poisoning. The initial intravenous dose of atropine in adults should be determined by the severity of symptoms: An initial adult dose of 1.0 to 2.0 mg or pediatric dose of 0.01 mg/kg (minimum 0.01 mg) should be administered intravenously. If intravenous access cannot be established, atropine may also be given intramuscularly, subcutaneously or via endotracheal tube. Doses should be repeated every 15 minutes until excessive secretions and sweating have been controlled. Once bronchial secretion has been controlled, atropine administration should be repeated whenever the secretions begin to recur. In seriously poisoned patients, very large doses may be required. Alterations of pulse rate and pupillary size should not be used as indicators of treatment adequacy. Pralidoxime should be administered as early in poisoning as possible as its efficacy may diminish when given more than 24 to 36 hours after exposure. Doses are as follows: adult 1.0 g; pediatric 25 to 50 mg/kg. The drug should be administered intravenously over 30 to 60 minutes, but in a life-threatening situation, one-half of the total dose can be given per minute for a total administration time of 2 minutes. Treatment should begin to take effect within 40 minutes with a reduction in symptoms and the amount of atropine necessary to control bronchial secretion. The initial dose can be repeated in 1 hour and then every 8 to 12 hours until the patient is clinically well and no longer requires atropine. If intravenous access cannot be established, pralidoxime may also be given intramuscularly. Early administration of diazepam in addition to the combined atropine and pralidoxime treatment may help prevent the onset of seizures and potential brain and cardiac morphologic damage following high-level organophosphate poisoning.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. One recommendation is the use of DuPont Tychem suit fabrics[88] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First, remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Stay upwind; keep out of low areas. Ventilate area of spill or leak. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, phosphorus, sulfur and carbon. May be fatal if inhaled, ingested or absorbed through skin. Inhalation or contact with some of these materials will irritate or burn skin and eyes. Vapors may cause dizziness or suffocation. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destruction by alkali hydrolysis or incineration. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Bentazon B:0240

Formula: $C_{10}H_{12}N_2O_3S$

Synonyms: Asagio; BAS351-H; Basagran; Bendioxide; Bentazone; 1*H*-2,1,3-Benzothiadiazin-4(3*H*)-one, 3-(1-methylethyl)-, 2,2-dioxide; 3-Isopropyl-2,1,3-benzothiadiazinon-(4)-2,2-dioxid (German); 3-Isopropyl-1*H*-2,1,3-benzothiadiazin-4(3*H*)-one-2,2-dioxide; 3-(1-Methylethyl)-1*H*-2,1,3-benzothiazain-4(3*H*)-one-2,2-dioxide; Pledge

CAS Registry Number: 25057-89-0; 50723-80-3 (sodium bentazon)

HSDB Number: 3430

RTECS Number: DK9900000

UN/NA & ERG Number: UN2588 (Pesticides, solid, toxic, n.o.s.)/151

EC Number: 246-585-8 [*Annex I Index No.:* 613-012-00-1]; 256-735-4 (sodium bentazon)

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Possible sensitization hazard (skin)

Safe Drinking Water Act, 55FR1470 Priority List

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*25057-89-0*): Hazard symbol: Xn, N, Xi; risk phrases: R22; R36; R43; R51/53; safety phrases: S2; S24; S37; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Bentazon is a colorless to white crystalline powder. Molecular weight = 240.3; boiling point = 200°C (decomposes); freezing/melting point = 137−139°C; vapor pressure = 10^{-3} @ 20°C. Hazard identification (based on NFP A-704 M Rating System): Health 2; flammability 2; reactivity 0 ₩. Very slightly soluble in water; solubility = 490 mg/L @ 20°C.

Potential Exposure: A potential danger to those involved in the manufacture, formulation or application of this selective postemergent thiadiazine herbicide.

Incompatibilities: Keep away from flammable materials, heat and flame. Risk of fire and explosion if formulations contain flammable/explosive solvents.

Permissible Exposure Limits in Air

No standards or PAC available.

Permissible Concentration in Water: A no-observed adverse-effect-level (NOAEL) of 2.5 mg/kg/day has been determined by EPA based on the absence of prostatic effects in dogs. This led to the determination of a longer-term.

Health advisory: of 0.875 mg/L for a 70-kg adult. It also led to the establishment of a lifetime Health advisory: of 0.0175 mg/L. In addition, California[61] has set a guideline in drinking water of 8.0 μg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.48$. Unlikely to bioaccumulate in marine organisms. Fish Tox (sodium bentazon): 40423.03894000 (VERY LOW). Fish Tox Type: MATC

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: LD_{50} = (oral-rat) 1100 mg/kg (slightly toxic). Avoid eye contact; may cause severe irritation or injury. May cause skin burns.

Long-Term Exposure: May be a reproductive hazard. May cause skin sensitization; Human Tox (sodium bentazon): 200.00000 Health advisory: (VERY LOW).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved [for pesticides] SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:

Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from flammable materials, sources of heat and fire.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (sodium bentazon) $K_{oc} = 34$.

Fire Extinguishing: Bentazon is not combustible, but may support combustion under fire conditions. Risk of fire and explosion if formulations contain flammable/explosive solvents. Stay upwind of fire. Use dry chemical, carbon dioxide, water spray, or standard foam extinguishers. Thermal decomposition products may include oxides of nitrogen and sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Bentonite B:0250

Formula: $Al_2H_2O_{12}Si_4$; $Al_2O_3A4SiO_2 \cdot AH_2O$

Synonyms: Albagel premium USP 4444; Bentonite clay absorbent; Bentonite magma; Entonite 2073; Hi-Jel; Imvite I.G.B.A; Magbond; Montmorillonite; Panther Creek bentonite; Southern bentonite; Tixoton; Volclay; Volclay bentonie BC; Wilkinite

CAS Registry Number: 1302-78-9

HSDB Number: 392

RTECS Number: CT9450000

UN/NA & ERG Number: Not a regulated substance.

EC Number: 215-108-5

Regulatory Authority and Advisory Information

Carcinogenicity: NTP: Carcinogenesis studies; selected, October 2000

Hazard Alert: Combustible, Possible risk of forming tumors, FDA-proprietary drug.

United States National Primary Drinking Water Regulations: SMCL = 0.05 to 0.2 mg[Al]/L as aluminum.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Bentonite is a light yellow, creamy, pale brown or gray to black powder or granules. These chemicals contain 1% to 24% crystalline silica (O_2Si). Specific gravity (H_2O:1) = 2.5. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0 ₩. Insoluble in water.

Potential Exposure: This material is used as Fuller's earth; as a mineral, natural, or synthetic fiber; as an emulsifier for oils; as a base for plasters; in cosmetics, in polishes and abrasives; as a food additive and others. Bentonites are aluminate silicate and can contain crystalline silica. The content varies widely from less than 1% to about 24% [WHO].

Incompatibilities: Substance is a weak acid in water; avoid contact with strong alkaline material. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 27; No values found in Ver. 29[138]

PAC-1: 0.21 milligram per cubic meter

PAC-2: 2.3 milligram per cubic meter

PAC-3: 14 milligram per cubic meter

Inasmuch as this material can contain up to 24% crystalline silica, the OSHA PEL is listed for reference: crystalline silica (as respirable quartz): either 250 mppcf/%SiO_2 + 5 or 10 milligram per cubic meter/[%SiO_2 + 2] TWA. Also under study by ACGIH[1].

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Dust may cause irritation to nose, throat and lungs. Dust may cause eye irritation. The intravenous LD_{50} (inh, rat) = 35 mg/kg[9]

Long-Term Exposure: Repeated inhalation of dust can cause irritation and bronchial asthma. Bentonite contains crystalline silica and may cause silicosis.

Points of Attack: Lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: *Inhalation:* Move person to fresh air. Seek medical attention if necessary. *Skin:* Wash with water. *Eyes:* Wash with water as needed. Seek medical attention if necessary. *Ingestion:* Seek medical attention if necessary.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wear dust mask.

Storage: Color code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area

Shipping: Bentonite is not cited in the DOT Performance-Oriented Packaging Standards.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen dry material. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. Dispose with normal trash. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible. Use extinguishers suitable for surrounding fires. Thermal decomposition products may include metallic oxides of aluminum and silicon. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land fill disposal.

UN/NA & ERG Number: UN3259/154

EC Number: 214-927-5

Regulatory Authority and Advisory Information

Hazard Alert: Suspected reprotoxic hazard

Description: Colorless to off-white or yellow powder. Corrosive. Molecular weight = 225.27; freezing/melting point = 233°C; vapor pressure = 2×10^{-11} mmHg @ 25°C. Henry's Law constant = 9×10^{-14} atm m^3/mol @ 25°C (est). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0 ₩. Low solubility in water.

Potential Exposure: A polyamine plant growth regulator used to lengthen and enhance the shape of apples and to increase the fruit set in pears. It increases the yield of pistachios and tomatoes. Not listed for use in the EU countries.

Incompatibilities: May react with strong oxidizers such as chlorates, peroxides, nitrates, etc. May release heat on contact with water. Solid and corrosive amines are chemical bases. Neutralize acids to form salts plus water in exothermic reactions. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. May generate flammable gaseous hydrogen in combination with strong reducing agents, such as hydrides[88].

Permissible Concentration in Water: Runoff from fire control or dilution water may be corrosive and/or toxic and cause pollution.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of dust, dermal and/or eye contact.

Harmful Effects and Symptoms

Toxic; inhalation, ingestion, or dermal contact with material may cause severe injury or death. Contact with molten substance may cause severe burns to skin and eyes. Avoid any dermal and/or eye contact. Effects of contact or inhalation may be delayed.

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause burns and permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May be harmful if swallowed. LD_{50} (oral, rat) = 1300 mg/kg[83]; LD_{50} (dermal, rabbit) = 5 mg/kg[83]. LD_{50} (inhalation, rabbit) = 5 mg/L/1-hour[83]

Long-Term Exposure: NIOSH warns this may be mutagenic.

Points of Attack: Lungs, eyes, Reproductive material/DNA.

Medical Surveillance: In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. *Eyes*: Check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20 to 30 minutes. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: Flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as red ness or irritation develop, call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation:* Leave the contaminated area; take deep breaths of fresh air. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician and be prepared to transport the victim to a hospital. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA should be used; if not available, use a level of protection greater than or equal to that advised under Protective Clothing. *Ingestion*: *Do not induce vomiting.* If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. *Do not induce vomiting.* Immediately transport the victim to a hospital.

Personal Protective Methods: Reacts with the following kinds of absorbents: Mineral- and Clay Based[88]. Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. *Agricultural Use/Engineering Controls:* When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40CFR170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN3259 Amines, solid, corrosive, n.o.s, or Polyamines, solid, corrosive, n.o.s., Hazard class: 8; Labels: 8—Corrosive material, Technical Name Required.

Spill Handling: Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Stay upwind. Keep out of low areas. Ventilate enclosed areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible. Remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Prevent entry into waterways, sewers, basements or confined areas. Sweep up or vacuum powdered material being careful not to raise dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. *Do not get water inside containers*. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Fire Extinguishing: Thermal decomposition products may include poisonous oxides of nitrogen and carbon. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire:* Dry chemical, carbon dioxide or water spray. *Large fire:* dry chemical, carbon dioxide, alcohol-resistant foam or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/trailer loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R50/53; R61; R62; safety phrases: S29; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. 1-Low hazard to waters.

Description: Benz(*a*)anthracene is a colorless plate-like material which is recrystallized from glacial acetic acid or a light yellow to tan powder. PAHs are compounds containing multiple benzene rings and are also called polynuclear aromatic hydro carbons. Molecular weight = 228.29; boiling point = (sublimates) 437.6°C; freezing/melting point = 158−162°C; vapor pressure = 4.9×10^{-9} mmHg @ 20. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0 ₩. Practically insoluble in water.

Potential Exposure: Benz(*a*)anthracene is a contaminant and does not have any reported commercial use or application, although one producer did report the substance for the Toxic Substances Control Act Inventory. Benz(*a*)anthracene has been reported present in cigarette smoke condensate, automobile exhaust gas; soot; and the emissions from coal and gas works and electric plants. Benz(*a*)anthracene also occurs in the aromatic fraction of mineral oil, commercial solvents, waxes, petrolatum, creosote, coal tar; petroleum asphalt; and coal tar pitch. Microgram quantities of benz(*a*)anthracene can be found in various foods, such as charcoal broiled, barbecued, or smoked meats and fish; certain vegetables and vegetable oils, roasted coffee, and coffee powders. Human subjects are exposed to benz(*a*) anthracene through either inhalation or ingestion. Workers at facilities with likely exposure to fumes from burning or heating of organic materials have a potential for exposure to benz(*a*)anthracene. Consumers can be exposed to this chemical through ingestion of various foods, with concentrations of 100 μg/kg in some instances. Cigarette smoke condensate has quantities of benz(*a*)anthracene that range from 0.03 to 4.6 μg/g. Benz(*a*)anthracene is found in the atmosphere at levels that vary with geography and climatology. These values can range from up to 136 μg/1000 m^3 in summer to 361 μg/1000 m^3 in winter. Drinking water samples may contain up to 0.023 μg/L benz(*a*)anthracene, and surface waters have been found to contain 0.004−0.185 μg/L. The soil near industrial centers has been shown to contain as much as 390 μg/kg of Benz(*a*)anthracene, whereas soil near highways can have levels of up to 1500 μg/kg, and areas polluted with coal tar pitch can reach levels of 2500 mg/kg.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Powder can form an explosive mixture with air.

Permissible Exposure Limits in Air

NIOSH IDLH = 80 milligram per cubic meter, *coal tar pitch volatiles*

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines “coal tar pitch volatiles” in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen; BEIp assigned *as Polycyclic Aromatic Compounds (PAHs)*

PAC Ver. 29[138]

PAC-1: 0.6 milligram per cubic meter

PAC-2: 120 milligram per cubic meter

PAC-3: 700 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2; Pregnancy Risk Group 3A

France: carcinogen, 1993; Norway: TWA 0.04 milligram per cubic meter, 1999

Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; NIOSH Analytical Method #5515, PAHs by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms; therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/L, respectively.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \geq 5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Bioaccumulation can take place in the food chain, especially seafood. Extraction with methylene chloride followed by GC/mass spectrometry (EPA Methods 625 and 1625) are summarized in the EPA Toxicological Profile cited below.

Routes of Entry: Inhalation, dermal contact.

Harmful Effects and Symptoms

Benz(*a*)anthracene is absorbed by the oral and dermal routes of exposure; no direct evidence is available for absorption of B(*a*)A via the lungs. Following oral absorption, B(*a*)A is distributed to several tissues and accumulates preferentially in the adipose and mammary tissues. It is metabolized to conjugated derivatives and eliminated. It is expected that absorbed B(*a*)A will be excreted predominantly in the feces, as is true for other PAHs. B(*a*)A is metabolized to reactive derivatives that are thought to be responsible for its mutagenic activity in experimental systems. B(*a*)A is a weak experimental carcinogen by the dermal route of exposure. There is some evidence that it is carcinogenic by the oral route as well. Its carcinogenicity by the inhalation route has not been studied. Mutation is thought to be a necessary (although insufficient) step for the carcinogenic activity of B(*a*)A.

Short-Term Exposure: No acute health effects known at this time.

Long-Term Exposure: May be a carcinogen in humans. Has shown to cause bladder and skin cancer in animals. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies.

Points of Attack: Skin, respiratory system; bladder, liver, kidneys as PAH.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure preplacement and regular physical examinations are indicated for workers having contact with acenaphthene in the work-place. CBC, chest X-ray, pulmonary function tests, photopatch testing; sputum cytology, urinalysis (routine) [cytology, hematuria], liver, kidney, and bladder function tests are recommended for coal tar pitch volatiles[2].

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place away from oxidizers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Atomize into incinerator with a flammable liquid[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Benzal chloride is a combustible, fuming, colorless, oily liquid; fumes on exposure to air. Faint, pungent odor. Molecular weight = 161.03; Specific gravity (H_2O:1) = 1.2557 @ 14°C; boiling point = 205−207°C; freezing/melting point = −16.8°C; relative vapor density (air = 1) = 5.6; latent heat of vaporization = 2.9×10^5 J/kg; vapor pressure = 0.30 mmHg @ 20°C; 0.75 mmHg @ 31°C; flash point = 93°C; autoignition temperature = 585°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 1 ₩. Insoluble in water; biodegrades.

Potential Exposure: Benzal chloride is used almost exclusively for the manufacture of benzaldehyde. It can also be used to prepare cinnamic acid and benzoyl chloride.

Incompatibilities: May form explosive mixture with air. Reacts with water, air, or heat, forming fumes of hydrochloric acid. Reacts (possibly violently) with acids, bases, strong oxidizers; many metals; potassium, sodium, aluminum. Attacks plastics and coatings.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.21 milligram per cubic meter

PAC-2: 2.3 milligram per cubic meter

PAC-3: 14 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2 *as benzyl dichloride Note:* DFG MAK: [skin] Carcinogen Category 1, Confirmed Human Carcinogen (α-chlorinated toluenes, mixtures of Benzoyl and various Benzyl chlorides)

Austria: carcinogen, 1999; Finland: carcinogen, 1993; Russia: STEL 0.5 milligram per cubic meter, 1993; Sweden: carcinogen, 1999

Permissible Concentration in Water: No criteria set. Benzal chloride hydrolyzes to benzaldehyde and HCl on contact with water.

Determination in Water: Octanol−water coefficient: Log K_{ow} => 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Biodegrades in water.

Routes of Entry: Inhalation, ingestion, passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Benzal chloride can affect the nervous system; and may be fatal if inhaled, swallowed or absorbed through the skin. Benzal chloride is irritating to the skin and eyes, causing excessive tearing. Irritates the respiratory tract causing shortness of breath and cough. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Benzal chloride may cause skin cancer. This chemical was found to induce carcinomas, leukemia, and papillomas in mice. Benzal chloride was shown to possess a longer latency period than benzotrichloride before the onset of harmful effects. May affect the CNS.

Points of Attack: Central nervous system; skin.

Medical Surveillance: Lung function and nervous system tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, flammable materials, sources fire as this material is combustible. Sources of ignition, such as smoking and openflames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1886 Benzylidene chloride, Hazard class 6.1; Label 6.1—Poisonous materials.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors−contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flashback. Containers may explode when heated or if contaminated with water.

Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers.* If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Incineration @ 816°C, 0.5 second minimum for primary combustion; 1204°C, 1.0 second for secondary combustion; elemental chlorine formation may be alleviated through injection of steam or methane into the combustion process.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Benzaldehyde is a clear to yellowish liquid with an almond odor. The Odor Threshold is 0.042 ppm. Molecular weight = 106.13; specific gravity (H_2O:1) = 1.04; boiling point = 198°C @ 19.5 mmHg; freezing/melting point = -26°C; flash point = 63°C (cc); vapor pressure = 1 mmHg @ 26°C; 5 mmHg @ 50°C; autoignition temperature = 190°C. Explosive limits: LEL: 1.4%, UEL: 13.5%. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 1 ₩. Practically insoluble in water; solubility =< 1 mg/mL 0.3 g/100 mL.

Potential Exposure: In manufacture of perfumes, dyes, and cinnamic acid; as solvent; in flavors.

Incompatibilities: The substance reacts with air, forming explosive peroxides. Reacts violently with performic acid, oxidants, aluminum, iron, bases, and phenol, causing fire and explosion hazard. May self-ignite if absorbed in combustible material with large surface area, or otherwise dispersed over large areas. Reacts with rust, amines, alkalies, strong bases, reducing agents such as hydrideds and active metals.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 4 ppm

PAC-2: 9.9 ppm

PAC-3: 59 ppm

DFG MAK: [skin] May cause dermal sensitization.

Hungary: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter, 1993; Poland: TWA 10 milligram per cubic meter, STEL 40 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter, 1993; United Kingdom: carcinogen, 2000.

Permissible Concentration in Water: No criteria set. Toxic to aquatic organisms.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion and skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Anyone with a history of asthma must avoid all contact with this chemical. Absorbed through the skin, thereby increasing exposure. The substance irritates the eyes, skin, and the respiratory tract, causing coughing and shortness of breath. May cause asthma symptoms; this may take hours to develop; physical activity and/or alcohol consumption can aggravate the symptoms. May cause contact dermatitis. Acts as a narcotic in high concentrations; exposure can cause dizziness; and, at higher levels, unconsciousness. LD_{50} = (oral-rat) 1300 mg/kg.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization, rashes, and kidney damage. Causes mutations; may cause cancer or reproductive risks.

Points of Attack: Skin, central nervous system; kidneys.

Medical Surveillance: Examination by a qualified dermatologist and allergist. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers recommend polyvinyl alcohol gloves; styrene-butadiene rubber, butyl rubber; and polyethylene-coated materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store under nitrogen in an area away from steam or water, See also, incompatibilities section. Keep away from strong acids and oxidizers.

Shipping: UN1990 Benzaldehyde, Hazard class: 9; Labels: 9—Miscellaneous hazardous material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzaldehyde is a combustible liquid. Thermal decomposition products may include acrid smoke, irritating fumes, and oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; add combustible solvent and spray into incinerator with afterburner[22].

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Benzamide is a combustible, colorless to beige, off-white, crystalline solid; freezing/melting point = 132−133°C. Molecular weight = 121.15; specific gravity (H_2O:1) = 1.34; boiling point = 288°C; freezing/melting point = 130°C; vapor pressure = (est) 1.65×10^{-4} mmHg. Water solubility = 1.34 g in 100 mL; flash point = 180°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0 ₩. Soluble in water; solubility = 13 g/L.
Potential Exposure: Benzamide is used in organic synthesis.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 4.7 milligram per cubic meter
PAC-2: 52 milligram per cubic meter
PAC-3: 310 milligram per cubic meter
Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.6. Unlikely to bioaccumulate in marine organisms. Fish Tox (benzamide) LC_{50} (fathead minnow, 96 hours) = 661 mg/L.
Routes of Entry: Inhalation, passing through the skin.
Harmful Effects and Symptoms
Short-Term Exposure: Irritates the eyes, nose, and throat. May produce gastric pain, nausea and vomiting[52]. The oral LD_{50} (mouse) = 1160 mg/kg (slightly toxic).
Long-Term Exposure: Similar chemicals cause methemoglobinemia and liver damage, but it is not known if benzamide has these effects.
Medical Surveillance: CBC, liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode).
Storage: Combustible solid. Store in a refrigerator or a cool, dry place.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60%−70% ethanol to avoid dust and transfer to vapor-tight plastic bags for eventual disposal. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: A combustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially

contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 500 lb
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%
Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xi, Xn, N: risk phrases: R20/21/22; R23/24/25; R26; R33; R36/37/38; R51/53; safety phrases: S36/37/39; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: Benzenamine, 3-(trifluoromethyl)-is a combustible, colorless to yellow oily liquid. Unpleasant amine odor. Molecular weight = 161.13; Specific gravity (H_2O:1) = 1.3 @ 15°C; vapor density = 5.6; boiling point = 187.5; freezing/melting point = 2.8°C; flash point = 85°C[52]. Hazard identification (based on NFP A-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩
Potential Exposure: This material is used as a chemical intermediate for herbicides, antihypertensives, and diuretics.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Light and air sensitive.
Permissible Exposure Limits in Air
NIOSH IDLH = 250 milligram per cubic meter
OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA
NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 minutes. Ceiling Concentration
ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a hum an carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift
PAC Ver. 29[138]
PAC-1: 0.4 milligram per cubic meter
PAC-2: 4.4 milligram per cubic meter
PAC-3: 19 milligram per cubic meter
DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift
Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg[F]/L, as Fluoride.
Routes of Entry: Inhalation, ingestion, skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: Contact may cause burns to skin and eyes. May be poisonous if inhaled, swallowed or absorbed through the skin. LD_{50} = (oral-rat) 480 mg/kg; the oral LD_{50} mouse is 220 mg/kg.
Long-Term Exposure: Repeated exposure to fluoride chemicals may cause stiffness in muscles or ligaments and even crippling. Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 milligram per cubic meter or higher. Mottling of the teeth may occur at this level.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit.

NIOSH: (*fluorides*) *12.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)*+ (any supplied-air respirator operated in a continuous-flow mode); or * ** *if not present as a fume* PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *125 milligram per cubic meter:* HieF** (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF** (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

**May need acid gas sorbent.

Storage: Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked and cool, ventilated area. Store in tightly closed, light-resistant containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN29483-Trifluoromethylaniline, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Benzene is a clear, volatile, colorless, highly flammable liquid with a pleasant, characteristic odor. Molecular weight = 78.112; boiling point @ 1 atm = 80.1°C; melting/freezing point = 5.5°C; critical temperature = 288.9°C; critical pressure = 710 psia; specific gravity (H_2O:1) = 0.879 @ 20°C; liquid surface tension = 0.0289 N/m @ 20°C; liquid water interfacial tension = 0.035 N/m @ 20°C; relative vapor density (air = 1) = 2.7; latent heat of vaporization = 3.94×10^5 J/kg; heat of combustion = -406.0×10^5 J/kg; vapor pressure = 75 mmHg @ 20; electrical conductivity = 3.8 pS/m; flash point = −11°C; autoignition temperature = 498°C. Explosive limits: LEL: 1.2%, UEL: 7.8%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. The Odor Threshold in air is 4.9 milligram per cubic meter; the Odor Threshold in water is 2.0 mg/L. Very slightly soluble in water; solubility = 0.18 g/100 mL.
Potential Exposure: Benzene is used as a constituent in motor fuels; as a solvent for fats; inks, oils, paints, plastics, and rubber, in the extraction of oils from seeds and nuts; in photogravure printing. It is also used as a chemical intermediate. By alkylation, chlorination, nitration, and sulfonation, chemicals, such as styrene, phenols, and malefic anhydride are produced. Benzene is also used in the manufacture of detergents, explosives, pharmaceuticals; in the manufacture of cyclohexane and ethylbenzene; and dye-stuffs. Increased concern for benzene as a significant environmental pollutant arises from public exposure to the presence of benzene in gasoline and the increased content in gasoline due to requirements for unleaded fuels for automobiles equipped with catalytic exhaust converters.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, many fluorides and perchlorates, nitric acid.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

Conversion factor: 1 ppm = 3.19 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 ppm TWA; 5 ppm STEL, cancer hazard. See Appendix F of the *NIOSH Pocket Guide*

NIOSH REL: 0.1 ppm TWA; 1 ppm STEL, potential carcinogen. Limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 0.5 ppm TWA; 2.5 ppm [skin] STEL, Confirmed Human Carcinogen; BEI: 25 μg[*S*-Phenylmercapturic acid]/g creatinine in urine/end-of-shift; 500 μg[*t,t*-Muconic acid]/g creatinine in urine/end-of-shift

PAC* Ver. 29[138]

PAC-1: **52**$_{\mathbf{A}}$ ppm

PAC-2: **800**$_{\mathbf{A}}$ ppm

PAC-3: **4000**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Emergency Response Planning Guidelines (ERPG) (DOE)

ERPG-1: 50 ppm

ERPG-2: 150 ppm

ERPG-3: 1000 ppm

DFG MAK: [skin], Carcinogen Category 1; Germ Cell Mutagen Group: 3A; TRK: 1 mL/m^3/3.3 milligram per cubic meter; 5 μg[Benzene]/L in whole blood/end-of-shift; 0.045 mg[*S*-Phenylmercapturic acid]/g creatinine in urine/end-of-shift; 2 mg[*trans,trans*-Muconic acid]/L in urune/end-of-shift, Class 1, human carcinogen

Australia: TWA 5 ppm (16 milligram per cubic meter), carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 10 ppm (32 milligram per cubic meter), carcinogen, 1993; Denmark: TWA 5 ppm (16 milligram per cubic meter), [skin], 1999; Finland: TWA 5 ppm (15 milligram per cubic meter), STEL 10 ppm (30 milligram per cubic meter), [skin], carcinogen, 1993; United Kingdom: TWA 3 ppm (9.6 milligram per cubic meter), carcinogen, 2000; Hungary STEL 5 milligram per cubic meter, [skin], carcinogen, 1993; the Netherlands: MAC-TGG 3.25 milligram per cubic meter, [skin], 2003; Japan: 10 ppm (32 milligram per cubic meter), Group 1 carcinogen, 1999; Norway: TWA 1 ppm (3 milligram per cubic meter), 1999; the Philippines: TWA 25 ppm (80 milligram per cubic meter), [skin], 1993; Poland: MAC (time-weighted average) 10 milligram per cubic meter; MAC (STEL) 40 milligram per cubic meter, 1999; Russia: TWA 10 ppm (5 milligram per cubic meter), STEL 25 ppm (15 milligram per cubic meter), [skin], carcinogen, 1993; Sweden: NGV 0.5 ppm (1.5 milligram per cubic meter), KTV 3 ppm (9 milligram per cubic meter), [skin], carcinogen, 1999; Switzerland: MAK-week 1 ppm (3.2 milligram per cubic meter), [skin], carcinogen, 1999; Thailand: TWA 10 ppm (30 milligram per cubic meter), STEL 25 ppm (75 milligram per cubic meter), 1993; Turkey: TWA 20 ppm (64 milligram per cubic meter), [skin], 1993; United Kingdom LTEL 10 ppm (30 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 2.5 ppm [skin]. Russia[43] set a MAC in ambient air in residential areas on a momentary basis and 0.8 milligram per cubic meter in residential air on a daily average basis. Several states have set guidelines or standards for benzene in ambient air[60] ranging from zero (North Dakota) to 0.12 μ/m^3 (North Carolina) to 0.14 μ/m^3 (Michigan) to 1.2 μ/m^3 (Massachusetts) to 72 μ/m^3 (Pennsylvania) to 100 μ/m^3 (New York and Rhode Island) to 150 μ/m^3 (Connecticut and South Carolina) to 300 μ/m^3 (Virginia).

The final OSHA benzene standard in 1910.1028 applies to all occupational exposures to benzene except some subsegments of industry where exposures are consistently under the action level (i.e., distribution and sales of fuels, sealed containers and pipelines, coke production, oil and gas drilling and production, natural gas processing; and the percentage exclusion for liquid mixtures); *for the excepted subsegments, the benzene limits in Table Z-2 apply* (i.e., an 8-hour TWA of 10 ppm, an acceptable ceiling of 25 ppm, and 50 ppm for a maximum duration of 10 minutes as an acceptable maximum peak above the acceptable ceiling).

Determination in Air: NIOSH Analytical Method #1500, Hydrocarbons, BP = 36−126°C, #1501, Hydrocarbons, aromatic; #3700, Benzene, by portable GC, #3800, OSHA Analytical Method 12.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG, zero; MCL, 0.005 mg/L. Regulated chemical (47FR9352) Federal Drinking Water Guidelines: EPA 5 μg/L; State Drinking Water Standards: California 1 μg/L; Florida 1 μg/L; New Jersey 1 μg/L; State Drinking Water Guidelines: Arizona 1.3 μg/L; Connecticut 1 μg/L; Maine 6 μg/L; Minnesota 3 μg/L.

Determination in Water: Gas chromatography (EPA Method 602) or GC plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{\text{ow}} =< 2.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation of Benzene may produce both nerve and blood effects. Irritation of the nose, throat and lungs may occur (3000 ppm may be tolerated for only 30−60 minutes). Lung congestion may occur. Nerve effects may include an exaggerated feeling of well-being, excitement, headache, dizziness, and slurred speech. At high levels, slowed breathing and death may result. Death has occurred @ 20,000 ppm for 5−10 minutes, or 7500 ppm for 30 minutes. Skin contact: Irritation may occur, with redness and blistering if not promptly removed. Benzene is poorly absorbed. Whole body exposure for 30 minutes has been reported with no health effects. Eye contact may cause severe irritation. Ingestion may cause irritation of mouth, throat and stomach. Symptoms are similar to those listed under inhalation. One tablespoon may cause collapse, bronchitis, pneumonia and death. Use of alcoholic beverages enhances the harmful effect.

Long-Term Exposure: Benzene is a known human carcinogen. Exposure has been linked to increased risk of several forms of leukemia. The liquid defats the skin. The substance may have effects on the blood forming organs, liver and immune system. May cause loss of appetite; nausea, weight loss; fatigue, muscle weakness; headache, dizziness, nervousness and irritability. Mild anemia has been reported from exposures of 25 ppm for several years and 100 ppm for 3 months. At levels between 100 and 200 ppm for periods of 6 months, or more, severe irreversible blood changes and damage to liver and heart may occur. Temporary partial paralysis has been reported.

Points of Attack: Eyes, skin, respiratory system; blood, central nervous system; bone marrow. *Cancer site:* leukemia.

Medical Surveillance: OSHA mandates the following: CBC: leulocyte count, thrombocyte count, hematocrit, hemoglobin, erythrocyte count; pulmonary function tests. NIOSH lists the following tests: CBC including leucocyte count, thrombocyte count, hematocrit, hemoglobin, erythrocyte count; white blood cell count/differential; whole blood (chemical/metabolite)*; whole blood (chemical/metabolite), prior to next shift; expired air, next shift, prior to next shift; urine (chemical/metabolite)*; urine (chemical/metabolite), during exposure, end-of-shift, end-of-work-week, pre- & postshift. **no time specified*

Preplacement and periodic examinations should be concerned especially with effects on the blood and bone marrow and with a history of exposure to other myelotoxic agents or drugs or of other diseases of the blood. Preplacement laboratory exams should include: (1) CBC (hematocrit, hemoglobin, mean corpuscular volume, white blood count, differential count, and platelet estimation); (2) reticulocyte count; (3) serum bilirubin; and (4) urinary phenol. The type and frequency of periodic hematologic studies should be related to the data obtained from biologic monitoring and industrial hygiene studies, as well as any symptoms or signs of hematologic effects. Recommendations for proposed examinations have been made in the "Criteria for a recommended standard. Examinations should also be concerned with other possible effects, such as those on the skin, CNS; and liver and kidney functions. Biologic monitoring should be provided to all workers subject to benzene exposure. It consists of sampling and analysis of urine for total phenol content. The objective of such monitoring is to be certain that no worker absorbs an unacceptable amount of benzene. Unacceptable absorption of benzene, posing a risk of benzene poisoning, is considered to occur at levels of 75 mg phenol per liter of urine (with urine specific gravity, corrected to 1.024), when determined by methods specified in the NIOSH "Criteria for Recommended Standard-Benzene." Alternative methods shown to be equivalent in accuracy and precision may also be useful. Biological monitoring should be done at quarterly intervals. If environmental sampling and analysis are equal to or exceed accepted safe limits, the urinary phenol analysis should be conducted every 2 weeks. This increased monitoring frequency should continue for at least 2 months after the high environmental level has been demonstrated. Two follow-up urines should be obtained within 1 week after receipt of the original results, one at the beginning and the other at the end of the work week. If original elevated findings are confirmed, immediate steps should be taken to reduce the worker's absorption of benzene by improvement in environment control, personal protection, personal hygiene, and administrative control.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth, get medical attention. Do not induce vomiting.

Personal Protective Methods:

General information: First responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): Select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2.

It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APR or Powered APR (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves; 4H and Silver Shield gloves; Barricade-coated suits; CPF3 suits; Responder suits; Trychem 1000 suits; **4 hours:** (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Teflon gloves, suits, boots; Viton gloves, suits. Also, safety equipment suppliers/manufacturers can also provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: < or = 10 ppm (parts per million) Half-mask air-purifying respirator with organic vapor cartridge. < or = 50 ppm (1) full-facepiece respirator with organic vapor cartridges; or (2) full-facepiece gas mask with chin-style canisters*. < or = 100 ppm Full-facepiece PAPR with organic vapor canister*. < or = 1000 ppm Supplied-air respirator with full facepiece in positive-pressure mode. >1000 ppm or unknown concentration (1) SCBA with full facepiece in positive-pressure mode; or (2) full-facepiece positive-pressure supplied-air respirator with auxiliary self-contained air supply. Escape (1) Any organic vapor gas mask; or (2) any SCBA with full facepiece. Firefighting full-facepiece SCBA in positive-pressure mode.

* Canisters must have a minimum service life of 4 hours when tested at 150 ppm benzene, at a flow rate of 64 liters per minute (LPM), 25°C, and 85% relative humidity for non-PAPRs. The flow rate shall be 115 and 170 LPM, respectively, for tight-fitting and loose-fitting PAPRs.

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Before entering confined space where benzene may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Protect containers against physical damage. Storage preferred in an outdoor or detached building. If storage is indoor, use a standard flammable liquid storage room. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1114 Benzene, Hazard Class: 3; Labels: 3—Flammable liquid

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep benzene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is highly flammable. Thermal decomposition products may include acrid smoke, irritating fumes, and oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Dilution with alcohol or acetone to minimize smoke is recommended[22]. Bacterial degradation is also possible.

PAC-1: 0.025 milligram per cubic meter

PAC-2: 0.27 milligram per cubic meter

PAC-3: 13 milligram per cubic meter

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Arab Republic of Egypt: TWA 0.2 mg(As)/m^3, 1993; Australia: TWA 0.05 mg(As)/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg(As)/m^3, 1993; Finland: carcinogen, 1999; France: VME 0.2 mg(As)/m^3, 1993; Hungary STEL 0.5 mg(As)/m^3, carcinogen, 1993; India: TWA 0.2 mg (As)/m^3, 1993; the Philippines: TWA 0.5 mg(As)/m^3, 1993; Poland: MAC (time-weighted average) 0.3 mg(As)/m^3, 1993; Sweden: NGV 0.03 mg(As)/m^3, carcinogen, 1999; Switzerland: MAK-week 0.1 mg(As)/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; United Kingdom LTEL 0.2 mg(As)/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen

Determination in Air: Use NIOSH Analytical Method #5022, arsenic, organic compounds.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA MCL: 0.010 mg[As]/L [40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As]mg/L.

Determination in Water: *For arsenic:* The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of arsenic poisoning usually appear one-half to one hour after ingestion, but may be delayed many hours. Symptoms include a sweetish metallic taste and garlicky odor; difficulty in swallowing; abdominal pain; vomiting and painful diarrhea; dehydration, thirst, and cramps; dizziness, stupor, delirium, rapid heartbeat; headache, skin disorders; and coma. Benzenearsonic acid is a deadly poison. The LD_{low} oral (rat) is 50 mg/kg; the oral LD_{50} mouse is 270 μg/kg.

Long-Term Exposure: Chronic exposure to arsenic compounds can cause dermatitis and digestive disorders. Renal damage may develop.

Points of Attack: Skin, kidneys.

Medical Surveillance: Kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH; however, where the potential exists for exposure, the following might be considered: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN3280 Organoarsenic compound, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required. Potential Inhalation Hazard (Special Provision 5).

Spill Handling:

Organoarsenic compound, solid or liquid

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/60
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict Persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills:* take up with sand or other noncombustible absorbent material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon and arsenic metal. This material does not burn or burns with difficulty. Extinguish fire using agent suitable for surrounding fire. Use water in flooding quantities as fog. Avoid breathing dusts and fumes; keep upwind; wear SCBA. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 500 lb (227 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R22; R34; R36/37/38; R50/53; safety phrases: S26; S27; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Benzene, 1-(chloromethyl)-4-nitro-, is a crystalline solid. Molecular weight = 171.59; Specific gravity = 1.57; boiling point = 229.8°C; freezing/melting point = 71°C; vapor pressure = 0.05 @ 25°C. Very slightly soluble in water; slow reaction.

Potential Exposure: A chloronitrobenzene compound, used in organic synthesis.

Incompatibilities: Can react with sulfuric acid[52]. Keep away from oxidizers, amines, bases: sodium hydroxide, and potassium hydroxide; may cause fire and explosions. Incompatible with strong oxidizing and reducing agents such as hydrides, certain amines, nitrides, azo/diazo compounds, alkali metals (potassium), and epoxides. Corrodes steel, some plastics and human tissue.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.5 milligram per cubic meter

PAC-2: 28 milligram per cubic meter

PAC-3: 360 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical is a lachrymator[52]. Poisonous if swallowed or dust is inhaled. Can cause headaches, vomiting, cyanosis, difficulty in breathing. May cause skin irritation and sensitization.

Long-Term Exposure: Prolonged chronic exposure to nitro compounds of aromatic hydrocarbons may cause liver and kidney damage.

Points of Attack: Liver, kidneys.

Medical Surveillance: Kidney and liver function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where risk assessment shows APRs are appropriate, use a full-face respirator type (N100) United States or Type P3 (EN-143) respirators as backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Before entering confined space where benzotrichloride may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a dark, cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3261 Corrosive solid, acidic, organic, n.o.s., Hazard class: 8; Labels: 8—Corrosive material, Technical Name Required. UN1578 Chloronitrobenzenes, solid or liquid, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk.

Small liquid spills: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel, place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a Hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Benzenesulfonyl chloride is a colorless oily liquid with a pungent odor. Molecular weight = 176.6; specific gravity (H_2O:1) = 1.3842 @ 15°C; boiling point = 251−252°C (decomposes); freezing/melting point = 14.6°C; vapor pressure = 0.68 mmHg @ 25°C; relative vapor density (air = 1) = 6.12; flash point = 130°C; autoignition point = 460°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 1 ₩. Moderately soluble in water.

Potential Exposure: It is used as a chemical intermediate for benzenesulfonamides, thiophenol, glybuzole (hypoglycemic agent), *N*-2-chloroehtylamides, benzonitrile; for its esters-useful as insecticides, and miticides.

Incompatibilities: Violent reaction with strong oxidizers, dimethyl sulfoxide, and methyl formamide. It is very reactive with bases and many organic compounds. Incompatible with ammonia, aliphatic amines. Water contact forms hydrochloric and chlorosulfonic acids. Aqueous solutions of this chemical are strong acids that react violently with bases. Attacks metals in presence of moisture.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.77 milligram per cubic meter

PAC-2: 8.4 milligram per cubic meter

PAC-3: 51 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may cause severe irritation and burns to skin and eyes. Breathing this chemical may cause liver damage. Symptoms may include allergic reactions, and severe shock. Benzene sulfonyl chloride is poisonous; may be fatal if inhaled, swallowed or absorbed through the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Reversible toxic damage to the liver is possible after dermal exposure. LD_{50} = (oral-rat) 1960 mg/kg[9].

Long-Term Exposure: May cause chronic irritation of the air passages and lungs, bronchitis with cough and phlegm. Repeated exposure may cause liver damage. Repeated skin contact may cause dry skin, redness, rash, and sores.

Points of Attack: Liver, lungs.

Medical Surveillance: lung function tests, liver function tests. Consider X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]; CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full face piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Before entering confined space where benzotrichloride may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a dark, cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2225 Benzene sulfonyl chloride, Hazard class: 8; Labels: 8—Corrosive material.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors−contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. *Do not use water*. Thermal decomposition products may include hydrogen chloride and sulfur dioxide. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flashback. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers.* If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 1 lb (0.45 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R22; R50/53; R60; R62; safety phrases: S29; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Benzidine is a white, grayish-yellow crystalline solid or powder. Turns brownish-red on exposure to air and light; molecular weight = 184.24; specific gravity (H_2O:1) = 1.25 @ 20°C; freezing/melting point = 127°C.

Molecular weight = 184.2; boiling point = 400.7°C; freezing/melting point = 128°C (anhydrous, rapid heat); 115−120°C (slow heat). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0 ₩. Slightly soluble in water; solubility = 0.04% @ 12°C.

Potential Exposure: Benzidine is used primarily in the manufacture of azo dyestuffs; there are over 250 of these produced. Other uses, including some which may have been discontinued, are in the rubber industry as a hardener; in the manufacture of plastic films; for detection of occult blood in feces, urine, and body fluids; in the detection of H_2O_2 in milk; in the production of security paper; and as a laboratory reagent in determining HCN, sulfate, nicotine, and certain sugars. No substitute has been found for its use in dyes. Free benzidine is present in the benzidine-derived azo dyes. According to industry, quality control specifications require that the level not exceed 20 ppm and in practice the level is usually below 10 ppm. Regulations in the USA concerning this chemical define strict procedures to avoid worker contact: mixture containing 0.1% or more must be maintained in isolated or closed systems; employees must observe special personal hygiene rules, and certain procedures must be followed in case of emergencies. Some *p*-phenylenediamine compounds have been used as rubber components, and DFG warns of danger of skin sensitization. Benzidine and dyes metabolized to benzidine: The following three benzidine-based dyes have been tested and found to cause cancer in rodents after oral exposure for 13 weeks (NCI 1978, IARC 1982): C.I. direct black 38 (CAS 1937-37-7) caused liver cancer in rats and mice, mammary-gland cancer in mice, and colon and urinary-bladder cancer in rats. C.I. direct Blue 6 (CAS 2602-46-2) caused liver cancer in rats. C.I. direct brown 95 (CAS 16071-86-6) caused hepatocellular adenoma in the liver and one malignant liver tumor in rats.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. On contact with strong reducing agents, such as hydrides may form flammable gases. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with red fuming nitric acid may cause fire. Oxidizes in air. Neutralizes acids in exothermic reactions to form salts plus water. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides.

Permissible Exposure Limits in Air

NIOSH IDLH = Not determined. Potential occupational carcinogen

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

PAC Ver. 29[138]

PAC-1: 0.93 milligram per cubic meter

PAC-2: 10 milligram per cubic meter

PAC-3: 61 milligram per cubic meter

Note: OSHA and NIOSH concluded that benzidine and benzidine-based dyes were potential occupational carcinogens and recommended that worker exposure be reduced to the lowest feasible level. OSHA and NIOSH further concluded that *o*-tolidine and *o*-dianisidine (and dyes based on them) may present a cancer risk to workers and should be handled with caution and exposure minimized.

DFG MAK: [skin] Carcinogen Category 1. Some *p*-phenylenediamine compounds have been used as rubber components, and DFG warns of danger of skin sensitization.

Australia: (prohibited) [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Finland: carcinogen, 1999; France: VME 0.001 ppm (0.008 milligram per cubic meter), carcinogen, 1999; Poland: MAC (time-weighted average) 0 milligram per cubic meter; MAC (STEL) 0 milligram per cubic meter, 1999; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. Several states have set guidelines or standards for benzidine in ambient air[60] ranging from zero (New York, North Dakota, South Carolina, Virginia) to 0.014 ng/m^3 (North Carolina) to 0.02 ng/m^3 (Rhode Island) to 30 μ/m^3 (30,000 ng/m^3) (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method #5509, Benzidine, #8306, in urine, OSHA Analytical Method ID-65.

Permissible Concentration in Water: Federal Drinking Water Guidelines: State Drinking Water Guidelines: Arizona 0.0001 μg/L; Florida 250 μg/L; New Hampshire 0.0002 μg/L.

Determination in Water: High performance liquid chromatography (EPA Method 605) or an oxidation/colorimetric method using Chloramine T (available from EPA) or a GC/mass spectrometric method (EPA Method 625). Octanol−water coefficient: Log K_{ow} =< 1.5. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, percutaneous absorption, and ingestion of dust.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes. Corrosive to the skin and respiratory tract. Easily absorbed thought the skin. Inhalation can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Ingestion: animal studies suggest 0.01%−0.08% in food may cause a decrease in liver, kidney and body weight; an increase in spleen weight; swelling of the liver and blood in the urine.

Long-Term Exposure: May cause skin allergy. Benzidine is a human carcinogen. Exposure may cause an increase in urination, blood in the urinary tract tumors. Can affect the blood and cause bladder tumors; liver and kidney damage.

Points of Attack: Skin, bladder, kidney, liver.

Medical Surveillance: OSHA mandates the following be investigated: reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking; NIOSH lists the following tests: cystoscopy; pulmonary function tests; urine (chemical/metabolite); urinalysis (routine); urinalysis (routine), cytology every six months, hematuria every month; urinalysis (routine), every month. Placement and periodic examinations should include an evaluation of exposure to other carcinogens; use of alcohol, smoking, medications: and family history. Special attention should be given on a regular basis to urine sediment and cytology. If red cells or positive smears are seen, cystoscopy should be done at once. The general health of exposed persons should also be evaluated in periodic examinations. Urine cytology. Evaluation by a certified allergist. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Use gastric lavage if ingested followed by saline catharsis. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: These are designed to supplement engineering controls (such as a prohibition on open-vessel operation) and to prevent all skin or respiratory contact. Full body protective plastic clothing and butyl rubber gloves should also be used. On exit from a regulated area employees should shower and change into street clothes, leaving their protective clothing and equipment at the point of exit to be placed in impervious containers at the end of the work shift for decontamination or disposal. Effective methods should be used to clean and decontaminate gloves and clothing.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCB A (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Store in a dark, cool, well-ventilated area in closed, sealed containers. Keep out of sunlight and away from heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1885 Benzidine, Hazard Class: 6.1; Labels: 6.1—Poisonous materials. PGII.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Cover the spill with a mixture of 9 parts sand to 1 part soda ash. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzidine may burn, but does not readily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Use water spray in flooding quantities as fog. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device[22]. Package spill residues and sorbent media in 17 hour epoxy-lined drums and move to an EPA-approved disposal site. Treatment may include destruction by potassium permanganate oxidation, high-temperature incineration, or microwave plasma methods.

Encapsulation by organic polyester resin or silicate fixation. These disposal procedures should be confirmed with responsible environmental engineering and regulatory officials.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R50/53; R62; safety phrases: S29; S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Benzo(*b*)fluoranthene is a colorless, needle-shaped solid. Molecular weight = 252.32; boiling point = 480 °C; freezing/melting point = 168°C; vapor pressure = 5.0×10^{-7} mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩. Practically insoluble in water; solubility =< 1 mg/mL @ 19°C.

Potential Exposure: There is no commercial production of this compound. Benzo(*b*)fluoranthene is a chemical substance formed during the incomplete burning of fossil fuel, garbage, in cigarette smoke, or any organic matter and is found in smoke in general; it is carried into the air, where it condenses onto dust particles and is distributed into water and soil and on crops. B(*b*)F is a PAH and a component of coal tar pitch used in industry as a binder for electrodes. It is also a component of creosote, which is used to preserve wood. PAHs are also found in limited a mounts in bituminous materials and asphalt used for paving, roofing, and insulation. B(*b*)F has some use as a research chemical. It is available from some specialty chemical firms in low quantities (25−100 mg).

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens

ACGIH TLV[1]: Exposure by all routes should be carefully controlled to levels as low as possible; Suspected Human Carcinogen

PAC Ver. 29[138]

PAC-1: 0.12 milligram per cubic meter

PAC-2: 1.3 milligram per cubic meter

PAC-3: 7.9 milligram per cubic meter

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Group 2

Austria: carcinogen, 1999; France: carcinogen, 1993; Norway: TWA 0.04 milligram per cubic meter, 1999

Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; NIOSH Analytical Method #5515, PAHs by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aqua tic organisms; therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/L, respectively.

Determination in Water: The analytical methods required by EPA for the analysis of B(b)F in water are procedures 610 (HPLC/FS), 625 (GC/MS), and 1625 (GC/MS). These are required test procedures under the Clean Water Act for municipal and industrial wastewater-discharging sites. GC/MS is also the method recommended be the EPA Contract Laboratory Program for analysis of B(*b*)F and other PAHs in water and soil. Octanol/water partition coefficient as Octanol−water coefficient: Log $K_{\text{ow}} = 6.1$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, passing through the skin. B(*b*)F enters the body primarily through breathing polluted air containing the compound or from inhaling tobacco smoke. Drinking contaminated water or accidentally swallowing soil or dust particles containing B(*b*)F can also result in B(*b*)F entering the body. Smoking or charcoal-broiling food can cause B(*b*)F to be formed. B(*b*)F can then enter the body through consumption of the contaminated food. Under normal conditions of environmental exposure, B(*b*)F does not usually enter the body through the skin; however, small amounts could enter the body if contact occurs with soil that contains high levels of B(*b*)F (e.g., near a hazardous waste site) or if contact occurs with heavy oils containing B(*b*)F.

Harmful Effects and Symptoms

B(*b*)F is a toxic chemical that causes cancer in laboratory animals when it is applied to their skin. B(*b*)F has not been studied adequately, and, consequently, it is not known whether it causes cancer if it is breathed or ingested, or if it causes harmful effects other than cancer. Because B(*b*)F causes skin cancer in animals, it is possible that humans exposed in the same manner or by other routes could develop cancer as well.

Short-Term Exposure: The substance can be absorbed into the by inhalation of its aerosol skin absorption. Skin contact may cause irritation or skin allergy, which is greatly aggravated by sunlight on contaminated skin. Eye contact or "fume" exposure may cause irritation and a reaction greatly aggravated by sunlight during or shortly following exposure. Direct contact or "fumes" can cause irritation of the nose, throat, and bronchial tubes; skin irritation, redness, and possible swelling.

Long-Term Exposure: Repeated skin contact may cause thickening, pigment changes and skin growths, including warts, pimples and skin cancer. B(*b*)F is a probable carcinogen in humans. May cause eye allergy. Repeated inhalation of fumes, especially with heating may cause chronic bronchitis with cough and phlegm.

Points of Attack: Skin, eyes.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Periodic skin examination.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Sun screen lotion or creams with a high ability to screen out ultraviolet light can help prevent skin allergic reactions. These may need frequent reapplication if the user is sweating. Ultraviolet-screening sunglasses can help with eye allergic reactions. Consult your doctor or pharmacist in selecting these. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include acrid smoke, irritating fumes, and oxides of carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Residues and sorbent media may be packaged in 17H epoxy-lined drums and disposed of at an EPA-approved site. Destroy by permanganate oxidation, high-temperature incineration with scrubbing equipment, or microwave plasma treatment, if available. Confirm disposal procedures with responsible environmental engineer and regulatory officials.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Benzoic acid is a white crystalline or flaky solid with a faint, pleasant odor. Molecular weight = 122.13; boiling point = 249°C; freezing/melting point = 122.4°C (sublimes); specific gravity (H_2O:1) = 1.27 @ 28°C; relative vapor density (air = 1) = 4.21; vapor pressure =< 0.076 mmHg @20°C; Flash point = 121°C; autoignition temperature = 570°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0 ₩. Soluble in water; solubility 0.3% @ 20°C.

Potential Exposure: Benzoic acid is used in production of plasticizers, benzoyl chloride, sodium benzoate and alkyl resins; in the manufacture of benzoates; in the manufacture of food preservatives; as a dye binder in calico printing; in curing of tobacco, flavors, perfumes, dentifrices; standard in analytical chemistry; antifungal agent.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, caustics, ammonia, amines, isocyanates. Dust forms an explosive mixture with air.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 13 milligram per cubic meter

PAC-2: 140 milligram per cubic meter

PAC-3: 830 milligram per cubic meter

Permissible Concentration in Water: Russia has proposed a MAC of 0.6 mg/L in surface water[35].

Determination in Water: Octanol−water coefficient: Log K_{ow} =< 2. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Irritating to skin, eyes (possibly severe), and mucous membranes. Skin contact may cause irritation, skin rash, or burning feeling on contact. Ingestion causes nausea and G.I. troubles. For most people, ingestion of 1/10−2/10 ounce will have no effect although some sensitive people may experience allergic reactions. Larger amounts may cause stomach upset. Information from animal studies show that about 6 ounces may be lethal to a 150 pound person. LD_{50} (oral, rat) = 1700 mg/kg.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. Mutation data reported.

Points of Attack: Skin, eyes, and mucous membranes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Cannister mask recommended.

Storage: Color code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked and cool, ventilated area. Store away from excessive heat. Benzoic acid must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Vapor may explode if ignited in an enclosed area. Solutions should be neutralized with soda ash. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Then flush the area with water. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Benzoic acid is a combustible solid. Benzoic acid may burn, but does not readily ignite. High levels of dust may form an explosive concentration in air. Use dry chemical, CO_2, or water spray extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 5000 lb (2270 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions, or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R10; R21/22; R51/53; R62; safety phrases: S2; S23; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Bezonitrile is a colorless, oily liquid. It has an almond odor. Molecular weight = 103.13; Specific gravity (H_2O:1) = 1.01 @ 25°C; boiling point = 191°C; freezing/melting point = −12.8°C; critical temperature = 426°C; critical pressure = 611 psia; relative vapor density (air = 1) = 3.6; electrical conductivity = 2×10^6 pS/m; ratio of specific heats of vapor (gas) = 1.091; latent heat of vaporization = 3.67×10^5 J/kg; heat of combustion = -351×10^5 J/kg. flash point = 71°C; explosive limits in air: lower = 1.4%; upper = 7.2%; autoignition temperature = 550°C. Hazard identification (based on NF PA-704 M Rating System): Health 2; flammability 2; reactivity 0 ₩. Poor solubility in water.

Potential Exposure: Bezonitrile is used as an electroplating agent; in organic synthesis of pharmaceuticals; dyestuffs; rubber chemicals; as a solvent and chemical intermediate.

Incompatibilities: May form explosive mixture with air. Strong acids which can release hydrogen cyanide. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

Permissible Exposure Limits in Air

NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.

PAC* Ver. 29[138]

PAC-1: 0.56 ppm

PAC-2: $\mathbf{6.2}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{19}_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

Russia[43] set a MAC in work-place air of 1.0 milligram per cubic meter.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.6$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Benzonitrile can affect you when breathed in by passing through your skin. Lower exposures can cause you to feel dizzy and lightheaded. Exposure to high levels, by breathing or skin contact, can cause trouble breathing, convulsions, coma and death. Exposure may impede cellular or tissue respiration causing cyanosis and unconsciousness. Contact can irritate the eyes and skin. Prolonged contact can cause skin burns. The oral LD_{50} cat and rabbit is 800 mg/kg.

Long-Term Exposure: Repeated exposure may damage the liver and nervous system. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Liver, nervous system.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once, and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth and get medical attention. If cyanide poisoning is suspected use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Butyl rubber and polyvinyl alcohol gloves have been tested and found to be resistant to permeation by benzonitrile. Wash thoroughly immediately after exposure to benzonitrile and at the end of the work-shift. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of benzonitrile to potentially exposed workers. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: W*here there is a potential for overexposure:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area. Away from strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2224 Benzonitrile, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling:

Nitriles spill

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Before entering confined space where benzonitrile may be present, check to make sure that an explosive concentration does not exist. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzonitrile is a combustible liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Water may ineffective in controlling fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: (1) Mix with calcium hypochlorite and flush to sewer with water or (2) incinerate.

United States Environmental Protection Agency Gene-Tox Program, Negative: *E. coli polA* without S9 (see Appendix 4).

Hazard Alert: Combustible, Possible risk of forming tumors, Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi, Xn, N: risk phrases: R11; R36/37/38; R40; R48/20; R48/20; R50/51/52/53; R65; R67; R62; safety phrases: S9; S16; S26; S33; S36/37/39; S45; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Benzophenone is a combustible, white, crystalline solid with a rose-like odor. Molecular weight = 182.23; specific gravity (H_2O:1) = 1.085 @ 50°C; boiling point = 305°C; freezing/melting point = 48.5°C; latent heat of vaporization = 2.93×10^5 J/kg; heat of combustion = -358×10^5 J/kg. Autoignition temperature => 500°C; Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0 ₩. Insoluble in water.

Potential Exposure: Benzophenone is used in UV curing of inks and coatings; as an intermediate; as an odor fixative in fragrances, flavoring, soaps; in the manufacture of pharmaceuticals and insecticides; in organic syntheses.

Incompatibilities: Oxidizing materials, such as dichromates and permanganates.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 1.5 milligram per cubic meter
PAC-2: 90 milligram per cubic meter
PAC-3: 310 milligram per cubic meter

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, through the skin, and by ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Skin and eye contact can cause irritation. Ingestion can cause nausea, vomiting and stomach pain. Estimated lethal dose is 8 oz.

Medical Surveillance: See NIOSH Criteria Document: 78-173 *Ketones*

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth and get medical attention.

Personal Protective Methods: Adequate ventilation; sinks, showers and eyewash stations should be available. Goggles or face shields and rubber gloves should be worn if contact is likely.

Respirator Selection: Local exhaust or breathing protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1224 Ketones, liquid, n.o.s., Hazard Class: 3; Labels: 3—Flammable liquid, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Use dry chemical, alcohol foam, or CO_2.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xi; risk phrases: R45; R46; R60; R61; R43; R50/53; R62; R63; safety phrases: S29; S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: B(*a*)P, is yellowish needles[2], crystals or powder. Odorless. PAHs are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Molecular weight = 252.32; freezing/melting point = 179°C[2]; boiling point = 311°C @ 10 mmHg[2]. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 1; reactivity 0 ₩. Insoluble in water.

Potential Exposure: Benzo[*a*]pyrene (B[*a*]P) is a PAH that has no commercial-scale production. B(*a*)P is produced in the United States by one chemical company and distributed by several specialty chemical companies in quantities from 100 mg to 5 g for research purposes. Although not manufactured in great quantity, B(*a*)P is a by-product of combustion. It is estimated that 1.8 million pounds per year are released from stationary sources, with 96% coming from: (1) coal refuse piles, outcrops, and abandoned coal mines; (2) residential external combustion of bituminous coal; (3) coke manufacture; and (4) residential external combustion of anthracite coal. Human exposure to B(*a*)P can occur from its presence as a by-product of chemical production. The number of persons exposed is not known. Persons working at airports in tarring operations; refuse incinerator operations; power plants, and coke manufacturers, may be exposed to higher B(*a*)P levels than the general population. Scientists involved in cancer research or in sampling toxic materials may also be occupationally exposed. The general population may be exposed to B(*a*)P from air pollution, cigarette smoke, and food sources. B(*a*)P has been detected in cigarette smoke at levels ranging from 0.2 to 12.2:g per 100 cigarettes. B(*a*)P has been detected at low levels in foods ranging from 0.1 to 50 ppb.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrogen dioxide and ozone.

Permissible Exposure Limits in Air

PAHs

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens; See NIOSH Pocket Guide, Appendix C.

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen; Suspected Human Carcinogen; BEIp assigned *as Polycyclic Aromatic Compounds (PAHs)*

PAC Ver. 29[138]

PAC-1: 0.6 milligram per cubic meter

PAC-2: 120 milligram per cubic meter

PAC-3: 700 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutagen Group 2

Australia: carcinogen, 1993; Belgium: carcinogen, 1993; Finland: TWA 0.01 milligram per cubic meter, [skin], carcinogen, 1999; France: carcinogen, 1993; Norway: TWA 0.04 milligram per cubic meter, 1999; Poland: TWA 0.003 milligram per cubic meter, 1999; Russia: STEL 0.00015 milligram per cubic meter, carcinogen, 1993; Sweden: NGV 0.002 milligram per cubic meter, KTV 0.02 milligram per cubic meter, [skin], carcinogen, 1999; Switzerland: MAK-week 0.0002 ppm

(0.002 milligram per cubic meter), carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. Russia[43] set a MAC of 0.001 μ/m^3 in ambient residential air. In addition, several states have set guidelines or standards for benzo[*a*]pyrene in ambient air[60] ranging from zero (New York and Virginia) to 0.0007 μ/m^3 (Pennsylvania) to 0.10 μ/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; NIOSH Analytical Method #5515, PAHs by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms; therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/L, respectively.

Determination in water: Octanol−water coefficient: Log $K_{ow} = 6.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation skin absorption.

Harmful Effects and Symptoms

B(*a*)P has produced tumors in all of the nine species for which data are reported following different administrations including oral, skin and intratracheal routes. It has both a local and a systemic carcinogenic effect. In subhuman primates, there is convincing evidence of the ability of B(*a*)P to produce local sarcomas following repeated subcutaneous injections and lung carcinomas following intratracheal instillation. It is also an initiator of skin carcinogenesis in mice, and it is carcinogenic in single-dose experiments and following prenatal exposure. In skin carcinogenesis studies in mice, B(*a*)P was consistently found to produce more tumors in a shorter period of time than did other polycyclic aromatic hydrocarbons (PAH), with the possible exception of DB(*a,h*)A. In a dose−response study involving subcutaneous injection in mice, the minimal dose at which carcinogenicity was detected was higher for B(*a*)P than for DB(*a,h*)A and for MC. However, the latent periods were shorter for B(*a*)P than for DB(*a,h*)A. In studies using intratracheal administration, B(*a*)P appeared to be less effective than 7*H*-dibenzo(*c,g*)carbazole in the hamster[1]. No epidemiological studies on the significance of B(*a*)P exposure to humans are available, and studies are insufficient to prove that B(*a*)P is carcinogenic for man. However, coal-tar and other materials which are known to be carcinogenic to humans may contain B(*a*)P. The substance has also been detected in other environmental situations. A 1% solution applied to the skin caused skin irritation, swelling, flaking, coloration of skin, and formation of warts.

Short-Term Exposure: B(*a*)P can cause exposure by inhalation and passing through the unbroken skin. Can cause skin irritation with rash and/or burning sensations. Exposure to sunlight can increase these effects. Eye contact can cause irritations and burns.

Long-Term Exposure: B(*a*)P is a probable carcinogenic in humans. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies. May damage the developing fetus. May affect male reproductive glands and cause genetic damage. May be transferred to nursing infants through exposed mother's milk. Repeated exposure can cause skin changes, such as thickening; darkening, and pimples. Later skin changes include loss of color, reddish areas, thinning of the skin, and warts. Sunlight may cause rash to develop, and increased risk of skin cancer. Skin cancer is very often easily cured when detected early.

Points of Attack: Skin, respiratory system; bladder, liver, kidneys as PAH.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. CBC, chest X-ray, pulmonary function tests, photopatch testing; sputum cytology, urinalysis (routine) [cytology, hematuria], liver, kidney, and bladder function tests recommended for coal tar pitch volatiles[2].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Avoid exposure of (pregnant) women*! Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when

skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing chemicals (such as chlorates, perchlorates, permanganates, and nitrates). A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Flammable, but generally found in such low quantities it is not considered a fire hazard. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with a flammable solvent[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Benzotrichloride is a combustible, colorless to yellow-brown, oily liquid that fumes on contact with air. It has a penetrating odor. Molecular weight = 195.47; specific gravity (H_2O:1) = 1.38; boiling point = 220.7°C; freezing/melting point = −4.4°C; flash point = 127°C (cc); autoignition temperature = 211°C. Explosive limits in air: LEL 2.1%; UEL 6.5% @ 160°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩. Slowly reacts in water.

Potential Exposure: Benzotrichloride is used as a chemical and dye intermediate; extensively used in the dye industry for the production of Malachite green, Rosamine, Quinoline red, and Alizarin yellow A. It can also be used to produce ethyl benzoate. Commercial grades may contain hydrochloric acid, benzylidene chloride, or benzyl chloride.

Incompatibilities: Benzotrichloride decomposes on heating, on contact with acids and/or water, producing toxic and corrosive hydrogen chloride and benzoic acid. Reacts violently with strong oxidizers, iron and other metals, alkali and earth alkali metals; bases and organic substances, and may cause fire and explosions. On contact with air it emits toxic and corrosive hydrogen chloride. Attacks many metals in presence of water. Attacks many plastics.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 0.1 ppm/0.8 milligram per cubic meter TWA [skin]; Ceiling; Suspected Human Carcinogen

PAC Ver. 29[138]

PAC-1: 0.064 milligram per cubic meter

PAC-2: 0.7 milligram per cubic meter

PAC-3: 5.3 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2

Austria: carcinogen, 1999; Finland: carcinogen, 1999; Russia: STEL 0.2 milligram per cubic meter, 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000. Several states have set guidelines or standards for benzotrichloride in ambient air ranging from zero in North Dakota to 0.0007 μ/m^3 in Rhode Island.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Permissible Concentration in Water: No criteria set. (Benzotrichloride decomposes in the presence of water to benzoic acid and hydrogen chloride).

Determination in Water: Octanol−water coefficient: Log K_{ow} = ~3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation may cause irritation and chemical burns to the nose, throat and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Based on animal study information, permanent injury or death may occur from exposure to 125 ppm for 4 hours. Skin contact may cause irritation and chemical burns. Eye contact can cause severe irritation and chemical burns. Ingestion may cause severe irritation and chemical burns to the mouth, throat and stomach. Additionally, it may be aspirated into the lungs with the risk of chemical pneumonitis. The damage may be permanent. LD_{50} = (oral-rat) 6 mg/kg.

Long-Term Exposure: Benzotrichloride may affect the liver, kidneys, thyroid, CNS, and hematopoetic system, causing impaired functions and anemia. Probable carcinogen in humans.

Points of Attack: Lungs, liver, kidneys, thyroid glands, blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests; examination of the nervous system; thyroid function, CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Before entering confined space where benzotrichloride may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a dark, cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2226 Benzotrichloride, Hazard class: 8; Labels: 8—Corrosive material.

Spill Handling: Material is extremely hazardous to health but areas may be entered with extreme care. Full protective clothing including SCBA should be provided. No skin surface should be exposed. Spilled material should not be touched. Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors−contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may react violently with water. Fire may produce irritating and/or Thermal decomposition products may include hydrogen chloride and oxides of carbon. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flashback. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Incineration with flammable solvent added in incinerator with afterburner and alkaline scrubber.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Benzoyl chloride is a colorless to slight brown liquid with a strong, penetrating odor. Molecular weight = 140.57; specific gravity (H_2O:1) = 1.22 @ 15°C; boiling point = 197.2°C @ 760 mmHg; freezing/melting point = −0.5°C; flash point = 72°C; vapor pressure = 0.38 mmHg @ 20°C; autoignition temperature = 19°C. Explosive limits in air: Lower = 2.5%; Upper = 27%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 2 ₩ (water reactive). Decomposes in water forming hydrogen chloride.
Potential Exposure: Benzoyl chloride is used as a chemical intermediate; in organic synthesis; to produce other chemicals, dyes, perfumes, herbicides, and medicines.
Incompatibilities: May form explosive mixture with air. Contact with heat, hot surfaces, and flames causes decomposition, forming phosgene and hydrogen chloride. Water contact may be violent; forms hydrochloric acid. Reactions with amines, alcohols, alkali metals, dimethyl sulfoxide, strong oxidizers, and metal salts may be violent, causing fire and explosions. Attacks metals in the presence of moisture, forming explosive hydrogen gas. Attacks some plastics, rubber or coatings.
Permissible Exposure Limits in Air
ACGIH TLV[1]: 0.5 ppm/0.8 milligram per cubic meter Ceiling Concentration; not classified as a human carcinogen
PAC* Ver. 29[138]
PAC-1: $\mathbf{0.3_E}$ ppm
PAC-2: $\mathbf{5_E}$ ppm
PAC-3: $\mathbf{20_E}$ ppm
*ERPG are marked with a subscript "**E.**"
DFG MAK: Carcinogen Category 3B
Hungary: TWA 5 milligram per cubic meter, STEL 10 milligram per cubic meter, 1993; Russia: STEL 5 milligram per cubic meter, 1993
Determination in Air: By photometry[11].
Permissible Concentration in Water: EPA has suggested a limit of 69 μg/L[52].
Routes of Entry: Inhalation, ingestion.
Harmful Effects and Symptoms
Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Corrosive if ingested. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.
Long-Term Exposure: Can cause chronic rash, warts, sore throat, and reduced sense of smell. Can cause bronchitis with cough and phlegm, and/or shortness of breath. May cause skin sensitization and allergic reaction.
Points of Attack: Eyes, skin, and mucous membranes.
Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute exposure. Examination by a qualified allergist.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Use in a well-ventilated area. Showers, sinks, and eyewash stations should be readily available. Wear an apron, gauntlets, rubber gloves, boots and any additional protective clothing to prevent skin contact. Wear safety goggles.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Color code—White: Store in a cool, dry, well-ventilated area preferably in a detached warehouse. Keep away from sources of ignition. Avoid physical damage to the container.

Shipping: UN 1736 Benzoylchloride, Hazard class: 8; Labels: 8—Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. *Do not use water or wet method.* Absorb liquid in vermiculite, dry sand; earth, or similar material and deposit in sealed containers; or cover any spills with sodium bicarbonate. Remove the resulting mixture to a fiber container or plastic bag for disposal by incineration[22].Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzoyl chloride is a combustible liquid. Thermal decomposition products may include deadly phosgene gas, hydrogen chloride fumes and oxides of carbon. *Do not use water.* Reacts violently with water or steam releasing heat, phosgene and hydrogen chloride fumes. Use dry chemical, carbon dioxide, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pour into sodium bicarbonate solution and flush to sewer.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Limited Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999. United States Environmental Protection Agency Gene-Tox Program, Inconclusive: *E. coli polA* without S9.

Hazard Alert: Organic peroxide, Extremely flammable, Strong oxidizer, Possible risk of forming tumors, Suspected of causing genetic defects, Sensitization hazard (skin), Primary irritant (w/o allergic reaction), FDA-over the counter drug.

Banned or Severely Restricted (in consumer products) (Sweden)[13]

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 7500 lb (3504 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: E, O, F+, Xi; risk phrases: R2; R3; R7; R8; R12; R36/37/38; R43; R61; R62; safety phrases: S3/7; S14; S17; S36/37/39; S41; (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Benzoyl peroxide is an odorless, white or colorless crystalline powder. Molecular weight = 242.23; specific gravity (H_2O:1) = 1.33 @ 15°C; boiling point = explosive decomposition; freezing/melting point = (possible explosive decomposition heated) 103−105°C; vapor pressure =< 1 mmHg @ 20°C; flash point = 80°C; autoignition temperature = 80°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 4; reactivity 3−4 OX. Poor solubility in water; solubility =< 1 mg/mL @ 25°C. Commercial formulations use carrier solvents that may alter the physical properties shown.

Potential Exposure: Used as polymerization initiator, curing agent, and cross-linking agent.

Incompatibilities: May explode when heated above melting point, 103°C. A strong oxidizer. Extremely explosion-sensitive to heat, shock, friction, and concussion. May explode or cause fire on contact with reducing agents; combustible substances, organic substances, wood, paper, metal powders, lithium aluminum hydride. Violent reaction with alcohols, organic and inorganic acids, and amines.

Permissible Exposure Limits in Air

NIOSH IDLH = 1500 milligram per cubic meter

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA, not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 1200 milligram per cubic meter

PAC-3: 7500 milligram per cubic meter

DFG MAK: 5 milligram per cubic meter, inhalable fraction TWA; Peak limitation Category I(1)

Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter [skin] 1999; France: VME 5 mg/m^3, 1999; Hungary: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter [skin] 1993; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Norway: TWA 5 milligram per cubic meter, 1999; the Philippines: TWA 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 5 milligram per cubic meter, MAC (STEL) 10 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, KZG-W 10 milligram per cubic meter, 1999; United Kingdom: TWA 5 milligram per cubic meter, 2000 Occupational Exposure Limit; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. In addition, four states have set guidelines or standards for benzoyl peroxide in ambient air[60] ranging from 50 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5009, Benzoyl peroxide[18]

Determination in Water: Octanol−water coefficient: Log K_{ow} => 3.4. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes, skin and respiratory tract. *Inhalation:* 1.3 milligram per cubic meter may cause nose and throat irritation. 12 milligram per cubic meter may cause lung irritation, asthmatic wheezing, decreased pulse rate and temperature, difficult breathing and stupor. *Skin:* a 5% solution left on the skin for 12 hours has caused redness, swelling, and burning. A 5% solution left on the skin for 48 hours may cause severe irritation. Solutions greater than 20% left on for more than a few minutes caused severe irritation. *Eyes:* 2.6 milligram per cubic meter has caused irritation. *Ingestion:* there is little or no information available on human ingestion. However, results from animal studies suggest that the lethal dose for humans is about 3/4 pound. LD_{50} = (oral-rat) 7710 mg/kg[9].

Long-Term Exposure: May cause skin sensitization; allergic reaction may develop. May cause lung irritation and bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Skin, respiratory system, and eyes.

Medical Surveillance: Preplacement and periodic medical examinations should be conducted with particular attention to skin conditions. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Protective clothing and safety glasses with side shields or safety goggles should be worn by employees to reduce the possibility of skin contact and eye irritation. Such protection is especially important where benzoyl peroxide and other powder or granular benzoyl formulations may become airborne or where liquid or paste formulations of benzoyl peroxide might be spattered or spilled. Protective clothing should be fire resistant. Any fabric that generates static electricity is not recommended. To prevent the buildup of static electricity, appropriate conductive footwear should be worn. Gloves made of rubber, leather, or other appropriate material should be worn by employees pure benzoyl peroxide. Aprons made of rubber or another appropriate material are recommended for added protection when handling benzoyl peroxide and its formulations. Plastic aprons that may generate static electricity should not be used. Employees should wash promptly when skin is contaminated. Work clothing should be changed daily if it may be contaminated. Remove nonimpervious clothing promptly if contaminated.

Respirator Selection: Respiratory protection as follows must be used whenever airborne concentrations of benzoyl peroxide cannot be controlled to the recommended workplace environmental limit by either engineering or administrative controls. NIOSH: *50 milligram per cubic meter:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any PAPR with a high-efficiency particulate filter). *250 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1500 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Protect containers against physical damage. Isolate in well-detached, fire-resistive, cool and well-ventilated building with no other materials stored therein; provide explosion venting in a safe direction and prohibit any electrical installation or heating facilities. Dibenzoyl peroxide should be stored in and used from original containers. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN3104 [Benzoyl peroxide ($\geq$77% but $<$95% with water)]: Organic peroxide type C, solid, Hazard Class: 5.2; Labels: 5.2—Organic peroxide, Technical Name Required. UN3108 [Benzoyl peroxide (with $\leq$77% water)]: Organic peroxide type E, solid, Hazard Class: 5.2; Labels: 5.2—Organic peroxide, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. *Mix spilled material with water-wetted vermiculite, and deposit in sealed containers. Do not use spark-generating materials or materials made of paper or wood for* *sweeping or handling spilled benzoyl peroxide*. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable liquid. At high temperatures it may explode. Thermal decomposition products may include suffocating smoke and oxides of carbon. Use water only. Do not use chemical or carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. Clean-up and salvage operations after a fire should not be attempted until all of the peroxide has cooled completely.

Disposal Method Suggested: Pretreatment involves decomposition with sodium hydroxide. The final solution of sodium benzoate, which is very biodegradable, may be flushed into the drain. Disposal of large quantities of solution may require pH adjustment before release into the sewer or controlled incineration after mixing with a noncombustible material.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable, Dangerously water reactive, Suspected reprotoxic hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R10; R36/37/38; R51; safety phrases: S2; S39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Benzylbromide is a combustible, colorless to yellow liquid with a pleasant odor. Molecular weight = 171.05; Specific gravity (H_2O:1) = 1.738; boiling point = 198−201°C; freezing/melting point = −4.0°C; vapor pressure = 0.45 mmHg @ 25°C; flash point = 79°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 1 ₩ Insoluble in water; slowly decomposes, releasing dangerous chemicals.

Potential Exposure: It is used as a chemical intermediate; in organic syntheses; as a foaming and frothing agent.

Incompatibilities: May form explosive mixture with air. Contact with water forms hydrogen bromide and benzyl alcohol. Incompatible with strong oxidizers, bases, magnesium. Attacks metals, except nickel and lead, in the presence of moisture.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.41 milligram per cubic meter

PAC-2: 4.5 milligram per cubic meter

PAC-3: 27 milligram per cubic meter

Permissible Concentration in Water: No criteria set. Toxic to aquatic organisms.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = \sim 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin, and respiratory system. Eye contact can cause severe irritation and burns. Skin contact can cause severe irritation, redness, swelling and sores. High levels can cause dizziness because it attacks the nervous system

Long-Term Exposure: Mutation data reported. Repeated skin contact can cause chronic irritation with dry skin, redness, rash, and sores. Similar very irritating substances can cause lung damage.

Points of Attack: Skin, lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Store in tightly closed containers in a cool, well-ventilated area away from water and other incompatible materials listed above.

Shipping: UN1737 Benzyl Bromide, Hazard class: 6.1; Labels: 6.1—Poisonous materials, 8—Corrosive material.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and run off from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include bromine gas. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flashback. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Pour into vermiculite, sodium bicarbonate, or a sand-soda ash mixture and transfer to paper boxes, then to an open incinerator. Alternatively, mix with flammable solvent and spray into incinerator equipped with after burner and alkali scrubber.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Benzyl chloride is a colorless to slightly yellow liquid with a strong, unpleasant, irritating odor. The Odor Threshold is 0.05 ppm[41]. Molecular weight = 126.6; specific gravity (H_2O:1) = 1.10; boiling point = 179.4°C; freezing/melting point = −45°C; vapor pressure = 1 mmHg @ 20°C; flash point = 67°C (cc); autoignition temperature = 585°C. Flammable Limits in Air: LEL: 1.1%; UEL: 14.0%[52]. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 1 ₩. Practically insoluble in water; solubility = 0.05%.

Potential Exposure: Used as an intermediate and as an irritant gas in chemical warfare. In contrast to phenyl halides, benzyl halides are very reactive. Benzyl chloride is used in production of benzal chloride, benzyl alcohol, and benzaldehyde. Industrial usage includes the manufacture of plastics, dyes, synthetic tannins, perfumes and resins. It is used in the manufacture of many pharmaceuticals. Suggested uses of benzyl chloride include: the vulcanization of fluororubbers and the benzylation of phenol and its derivatives for the production of possible disinfectants.

Incompatibilities: May form explosive mixture with air. Contact with water forms hydrogen chloride fumes. Strong oxidizers may cause fire and explosions. Unstabilized benzyl chloride undergoes polymerization with copper, aluminum, iron, zinc, magnesium, tin, and other common metals except lead and nickel, with the liberation of heat and hydrogen chloride gas. May accumulate static electrical charges, and may cause ignition of its vapors. Attacks some plastics and rubber. Thermal decomposition and polymerization reactions are inhibited, to a limited extent, by addition of triethylamine, propylene oxide, or sodium carbonate[17].

Permissible Exposure Limits in Air

NIOSH IDLH = 10 ppm

OSHA PEL: 1 ppm/5 milligram per cubic meter TWA

NIOSH REL: 1 ppm/5 milligram per cubic meter [15 minutes] Ceiling Concentration

ACGIH TLV[1]: 1 ppm/5.2 milligram per cubic meter TWA; Confirmed Carcinogen with unknown relevance to humans

PAC-3: $\mathbf{50_E}$ ppm

*ERPG are marked with a subscript "**E.**"

DFG MAK: [skin] Carcinogen Category 2

Australia: TWA 1 ppm (5 milligram per cubic meter), 1993; Austria: carcinogen, 1999; Belgium: TWA 1 ppm (5.2 mg/

m^3), 1993; Denmark: TWA 1 ppm (5 milligram per cubic meter), 1999; Finland: TWA 1 ppm (5 milligram per cubic meter); STEL 3 ppm (15 milligram per cubic meter), 1999; France: VME 1 ppm (5 milligram per cubic meter), VLE 2 ppm (11 milligram per cubic meter); STEL 3 ppm (15 milligram per cubic meter), carcinogen, 1993; Hungary: STEL 0.5 milligram per cubic meter [skin] 1993; Norway: TWA 1 ppm (5 milligram per cubic meter), 1999; the Philippines: TWA 1 ppm (5 milligram per cubic meter), 1993; Poland: 3 milligram per cubic meter, ceiling 5 milligram per cubic meter, 1999; Russia: STEL 0.5 milligram per cubic meter, 1993; Sweden: NGV 1 ppm (5 milligram per cubic meter), KTV 2 ppm (11 milligram per cubic meter), carcinogen, 1999; Switzerland: MAK-W 1 ppm (5 milligram per cubic meter), carcinogen, 1999; Turkey: TWA 1 ppm (5 milligram per cubic meter), 1993; United Kingdom: TWA 0.5 ppm (2.6 milligram per cubic meter); STEL 1.5 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several States have set guidelines or standards for benzyl chloride in ambient air[60] ranging from $0.01\,\mu/m^3$ (Rhode Island) to $0.7\,\mu/m^3$ (Massachusetts) to $16.7\,\mu/m^3$ (New York) to $20.0\,\mu/m^3$ (Rhode Island) to $25\,\mu/m^3$ (South Carolina) to $50\,\mu/m^3$ (North Dakota) to $85\,\mu/m^3$ (Virginia) to $100\,\mu/m^3$ (Connecticut) to $119\,\mu/m^3$ (Nevada) to $500\,\mu/m^3$ (North Carolina).

Determination in Air: Use NIOSH Analytical Methods 1003, Hydrocarbons, halogenated[18].

Permissible Concentration in Water: No criteria set but EPA[32] has suggested an ambient limit of $69\,\mu g/L$ based on health effects.

Determination in Water: Octanol−water coefficient: $\log K_{ow} = 2.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation exposure may result in severe irritation of upper respiratory tract with coughing, burning of the throat, headache, dizziness, and weakness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Eye contact may result in immediate and severe eye irritation and prolonged exposure may cause permanent eye damage. Ingestion may cause severe burns of the mouth, throat; and gastrointestinal tract resulting in nausea, vomiting, cramps, and diarrhea. It is intensely irritating to skin, eyes, and mucous membranes. Highly toxic; may cause death or permanent injury after very short exposure to small quantities. Large doses cause CNS depression, with possible unconsciousness.

Long-Term Exposure: Causes thyroid cancer in animals. Has been listed as a direct-acting or primary carcinogen. May damage the developing fetus. May cause liver damage and affect the nervous system.

Points of Attack: Eyes, skin, and respiratory system.

Medical Surveillance: NIOSH recommends Pulmonary function tests; chest X-ray; Expired air test. Preplacement and periodic examinations should include the skin, eyes, and an evaluation of the liver, kidney, respiratory tract, blood, and nervous system. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\,\mu g/cm^2/min$): 4H and Silver Shield gloves, CPF3 suits; Responder suits; Trychem 1000 suits; **4 hours:** (At least 4 but $<$ 8 hours of resistance to breakthrough $>0.1\,\mu g/cm^2/min$): Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: 10 ppm: CcrOvAg* (APF = 10) [any chemical cartridge respirator with organic vapor and acid gas cartridge(s)]; or GmFOvAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor or acid gas canister]; or PaprOvAg* (APF = 25) [any PAPR with organic vapor and acid gas cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode. *Escape:* GmFOvAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor or acid gas canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This material should be stored in tightly closed containers in a cool, well-ventilated area away from sunlight, heat, moisture, active metals, oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1738 Benzyl chloride, Hazard class: 6.1; Labels: 6.1—Poisonous materials, 8—Corrosive material.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors–contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated run off enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzyl chloride is a combustible liquid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. *Do not use water. Small fire*: use d*ry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flashback. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Incineration @ 816°C for 0.5 second minimum for primary combustion and 1204°C for 12.0 second for secondary combustion. Elemental chlorine formation may be alleviated by injection of steam or methane into the combustion process[24].

Benzyl Cyanide B:0460

Formula: C_8H_4N; $C_6H_2CH_2CN$
Synonyms: Acetic acid, phenyl-nitrile; Acetonitrile, phenyl-; Benzeneacetonitrile; Benzylkyanid; Benzylnitrile; Cianuro de bencilo (Spanish); (Cyanomethyl) benzene; α-Cyanotoluene; Fenilacetonitrilo, líquido (Spanish); 2-Phenylacetonitrile; α-Phenylacetonitrile; Phénylacétonitrile, liquide (French); Phenylacetonitrile; Phenyl acetyl nirtile; Toluene, α-cyano; α-Tolunitrile
CAS Registry Number: 140-29-4
HSDB Number: 2103 as phenylacetonitrile
RTECS Number: AM1400000
UN/NA & ERG Number: UN2470/152
EC Number: 205-410-5
Regulatory Authority and Advisory Information
Hazard Alert: Poison, Combustible, Primary irritant (w/o allergic reaction), Environmental hazard.
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cyanide compound
Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 500 lb (227 kg)
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
United States DOT Regulated Marine Pollutant (49CFR 172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.
List 1, DEA chemical code 8735 (Title 21 CFR1310.02)
United States National Primary Drinking Water Regulations: MCLG = 0.2 mg[CN$^-$]/L; MCL = 0.2 mg[CN$^-$]/L as cyanide
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R22; R 23/24/25; R26; R51/53; safety phrases: S23; S28; S36/37/39; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: Benzyl cyanide is a colorless, oily liquid with an aromatic odor. Molecular weight = 117.2; specific gravity (H_2O:1) = 1.02; boiling point = 233.5°C; freezing/melting point = −24; vapor pressure = low <0.40 @ 20°C; Flash point = 113°C (oc),[17] also cited as 101°C[52]. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩. Insoluble in water.
Potential Exposure: (as CN): Benzyl cyanide is used in organic synthesis, especially of penicillin precursors. It is used as a chemical intermediate for amphetamines, phenobarbital; the stimulant, methyl phenidylacetate; esters as perfumes and flavors.
Incompatibilities: Violent reaction with strong oxidizers; sodium hypochlorite, lithium aluminum hydride. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].
Permissible Exposure Limits in Air
NIOSH IDLH = 25 mg[CN]/m^3
OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA
NIOSH REL: 5 mg[CN]/m^3/4; 7 ppm/10 minutes, Ceiling Concentration
ACGIH TLV[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration
PAC Ver. 29[138]
PAC-1: 0.39 milligram per cubic meter
PAC-2: 4.3 milligram per cubic meter
PAC-3: 15 milligram per cubic meter
DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.
Australia: TWA 5 milligram per cubic meter, [skin], 1993; Austria: MAK 5 mg[CN]/m^3, [skin], 1999; Denmark: TWA 5 milligram per cubic meter, [skin], 1999; France: VME 5 mg[CN]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 milligram per cubic meter, KZG-W 10 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 5 milligram per cubic meter [skin]. Russia[43] set a MAC of 0.8 milligram per cubic meter in work-place air.
Determination in Air: See NIOSH Criteria Document 212 *Nitriles*.
Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.
Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.6. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous. May be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause burns to skin and eyes. LD_{50} = (oral-rat) 270 mg/kg[9].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. For cyanide poisoning, use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: NIOSH/OSHA (as cyanides): *Up to 25 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode. *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials listed above. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2470 Phenylacetonitrile, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling:

Nitriles spill

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Thermal decomposition products may include cyanide and oxides of nitrogen. Container may explode in heat of fire. Runoff from fire control water may give off poisonous gases. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to Waters (*Beryllium nitrate*)

Description: Beryllium is a gray shiny metal or powder, or fine granules which resemble powdered aluminum. Beryllium is slightly soluble in water. All beryllium compounds are soluble in water, to some degree. Berylore is the primary source of beryllium, although there are numerous other sources. Molecular weight = 9.01; specific gravity (H_2O:1) = 1.85; boiling point = 2471°C; freezing/melting point = 1287°C; vapor pressure = 10 mmHg @ 1860°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩.

Potential Exposure: Beryllium is used extensively in manufacturing electrical components, chemicals, ceramics, nuclear reactors; in the aerospace industry; and X-ray tubes.

A number of alloys are produced in which beryllium is added to yield greater tensile strength, electrical conductivity, and resistance to corrosion and fatigue. The metal is used as a neutron reflector in high-flux test reactors. Human exposure occurs mainly through inhalation of beryllium dust or fumes by beryllium ore miners, beryllium alloy makers and fabricators; phosphor manufacturers; ceramic workers; missile technicians; nuclear reactor workers; electric and electronic equipment workers; and jewelers. The major source of beryllium exposure of the general population is thought to be the burning of coal. Approximately 250,000 pounds of beryllium is released from coal and oil-fired burners. EPA estimates the total release of beryllium to the atmosphere from point sources is approximately 5500 pounds per year. The principal emissions are from beryllium−copper alloy production. Approximately 721,000 persons living within 12.5 mi (20 km) of point sources are exposed to small amounts of beryllium (median concentration 0.005 μ/m^3). Levels of beryllium have been reported in drinking water supplies and in small amounts in food.

Incompatibilities: Beryllium metal reacts with strong acids; alkalis (forming combustible hydrogen gas), oxidizable materials. Forms shock sensitive mixtures with some chlorinated solvents, such as carbon tetrachloride and trichloroethylene. Incompatible with caustics, chlorinated hydrocarbons, oxidizers, molten lithium[77].

Permissible Exposure Limits in Air

NIOSH IDLH = 4 mg[Be]/m^3

OSHA PEL: 0.002 mg[Be]/m^3 TWA; 0.005 mg[Be]/m^3 Ceiling Concentration; 0.025 mg[Be]/m^3/30 minute maximum peak-per 8 hour shift.

NIOSH REL: 0.0005 mg[Be]/m^3 STEL (do not exceed) Limit exposure to lowest feasible concentration.

ACGIH TLV[1]: 0.00005 mg[Be]/m^3 TWA, inhalable fraction; Confirmed Human Carcinogen

PAC* Ver. 29[138]

7440-41-7 metal

PAC-1: 0.0023 mg[Be]/m^3

PAC-2: **0.025**$_{\mathbf{E}}$ mg[Be]/m^3

PAC-3: **0.1**$_{\mathbf{E}}$ mg[Be]/m^3

*ERPG are marked with a subscript "**E.**"

7787-47-5 chloride

PAC-1: 0.02 milligram per cubic meter

PAC-2: 0.22 milligram per cubic meter

PAC-3: 0.89 milligram per cubic meter

7787-49-7 fluoride

PAC-1: 0.012 milligram per cubic meter

PAC-2: 0.13 milligram per cubic meter

PAC-3:0.52 milligram per cubic meter

13327-32-7 hydroxide

PAC-1: 0.011 milligram per cubic meter

PAC-2: 0.12 milligram per cubic meter

PAC-3: 0.48 milligram per cubic meter

13597-99-4 nitrate

PAC-1: 0.47 milligram per cubic meter

PAC-2: 0.52 milligram per cubic meter

PAC-3: 2.1 milligram per cubic meter

1304-56-9 oxide

PAC-1: 0.0063 milligram per cubic meter

PAC-2: 0.069 milligram per cubic meter

PAC-3: 0.28 milligram per cubic meter

DFG MAK: Danger of sensitization of the airways; Carcinogen Category 1, proven carcinogens in humans.

Arab Republic of Egypt: TWA 0.002 milligram per cubic meter, 1993; Australia: TWA 0.002 milligram per cubic meter, carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.002 milligram per cubic meter, Carcinogen 1993; Denmark: TWA 0.001 milligram per cubic meter, 1999; Finland: TWA 0.002 milligram per cubic meter; STEL 0.006 milligram per cubic meter, carcinogen, 1999; France: VME 0.002 milligram per cubic meter, continuous carcinogen, 1999; Hungary: STEL 0.001 milligram per cubic meter, carcinogen, 1993; India: TWA 0.002 milligram per cubic meter, carcinogen, 1993; Japan: TWA 0.002 milligram per cubic meter, 2 A carcinogen, 1999; Norway: TWA 0.001 milligram per cubic meter, 1999; the Philippines: TWA 0.002 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.001 milligram per cubic meter, MAC STEL 0.003 milligram per cubic meter, 1999; Russia: STEL 0.001 milligram per cubic meter, carcinogen, 1993; Sweden: NGV 0.002 milligram per cubic meter, carcinogen, 1999; Switzerland: MAK-W 0.002 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.002 milligram per cubic meter; STEL 0.005 milligram per cubic meter, 1993; Turkey: TWA 0.002 milligram per cubic meter, 1993; United Kingdom: TWA 0.002 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. Several states have set guidelines or standards for beryllium in ambient air[60] ranging from zero (North Dakota) to 0.0042 μ/m^3 (Massachusetts) to 0.01 μ/m^3 (Connecticut, Pennsylvania, South Carolina) to 0.02 μ/m^3 (South Dakota and Virginia) to 0.1 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #7704[18]. Beryllium in Air by Field-Portable Fluorometry (4/6/2007); 9110[18] Beryllium in Surface Wipes by Field-Portable Fluorometry (4/6/2007). (See also the ATSDR profile cited below).

Permissible Concentration in Water: Federal Drinking Water Standards: MCL: 0.004 mg[Be]/L; Federal Drinking Water Guidelines: Maximum Contaminant Level Goal (MCGL) for inorganic contaminants: 0.004 mg[Be]/L. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation of fume or dust.

Harmful Effects and Symptoms

Local: The soluble beryllium salts are cutaneous sensitizers as well as Primary irritant (w/o allergic reaction)s. Contact dermatitis of exposed parts of the body is caused by acid salts as well as Primary irritant (w/o allergic reaction)s. Contact dermatitis of exposed parts of the body is caused by acid salts of beryllium. Onset is generally delayed about 2 weeks from the time of first exposure. Complete recovery occurs following cessation of exposure. Eye irritation and conjunctivitis can occur. Accidental implantation of beryllium metal or crystals of soluble beryllium compound in areas of broken or abraded skin may cause granulomatous lesions. These are hard lesions with a central nonhealing area. Surgical excision of the lesion is necessary. Exposure to soluble beryllium compounds may cause nasopharynigitis, a condition characterized by swollen and edematous mucous membranes; bleeding points, and ulceration. These symptoms are reversible when exposure is terminated. *Systemic:* Beryllium and its compounds are highly toxic substances. Entrance to the body is almost entirely by inhalation. The acute systemic effects of exposure to beryllium primarily involve the respiratory tract and are manifest by a nonproductive cough, substernal pain; moderate shortness of breath; and some weight loss. The character and speed of onset of these symptoms, as well as their severity, are dependent on the type and extent of exposure. An intense exposure, although brief, may result in severe chemical pneumonitis with pulmonary edema. Chronic beryllium disease can be classified by its clinical variants according to the disability the disease process produces. (1) Asymptomatic nondisabling disease is usually diagnosed only by routine chest X-ray changes and supported by urinary or tissue assay. (2) In its mildly disabling form, the disease results in some nonproductive cough and dyspnea following unusual levels of exertion. Joint pain and weakness are common complaints. Diagnosis is by X-ray changes. Renal calculi containing beryllium may be a complication. Usually, the patient remains stable for years, but eventually shows evidence of pulmonary or myocardial failure. (3) In its moderately severe disabling form, the disease produces symptoms of distressing cough and shortness of breath; with marked X-ray changes. The liver and spleen are frequently affected, and spontaneous pneumothorax may occur. There is generally weight loss; bone and joint pain; oxygen desaturation; increase in hematocrit; disturbed liver function; hypercalciuria, and spontaneous skin lesions similar to those of Boeck's sarcoid. Lung function studies show measurable decreases in diffusing capacity. Many people in this group survive for years with proper therapy. Bouts of chills and fever carry a bad prognosis. (4) The severely disabling disease will show all of the above mentioned signs and symptoms in addition to severe physical wasting and negative nitrogen balance. Right heart failure may appear, causing a severe nonproductive cough which leads to vomiting after meals. Severe lack of oxygen is the predominant problem, and spontaneous pneumothorax can be a serious complication. Death is usually due to pulmonary insufficiency or right heart failure.

Short-Term Exposure: Eye or skin contact can cause irritation, itching, and burning. Sometimes an allergic eye problem develops, breaking out with future exposure. Inhalation overexposure can severely irritate the airways and lungs, causing nasal discharge; tightness of the chest; cough, shortness of breath; and/or fever. Death can occur in severe cases. Seek prompt medical attention. Future exposures can cause further attacks. Symptoms may be delayed for days following exposure. Some persons later develop lung scarring after such exposures.

Long-Term Exposure: Causes acute and chronic toxicity; can cause damage to lungs and bones. Known carcinogen[182]. Beryllium can cause intestinal lesions. There is some evidence that it causes lung and bone cancer in humans and animals. High or repeated exposure can permanently scar the lungs or other body organs. If be particles get under cuts in the skin, ulcers or lumps can develop; these must be surgically removed. Allergic skin rashes can occur. High or repeated exposure can cause kidney stones to develop. May cause intestinal lesions.

Points of Attack: Skin, eyes, respiratory system, lungs, liver, spleen, heart.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Preemployment history and physical examinations for worker applicants should include chest X-rays, baseline pulmonary function tests (FVC and FEV_1), and measurement of body weight. Beryllium workers should receive a periodic health evaluation that includes: spirometry (FVC and FEV_1), medical history questionnaire directed toward respiratory symptoms and a chest X-ray, blood/urine trace metals. General health, liver and kidney functions, and possible effects of the skin should be evaluated. See NIOSH Criteria Document 72-10268.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Work areas should be monitored to limit and control levels of exposure. Personnel samplers are recommended. Good housekeeping, proper maintenance, and engineering control of processing equipment and technology are essential. The importance of safe work practices and personal hygiene should be stressed. When beryllium levels exceed the accepted standards, the workers should be provided with respiratory protective devices of the appropriate class, as determined on the basis of the actual or projected atmospheric concentration of airborne beryllium at the worksite. Protective clothing should be provided all workers who are subject to exposure in excess of the standard. This should include shoes or protective shoe covers as well as other clothing. The clothing should be reissued clean on a daily basis. Workers should shower following each shift prior to change to street clothes.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Red (powder): Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Beryllium must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); and strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Protect storage containers from physical damage. Use only non-sparking tools, and equipment, especially when opening and closing containers of beryllium. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1567: Beryllium powder, Hazard class: 6.1; Labels: 6.1—Poisonous material, 4.1—Flammable solid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Be is a combustible solid. Smother fire with dry sand, dry clay, dry ground limestone, or use approved Class "D" extinguishers (NFPA). *Do not use carbon dioxide or halogenated extinguishing agents. Do not use water.* Thermal decomposition products may include beryllium oxide fume. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For beryllium (powder), waste should be converted into chemically inert oxides using incineration and particulate collection techniques. These oxides should be returned to suppliers if possible. Recovery and recycling is an alternative to disposal for beryllium scrap and pickle liquors containing beryllium[22].

Bifenthrin B:0474

Formula: $C_{23}H_{22}ClF_3O_2$

Synonyms: Biphenthrin; Biflex; Bistar; Brigade; Capture Bifenthrin; Caswell No. 463F; Cyclo propanecarboxylic acid, 3-(2-chloro-3,3,3-trifluoro-1-propenyl)-2,2-dimethyl-, [2-methyl(1,1′-biphenyl)3-yl]methyl ester,*(Z)*-; Discipline; Double threat; Empower; FMC, 54800; FMC 58000; Talstar; Talstar lawn & tree; Torant; Zipak

CAS Registry Number: 82657-04-3

HSDB Number: 6568

RTECS Number: GZ12278000

UN/NA & ERG Number: UN2588 (Pesticides, solid, toxic, n.o.s.)/151; UN3349 (pyrethroid pesticide, solid toxic)/151

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen

Hazard Alert: Poison, Possible sensitization hazard (skin), Suspected reprotoxic hazard; Possible endocrine disruptor, Environmental hazard.

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum

Clean water act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, N; risk phrases: R40; R11; R20/21/22; R23/25; R36/37/38; R43; R48/22; R50/53; R63; safety phrases: S13; S16; S23; S24; S26; S29/35; S36; S36/37; S38; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Off white to pale tan waxy substance. Faint, sweet odor. Molecular weight = 422.9; specific gravity (H_2O:1) = 1.2125 @ 20°C; boiling point = (decomposes); freezing/melting point = 51°C; 57−63°C; vapor pressure = 1.8×10^{-7} mmHg; flash point = 165°C (oc). Practically insoluble in water; solubility =< 0.1 mg/L

Potential Exposure: A broad spectrum pyrethroid secticide/acaricide used to control cone worms, seed bugs, seed worms and other insects and mites in forests, on rangeland, and right-of-ways. It is also used to control household and lawn pests. A United States Environmental Protection Agency Restricted Use Pesticide (RUP).

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds, lime, and ordinary soaps. Mixture with some silver compounds forms explosive salts of silver oxalate.

Permissible Exposure Limits in Air:

NIOSH[2] IDLH = 5000 ppm

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA

STEL set by HSE[33] = 10 milligram per cubic meter.

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum.

Permissible Concentration in Water: ADI = 0.02 mg/kg as pyrethroid. *Fluoride ion*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg [F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol−water coefficient: Log K_{ow} => 6.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Extra high—0.06197 ppb, MATC.

Routes of Entry: Inhalation, ingestion, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May cause irritation of the skin, eyes, and respiratory tract. Skin sensitizer. Overexposure may cause tremors and staggered gait. LD_{50} (oral, rat) = 53−210 mg/kg; LD_{50} (dermal, rat) => 2 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. May be a nerve poison. A suspected carcinogen and endocrine disputer. Human toxicity (long-term)[101]: Intermediate—10.50 ppb, Health advisory.

Points of Attack: Bones, central nervous system; endocrine system (suspected).

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. Before beginning employment and at regular times after that, the following are recommended: Employees should be screened for history of certain medical conditions which might place the employee at increased risk from pyrethroid exposure. Chronic respiratory disease: In persons with chronic respiratory disease, especially asthma, the inhalation of pyrethroids might cause exacerbation of symptoms due to its sensitizing properties. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. These may be normal if the person is not having an attack at the time of the test. Consider chest X-ray if lung symptoms are present. Skin disease: Pyrethroids can cause dermatitis which may be allergic in nature. Persons with preexisting skin disorders may be more susceptible to the effects of this agent. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Any employee developing the above-listed conditions should be referred for further medical examination[9].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. Give artificial respiration if victim is not breathing. *Do not* use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: *50 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator).*125 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *250 milligram per cubic meter:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *5000 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location at temperature <35°C and away from alkaline materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required. UN3349 Pyrethroid pesticide, solid toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous material.

Spill Handling: First, remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride, hydrogen chloride and oxides of carbon. *On a small fire:* use dry chemical, CO_2 or water spray. On a large fire, use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. Fire involving tanks or car/trailer loads: *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire.

For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Biphenyl B:0480

Formula: $C_{12}H_{10}$; $C_6H_5C_6H_5$

Synonyms: Bibenzene; 1,1′-Biphenyl; Dibenzene; 1,1′-Diphenyl; Diphenyl; Dowtherm A; Lemonene; Phenador-X; Phenylbenzene; PHPH; Xenene

CAS Registry Number: 92-52-4

HSDB Number: 530

RTECS Number: DU8050000

UN/NA & ERG Number: UN2811 Toxic solids, organic, n.o.s./154

EC Number: 202-163-5 [*Annex I Index No.:* 601-042-00-8]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Limited Evidence, *probably carcinogenic to humans*, Group 2A (PCBs). United States Environmental Protection Agency Gene-Tox Program, Positive/dose response: In vitro SCE-nonhuman; Negative: In vitro UDS-human fibroblast; In vitro UDS in rat liver; Negative: *S. cerevisiae-homozygosis*.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 1 lb (0.454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; NPRI.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R36/37/38; R51/53; R62; safety phrases: S2; S23; S29; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Biphenyl is a combustible, white flakes or crystalline solid. Pleasant, characteristic odor. Molecular weight = 154.2; specific gravity (H_2O:1) = 1.04; boiling point = 256°C; freezing/melting point = 69−70°C; vapor pressure = 0.005 mmHg @ 20°C; flash point = 113°C; autoignition temperature = 540°C. Explosive limits in air: LEL: 0.6% @ 111°C, UEL: 5.8% @ 166°C[17]. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1; reactivity 1 ₩. Insoluble in water.

Potential Exposure: Biphenyl is a fungicide (pesticide). It is also used as a heat transfer agent, dye carrier, and as an intermediate in organic synthesis.

Incompatibilities: Mist may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 milligram per cubic meter

Conversion factor: 1 ppm = 6.31 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.2 ppm/1 milligram per cubic meter TWA

NIOSH REL: 0.2 ppm/1 milligram per cubic meter TWA

ACGIH TLV[1]: 0.2 ppm/1.3 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: 0.87 ppm

PA C-2: $\mathbf{9.6}_{\mathbf{A}}$ ppm

PAC-3: 300 ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin] Carcinogen Category 3B

Arab Republic of Egypt: TWA 0.2 ppm (1 milligram per cubic meter), 1993; Australia: TWA 0.2 ppm (1.5 milligram per cubic meter), 1999; Austria: MAK 0.2 ppm (1 milligram per cubic meter), 1993; Belgium: TWA 0.2 ppm (1.3 milligram per cubic meter), 1993; Denmark: TWA 0.2 ppm (1 milligram per cubic meter), 1999; Finland: TWA 0.2 ppm (1 milligram per cubic meter); STEL 0.6 ppm (3 milligram per cubic meter) [skin] 1993; France: VME 0.2 ppm (1.5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; India: TWA 0.2 ppm (1.5 milligram per cubic meter), 1993; Norway: TWA 0.2 ppm (1 milligram per cubic meter), 1999; Poland: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter, 1999; Sweden: NGV 0.2 ppm (1.3 milligram per cubic meter), KTV 0.4 ppm (2.5 milligram per cubic meter), 1999; Switzerland: MAK-W 0.2 ppm (1.3 mg/m^3), 1999; Thailand: TWA 0.2 ppm (1 milligram per cubic meter), 1993; United Kingdom: TWA 0.2 ppm (1.3 milligram per cubic meter); STEL 0.6 ppm (3.8 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV TWA 0.2 ppm. Several states have set guidelines or standards for biphenyl in ambient air[60] ranging from 0.086 μ/m^3 (Massachusetts) to 0.4 μ/m^3 (Rhode Island) to 5.0 μ/m^3 (New York) to 15.0 μ/m^3 (Florida and North Dakota) to 20.0 μ/m^3 (Connecticut) to 25 μ/m^3 (Virginia) to 36 μ/m^3 (Nevada) to 40 μ/m^3 (North Dakota).

Determination in Air: Tenax Gas chromatography; CCl_4; Gas chromatography/Flame ionization detection; NIOSH (IV) Method #2530.

Permissible Concentration in Water: Federal Drinking Water Guidelines: State Drinking Water Guidelines: Florid a 0.5 μg/L, Minnesota 300 μg/L.

Determination in Water: No tests listed. Octanol–water coefficient: Log K_{ow} => 3.2. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation of vapor or dust, percutaneous absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Skin contact contributes significantly to overall exposure. Repeated exposure to dust may result in irritation of skin and respiratory tract. The vapor may cause moderate eye irritation. Repeated skin contact may produce a sensitization dermatitis. In acute exposure, biphenyl exerts a toxic action on the CNS; on the peripheral nervous system (PNS); and on the liver. Symptoms of poisoning are headache; diffuse, gastrointestinal pain; nausea, indigestion; numbness and aching of limbs; and general fatigue. LD_{50} = (oral-rat) 3280 mg/kg[9].

Long-Term Exposure: Chronic exposure is characterized mostly be CNS symptoms, fatigue, headache, tremor, insomnia, sensory impairment; and mood changes. However, such symptoms may be rare. May cause lung irritation and bronchitis. Liver and kidney damage. May cause skin allergy with itching and rash.

Points of Attack: Liver, skin, central nervous system, upper respiratory system, eyes.

Medical Surveillance: Consider skin, eye, liver function, and respiratory tract irritation in any preplacement or periodic examination. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Examination of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Because of its low vapor pressure and low order of toxicity, it does not usually present a major problem in industry. a major problem in industry. Protective creams, gloves, and masks with organic vapor canisters for use in areas of elevated vapor concentrations should suffice. Elevated temperature may increase the requirement for protective methods or ventilation. Wear appropriate clothing to prevent repeated or prolonged skin contact. Wear eye protection to prevent any possibility of eye contact with molten biphenyl. Employees should wash promptly when skin is contaminated. Work clothing should be changed daily as it may be contaminated. Remove nonimpervious clothing immediately if wet or contaminated.

Respirator Selection: *Up to 10 milligram per cubic meter:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 milligram per cubic meter:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie* (APF = 25) (any PAPR with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 50 milligram per cubic meter:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge (s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie* (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) Any supplied-air respirator with a full facepiece. *Up to 100 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Before entering confined space where biphenyl may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft. (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Spill material should be dampened with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak following clean-up. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon and acrid smoke. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R25; R26/28; R36/37/38; safety phrases: S23; S26; S36/37; S45; S53 S41; S45 (see Appendix 4)
Description: Bis(2-chloroethoxy)methane is a colorless liquid. Molecular weight = 173.05; specific gravity (H_2O:1) = 1.24 @ 20°C; boiling point = 218°C; freezing/melting point = −32.8°C; vapor pressure = 0.1 mmHg @ 20°C; flash point = 110°C (oc). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0 ₩. Slight solubility in water; solubility = 0.8%. The aqueous solution is a strong acid.
Potential Exposure: The chloroalkyl ethers have a wide variety of industrial uses in organic synthesis, treatment of textiles; the manufacture of polymers; polysulfide rubbers, and insecticides; as degreasing agents and solvents; and in the preparation of ion exchange resins.
Incompatibilities: The aqueous solution is a strong acid; keep away from bases and alkaline material. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with mineral acids causes decomposition.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 0.04 ppm
PAC-2: 0.44 ppm
PAC-3: 2.7 ppm
Permissible Concentration in Water: No criteria set because of inadequate data according to EPA.
Determination in Water: Octanol−water coefficient: $\log K_{ow} = < 1$. Unlikely to bioaccumulate in marine organisms.
Harmful Effects and Symptoms
Specific data on this chemical is sparse. The reader is referred to the sections on other chloroalkyl ethers: Chloromethyl methyl ether, CMME: Bis(chloromethyl) ether (B:0510) or BCME: Bis(2-chloroethyl) ether (D:0550). BCIE LD_{50} = (oral-rat) 65 mg/kg[9]. This material is toxic by inhalation and ingestion and is a strong irritant.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a

pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode)

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling:

Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. This chemical is a combustible liquid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Destroy by high-temperature incineration with HCl scrubber.

Description: Dichloroisopropyl ether is a colorless liquid. Molecular weight = 171.1; specific gravity (H_2O:1) = 1.11 @ 25°C; boiling point = 187−189°C; freezing/melting point = −101°C; vapor pressure = 0.75 @ 27.3°C; flash point = 85°C (oc)[17]. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0 ₩. Slightly soluble in water.

Potential Exposure: BCIE was previously used as a solvent and as an extractant. It may be formed as a by-product of propylene oxide production. It has been found in industrial waste water and in natural water.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. It may form dangerous peroxides upon standing; may explode when heated.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.15 ppm

PAC-2: 0.1.6 ppm

PAC-3: 22 ppm

Russia: MAC: 5 milligram per cubic meter.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 300 μg/L; State Drinking Water Guidelines: New Hampshire 300 μg/L.

Determination in Water: Gas chromatography (EPA Method 611) or GC plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} = 2.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

There is no empirical evidence that BClE is carcinogenic; however, some chronic toxic effects of the compound have been noted.

Short-Term Exposure: Can cause irritation and burns on contact with eyes, nose and skin. Very high levels of BCIE may cause loss of appetite; fatigue, irritability, and even death. LD_{50} = (oral-rat) 240 mg/kg (moderately toxic)[9].

Long-Term Exposure: There is limited evidence that this chemical may cause cancer in animals; lung adenomas. Many similar solvents can cause brain or disturbed sleep; this chemical has not been fully evaluated for these effects. May cause liver and kidney damage.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. Kidney and liver function tests. Evaluate for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Ethers tend to form unstable peroxides. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2490 Dichloroisopropyl ether, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; or foam extinguishers. Thermal decomposition products may include hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use special incinerator due to high HCl content, such as seagoing incinerator ships[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Bis(chloromethyl)ether is a colorless, volatile liquid with a suffocating odor. Molecular weight = 115.0. Specific gravity (H_2O:1) = 1.32 @ 25°C; boiling point = 106.1°C; freezing/melting point = −42°C; vapor pressure = 30 mmHg @ 25°C; flash point = ≤18.8°C. Class IB Flammable Liquid: Flash point <23°C/73°F and Boiling point ≥37.8°C/100°F. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 3; reactivity 1 ₩. Insoluble in water; decomposes, releasing hydrogen chloride.

Potential Exposure: Exposure to bis(chloromethyl)ether may occur in industry and in the laboratory. This substance can form spontaneously in warm moist air by the combination of formaldehyde and hydrogen chloride. This compound is used as an alkylating agent in the manufacture of polymers; as a solvent for polymerization reactions; in the preparation of ion exchange resins; and as an intermediate for organic synthesis. Haloethers, primarily α-chloromethyl ethers, represent a category of alkylating agents of increasing concern due to the establishment of a causal relationship between occupational exposure to two agents of this class and lung cancer in the United States and abroad. The cancers are mainly oat cell carcinomas. Potential sources of human exposure to BCME appear to exist primarily in areas including: (1) its use in chloromethylating (crosslinking) reaction mixtures in anion-exchange resin production; (2) segments of the textile industry using formaldehyde-containing reactants and resins in the finishing of fabric and as adhesive in the laminating and flocking of fabrics; and (3) the nonwoven industry which uses as binders, thermosetting acrylic emulsion polymers comprising methylol acrylamide, since a finite amount of formaldehyde is liberated on the drying and curing of these bonding agents. NIOSH has confirmed the spontaneous formation of BCME from the reaction of formaldehyde and hydrochloric acid in some textile plants and is now investigating the extent of possible worker exposure to the carcinogen. However, this finding has been disputed by industrial tests in which BCME was not formed in air by the reaction of textile systems employing hydrochloric acid and formaldehyde.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Decomposes on contact with water, moist air, and heat, forming corrosive hydrochloric acid, hydrogen chloride, and formaldehyde vapors. May form shock-sensitive compounds on contact with oxidizers, peroxides, and sunlight. Attacks many plastics.

Permissible Exposure Limits in Air

NIOSH IDLH = Not determined. Potential occupational carcinogen

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements. See Appendix B of the *NIOSH Pocket Guide*.

NIOSH REL: Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.001 ppm/0.0047 milligram per cubic meter TWA, Confirmed Human Carcinogen

PAC* Ver. 29[138]

PAC-1: 0.004 ppm

PAC-2: **0.044**$_{\mathbf{A}}$ ppm

PAC-3: **0.18**$_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category 1

Australia: TWA 0.001 ppm (0.006 milligram per cubic meter), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.001 ppm (0.0047 milligram per cubic meter), carcinogen, 1993; Denmark: TWA 0.001 ppm (0.005 milligram per cubic meter), 1999; Finland: TWA 0.001 ppm (0.004 milligram per cubic meter); STEL 0.003 ppm, carcinogen, 1999; France: VME 0.001 ppm (0.006 milligram per cubic meter), carcinogen, 1999; India: TWA 0.001 ppm (0.005 milligram per cubic meter), carcinogen, 1993; Norway: TWA 0.001 ppm (0.005 milligram per cubic meter), 1999; Sweden: carcinogen, 1999; Switzerland: MAK−W 0.001 ppm (0.005 milligram per cubic meter), carcinogen, 1999; United Kingdom: TWA 0.001 ppm (0.005 milligram per cubic meter), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New

Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. The Czech Republic[35] has set a TWA of 0.00025 milligram per cubic meter and a ceiling value of 0.005 milligram per cubic meter.

Determination in Air: Collection by charcoal tube, analysis by gas liquid chromatography.

Permissible Concentration in Water: For maximum protection of human health from potential carcinogenic effects of exposure to BCME through ingestion of water and contaminated aquatic organisms, the ambient water concentration is zero. Concentrations of BCME estimated to result in additional lifetime cancer risks of 1 in 100,000 are presented by a concentration of 0.038 ng/l (3.8×10^{-5} μg/L)[6]. Kansas has set a guideline for drinking water also[61].

Determination in Water: Gas chromatography (EPA Method 611) or GC plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} =< 1.5$. Unlikely to bioaccumulate in marine organisms. Clean Water Act, Water Quality Criteria: Based on fish or shellfish and water consumption = 0.00010 μg/L; based on fish or shellfish Consumption only = 0.00029 μg/L.

Routes of Entry: Inhalation of vapor and percutaneous absorption.

Harmful Effects and Symptoms

Bis(chloromethyl) ether has an extremely suffocating odor even in minimal concentration so that experience with acute poisoning is not available. It is not considered a respiratory irritant at concentrations of 10 ppm. Bis(chloromethyl) ether is a known human carcinogen. Animal experiments have shown increases in lung adenoma incidence; olfactory esthesioneuroepitheliomas which invaded the sinuses, cranial vault, and brain; skin papillomas and carcinomas; and subcutaneous fibrosarcomas. There have been several reports of increased incidence of human lung carcinomas (primarily small cell undifferentiated) among ether workers exposed to bis(chloromethyl) ether as an impurity. The latency period is relatively short-10−15 years. Smokers as well as nonsmokers may be affected.

Short-Term Exposure: This chemical is corrosive to the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Affects the nervous system. Symptoms can be loss of appetite; nausea, and fatigue; higher exposures can cause irritability, anxiety, and weakness.

Long-Term Exposure: Can cause liver and kidney damage. Lungs may be affected by repeated or prolonged exposure. This substance is carcinogenic to humans and has caused lung cancer in humans. May cause genetic damage in humans.

Points of Attack: Skin, respiratory tract, eyes, lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. Preplacement and periodic medical examinations should include an examination of the skin and respiratory tract, including chest X-ray. Sputum cytology has been suggested as helpful in detecting early malignant changes; and in this connection, a smoking history is of importance. Possible effects on the fetus should be considered. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: These are designed to supplement engineering controls and should be appropriate for protection of all skin or respiratory contact. Full body protective clothing and gloves should be used on entering areas of potential exposure. Those employed in handling operations should be provided with full face, supplied air respirators of continuous flow or pressure demand type. Wash thoroughly *immediately* following exposure to this chemical. On exit from a regulated area, employees should remove and leave protective clothing and equipment at the point of exit, to be placed in impervious containers at the end of the work shift for decontamination or disposal. Showers should be taken before dressing in street clothes.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in airtight containers in a cool, dry, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Mine Safety and Health Administration: To control airborne exposure, BCME shall be used or stored except by competent persons under laboratory conditions approved by a nationally recognized agency acceptable to the Secretary.

Shipping: UN2249 Dichlorodimethyl ether, symmetrical, Hazard class: 6.1; Labels: 6.1—Poisonous materials, 3—Flammable liquid.

Spill Handling: Evacuate area. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line). Full body protective clothing and gloves should be used on entering areas of potential exposure. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. *Spill or leak:* do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible material and place into containers for later disposal. *Large spills:* dike far ahead of spills for later disposal. Do NOT let this chemical enter the environment (extra personal protection: complete protective clothing including SCBA). Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22].

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)].

Description: Bis(chhloromethyl)ketone is a crystalline solid. Molecular weight = 126.97; freezing/melting point = 45°C; specific gravity (H_2O:1) = 1.38 @ 46°C; boiling point = 173°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩. Soluble in water.

Potential Exposure: Formerly extensively used in textiles (especially polyester fabrics) and still employed in polyurethane foams, textile backcoating and adhesives.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 0.025 milligram per cubic meter
PAC-2: 0.27 milligram per cubic meter
PAC-3: 1 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: It causes tearing and blistering. It may be fatal if inhaled, swallowed or absorbed through skin. Contact may cause burns to skin and eyes.

Long-Term Exposure: Due to the availability of insufficient data on short-term effects, caution should be exercised.

Medical Surveillance: See: NIOSH Criteria Document: *78-173 Ketones*.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Keep away from sources of ignition. Store in a refrigerator, in a tightly closed container. Store below 4°C. Keep away from oxidizers, heat, flame, and sparks.

Shipping: UN2649 1,3-Dichloroacetone, Hazard class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid inhalation; wear respiratory protection, eye protection and protective clothing. In case of contact, immediately flush skin or eyes with water. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. For small spills, absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *For Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: For small fires, use dry chemical, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. Thermal decomposition products may include chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Bismuth is a pinkish-silver, hard, brittle metal. It is found as the free metal in ores, such as bismutite and bismuthinite and in lead ores. Molecular weight = 209.0; specific gravity (H_2O:1) = 9.8, no temperature cited; boiling point = 1420−1560°C; freezing/melting point = 271°C. Hazard identification (based on NFPA-704 M Rating System): (bismuth) Health 2; flammability 0; reactivity 0 ₩. Insoluble in water.

Bismuth acetate: Molecular weight = 386.1; Bismuth germanate: 297.6; Bismuth hydroxide: 260.

Potential Exposure: Bismuth is used as a constituent of tempering baths for steel alloys; in low Freezing/Melting point alloys which expand on cooling; in aluminum and steel alloys to increase machinability; and in printing type metal. Bismuth compounds are found primarily in pharmaceuticals as antiseptics, antacids, antiluetics, and as a medicament in the treatment of acute angina. They are also used as a contrast medium in roentgenoscopy and in cosmetics. For the general population the total intake from food is 5−20 μg with much smaller amounts contributed by air and water.

Incompatibilities: Finely divided powder is highly flammable. Reacts with strong acids and strong oxidizers, chlorine, fused ammonium nitrates, iodine pentafluoride, and nitrosyl fluoride.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

7440-69-9, bismuth

PAC-1: 15 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 990 milligram per cubic meter

22306-37-2, bismuth acetate

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

10361-43-0, bismuth hydroxide

PAC-1: 19 milligram per cubic meter

PAC-2: 210 milligram per cubic meter

PAC-3: 1200 milligram per cubic meter

10361-44-1 bismuth nitrate

PAC-1: 12 milligram per cubic meter

PAC-2: 139 milligram per cubic meter

PAC-3: 790 milligram per cubic meter

There is no Federal standard for bismuth metal. ACGIH has set TWA values for bismuth telluride only (see B:0540). Tellurium compounds are both an oral and dermal toxic hazard. The material is toxic by ingestion. Oral ingestion of tellurium compounds is generally regarded as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 70-kg (150 pound) person. Tellurium compounds are regarded as super toxic for skin exposures.

Permissible Concentration in Water: No criteria set but EPA[32] has suggested an ambient limit of 3.5 μg/L based on health effects. Russia[43] set a MAC of 0.5 mg/L of trivalent bismuth and 0.1 mg/L of pentavalent bismuth.

Determination in Water: Atomic absorption spectrophotometry may be used[1]. Spark source mass spectrometry may also be used.

Routes of Entry: Ingestion of powder or inhalation of dust.

Harmful Effects and Symptoms

Most accounts of bismuth poisoning are from the soluble compounds used previously in therapeutics. Bismuth compounds have been withdrawn from pharmaceuticals because of reports of encephalopathy[13]. Fatalities and near fatalities have been reported chiefly as a result of intravenous or intramuscular injection of soluble salts.

Short-Term Exposure: Bismuth and bismuth compounds have slight effect on intact skin and mucous membrane. Absorption occurs only minimally through broken skin.

Long-Term Exposure: All bismuth compounds do not have equal toxicity. Although considered less hazardous than most heavy metals, can cause kidney and possible liver damage. Chronic intoxication from repeated oral or parenteral doses causes "bismuth line," a gum condition with black spots of buccal and colonic mucosa, superficial stomatitis; foul breath; and salivation.

Points of Attack: Kidneys, liver.

Medical Surveillance: No special considerations are necessary other than following good general health practices. Liver and kidney function should be followed if large amounts of soluble salts are ingested.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note:* Dimercaptol (BAL) brings good results in the treatment of bismuth poisoning if given early. Other measures include atropine and meperidine to relieve gastrointestinal discomfort. *Note to physician:* For severe poisoning BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of bismuth poisoning it may have *some* value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Personal hygiene should be stressed, and eating should not be permitted in work areas. Dust masks should be worn in dusty areas to prevent inadvertent ingestion of the soluble bismuth compounds.

Storage: Color code—Red Stripe (*bismuth powder*) Flammability Hazard: Do not store in the same area as other flammable materials. Prior to working with bismuth all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acetylene gas, oxidizers, and other incompatible materials listed above. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where bismuth powder is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store to avoid conditions which create fumes or fine dusts.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1—Flammable solid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of metal. Use extinguishers suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a minimum amount of concentrated HCl. Dilute with water until precipitate is formed. Redissolve in HCl. Then saturate with H_2S. Filter, wash, dry and return to supplier.

Bismuth Telluride B:0540

Formula: Bi_2Te_3

Synonyms: Bismuth telluride, undoped; Bismuth sesquitelluride; Dibismuth telluride

Doped: Doped bismuth sesquitelluride; Doped bismuth telluride; Doped tellurobismuthite; Doped bismuth tritelluride (*Note*: Doped with selenium sulfide (SeS). Commercial mix may contain 80% Bi_2Te_3, 20% stannous telluride, plus some tellurium[77].)

Undoped: Bismuth sesquitelluride, Bismuth telluride, Bismuth tritelluride, Tellurobismuthite

CAS Registry Number: 1304-82-1; 37293-14-4 (doped and undoped)

HSDB Number: 7904

RTECS Number: EB311000 (undoped)

UN/NA & ERG Number: UN3284 (tellurium compound, n.o.s.)/151

EC Number: 215-135-2

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Slowly reacts with moisture; may be explosive.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. (1304-82-1).

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R20/21/22; R36/R37; R38; safety phrases: S26; S36; S41; S45 (see Appendix 4)

Description: Bismuth telluride is a gray or black crystalline solid or gray powder. Molecular weight = 800.83; Specific gravity (H_2O:1) = 7.8 g/cm^3; freezing/melting point = 586°C; vapor pressure = 0 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2; reactivity 2 ₩. *Note:* Commercial mix of doped bismuth tritelluride may contain 80% Bi_2Te_3, 20% stannous telluride, plus some tellurium. Insoluble in water. Doped and undoped have similar physical properties.

Potential Exposure: Bismuth telluride is used in thermoelectric cooling, power generation, semiconductor manufacture; pharmaceuticals; medical therapy; cosmetics. Exposure involves those working in "Silicon Valley" and similar locations around the world. An alloy of two metallic elements that are sometimes doped with SeS. The SeS dopant alters the electrical properties, but has too low a concentration to affect the chemical properties[101].

Incompatibilities: Reacts with acids forming toxic gases. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Toxic and flammable gas may slowly evolve from contact with moisture.

Permissible Exposure Limits in Air

Undoped

OSHA PEL: 15 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction (undoped); None (doped with Se)

NIOSH REL: 10 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction; 5 milligram per cubic meter TWA (doped with Se)

ACGIH TLV[1]: 10 milligram per cubic meter (undoped) TWA; 5 milligram per cubic meter TWA (doped with Se); not classifiable as a human carcinogen

No PAC available.

Australia: TWA 10 milligram per cubic meter, 1993; Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 0.1 mg(Te)/m^3, 1999; Belgium: TWA 10 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 10 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Norway: TWA 10 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, KZG-W 0.5 milligram per cubic meter, 1999; United Kingdom: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for bismuth telluride in ambient air [60] ranging from 0.05 milligram per cubic meter (North Dakota) to 0.08 milligram per cubic meter (Virginia) to 0.2 milligram per cubic meter (Connecticut) to 0.238 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Methods #0500, #0600, or OSHA Analytical Method ID-121 Metal & Metalloid Particulates in work-place Atmospheres (Atomic Absorption).

Routes of Entry: Inhalation/ingestion of dust, eye/skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Tellurium compounds are both an oral and dermal toxic hazard. Tellurium compounds are regarded as super toxic for skin exposures. Oral ingestion of tellurium compounds is generally regarded as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 70-kg (150 pound) person. Bismuth telluride is harmful if inhaled; may cause respiratory tract irritation. Harmful if absorbed through skin. Eye contact causes irritation and redness. The material is toxic by ingestion. May cause nausea, headache, and vomiting.

Long-Term Exposure: Lung changes may occur. It is unknown at this time whether these can be permanent. Can affect the kidneys and possibly the liver; bismuth nephropathy (with proteinuria) may occur. Bismuth may affect the amniotic fluid and fetus. in animals: pulmonary lesions (nonfibrotic)[77].

Points of Attack: Kidneys, liver.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of bismuth poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: *Clothing:* Avoid skin contact with Bismuth Telluride. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential exists for Exposures over *10 mg/m*^{3}, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure demand or other positive pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Bismuth telluride must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluoride), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture.

Shipping: UN3284 Tellurium compound, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquid containing Bismuth telluride in vermiculite, dry sand; earth, or similar material. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: For small fires, use dry chemical, carbon dioxide; water spray; or foam. Extinguish fire using an agent suitable for the type of surrounding fire; Bismuth telluride itself does not burn. Thermal decomposition products may include bismuth oxides and tellurium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; NPRI.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, N, Xi; risk phrases: R36/37/38; R41; R43; R51; R52; R62; R63; safety phrases: S2; S24; S26; S29/35; S36/37; S39; S41; S46; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Bisphenol A is a white or tan crystals or flakes with a mild phenolic odor. Molecular weight = 228.29; Specific gravity (H_2O:1) = 1.2; boiling point = 220°C @ 4 mmHg; freezing/melting point = 153°C; Flash point = 207°C (oc); Autoignition temperature = 600°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0 ₩. Practically insoluble in water; solubility = 120 mg/L.

Potential Exposure: Workers engaged in the manufacture of epoxy, polysulfone, polycarbonate and certain polyester resins. It is also used in flame retardants, rubber chemicals, and as a fungicide. Bisphenol A (BP A), an environmental estrogen, is found in a wide variety of products, including polycarbonate bottles food and drink containers. According to 2008 research conducted at University of Cincinnati, when it comes to BPA, it's not whether polycarbonate bottles are new or old but the liquid's temperature that has the greatest impact on how much BPA is released. When exposed to boiling hot water, BPA was released 55 times more rapidly than exposure to cold water.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid chlorides and acid anhydrides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 110 milligram per cubic meter

PAC-3: 650 milligram per cubic meter

DFG MAK: 5 mg/m^3, inhalable fraction TWA; Peak Limitation Category I(1); photosensitization; Pregnancy Risk Group C

Russia: STEL 5 milligram per cubic meter, 993; the Netherlands: MAC-TGG 5 milligram per cubic meter (respirable dust); 10 milligram per cubic meter (total dust), 2003.

It should be recognized that bisphenol-A can be absorbed through the skin, thereby increasing exposure.

Determination in Air: OSHA Method 1018 (December 2013). Bisphenol A and Diglycidyl Ether of Bisphenol A.

Determination in Water: Octanol−water coefficient: Log K_{ow} => 3.3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish Tox (benzamide) LC_{50} (fathead minnow, 96 h.) = 4.6 mg/L.

Routes of Entry: Passes through the unbroken skin; inhalation; ingestion.

Harmful Effects and Symptoms

Bisphenol-A and its resins produce a typical contact dermatitis; redness and edema with weeping, followed by crusting and scaling, usually confined to the area of contact. Since the face is frequently affected, this may indicate that vapors are the cause, although contact with contaminated clothing can also be a factor. Areas other than the face and neck, back of hands, and forearms are seldom involved. LD_{50} = (oral-rat) 3250 mg/kg[9] which is slightly toxic. Dusts may cause irritation to mouth, nose or throat and can cause eye irritation. As regards ingestion, comparison with phenol suggests probable symptoms would include nausea, burning of mouth, throat and stomach; severe stomach pain; stomach ulcers; vision disturbances; irregular breathing and pulse, dizziness, fainting, coma and possible death. Animal studies suggest that death may occur from ingestion of about 1/3 pound (6 ounces) for a 15-lb person. On long-term exposure, susceptible individuals may become sensitized after repeated or prolonged contact and thereafter exhibit an allergic response. Allergy may include reaction to many epoxy resins containing bisphenol A.

Short-Term Exposure: Eye and skin contact can cause irritation and burns. May irritate the respiratory tract.

Long-Term Exposure: May cause skin sensitization and allergy. There is limited evidence that this chemical may damage the developing fetus.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is

worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Dust mask should be worn to protect against inhaled dust. Fire fighters should wear SCBA to protect against noxious fumes.

Storage: Color code—Green: General storage may be used. Store away from heat and strong oxidizers and the incompatible materials listed above.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Vacuum cleaning is preferable to sweeping to keep dust levels down. Use special HEPA vacuum; not a shop vacuum. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Bisphenol A is a combustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard Alert: Poison, Combustible, Environmental hazard.

Banned or Severely Restricted (USA, Japan) (UN)[13]

TSCA 40CFR716.120(a)

CLEAN WATER ACT: Toxic Pollutant (Section 401.15) as chlorinated phenols

EPCRA Section 313 Form R *de minimus* concentration reporting level: 0.1%, as chlorophenols

United States DOT Regulated marine pollutant (49CFR 172.101, Appendix B) as chlorophenols.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R27/28; R50/53; safety phrases: S13; S28; S41; S45 (see Appendix 4)

Description: Bithionol is a white or grayish powder with a slight phenolic odor. Molecular weight = 365.03; freezing/melting point = 188°C; vapor pressure = very low. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩.

Potential Exposure: It is used as a surfactant-formulated antimicrobial against bacteria, molds and yeast. It is proposed as an agricultural fungicide. Other uses include deodorant, germicide, fungistat, and in the manufacture of pharmaceuticals. It is no longer allowed to be used in cosmetics. A food additive in feed and drinking water of animals. Also a food additive permitted in food for human consumption.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: Danger of photosensitization.

Routes of Entry: Ingestion, skin and/or eye contact

Harmful Effects and Symptoms

Probable oral lethal dose for humans is 5−15 g/kg for a 70-kg (150 lb) person. The toxicity of this compound is similar to that of phenol. Major hazard of phenol poisoning stems from its systemic effects which include CNS depression with coma, hypothermia, loss of vasoconstrictor tone, cardiac depression, and respiratory arrest. Symptoms of exposure include burning pain in mouth and throat; white necrotic lesions in mouth, esophagus and stomach; abdominal pain; vomiting, bloody diarrhea; paleness; sweating; weakness; headache; dizziness; tinnitus; scanty, dark-colored urine; weak irregular pulse, and shallow respiration.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a refrigerator or a cool dry place.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft(NJ). Isolation Distance, Fire: 800 m/0.5 miles[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60%−70% acetone to avoid airborne dust. Stay upwind. Do not touch spilled material. Use water spray to reduce vapors. Absorb spills with noncombustible absorbent material. For *large spills* dike far ahead for later disposal. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include sulfur oxides and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Description: Bitoscanate is a colorless to beige, odorless, crystalline compound. Molecular weight = 192.265; freezing/melting point = 129−131°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0 ₩.

Potential Exposure: Those engaged in the manufacture, formulation and application of this anthelmintic compound.

Incompatibilities: In general, keep away from strong oxidizers, moisture, strong acids, strong bases. This is a thiocyanate compound. Violent reactions may occur upon contact with chlorates (potassium chlorate, sodium chlorate), nitrates, nitric acid; organic peroxides.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[CN]/m^3

PAC Ver. 29[138]

PAC-1: 1.8 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 25 milligram per cubic meter

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: This material is highly toxic if ingested. It is a CNS and gastrointestinal toxin in humans. May cause nausea, headache, and vomiting. LD_{50} = (oral-rat) 2 mg/kg (highly toxic)[9]. Harmful if inhaled; may cause respiratory tract irritation. Harmful if absorbed through skin. Causes skin irritation. Eye contact causes irritation and redness.

Long-Term Exposure: Inhalation may result in respiratory tract sensitization.

Medical Surveillance: Blood cyanide level.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye Contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and

face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as cyanides): *Up to 25 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode. *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area. Store under inert gas; moisture sensitive.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft(NJ). Isolation Distance, Fire: 800 m/0.5 miles[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include cyanide and oxides of nitrogen, sulfur and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Blister Agents/Vesicants

Blister Agents or vesicants are chemicals which have severely irritating properties and can produce irritated and reddened skin with progression to blisters, swelling, and inflammation of tissues surrounding the eyes with progression to light sensitivity and lacrimation. They can damage the skin, eyes, and airways. They have the ability to form widespread vesicular lesions, causing blistering and peeling of the skin. High concentrations of vapor or direct liquid exposures to the eye can cause damage to the eye surface. Warm, moist tissues are most susceptible to damage and the tissues of the upper respiratory tract can also be affected. Symptoms of exposure may be delayed until hours or days after exposure depending on the magnitude of the absorbed dose. The major chemical warfare agents in this category are listed below along with their record number for quick access.

Sulfur Mustard, agents H and HD see M:1460
Sulfur Mustard, agent T or HT see M:1460
Nitrogen Mustard, agent HN-1 see E:0400
Nitrogen Mustard, agent HN-2 see M:0300
Nitrogen Mustard, agent HN-3 see T: 0960
Lewisite, agents L-1 and L-2 see HL L: 0250
Mustard-Lewisite, agent HL see L: 0250
Phosgene oxime, agent CX see P:0555

Blood Agents

Blood agents, among the most lethal chemical weapons agents, disrupt the normal biochemical processes required by your cells to use oxygen. The major chemical warfare agents in this category are listed below along with their record number for quick access.

Arsine, agent SA see A:1580
Cyanogen chloride, agent CK see C:1620
Hydrogen cyanide, agent AC 74-90-8 see H:0440
Potassium cyanide (KCN) see P:0910
Sodium cyanide (NaCN) S:0450
Sodium monofluoroacetate see S:0480

Borax B:0573

Formula: $B_4H_2Na_2O_8$ (borax); $Na_2B_4O_7 \cdot AH_2O$ (borax); $Na_2B_4O_7 \cdot 5H_2O$ (borax pentahydrate)

Synonyms: *Borax:* Borato sodico (Spanish); Borato sodico, anhidro (Spanish); Disodium tetraborate; Sodium borate; Sodium borate decahydrate; Sodium tetraborate

Borax pentahydrate: Borate pentahydrate sodium; tetraborate pentahydrate

Sodium borate: Disodium tetraborate

CAS Registry Number: 1303-96-4 (borax); *(alt.) borax*: *(alt.)* 1344-90-7; *(alt.)* 12447-40-4; *(alt.)* 61028-24-8; 1330-43-4 (disodium tetraborate, anhydrous); 12179-04-3 (borax pentahydrate)

HSDB Number: 328

RTECS Number: VZ2275000 (borax)

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 215-540-4 [*Annex I Index No.:* 005-011-01-1] (*disodium tetraborate, anhydrous*)

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Carcinogenesis Studies (feed); no evidence: mouse; EPA: Available data are inadequate for an assessment of human carcinogenic potential.

Hazard Alert: Suspected of causing genetic defects, Suspected reprotoxic hazard.

Safe Drinking Water Act, 55FR1470 Priority List

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. [sodium tetraborate (borax)]

Canada Drinking Water Quality: 5.0 mg/L IMAC

Mexico Drinking Water Criteria: 1.0 mg/L.

Hazard symbols, risk, & safety statements: (*disodium tetraborate, anhydrous*) Hazard symbol: T; risk phrases: R60; R61; R62; R63; safety phrases: S53; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Nonhazard to water. (*borax, decahydrate*)

Description: Borax is a noncombustible (an inherent fire retardant), bluish-gray or green, odorless crystalline powder or granules. Molecular weight = 301.37; boiling point = 320°C; freezing/melting point = 75°C (rapid heating). Borax is soluble in water; solubility = 6% @ 20°C. Borax pentahydrate is a white crystalline solid or free-flowing powder. Odorless. Molecular weight = 291.4; Specific gravity (H_2O:1) = 1.82; Melting Point: 200°C; Density: 1.82 g cm^{-3}. Soluble in water; solubility = 3%.

Potential Exposure: Borax is used as a soldering flux, preservative against wood fungus; and as an antiseptic. Used in ant poisons, for fly control around refuse and manure piles, as a larvicide. It is used in the manufacture of enamels and glazes, fiberglass insulation; sodium perborate bleach; in tanning, cleaning compounds; for fire-proofing fabrics and wood; and in artificial aging of wood.

Incompatibilities: Dissolves in water forming a basic solution. Boron dust may form explosive mixture with air. Contact with strong oxidizers may be violent. Boron is incompatible with ammonia, bromine tetrafluoride, cesium carbide, chlorine, fluorine, interhalogens, iodic acid, lead dioxide, nitric acid, nitric oxide, nitrosyl fluoride, nitrous oxide, potassium nitrite, rubidium carbide, silver fluoride.

Permissible Exposure Limits in Air

Borate compounds, inorganic (including borax)

OSHA PEL: None

NIOSH REL: None

ACGIH TLV: 2 milligram per cubic meter TWA (inhalable fraction); 6 milligram per cubic meter (inhalable fraction) not classifiable as a human carcinogen.

For particulates not otherwise classified (PNOC)

OSHA: 15 milligram per cubic meter TWA (Total dust); 5 milligram per cubic meter TWA (Respirable fraction)

DFG MAK: 4 milligram per cubic meter TWA (Inhalable fraction); 1.5 milligram per cubic meter TWA (Respirable fraction)

PAC Ver. 29[138]

1303-96-4, Borax

PAC-1: 6 milligram per cubic meter

PAC-2: 190 milligram per cubic meter

PAC-3: 1100 milligram per cubic meter

16940-66-2, borax (fused, sodium borohydrate)

PAC-1: 0.49 milligram per cubic meter

PAC-2: 5.3 milligram per cubic meter

PAC-3: 32 milligram per cubic meter

1330-43-4, disodium tetraborate

PAC-1: 6 milligram per cubic meter

PAC-2: 88 milligram per cubic meter

PAC-3: 530 milligram per cubic meter

12179-04-3, borax pentahydrate

OSHA PEL: None

NIOSH REL: 1 milligram per cubic meter TWA

ACGIH TLV: 2 milligram per cubic meter TWA inhalable fraction; 6 milligram per cubic meter TWA inhalable fraction; not classifiable as a human carcinogen (2004).

Determination in Air: Use NIOSH Analytical Method #0500 or OSHA Analytical Method ID-125G, Metal and Metalloid Particulates in work-place Atmospheres (ICP analysis).

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 600 μg[B]/L; State Drinking Water Guidelines: California 1000 μg[B]/L; Maine 1400 μg[B]/L; New Hampshire 630 μg[B]/L; Minnesota 1000 μg[B]/L; Wisconsin 960 μg[B]/L. Runoff from spills or fire control may cause water pollution. EPA in July 1976 established a criterion for boron of 750 μg/L for long-term irrigation on sensitive crops. More recently[32] EPA has suggested an ambient water limit of 43 μg/L based on health effects. Octanol−water coefficient: Log K_{ow} =< 0.2. Unlikely to bioaccumulate in marine organisms.

Determination in Water: Fish Tox: LC_{50} (goldfish, 72 h) = 178 mg/L; EC_{50} [daphnia magna (water flea), 48 h] = 1.085−1.402 mg/L.

Routes of Entry: Inhalation of dust, fumes, and aerosols; ingestion.

Harmful Effects and Symptoms

These effects vary greatly with the type of borax compound. Acute poisoning in humans from boric acid or borax is usually the result of application of dressings, powders, or ointment to large areas of burned or abraded skin, or accidental ingestion. The signs are: nausea, abdominal pain; diarrhea and violent vomiting, sometimes bloody, which may be accompanied by headache and weakness. There is a characteristic erythematous rash followed by peeling. In severe cases, shock with fall in arterial pressure, tachycardia, and cyanosis occur. Marked CNS irritation, oliguria, and anuria may be present. The oral lethal dose in adults is over 30 g. Little information is available on chronic oral poisoning, although it is reported to be characterized by mild Gl irritation, loss of appetite; disturbed digestion; nausea; possibly vomiting; and erythematous rash. The rash may be "hard" with a tendency to become purpuric. Dryness of skin and mucous membranes; reddening of tongue; cracking of lips; loss of hair; conjunctivitis; palpebral edema; gastro-intestinal disturbances; and kidney injury have also been observed. Workers manufacturing boric acid had some atrophic changes in respiratory mucous membranes; weakness; joint pains, and other vague symptoms. The biochemical mechanism of boron toxicity is not clear but seems to involve action on the nervous system; enzyme activity; carbohydrate metabolism; hormone function; and oxidation processes coupled with allergic effects. Borates are excreted principally by the kidneys.

Short-Term Exposure: Borax may affect the nervous system. Serious overexposure to borates can cause seizures, unconsciousness and death.

Long-Term Exposure: May cause brain, kidney and liver damage. Repeated exposure may cause boric acid to accumulate in the brain, bone, and other body parts. Repeated skin contact may cause dermatitis, borism (boron poisoning), dry skin, skin eruptions, and gastric disturbances. Animal tests show that this substance possibly causes toxic effects upon human reproduction (WHO).

Medical Surveillance: No specific considerations are needed for boric acid or borates except for general health and liver and kidney function. In the case of boron trifluoride; the skin, eyes, and respiratory tract should receive special attention. In the case of the boranes, CNS and lung function will also be of special concern.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Exposed workers should be educated in the proper use of protective equipment and there should be strict adherence to ventilating provisions in work areas. Workers involved with the manufacture of boric acid should be provided with masks to prevent inhalation of dust and fumes.

Storage: Color Code—Green: General storage may be used; Store in a cool, dry place away from incompatible materials listed above.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. The material may be dampened with water to avoid dust and then transferred to a sealed container for disposal. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water, or foam extinguishers. Irritation and toxic fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Borax, dehydrated: The material is diluted to the recommended provisional limit (0.10 mg/L) in water. The pH is adjusted to between 6.5 and 9.1 and then the material can be discharged into sewers or natural streams.

Regulatory Authority and Advisory Information
Carcinogenicity: NCI: Carcinogenesis Studies (feed); no evidence: mouse; EPA: Available data are inadequate for an assessment of human carcinogenic potential.
Hazard Alert: (*Boric acid*): Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).
Listed in TSCA inventory.
Safe Drinking Water Act, 55FR1470 Priority List
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; Category D-2A.
Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R60; R61; R62; R63; safety phrases: S53; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Non hazard to water.
Description: Boric acid is a white, amorphous powder or colorless, crystalline solid. Molecular weight = 61.8; Specific gravity (H_2O:1) = 1.44 @ 20°C; boiling point = 300°C (decomposes: loses ½ its H_2O); freezing/melting point = 171°C (decomposes above 100°C). Saturated solutions: @ 0°C, 2.6% acid; @ 100°C, 28% acid. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 1 ₩. Boric acid is soluble in water; solubility = ~4.5 g/100 mL @ 20°C.
Potential Exposure: Boric acid is a fireproofing agent for wood; a preservative, and an antiseptic. It is used in the manufacture of glass, pottery, enamels, glazes, cosmetics, cements, porcelain, borates, leather, carpets, hats, soaps; artificial gems; in tanning leather; printing, dyeing, painting, and photography.
Incompatibilities: Boric acid decomposes in heat above 100°C, forming boric anhydride and water. Boric acid is hygroscopic; it will absorb moisture from the air. Boric acid aqueous solution is a weak acid; incompatible with strong reducing agents including alkali metals and metal hydrides (may generate explosive hydrogen gas); acetic anhydride, alkali carbonates, and hydroxides. Violent reaction with powdered potassium metal, especially if impacted. Attacks iron in the presence of moisture.

OSHA: 15 milligram per cubic meter TWA (Total dust); 5 milligram per cubic meter TWA (Respirable fraction)
DFG MAK: 4 milligram per cubic meter TWA (Inhalable fraction); 1.5 milligram per cubic meter TWA (Respirable fraction)
PAC Ver. 29[138]
PAC-1: 6 milligram per cubic meter
PAC-2: 23 milligram per cubic meter
PAC-3: 830 milligram per cubic meter
Determination in Air: Use NIOSH Analytical Method #0500 or OSHA Analytical Method ID-125G, Metal and Metalloid Particulates in work-place Atmospheres (ICP analysis).
Determination in Water: Fish Tox: LC_{50} (goldfish, 72 h) = 178 mg/L; EC_{50} [daphnia magna (water flea), 48 h] = 1.085−1.402 mg/L.
Permissible Concentration in Water: EPA in July 1976 established a criterion for boron of 750 μg/L for long-term irrigation on sensitive crops. More recently[32], EPA has suggested an ambient water limit of 43 μg/L based on health effects.
Routes of Entry: Inhalation of dust, fumes, and aerosols; ingestion.
Harmful Effects and Symptoms
Workers manufacturing boric acid had some atrophic changes in respiratory mucous membranes; weakness; joint pains, and other vague symptoms. The biochemical mechanism of boron toxicity is not clear but seems to involve action on the nervous system; enzyme activity; carbohydrate metabolism; hormone function; and oxidation processes coupled with allergic effects. Borates are excreted principally by the kidneys. Based on animal studies, may be fetotoxic, affect reproductive material and fertility; teratogenic effects.
Short-Term Exposure: Boric acid dust or aqueous solutions cause irritation of the eyes, skin, and the respiratory tract. Boric acid dust is absorbed through mucous membranes but not through the unbroken skin. Solutions and dust can be absorbed in harmful amounts through abraded skin, burns, and open wounds. Prolonged skin contact may

cause dermatitis. If absorbed through the broken skin, boron may affect behavior, metabolism, sense organs, the gastrointestinal tract, and respiratory tract (respiratory depression). Ingestion can cause digestive/gastrointestinal tract irritation with symptoms of nausea, vomiting and diarrhea. Prolonged or high levels of exposure may cause effects on the gastrointestinal tract; liver and kidneys. Prolonged exposure to boric acid may affect the nervous system. Serious overexposure can cause seizures, unconsciousness and death. Ingestion of 5 g or more may irritate gastrointestinal tract and affect CNS; may be fatal to some adults. LD_{50} = (rat-oral) 2660 mg/kg; 3450 (mouse-oral) mg/kg (slightly toxic).

Long-Term Exposure: Repeated exposure may cause boric acid to accumulate in the brain, bone, and other body parts. Repeated skin contact may cause dermatitis, borism (boron poisoning), dry skin, skin eruptions, and gastric disturbances. May affect behavior, cause damage to the brain, kidneys, liver, cardiovascular system, CNS, PNS, cardiovascular system, blood, liver, urinary system (kidney, ureter, bladder), and endocrine system. Animal tests show that this substance possibly causes toxic effects upon human reproduction[WHO].

Medical Surveillance: Check for eye and skin disorder problems. Tests for liver, kidney, or respiratory function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Exposed workers should be educated in the proper use of protective equipment and there should be strict adherence to ventilating provisions in work areas. Workers involved with the manufacture of boric acid should be provided with masks to prevent inhalation of dust and fumes. Wear impervious gloves: recommended gloves include Butyl rubber, Neoprene, Viton.

Respirator Selection: A respiratory protection program that meets OSHA's Respiratory Protection Standard 29 CFR 1910.134 requirements or European Standard EN 149 must be followed whenever workplace conditions warrant a respirator's use. Oxygen levels below 19.5% are considered IDLH by NIOSH/OSHA and require use of a full facepiece pressure/demand SCBA; or, a full facepiece, supplied air respirator with auxiliary self-contained air supply is required under 1910.134-1998.

Storage: Color code—Green: General storage may be used. Store in a cool, dry place away from incompatible materials listed above.

Shipping: UN 3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. The material may be dampened with water to avoid dust and then transferred to a sealed container for disposal. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water, or foam extinguishers. Irritation and toxic fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Boric acids may be recovered from organic process wastes as an alternative to disposal.

Carcinogenicity: NCI: Carcinogenesis Studies (feed); no evidence: mouse; EPA: Available data are inadequate for an assessment of human carcinogenic potential.
Hazard Alert: Combustible, Pyrophoric (dust); Agricultural chemical, Suspected of causing genetic defects, Suspected reprotoxic hazard.
Safe Drinking Water Act, 55FR1470 Priority List
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. [boric acid, sodium tetraborate (borax)]
Canada Drinking Water Quality: 5.0 mg/L IMAC
Mexico Drinking Water Criteria: 1.0 mg/L.
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R17; R22; R62; R63; R63; safety phrases: S16; S24/25; S26; S27; S36/37/39; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Non hazard to water. (*boron, borax*)
Description: Boron is a yellow or brownish-black powder and may be either crystalline or amorphous. It does not occur free in nature and is found in the minerals borax, colemanite, boronatrocalcite, and boracite. Molecular weight = 10.81; Specific gravity (H_2O:1) = 2.45; boiling point = 3660°C; 2550°C (highly purified); freezing/melting point = 2190°C; 2079°C (highly purified); Autoignition temperature = 580°C. Hazard identification (based on NFP A-704 M Rating System) (*boron, 1000 μg/mL*) Health 1; flammability 1; reactivity 0 ₩; (*Boron, 10,000 μg/mL)*: Health 2; flammability 1; reactivity 2 ₩. Practically insoluble in water.
Boron carbide: Molecular weight = 55.26; Specific gravity (H_2O:1) = 2.95; freezing/melting point = 2350°C.
Boron nitride: Molecular weight = 24.82; Specific gravity (H_2O:1) = 22; freezing/melting point = 2966°C.
Potential Exposure: Boron is used in metallurgy as a degasifying agent and is alloyed with aluminum, iron, and steel to increase hardness. It is also a neutron absorber in nuclear reactors. Boron is frequently encountered in a variety of chemical formulations including boric acid, various borate salts, borax, and boron soil supplements.
Incompatibilities: Boron dust may form explosive mixture in air. Contact with strong oxidizers may cause explosions. Violent reaction (possible explosion) with concentrated nitric acid, hydrogen iodide; silver fluoride. Boron is incompatible with ammonia, bromine tetrafluoride, cesium carbide, chlorine, fluorine, interhalogens, iodic acid, lead dioxide, nitric acid, nitrosyl fluoride, nitrous oxide, potassium nitrite, rubidium carbide. Reacts exothermically with metals at high temperature above 900°C.
Permissible Exposure Limits in Air
For particulates not otherwise classified (PNOC)
OSHA: 15 milligram per cubic meter TWA (Total dust); 5 milligram per cubic meter TWA (Respirable fraction)
DF G M AK: 4 milligram per cubic meter TWA (Inhalable fraction); 1.5 milligram per cubic meter TWA (Respirable fraction)
Borate compounds, inorganic (including 1330-43-4; 1303-96-4; 10043-35-3; 12179-04-3)
OSHA PEL: None
NIOSH REL: None
ACGIH TLV: 2 milligram per cubic meter TWA (inhalable fraction); 6 milligram per cubic meter (inhalable fraction) not classifiable as a human carcinogen
PAC Ver. 29[138]
7440-42-8, boron (elemental)
PAC-1: 1.9 milligram per cubic meter
PAC-2: 21 milligram per cubic meter
PAC-3: 130 milligram per cubic meter
12069-32-8, boron carbide
PAC-1: 2.4 milligram per cubic meter
PAC-2: 27 milligram per cubic meter
PAC-3: 170 milligram per cubic meter
Determination in Air: Use NIOSH Analytical Method #0500 or OSHA Analytical Method ID-125G, Metal and Metalloid Particulates in work-place Atmospheres (ICP analysis).
Determination in Water: Fish Tox: LC_{50} (goldfish, 72 h) = 178 mg/L; EC_{50} [daphnia magna (water flea), 48 h] = 1.085−1.402 mg/L.
Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 600 μg[B]/L; State Drinking Water Guidelines: California 1000 μg[B]/L; Maine 1400 μg[B]/L; New Hampshire 630 μg[B]/L; Minnesota 1000 μg[B]/L; Wisconsin 960 μg[B]/L. Runoff from spills or fire control may cause water pollution.
Routes of Entry: Inhalation of dust, fumes, and aerosols; ingestion; skin absorption.
Harmful Effects and Symptoms
Boron compounds may produce irritation of the nasal mucous membranes; the respiratory tract, and eyes. *Systemic:* These effects vary greatly with the type of compound. Acute poisoning in humans from boric acid or borax is usually the result of application of dressings, powders, or ointment to large areas of burned or abraded skin, or accidental ingestion. The signs are: nausea, abdominal pain; diarrhea and violent vomiting, sometimes bloody, which may be accompanied by headache and weakness. There is a characteristic erythematous rash followed by peeling. In severe cases, shock with fall in arterial pressure, tachycardia, and cyanosis occur. Marked CNS irritation, oliguria, and anuria may be present. The oral lethal dose in adults is over 30 g. Little information is available on chronic oral

poisoning, although it is reported to be characterized by mild Gl irritation, loss of appetite; disturbed digestion; nausea; possibly vomiting; and erythematous rash. The rash may be "hard" with a tendency to become purpuric. Dryness of skin and mucous membranes; reddening of tongue; cracking of lips; loss of hair; conjunctivitis; palpebral edema; gastro-intestinal disturbances; and kidney injury have also been observed. Workers manufacturing boric acid had some atrophic changes in respiratory mucous membranes; weakness; joint pains, and other vague symptoms. The biochemical mechanism of boron toxicity is not clear but seems to involve action on the nervous system; enzyme activity; carbohydrate metabolism; hormone function; and oxidation processes coupled with allergic effects. Borates are excreted principally by the kidneys. No toxic effects have been attributed to elemental boron.

Short-Term Exposure: Irritating by skin and eye contact. Can be absorbed through the skin. Harmful by inhalation and ingestion. LD_{50} = (mouse-oral) 560 mg/kg; (oral-rat) 650 mg/kg. High exposure may cause CNS disturbances.

Long-Term Exposure: May cause brain, kidney and liver damage. Repeated exposure may cause boric acid to accumulate in the brain, bone, and other body parts. Repeated skin contact may cause dermatitis, borism (boron poisoning), dry skin, skin eruptions, and gastric disturbances. Animal tests show that this substance possibly causes toxic effects upon human reproduction (WHO). Repeated exposure may cause CNS effects.

Medical Surveillance: No specific considerations are needed for boric acid or borates except for general health and liver and kidney function. In the case of boron trifluoride; the skin, eyes, and respiratory tract should receive special attention. In the case of the boranes, CNS and lung function will also be of special concern.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Exposed workers should be educated in the proper use of protective equipment and there should be strict adherence to ventilating provisions in work areas. Safety glasses, respirator, adequate ventilation.

Respirator Selection: A respiratory protection program that meets OSHA's 29 CFR 1910.134 requirements or European Standard EN 149 must be followed whenever workplace conditions warrant a respirator's use. In many cases, a dust respirator meeting these standards may suffice.

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Store in a cool, dry place away from incompatible material, sources of heat and ignition. Boron powder may decompose on exposure to air and may have to be stored under a nitrogen blanket.

Shipping: Boron powder or dust: UN3178 Flammable solid, inorganic, Hazard Class: 4.1; Labels: 4.1—Flammable solid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. The material may be dampened with water to avoid dust and then transferred to a sealed container for disposal. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products include boron oxide. Use dry chemical, carbon dioxide; water, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed.

Boron Oxide B:0590

Formula: B_2O_3

Synonyms: Anhydrous boric acid; Boric anhydride; Boron sesquioxide; Boron trioxide; Diboron trioxide; Fused boric acid; Oxido de boro (Spanish)

CAS Registry Number: 1303-86-2

HSDB Number: 1609

RTECS Number: ED7900000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 215-125-8 [*Annex I Index No.:* 005-008-00-8]

Regulatory Authority and Advisory Information

Hazard Alert: Primary irritant (w/o allergic reaction), Suspected of causing genetic defects.

Canada, WHM IS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As boric anhydride.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R36/37/38; R60; R61; R62; safety phrases: S53; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Boron oxide is a noncombustible, colorless, semitransparent lumps or hard, white, odorless crystals, with slightly bitter taste. Molecular weight = 69.62; Specific gravity (H_2O:1) = 2.46; boiling point = 2250°C; freezing/melting point = 450°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0 ₩. Moderately soluble in water; solubility = (moderate) 3%; slow reaction forming boric acid.

Potential Exposure: Boron oxide is used in glass manufacture and the production of other boron compounds. It is used in fluxes, enamels, drying agents, and as a catalyst.

Incompatibilities: Incompatible with bromine pentafluoride, calcium oxide. Reacts slowly with water, forming boric acid. Reacts exothermically with alkaline material and strong bases. May react with strong reducing agents such as metal hydrides, metal alkyls to generate flammable or explosive gases. May react violently on contact with bromine pentafluoride. Corrosive to metals in the presence of air[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 milligram per cubic meter

OSHA PEL: 15 milligram per cubic meter TWA (total dust)

NIOSH REL: 10 milligram per cubic meter TWA

ACGIH TLV[1]: 10 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 620 milligram per cubic meter

Austria: MAK 15 milligram per cubic meter, 1993; Denmark: TWA 10 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; Norway: TWA 10 milligram per cubic meter, 1999; the Philippines: TWA 15 milligram per cubic meter, 1993; Poland: MAC (TWA) 10 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; United Kingdom: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 milligram per cubic meter. Several states have set guidelines or standards for Boron oxide in ambient air[60] ranging from 10 μ/m^3 (North Dakota) to 160 μ/m^3 (Virginia) to 200 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Air: Collection on a filter and gravimetric analysis. Use NIOSH Analytical Method #0500 Particulates NOR, total dust[18].

Determination in Water: Fish Tox: LC50 (goldfish, 72 h) = 570 mg/L; EC_{50} [daphnia magna (water flea), 48 h] = 370 to 490 mg/L.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 600 μg[B]/L; State Drinking Water Guidelines: California 1000 μg[B]/L; Maine 1400 μg[B]/L; New Hampshire 630 μg[B]/L; Minnesota 1000 μg[B]/L; Wisconsin 960 μg[B]/L. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May irritate the skin, causing a rash or burning feeling on contact. May cause nasal irritation, conjunctivitis, erythema. Ingestion causes abdominal pain; diarrhea, nausea, vomiting. Low toxicity. The oral LD_{50} mouse is 3163 mg/kg[9].

Long-Term Exposure: Unknown at this time.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *100 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *250 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *500 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *2000 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode. *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Store in tightly closed containers in a dry, well-ventilated area away from incompatible materials listed above and water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Moisten dry material to prevent dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental Protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Boron oxide is a noncombustible solid. Extinguish fire using an agent suitable for type of surrounding fire. Boron oxide itself does not burn. Thermal decomposition products may include oxides of boron and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling stream s are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening TQ (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade); *Theft hazard* 45 ($\geq$12.67% concentration)

Hazard Alert: Poison inhalation hazard (highly toxic gas).

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C; risk phrases: R14; R26/28; R35; safety phrases: S1; S26; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Boron tribromide is a colorless, fuming liquid. Molecular weight = 250.54. Specific gravity (H_2O:1) = 2.65; boiling point = 91°C; freezing/melting point = −46°C; vapor pressure = 40 mmHg @14°C. Hazard identification (based on NFP A-704 M Rating System): Health 3; flammability 0; reactivity 2 ₩. Soluble in water; dangerous reaction.

Potential Exposure: Boron tribromide is highly toxic and corrosive, it is used as a catalyst in organic synthesis, making diborane, high purity boron, and semiconductors.

Incompatibilities: Reacts violently and explosively with water, steam, or alcohols, forming toxic, corrosive, and potentially explosive hydrogen bromide gas. Mixtures with potassium or sodium can explode on impact. Incompatible with oxidizers, strong bases. Attacks some metals, rubbers, and plastics.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 ppm.

Conversion factor: 1 ppm = 10.25 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 1 ppm/10 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 0.7 ppm, Ceiling Concentration

PAC* Ver. 29[138]

PAC-1: **0.33**$_{\mathbf{A}}$ ppm

PAC-2: **13**$_{\mathbf{A}}$ ppm

PAC-3: **40**$_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

Australia: TWA 1 ppm (10 milligram per cubic meter), 1993; Austria: MAK 1 ppm (10 milligram per cubic meter), 1999; Belgium: STEL 1 ppm (10 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (10 milligram per cubic meter), 1999; Finland: TWA 1 ppm (10 milligram per cubic meter); STEL 3 ppm (30 milligram per cubic meter), 1999; Norway: TWA 1 ppm (10 milligram per cubic meter), 1999; Switzerland: MAK-W 1 ppm (10 milligram per cubic meter), 1999; the Netherlands: MAC 10 milligram per cubic meter (total dust), 2003; Argentina, Bulgaria, Columbia, Israel, Jordan, South Korea, New Zealand, Singapore, Vietnam: use ACGIH TLV Ceiling Concentration 1 ppm. Several states have set guidelines or standards for boron tribromide in ambient air[60] ranging from 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Water: No method established. Reaction.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 600 μg[B]/L; State Drinking Water Guidelines: California 1000 μg[B]/L; Maine 1400 μg[B]/L; New Hampshire 630 μg[B]/L; Minnesota 1000 μg[B]/L; Wisconsin 960 μg[B]/L. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Eyes, skin, respiratory system.

Harmful Effects and Symptoms

Short-Term Exposure: Boron tribromide is highly toxic and can affect you when inhaled, on skin contact and by eye contact. Boron tribromide is a corrosive liquid and exposure can cause severe burns of the eyes, nose, throat, lungs, and skin. Boron tribromide may cause cough, headaches, nose bleeds, and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. LD50 = (rat, inhal.) =< 400 ppm.

Long-Term Exposure: Repeated exposure may cause a brownish color of the tongue and/or runny nose. May cause irritation of the lungs and bronchitis to develop. May cause kidney damage and affect the nervous system.

Points of Attack: Kidneys, nervous system; lungs.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: lung function tests, kidney function tests, examination of the nervous system. If symptoms develop or overexposure is suspected the following may be useful: consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear acid resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Gloves made of chlorinated polyethylene are considered fair to good protection for boron tribromide. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 1 ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with an acid gas canister. Increased protection is obtained from full facepiece PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/M SHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Before entering confined space where boron tribromide may be present, check to make sure that an explosive concentration does not exist. Store in airtight, unbreakable containers in a cool well-ventilated area away from water, steam, potassium, sodium, alcohol, and other incompatible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2692 Boron tribromide, Hazard class: 8; Labels: 8—Corrosive materials, 6.1—Poison Inhalation Hazard, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

When spilled on land

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.4/0.6

when spilled in water

Day 0.3/0.5
Night 0.6/1.0
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.3/0.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/100
Then: Protect persons downwind (mi/km)
Day 0.5/0.8
Night 1.6/2.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Stop discharge if possible. Avoid contact with liquid or vapor[41]. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. Ventilate area of leak or spill after clean-up is complete. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical decomposes in heat and may explode. Use dry chemical or carbon dioxide. Do not use foam. Do not use water on material itself. Water can be used to cool intact containers and to absorb vapors. Thermal decomposition products may include hydrogen bromide and boron oxides. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening TQ (pounds): *Release hazard* 5000 (≥1.00% concentration); *Theft hazard* 45 (≥84.70% concentration)

Hazard Alert: Poison inhalation hazard (extremely toxic gas), water reactive, corrosive, frostbite/cryogenic burn hazard, asphyxiation hazard, contains gas under pressure; may explode if heated.

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 2500 lb (1135 kg)

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 5000 lb (2270 kg)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 500 lb (227 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R5; R14; R21; R26/28; R34; safety phrases: S1/2; S9; S26; S28; S33; S36/37/39; S38; S41; S45 (see Appendix 4).

Description: Boron trichloride is a colorless liquid or liquefied gas with a pungent, irritating odor. Molecular weight = 117.2; Specific gravity (H_2O:1) = 1.35 @ 12.7°C; boiling point = 12.5°C; freezing/melting point = −107°C; vapor pressure = 985 mmHg @ 20°C; Relative vapor density (air = 1) = 4.02. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 0; reactivity 2 ₩. Insoluble in water, releasing hydrogen chloride and boric acid.

Potential Exposure: Used in refining of aluminum, magnesium, copper alloys, and in polymerization of styrene. Manufacture and purification of boron; catalyst in organic reactions; semiconductors; bonding of iron or steel; purification of metal alloys to remove oxides, nitrides, and carbides; chemical intermediate for boron filaments; soldering flux; electrical resistors; and extinguishing magnesium fires in heat treating furnaces.

Incompatibilities: Incompatible with lead, graphite-impregnated asbestos, potassium, sodium. Vigorously attacks elastomers, packing materials, natural and synthetic rubber; viton, tygon, saran, silastic elastomers. Avoid aniline, hexafluorisopropylidene amino lithium, nitrogen dioxide, phosphine, grease, organic matter; and oxygen. Nitrogen peroxide, phosphine. Fat or grease react vigorously with boron trichloride. It reacts with water or steam to produce heat, boric acid, and corrosive hydrochloric acid fumes. Oxygen and boron trichloride react vigorously on sparking. Attacks most metals in the presence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 ppm
PAC Ver. 29[138]
PAC-1: 0.19 ppm
PAC-2: 2.1 ppm
PAC-3: 71 ppm

Boron trichloride is a poisonous, corrosive gas. Other than PAC, shown above, no other numerical standards have been established. Since the hydrolysis product, HCl, tends to govern the effect in moist air, reference should be made to the limit for hydrogen chloride as follows:

OSHA PEL: 5 ppm/7 milligram per cubic meter Ceiling Concentration

NIOSH REL: 5 ppm/7 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 5 ppm/7.5 milligram per cubic meter Ceiling Concentration; not classifiable as a human carcinogen

DFG MAK: 5 ppm/7.6 milligram per cubic meter, Pregnancy Risk Group C

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 600 μg[B]/L; State Drinking Water Guidelines: California 1000 μg[B]/L; Maine 1400 μg[B]/L; New Hampshire 630 μg[B]/L; Minnesota 1000 μg[B]/L; Wisconsin 960 μg[B]/L. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Extremely corrosive to the eyes, skin and respiratory tract. Contact with eyes produces severe pain, swelling, corneal erosions and blindness. Viscid white or blood-stained foamy mucus and threads of tissue may appear in mouth. Inhalation can cause low blood oxygen, difficulty in breathing; chest pain and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Symptoms of overexposure include depression of circulation, persistent vomiting and diarrhea, profound shock and coma. Temperature becomes subnormal and rash may cover entire body. Boron affects the CNS causing depression of circulation as well as shock and coma. May result in marked fluid and electrolyte loss and shock. LD50 (rat, inhal.) =< 1300 ppm/4 h.

Long-Term Exposure: Can cause liver, kidney and brain damage.

Medical Surveillance: Consider X-ray following acute overexposure. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Liver kidney.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention immediately. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Person al Protective Methods: Wear acid-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge (s)]; CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. This gas is toxic and/or corrosive, nonflammable. Outside or detached storage is preferred in an area that is roofed, shaded with the cylinders stored off the ground on nonwooden floors, and away from radiant heat sources and all possible sources of ignition. If indoors or outdoors, store in a well-ventilated noncombustible location temperatures not to exceed 50°C. Automatic monitoring systems are also preferred. Before entering confined space where boron trichloride may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated, fireproof place. Metal containers involving the transfer of this chemical should be grounded and bonded. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1741 Boron trichloride, Hazard class: 2.3; Labels: 2.3—Poisonous gas, 8—Corrosive material, Inhalation Hazard Zone C. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Seek expert help. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

when spilled on land

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)

Day 0.1/0.2
Night 0.2/0.3
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.0/1.5
when spilled in water
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.3/0.5
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.8/1.2
Night 2.4/3.8

Avoid breathing vapors. Keep up wind. Remove all ignition sources. Ventilate area of leak or spill. Isolate area until gas has dispersed. Stop leak if you can do so without risk. Keep material out of water sources and sewers. Use water spray to knock down vapors. Do not use water on material itself. Neutralize spilled material with crushed limestone, soda ash, or lime. Collect neutralized material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Boron trichloride is not combustible. Thermal decomposition products may include hydrogen chloride gas. This gas is under pressure; containers may rupture and explode when heated. Reacts with water forming boric acid and hydrochloric acid fumes. Use dry chemical, carbon dioxide; or dry sand to extinguish. If large quantities of combustibles are involved, use water in flooding quantities as spray and fog. Use water spray to absorb vapors. For large fires use water spray, fog, or foam. *Do not get water on material itself.* Thermal decomposition products may include hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed, undamaged containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state, and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Boron trifluoride is a nonflammable, colorless gas. Pungent, suffocating odor. Forms dense white fumes in moist air. Shipped as a nonliquefied compressed gas. Molecular weight = 67.8; Relative vapor density (air = 1) = 2.38; boiling point = −100°C; freezing/melting point = −127°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 0; reactivity 1 ₩. Reacts with water; solubility in cold water = 106%.

Potential Exposure: Boron trifluoride is a highly reactive chemical used primarily as a catalyst in chemical synthesis. It is stored and transported as a gas, but can be reacted with a variety of materials to form both liquid and solid compounds. The magnesium industry utilizes the fire-retardant and antioxidant properties of boron trifluoride in casing and heat treating. Nuclear applications of boron trifluoride include neutron detector instruments; boron-10 enrichment and the production of neutroabsorbing salts for molten-salt breeder reactors.

Incompatibilities: Boron trifluoride reacts with polymerized unsaturated compounds. Decomposes on contact with water, moist air, and other forms of moisture, forming toxic and corrosive hydrogen fluoride, fluoroboric acid, and boric acid. Reacts violently with alkali and alkaline earth metals (except magnesium); metals, such as sodium, potassium, and calcium oxide, and with alkyl nitrates. Attacks many metals in presence of water.

Permissible Exposure Limits in Air

Arab Republic of Egypt: TWA 1 ppm (3 milligram per cubic meter), 1993; Australia: TWA 1 ppm (3 milligram per cubic meter), 1993; Austria: MAK 1 ppm (3 milligram per cubic meter), 1999; Belgium: STEL 1 ppm (2.8 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (3 milligram per cubic meter), 1999; Finland: TWA 1 ppm (3 milligram per cubic meter); STEL 3 ppm (8.3 milligram per cubic meter), 1999; France: VLE 1 ppm (3 milligram per cubic meter), 1999; the Netherlands: MAC 3 milligram per cubic meter, 2003; Japan: 0.3 ppm (0.83 milligram per cubic meter), 1999; Norway: TWA 1 ppm (3 milligram per cubic meter), 1999; the Philippines: STEL 1 ppm (3 milligram per cubic meter), 1993; Russia: TWA 0.3 ppm; STEL 1 milligram per cubic meter, 1993; Switzerland: MAK-W 1 ppm (3 milligram per cubic meter), KZG-W 2 ppm (6 milligram per cubic meter), 1999; Thailand: TWA 1 ppm (3 milligram per cubic meter), 1993; Turkey: TWA 1 ppm (3 milligram per cubic meter), 1993; United Kingdom: STEL 1 ppm (2.8 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 1 ppm. Several states have set guidelines or standards for boron trifluoride in ambient air[60] ranging from zero (Connecticut) to 25 μ/m^3 (Virginia) to 30 μ/m^3 (North Dakota) to 71 μ/m^3 (Nevada).

Determination in Air: Collection by an impinger preceded by a filter followed by colorimetric analysis.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 600 μg[B]/L; State Drinking Water Guidelines: California 1000 μg[B]/L; Maine 1400 μg[B]/L; New Hampshire 630 μg[B]/L; Minnesota 1000 μg[B]/L; Wisconsin 960 μg[B]/L. Runoff from spills or fire control may cause water pollution. *Fluoride ion*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/[F]/L, as Fluoride.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Boron trifluoride gas, upon contact with air, immediately reacts with water vapor to form a mist; which, if at a high enough concentration, provides a visible warning of its presence. The gas or mist is severely irritating and corrosive to the skin, eyes, and respiratory system. Inhalation causes coughing and breathing difficulties. Boron trifluoride is highly toxic; may cause death, by inflammation, lung congestion, or pulmonary edema, a medical emergency that can be delayed for several hours. Death or permanent injury can result from very short exposure to small quantities (an estimated 40−60 ppm for 30−60 minutes). Contact with the skin and eyes can cause redness, pain, and serious burns. May cause depression of the CNS. Rapid evaporation of the liquid may cause frostbite. The toxic action of the halogenated borons (boron trifluoride and trichloride) is considerably influenced by their halogenated decomposition products. They are Primary irritant (w/o allergic reaction)s of the nasal passages, respiratory tract, and eyes in man. Animal experiments showed a fall in inorganic phosphorus level in blood and on auropsy, pneumonia, and degenerative changes in renal tubules.

Long-Term Exposure: May cause liver and kidney damage. Long-term exposure leads to irrigation of the respiratory tract, dysporteinemia, reduction in cholinesterase activity; increased nervous system liability.

Points of Attack: Respiratory system; kidneys, eyes, skin.

Medical Surveillance: In the absence of a suitable monitoring method, NIOSH recommends that medical surveillance, including comprehensive preplacement and annual periodic examinations be made available to all workers employed in areas where boron trifluoride is manufactured, used, handled, or is evolved as a result of chemical processes.

First Aid: If contact with liquid, treat for frostbite. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Engineering controls should be used to maintain boron trifluoride concentrations at the lowest feasible level. Prevent skin contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Teflon gloves, suits, boots; Responder suits. Wear corrosive-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* SA* (any supplied-air respirator). *25 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poison gas. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed below −28.9°C or above 54.4°C. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1008 Boron trifluoride, Hazard class: 2.3; Labels: 2.3—Poisonous gas, 8—Corrosive material, Inhalation Hazard Zone B. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Boron trifluoride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

Liquid or Compressed

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300

Then: Protect persons downwind (mi/km)

Day 1.1/1.8

Night 3.0/4.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse gas. Stop leak if you can do it without risk. Use water spray to reduce vapor but do not put water on leak or spill area. *Small spills:* flush area with flooding amounts of water. *Large spills:* dike far ahead of spill for later disposal. Do not get water inside container. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Decomposes upon heating or on contact with moist air, releasing toxic and corrosive fumes of boric acid, hydrofluoric acid, and oxides of carbon. This gas is under pressure; containers may rupture and explode when heated. Do not use water. For small fire use dry chemical or carbon dioxide. On larger fires use any agent suitable for surrounding fire. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. Chemical reaction with water to form boric acid, and fluoroboric acid. The fluoroboric acid is reacted with limestone, forming boric acid and calcium fluoride. The boric acid may be discharged into a sanitary sewer system while the calcium fluoride may be recovered or landfilled. Protect cylinder and labels from physical damage.

EC Number: 206-532-1 (*with dimethyl ether*); 203-689-8 (*with diethyl ether*)

Regulatory Authority and Advisory Information

The following is for 353-42-4 (with methyl ether), except as noted.

Department of Homeland Security Screening TQ (pounds): *Release hazard* 15,000 (≥1.00% concentration). [Boron triflouride compound with methyl ether (1:1)]

Hazard Alert: Exposure can be lethal, Highly flammable, Highly reactive, Corrosive, Dangerously water reactive (spontaneously explosive).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg)

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Safe Drinking Water Act: Priority List (55FR1470), as boron

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 1000 lb (454 kg) (with methyl ether)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg) (with methyl ether)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. [109-63-7 (*boron trifluoride diethyletherate*)].

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F+, C; risk phrases: R12; R14/15; R20/22; R34; R48/23; safety phrases: S1; S8; S16; S21; S23; S26; S28; 36/37/39; S43; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Boron trifluoride etherates: (*compounded with methyl ether*) is moisture-sensitive, corrosive, flammable liquid. Molecular weight = 113.9; boiling point = 126−127°C; freezing/melting point = −14°C. Hazard identification (based on NFPA −704 M Rating System): (*dimethyl etherate/ UN2965*) Health 4; flammability 4; reactivity 1 ₩.

(*compounded with ethyl ether*) is a moisture-sensitive, corrosive, flammable liquid. Molecular weight = 141.9; boiling point = 126°C; freezing/melting point = −58°C; flash point = 64°C (oc). Hazard identification (based on NFPA-704 M Rating System) (*methyl ether*): Health 3; flammability 3−4; reactivity 1 ₩. Decomposes in water.

(*methanol complex in excess methanol*)

Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 4; reactivity 1 ₩.

Potential Exposure: Used as a catalyst.

Incompatibilities: Reacts with air forming corrosive hydrogen fluoride vapors. Incompatible with oxidizers (may cause fire and explosion), water, steam or heat, forming corrosive and flammable vapors. Peroxide containing etherate reacts explosively with aluminum lithium hydride, magnesium tetrahydroaluminate. Mixtures with phenol react explosively with 1,3-butadiene. Presumed to form explosive peroxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 ppm

There are no airborne exposure limits for the etherates. Exposure limits for boron trifluoride may be applicable in most cases as follows:

OSHA PEL: 1 ppm/3 milligram per cubic meter Ceiling Concentration

NIOSH REL: 1 ppm/3 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 1 ppm/2.8 milligram per cubic meter Ceiling Concentration

PAC* Ver. 29[138]

353-42-4 compounded with methyl ether

PAC-1: 2.5 milligram per cubic meter

PAC-2: 29 milligram per cubic meter

PAC-3: 88 milligram per cubic meter

109-63-7 compounded with ethyl ether

PAC-1: 2.5 milligram per cubic meter

PAC-2: 29 milligram per cubic meter

PAC-3: 88 milligram per cubic meter

Arab Republic of Egypt: TWA 1 ppm (3 milligram per cubic meter), 1993; Australia: TWA 1 ppm (3 milligram per cubic meter), 1993; Austria: MAK 1 ppm (3 milligram per cubic meter), 1999; Belgium: STEL 1 ppm (2.8 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (3 milligram per cubic meter), 1999; Finland: TWA 1 ppm (3 milligram per cubic meter); STEL 3 ppm (8.3 milligram per cubic meter), 1999; France: VLE 1 ppm (3 milligram per cubic meter), 1999; the Netherlands: MAC 3 milligram per cubic meter, 2003; Japan: 0.3 ppm (0.83 milligram per cubic meter), 1999; Norway: TWA 1 ppm (3 milligram per cubic meter), 1999; the Philippines: STEL 1 ppm (3 milligram per cubic meter), 1993; Russia: TWA 0.3 ppm; STEL 1 milligram per cubic meter, 1993; Switzerland: MAK-W 1 ppm (3 milligram per cubic meter), KZG-W 2 ppm (6 milligram per cubic meter), 1999; Thailand: TWA 1 ppm (3 milligram per cubic meter), 1993; Turkey: TWA 1 ppm (3 milligram per cubic meter), 1993; United Kingdom: STEL 1 ppm (2.8 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 1 ppm. Several states have set guidelines or standards for boron trifluoride in ambient air[60] ranging from zero.

(Connecticut) to 25 μ/m^3 (Virginia) to 30 μ/m^3 (North Dakota) to 71 μ/m^3 (Nevada).

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 600 μg[B]/L; State Drinking Water Guidelines: California 1000 μg[B]/L; Maine 1400 μg[B]/L; New Hampshire 630 μg[B]/L; Minnesota 1000 μg[B]/L; Wisconsin 960 μg[B]/L. Runoff from spills or fire control may cause water pollution. *Fluorideion*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: These compounds are corrosive. Contact may cause severe burns to skin and eyes. The boron fluoride etherates are highly toxic by inhalation. Inhalation may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Can cause kidney damage.

Points of Attack: Kidneys.

Medical Surveillance: Consider chest X-ray following acute overexposure. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (as boron trifluoride) *10 ppm:* SA* (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Un2604 Corrosive or Contact Hazard; Store separately in a corrosion resistant location.UN2965 Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Before entering confined space where these chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: *Diethyl*: UN2604 Boron trifluoride diethyl etherate, Hazard class: 8; Labels: 8—Corrosive material, 3—Flammable liquid. *Dimethyl*: UN2965 Boron trifluoride dimethyl etherate, Hazard class: 4.3; Labels: 4.3—Dangerous when wet, 8—Corrosive material, 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spill material. Use water spray to reduce vapors, but do not get water inside containers. For *small spills*, absorb with sand or other non-combustible absorbent material and place into containers. For *large spills*, dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include fluoride compounds, boric acid and oxides of carbon. For small fires use dry chemical, carbon dioxide; water spray; or foam extinguishers. For large fires, use water spray, fog, or foam. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard Alert: Poison, Flammable, Suspected of causing genetic defects, Suspected reprotoxic hazard.
Safe Drinking Water Act (47FR 9352): Priority List (55FR1470)
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Hazard symbols, risk, & safety statements: Hazard symbol: F, N, Xn; risk phrases: R10; R22; R36/37/38; R51; R61; R62; R63; safety phrases: S16; S26; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]
Description: Bromacil is a noncombustible colorless, crystalline solid, which may be dissolved in a flammable liquid. Molecular weight = 261.2; Specific gravity (H_2O:1) = 1.55 @ 25°C; boiling point = (sublimes); freezing/melting point = 158.3°C (sublimes); vapor pressure = 0.0008 mmHg @ 25°C (NIOSH); 3.1×10^{-7} mmHg (EPA); Flash point (*in ethanol or methanol*) = ~44°C. Hazard identification (based on NFP A-704 M Rating System): Health 1; flammability 1; reactivity 0 ₩; (*in ethanol or methanol*): Health 1; flammability 2; reactivity 0 ₩. Slightly soluble in water; 0.08% @ 77°F/25°C. Commercial formulations use carrier solvents that may alter the physical properties shown.
Potential Exposure: Used for general weed or brush control in noncrop areas and primarily for the control of annual and perennial grasses and broadleaf weeds, both nonselectively on noncrop lands and selectively for weed-control in a few crops (citrus and pineapple). A limit of 0.1 mg/kg of agricultural products is set in several countries[35]. Those exposed will be those involved in manufacture, formulation, and application.
Incompatibilities: Incompatible with strong acids; oxidizers, heat. Decomposes slowly in strong acids.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 10.68 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 1 ppm/10 milligram per cubic meter TWA
ACGIH 10 milligram per cubic meter TWA, confirmed animal carcinogen with unknown relevance to humans.
No PAC available.
Australia: TWA 1 ppm (10 milligram per cubic meter), 1993; Belgium: TWA 1 ppm (11 milligram per cubic meter), 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 1 ppm (10 milligram per cubic meter); STEL 3 ppm (30 milligram per cubic meter), 1999; France: VME 1 ppm (10 milligram per cubic meter), 1999; Switzerland: MAK-W 1 ppm (10 milligram per cubic meter), 1999; United Kingdom: TWA 1 ppm (11 milligram per cubic meter), STE; 2 ppm (22 milligram per cubic meter), 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Some states have set guidelines or standards for bromacil in ambient air[60] ranging from 100 μ/m^3 (North Dakota) to 160 μ/m^3 (Virginia) to 200 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada).
Determination in Air: Use NIOSH Analytical Methods (IV) #0500, Particulates NOR, total dust.
Permissible Concentration in Water: A no-adverse-effects-level in drinking water has been calculated by NAS/NRC as 0.086 mg/L[46]. Some states have set guidelines for Bromacil in drinking water[61] including Maine @ 25 μg/L, and Kansas @ 87.5 μg/L.
Determination in Water: Octanol–water coefficient: Log K_{ow} = 2.1. Unlikely to bioaccumulate in marine organisms. Fish Tox: 6485.34001000 ppb MATC (VERY LOW).
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Irritates the eyes, skin, upper respiratory system; lungs. Inhalation can cause irritation, coughing, and wheezing.
Long-Term Exposure: Has cause thyroid affects in animals. Human Tox: 90.00000 ppb Health advisory: (LOW).
Points of Attack: Eyes, skin, respiratory system; thyroid.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours

following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Thyroid function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing, and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-or dust-proof chemical goggles (depending on physical state of material) and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 1 ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure demand or other positive pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with bromacil all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids; oxidizers, heat and open flame.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 miles[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquid containing bromacil in vermiculite, dry sand; earth, or similar material. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index $K_{oc} = 32$.

Fire Extinguishing: Bromacil may burn, but does not readily ignite. Bromacil may be ignited by heat or open flame. Dust may cause an explosion. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include bromine and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Bromacil should be incinerated in a unit operating @ 850°C equipped with gas scrubbing equipment[22].

EC Number: 249-205-9

Regulatory Authority and Advisory Information

Hazard Alert: Exposure can be lethal, Highly toxic(ingestion), Combustible, Environmental hazard, Agricultural chemical.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV.D.3.b, RQ: 100 lb (45.4 kg).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R27/28; R50/53; safety phrases: S13; S28; S29/35; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Bromadiolone is white to off-white (yellowish) powder. Molecular weight = 527.41; freezing/melting point = 200−210°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 1; reactivity 0 ₩. Very low solubility in water.

Potential Exposure: Bromadiolone is used as an anticoagulant rodenticide. It is bait for rodent control used against house mice, roof rats, warfarin-resistant Norway rats. It is also authorized by USDA for use in official establishments operating under the federal meat, poultry, shell egg grading, and egg products inspection program. May be used as a drug.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 0.091 milligram per cubic meter
PAC-2: 1 milligram per cubic meter
PAC-3: 3.4 milligram per cubic meter

Routes of Entry: Ingestion, inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

The compound is toxic by oral exposure, the oral LD_{50} rabbit is 1.0 mg/kg and LD_{50} = (oral-rat) 1.125 mg/kg (Extremely toxic)[9].

Short-Term Exposure: Very toxic if ingested; by skin and eye contact. May cause eye irritation. Bro madiolone has an acute oral toxicity LD_{50} = 1−3 mg/kg, rodents/nonrodents (HIGH). Dermal toxicity LD_{50} = 9.4 mg/kg, rabbits (HIGH).

Long-Term Exposure: Studies of mutagenicity and teratogenicity have not shown any mutagenic, embryotoxic, or teratogenic effects. Coumarin and its derivatives may be carcinogenic to humans.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full face piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with bromadiolone all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN3027 Coumarin derivative pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials. UN3026 Coumarin derivative pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal.

Fire Extinguishing: Thermal decomposition products may include toxic hydrogen bromide and oxides of carbon. This material may burn but does not ignite readily. *Small fires:* dry chemicals, carbon dioxide; water spray or foam. *Large fires:* water spray, fog or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN2588 (pesticide, solid, poisonous, n.o.s.)/151

EC Number: 216-882-7 [*Annex I Index No.:* 608-006-00-0]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen

California Proposition 65 Chemical[102]: Developmental toxin (10/1/1990)

Hazard Alert: Poison, Sensitization hazard (skin), Environmental hazard, Agricultural chemical.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0% (also, octanoate)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xi; risk phrases: R25; R26; R43; R50/53; R63; safety phrases: S1/2; S27/28; S29; S36/37; S41; S45; S63; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): [3-Severe hazard to waters (est.)]

Description: Bromoxynil is a colorless to white crystalline solid or tan powder. Odorless (pure). Molecular weight = 276.93; boiling point = (sublimes) 135°C @ 0.15 mmHg[88]; freezing/melting point = 194–195°C; 360°C (sodium or potassium salt); vapor pressure = 4.5×10^{-8} mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0 ₩. Moderately soluble in water; solubility = 125 ppm @ 20°C.

Potential Exposure: Bromoxynil is a hydroxybenzonitrile herbicide used for postemergent control of broadleaf weeds; on alfalfa, garlic, corn, sorghum, flax, cereals, turf and on pasture and rangelands. A United States Environmental Protection Agency RUP.

Incompatibilities: A weak acid; keep away from bases and alkalies. React with boranes, alkalies, aliphatic amines, amides, nitric acid, sulfuric acid. Keep away from oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.) and strong acids.

Permissible Exposure Limits in Air

NIOSH REL: *Nitriles:* 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.

Determination in Air: Bromoxynil/bromoxynil octanoate, NIOSH: #5010. See NIOSH Criteria Document 78-212 *NITRILES*(18)

Permissible Concentration in Water: State Drinking Water Guidelines: Florida 140 μg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: State Drinking Water Guidelines: Florida 140 μg/L. Octanol−water coefficient: Log K_{ow} => 2.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)(101): Low−283.24412 ppb, MATC; (octanoate).

Routes of Entry: Inhalation, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may cause burns to skin and eyes. Because this material has a low vapor pressure, significant inhalation of vapors is unlikely at ordinary temperatures. May affect the iron metabolism, causing asphyxia. It is highly toxic. Forms cyanide in the body. Exposure results in headache, dizziness, rapid pulse, deep-rapid breathing, nausea, vomiting, unconsciousness, convulsions and sometimes death. May cause cyanosis (blue coloration of skin and lips caused by lack of oxygen). LD_{50} (oral, rat) = 80−190 mg/kg; LD_{50} (dermal, rat) => 2 g/kg.

Long-Term Exposure: Chronic exposure over long periods may cause fatigue and weakness. Can cause same general symptoms as hydrogen cyanide but onset of symptoms is likely to be slower. May cause liver and kidney damage. May cause skin sensitization. Human toxicity (long-term)[101]: Intermediate—10.50 ppb, Health advisory; *octanoate:* Very low—140.00 ppb, Health advisory: High—4.40230 ppb, MATC.

Points of Attack: Skin. In animals: liver, kidney damage. May be a nerve toxin.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Comprehensive physical examination with emphasis on the genitourinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum FSH, and serum LH may be carried out if, in the opinion of a physician, they are indicated. Liver and kidney function tests. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves[31].

Personal Protective Methods: Wear positive pressure SCBA (SCBA). Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible[31]. Smoking, eating, and drinking before washing should be absolutely prohibited when any pesticide is being handled or used. Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics; Chemical-resistant footwear plus socks; protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS.

Respirator Selection: *Nitriles*: NIOSH, *10 ppm:* Sa (APF = 10) (any supplied-air respirator); *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); *50 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece); *250 ppm:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode. *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as Sodium Hydroxide, Sodium Bicarbonate, etc.). Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: Issue poison warning. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers. If a spill occurs, clean it up promptly. Don't wash it away. Instead, sprinkle the spill with sawdust, vermiculite, or kitty litter. Sweep it into a plastic garbage bag, and dispose of it as directed on the pesticide product label.

Fire Extinguishing: Thermal decomposition products may include hydrogen bromide and oxides of nitrogen and carbon. *On a small fire:* use dry chemical, CO_2 or water spray. On a large fire, use water spray, fog, or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mile in all directions; also, consider initial evacuation for 800 m/0.5 mile in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Incineration with effluent gas scrubbing is recommended. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C, N; risk phrases: R26; R35; R33; R51; safety phrases: S1/2; S7/9; S26; S29/35; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Bromine is a fuming red to dark reddish-brown, nonflammable, volatile liquid with a suffocating odor. Soluble in water and alcohol. Molecular weight = 159.8; specific gravity (H_2O:1) = (H_2O:1) = 3.12; boiling point = 58.8°C; freezing/melting point = −7.2°C; relative density of the vapor/air-mixture @ 20°C (air = 1) = 2.12; vapor pressure = 172 mmHg @ 20°C. The odor threshold is 3.5 ppm[41]. Hazard identification (based on NFPA-704 M Rating System): health 3−4; flammability 0; reactivity 2 ₩.

Potential Exposure: Bromine is primarily used in the manufacture of gasoline antiknock compounds (1,2-dibromoethane). Other uses are for gold extraction; in brominating hydrocarbons; in bleaching fibers and silk; in the manufacture of military gas, dyestuffs; and as an oxidizing agent. It is used in the manufacture of many pharmaceuticals and pesticides.

Incompatibilities: A powerful oxidizer. May cause fire and explosions in contact with organic or other readily oxidizable materials. Contact with aqueous ammonia, acetaldehyde, acetylene, acrylonitrile, or with metals, may cause violent reactions. Anhydrous Br_2 reacts with aluminum, titanium, mercury, potassium; wet Br_2 with other metals. Also incompatible with alcohols, antimony, alkali hydroxides, arsenites, boron, calcium nitrite, cesium monoxide, carbonyls, dimethyl formamide, ethyl phosphine, fluorine, ferrous and mercurous salts; germanium, hypophosphites, iron carbide, isobutyronphenone, magnesium phosphide, methanol, nickel carbonyl, olefins, ozone, sodium and many other substances. Attacks some coatings, and some forms of plastic and rubber. Corrodes iron, steel, stainless steel; and copper.

Permissible Exposure Limits in Air

NIOSH IDLH = 3 ppm

Conversion factor: 1 ppm = 6.54 milligram per cubic meter @ 25°C & 1 atm.

OSHA PEL: 0.1 ppm/0.7 milligram per cubic meter TWA

NIOSH REL: 0.1 ppm/0.7 milligram per cubic meter TWA; 0.3 ppm/0.8 milligram per cubic meter STEL

ACGIH TLV[1]: 0.1 ppm/0.66 milligram per cubic meter TWA; 0.1 ppm TWA; 0.2 ppm STEL

PAC* Ver. 27

PAC-1: $\mathbf{0.033_A}$ ppm

PAC-2: $\mathbf{0.24_A}$ ppm

PAC-3: $\mathbf{8.5_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: No numerical value established. Data may be available.

Europe OEL: 0.1 ppm/0.7 milligram per cubic meter TWA

Arab Republic of Egypt: TWA 0.1 ppm (0.7 milligram per cubic meter), 1993; Australia: TWA 0.1 ppm (0.7 milligram per cubic meter); STEL 0.3 ppm (2 milligram per cubic meter), 1993; Austria: MAK 0.1 ppm (0.7 milligram per cubic meter), 1999; Belgium: TWA 0.1 ppm (0.66 milligram per cubic meter); STEL 0.3 ppm, 1993; Denmark: TWA 0.1 ppm (0.7 milligram per cubic meter), 1999; Finland: STEL 0.1 ppm (0.7 milligram per cubic meter) [skin] 1999; France: VLE 0.1 ppm (0.7 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.7 milligram per cubic meter, 2003; India: TWA 0.1 ppm (0.7 milligram per cubic meter); STEL 0.3 ppm (2 milligram per cubic meter), 1993; Japan: 0.1 ppm (0.65 milligram per cubic meter), 1999; Norway: TWA 0.1 ppm (0.7 milligram per cubic meter), 1999; the Philippines: TWA 0.1 ppm (0.7 mg/m^3), 1999; Poland: MAC (TWA) 0.7 milligram per cubic meter, MAC (STEL) 2 milligram per cubic meter, 1999; Russia: TWA 0.1 ppm; STEL 0.5 milligram per cubic meter, 1993; Sweden: NGV 0.1 ppm (0.7 milligram per cubic meter), KTV 0.3 ppm (2 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (0.7 milligram per cubic meter), KZG-W 0.2 ppm, 1999; Turkey: TWA 0.1 ppm (0.7 milligram per cubic meter), 1993; United Kingdom: TWA 0.1 ppm (0.66 milligram per cubic meter); STEL 0.3 ppm (2.0 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 ppm; STEL 0.2 ppm. Several States have set guidelines or standards for bromine in ambient air[60] ranging from 2.33 μ/m^3 (New York) to 7.0 μ/m^3 (Florida and North Dakota) to 11.0 μ/m^3 (Connecticut) to 17 μ/m^3 (Nevada) to 200 μ/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #6011, OSHA Analytical Method ID-108.

Permissible Concentration in Water: Russia set a MAC value of 0.2 mg/L in water bodies used for domestic purposes. Maine has set a guideline[61] for drinking water of 660 μg/L.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

The majority of exposures to bromine occurs by inhalation and typically leads to symptoms of ocular, nasal, and respiratory irritation. A corrosive liquid, bromine can cause severe eye and skin irritation and burns that may cause permanent damage and scarring. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Short-Term Exposure

Symptoms of exposure can include dizziness, headache, lacrimation (discharge of tears), epistaxis (nosebleed); cough, feeling of oppression; abdominal pain; diarrhea. Signs and symptoms of poisoning include eye redness and lacrimation, nose and throat irritation, cough, and dyspnea. Ingestion of liquid bromine can cause abdominal pain and hemorrhagic gastroenteritis with secondary shock. Signs and symptoms might also include brown discoloration of mucous membranes and the tongue. *Inhalation:* small amount will cause coughing, nose bleed, dizziness, and headache followed by abdominal pain and diarrhea and sometimes measles-like eruption on trunk and extremities. *Skin contact:* causes pustules and painful nodules in exposed areas of skin; if not removed will cause deep, painful ulcers. *Ingestion (of liquid):* causes burning pain in mouth and esophagus, lips and mucous membranes stained brown; severe gastroenteritis evidenced by abdominal pain and diarrhea; cyanosis, and shock. Regular exposure to concentrations approaching the permissible exposure level causes irritability, loss of appetite; joint pains and dyspepsia. Other symptoms include loss of cornea reflexes, inflammation of the throat, thyroid dysfunction, cardiovascular disorders; disorders of digestive tract. Inhalation exposure to 11−23 milligram per cubic meter produces severe choking. 30−60 milligram per cubic meter is extremely dangerous. 200 milligram per cubic meter is fatal in a short time. Vapors can cause acute as well as chronic poisoning. It has cumulative properties. It is irritating to the eyes, and respiratory tract. Poisoning is due to the corrosive action on the gastrointestinal tract. Nervous, circulatory and renal disturbances occur after ingestion. Ingestion of liquid can cause death due to circulatory collapse and asphyxiation from swelling of the respiratory tract. The lowest oral lethal dose reported for humans is 14 mg/kg. The lowest lethal inhalation concentration reported for humans is 1000 ppm.

Long-Term Exposure: May cause acnelike eruptions on the skin. Repeated exposure may cause headache, chest pain; joint pain; and indigestion. Bronchitis or pneumonia may develop with cough, shortness of breath; and phlegm.

Points of Attack: Respiratory system, eyes, lungs, central nervous system.

Medical Surveillance: The skin, eyes, and respiratory tract should be given special emphasis during preplacement and periodic examinations. Chest X-rays as well as general health, lung, blood, liver, and kidney function should be considered. Exposure to other irritants or bromine.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. **4 hours:** (At least 4 but <8 hours of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *2.5 ppm:* Sa:Cf$^{£}$ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS¿$^{£}$ (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]. *3 ppm:* CcrFS¿ (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern] organic vapor and acid gas cartridge(s); or GmFS¿ (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or PaprTS¿ (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS¿ (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE [any appropriate escape-type, self-contained breathing apparat(s)]. *Note*:$^{£}$: Substance causes eye irritation or damage; eye protection needed.¿: Only *nonoxidizable sorbents* are allowed (not charcoal).

Storage: PIH; check oxygen content prior to entering storage area. (1) Corrosive or Contact Hazard; store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison. Store in a secure poison location. (3) Color code—Yellow Stripe: Reactivity Hazard. Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Store in a cool, dry room with ventilation along the floor. Keep sealed or glass stoppered. Protect against physical damage. Keep out of direct sunlight. Separate from combustibles, organics or other readily oxidizable materials. Store above −7°C /20°F to prevent freezing but avoid heating above room temperature to prevent pressure increase which could rupture containers. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: Bromine UN1744 Hazard class: 8; Labels: 8—Corrosive material; 6.1—Poison Inhalation Hazard, Inhalation Hazard Zone A. *Bromine solutions*, Hazard class: 8; Labels: 8—Corrosives materials; 6.1—Poison Inhalation Hazard, Inhalation Hazard Zone A; *Bromine solutions*, Hazard class: 8 Labels: 8—Corrosive material; 6.1—Poison Inhalation Hazard, Inhalation Hazard Zone B.

Spill Handling:
Bromine
Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6.3
Night 1.2/1.9

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.8/2.9
Night 4.0/6.5

Bromine solution and/or **Bromine, solution (Inhalation Hazard Zone A)**

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.2/1.9

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.8/2.9
Night 4.0/6.6

Small spills (From a small package or a small leak from a large package)

Bromine, solution (Inhalation Hazard Zone B)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.8/1.3

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.6/4.1

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Wear eye protection. Wear positive pressure breathing apparatus and special protective clothing. Ventilate area of spill or leak. Collect for reclamation by absorbing it in vermiculite, dry sand; earth, or a similar material and deposit it in sealed containers in secured sanitary landfill. Potassium carbonate, sodium carbonate, sodium bicarbonate, lime, and sodium hydroxide solutions are neutralizing agents for liquid bromine spills. Do not touch material, stop leak if possible without risk. Use water spray to reduce vapors. *Do not* absorb in sawdust or other combustible absorbents; avoid contact with metal implements. *Small spills:* absorb with sand or other noncombustible absorbent material and place in container. *Large spills:* dike spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic and corrosive fumes of bromine. Bromine is not combustible but enhances combustion of other substances. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Large volumes of concentrated solutions of reducing agents (bisulfites or ferrous salts) may be added[22]. The mixture is neutralized with soda ash or dilute HCl and flushed to the sewer with large volumes of water.

Bromine Chloride B:0663

Formula: BrCl

Synonyms: Bromine monochloride; Bromochloride; Chlorure de brome (French); Cloruro de bromo (Spanish)

CAS Registry Number: 13863-41-7

HSDB Number: 7820

RTECS Number: EF9200000

UN/NA & ERG Number: UN2901/124

EC Number: 237-601-4

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard (highly toxic gas); lacrimator, strong oxidizer, corrosive, dangerously water reactive.

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride

United States DOT 49CF R172.101, Inhalation Hazardous Chemical

Hazard symbols, risk, & safety statements: Hazard symbol: O, T; risk phrases: R8; R20/22; R34; safety phrases: S2; S13; S27; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters (very toxic to aquatic life)

Description: A reddish-yellow mobile liquid or gas. Irritating, pungent odor. Molecular weight = 115.36; Specific gravity (H_2O:1) = 2.32 @ 25°C; boiling point = 5°C; freezing/melting point = −65°C; vapor pressure = 17.8 mmHg @ 0°C. Decomposes above 10°C, releasing highly toxic fumes of chlorine and bromine. ₩ Soluble in water; dangerous reaction forming hydrochloric acid.

Potential Exposure: Used as an industrial disinfectant.

Incompatibilities: Dangerous, unstable material. Decomposes above 10°C, releasing highly toxic chlorine gas. A strong oxidizer. Contact with gas or liquefied gas may cause burns, severe injury and/or frostbite. Reacts with moisture, water or steam, forming corrosive hydrochloric acid. Reacts violently with combustibles and reducing agents; reactions may produce enough heat to both start and support combustion. May be corrosive to metals.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 0.075 ppm

PAC-2: $\mathbf{0.83_A}$ ppm

PAC-3: $\mathbf{2.5_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Ingestion, inhalation, absorbed through the skin

Harmful Effects and Symptoms

Lachrymation. The substance is corrosive to the eyes, the skin and the respiratory tract. Inhalation may cause asthma-like reactions. Inhalation may cause pneumonitis. Inhalation may cause lung edema, but only after initial corrosive effects on eyes and/or airways have become manifest. The symptoms of lung edema often do not become manifest until a few hours have passed, and they are aggravated by physical effort. Exposure may result in death. Long-term exposure: The substance may have effects on the respiratory tract and lungs, resulting in chronic inflammation and impaired functions (IARC).

Short-Term Exposure: Highly toxic by ingestion or inhalation. May cause irritation and burns of the eyes, skin and respiratory tract. Inhalation may cause respiratory irritation and damage. May cause cryogenic burns or injury from refrigerated gas. LD_{50} = (rat, inhalation) <300 ppm.

Long-Term Exposure: Prolonged or repeated exposure inhalation of bromine chloride may damage the lungs causing long-term effects on the respiratory tract and lungs; chronic inflammation and impaired functions are possible.

Points of Attack: Lungs, respiratory tract.

Medical Surveillance: Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Clothing frozen to the skin should be thawed before being removed. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. Keep victim warm and quiet. Keep victim under observation. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods:

Respirator Selection: Reacts with cellulose-based absorbents, mineral-based & clay-based absorbents, expanded polymeric absorbents, and dirt/earth. Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations *only*; it is not effective in spill situations where direct contact with the substance is possible.

Storage: Check oxygen content prior to entering storage area. Poison Gas, Corrosive, Oxidizer. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (3) Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2901 Bromine chloride, Hazard Class: 2.3; Labels: 2.3—Poisonous gas, 8—Corrosive material, 5.1—Oxidizer Inhalation Hazard Zone B.

Spill Handling:

Bromine chloride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1250/400
Then: Protect persons downwind (mi/km)
Day 1.5/2.4
Night 4.2/6.8

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Noncombustible, but as an oxidizer, this chemical may intensify an existing fire. Thermal decomposition products may include toxic chlorine gas. Prolonged exposure of the containers to intense heat may result in their violent rupturing and rocketing. Runoff from fire control may cause pollution. *Small fire: caution:* These materials do not burn but will support combustion. Some will react violently with water. Contain fire and let burn. If fire must be fought, water spray or fog is recommended. Water only; no dry chemical, CO_2 or Halon. Do not get water inside containers. Move containers from fire area if you can do it without risk. Damaged cylinders should be handled only by specialists. *Fire involving tanks:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Cool containers with flooding quantities of water until well after fire is out. Do not direct water at source of leak or safety devices; icing may occur. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. As an immediate precautionary measure, isolate spill or leak area for at least 300 ft./100 m in all directions. SPILL: See ERG Table 1-Initial Isolation and Protective Action Distances on the UN/NA 2901 datasheet. *Fire*: *If tank, rail car or tank truck is involved in a fire*, ISOLATE for 800 m/0.5 mile in all directions; also, consider initial evacuation for 800 m/0.5 mile in all directions depending on weather conditions and size of spill. For spills and leaks, wear fully encapsulating, vapor protective clothing should be worn for spills and leaks. Do not touch or walk through spilled material. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Stop leak if you can do it without risk. Use water spray to reduce vapors or divert vapor cloud drift. Avoid allowing water runoff to contact spilled material. Do not direct water at spill or source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. Prevent entry into waterways, sewers, basements or confined areas. Isolate area until gas has dispersed. Ventilate the spill area.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening TQ (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade); *Theft hazard* 45 (≥6007% concentration).

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Powerful oxidizer.

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 2500 lb (1135 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, O; risk phrases: R8; R9; R23/24/25; R34; safety phrases: S1; S7/8; S36/37/39; S41; 45 (see Appendix 4)

Description: Bromine pentafluoride is colorless to pale yellow fuming liquid, with pungent odor. At temperatures above boiling point this chemical is a colorless gas. Molecular weight = 174.92; specific gravity (H_2O:1) = 2.47; Relative vapor density (air = 1) = 6.1; boiling point = 40.5°C; freezing/melting point = −61°C; vapor pressure = 328 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 0; reactivity 3 ₩ Reacts explosively with water.

Potential Exposure: Bromine pentafluoride is used as an oxidizer in liquid rocket propellant combinations; it may be used in chemical synthesis.

Incompatibilities: A powerful oxidizer. Bromine pentafluoride reacts with every known element except inert gases, nitrogen, and oxygen. It reacts violently with water, acids, acid fumes (releasing highly toxic fumes of bromine and fluorine). Incompatible with halogens, arsenic, selenium, alkaline halides, sulfur, iodine, glass, metallic halides, metal oxides, and metals (except copper, stainless steel; nickel, and Monel). Fire may result from contact with combustibles or organic matter at room temperature, and contact of this substance with water produces an explosion. Even under mild conditions this substance attacks organic compounds vigorously, often causing explosion. Decomposes in heat above 460°C.

PAC-3: $\mathbf{33_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

Australia: TWA 0.1 ppm (0.7 milligram per cubic meter), 1993; Austria: MAK 0.1 ppm (0.7 milligram per cubic meter), 1999; Belgium: TWA 0.1 ppm (0.72 milligram per cubic meter), 1993; Denmark: TWA 0.1 ppm (0.7 milligram per cubic meter), 1999; Finland: STEL 0.1 ppm (0.7 milligram per cubic meter) [skin] 1999; France: VME 0.1 ppm (0.7 milligram per cubic meter), 1999; Norway: TWA 0.6 mg[F]/m^3, 1999; the Netherlands: MAC-TGG 0.7 milligram per cubic meter, 2003; Sweden: TWA 2 mg [F]/m^3, 1999; Switzerland: MAK-W 0.1 ppm (0.7 milligram per cubic meter), 1999; United Kingdom: TWA 0.1 ppm (0.73 milligram per cubic meter); STEL 0.3 ppm (2.2 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH) Threshold Limit Value: TWA 0.1 ppm. Several states have set guidelines or standards for bromine pentafluoride in ambient air[60] ranging from 7.0 μ/m^3 (North Dakota) to 11.0 μ/m^3 (Virginia) to 14.0 μ/m^3 (Connecticut) to 17.0 μ/m^3 (Nevada).

Determination in Air: Sample collection by impinger or fritted bubbler, analysis by ion-specific electrode.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L.

SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Respiratory irritation is noted. See also "Fluorine" and "Chlorine trifluoride."

Short-Term Exposure: Can cause severe irritation and burns of the eyes and skin. Inhalation can irritate the nose and throat; higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Can cause kidney, liver, and lung damage.

Points of Attack: Eyes, skin, and mucous membranes.

Medical Surveillance: Kidney and liver function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use of SCBA is recommended[22]. Where there is potential exists for exposures over 0.1 ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: PIH; check oxygen content prior to entering storage area. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with bromine pentafluoride all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, acids, acid fumes and combustibles. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1745 Bromine pentafluoride 5.1; Labels: 5.1—Oxidizer, 6.1—Poison Inhalation Hazard, 8—Corrosive material, Inhalation Hazard Zone A.

Spill Handling:

Bromine pentafluoride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

when spilled on land

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.9/1.5

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 600/180
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 3.2/5.1

when spilled in water
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.8/1.2
Night 2.7/4.3

Name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. *Gas:* Ventilate area of spill or leak to disperse gas. If this is a gas leak, stop flow of gas. If the leak from a cylinder cannot be stopped, remove the container to a safe place in the open air, and repair leak, or allow cylinder to empty. *Liquid:* Cover spill with dry lime, sand, or soda ash and deposit in closed and sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible but enhances combustion of other substances. Thermal decomposition products may include hydrogen bromide and bromine. May spontaneously ignite combustible and organic materials. *Do not* use water or water-based extinguishers to fight fire; reacts explosively with steam or water. An exception is when large amounts of combustible material are involved and fire-fighters can protect themselves by distance or barrier from the violent reaction with water. Use carbon dioxide or dry chemical on small fires[17]. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Allow gas to flow into mixed caustic soda and slaked lime solution[22]. Return unwanted cylinders to supplier if possible.

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Bromine trifluoride is a noncombustible, colorless to gray-yellow fuming liquid. Extremely irritating odor. Molecular weight = 136.9. Specific gravity (H_2O:1) = 2.8 @ 20°C; boiling point = 135°C; freezing/melting point = 8.8°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 0; reactivity 3 ₩. Reacts with water, forming corrosive gas.

Potential Exposure: Bromine Trifluoride is used as a fluorinating agent and an electrolytic solvent.

Incompatibilities: A powerful oxidizer; highly reactive and a dangerous explosion hazard. Contact with water or other hydrogen containing materials forms hydrogen fluoride gas. Reacts with almost all elements except for inert gases. Violent reaction with reducing agents; organic materials; strong acids; strong bases; halogens, salts (antimony salts), metal oxides; and many other materials. Attacks some plastics, rubber, or coatings.

Permissible Exposure Limits in Air

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Bromine trifluoride can affect you when breathed in and passing through your skin. This substance is a corrosive chemical and contact can severely irritate and burn the skin and eyes (causing possible blindness). Exposure can severely irritate the nose, throat and lungs. Higher exposures can cause a build-up of fluid in the lungs which can cause death.

Long-Term Exposure: Repeated exposure can cause skin rash, lung irritation and bronchitis; and may cause a build-up of bromine and fluorine in the body.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Blood fluorine and bromine levels.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes without stopping, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: *Clothing:* Avoid skin contact with bromine trifluoride. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10)*[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa: Cf (APF = 25)*+ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any PAPR with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full face piece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Bromine trifluoride must be stored to avoid contact with water (which releases hydrogen fluoride gas), ammonium halides, antimony trioxide; antimony chloride and solvents (such as ether, acetone, acetic acid, toluene, etc.), since violent reactions occur. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with bromadiolone all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from organic and/or combustible materials (such as wood, cotton and straw), chloride and bromide salts and many metals. Whenever bromine trifluoride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1746 Bromine trifluoride, Hazard class 5.1; Labels: 5.1—Oxidizer, 6.1—Poison Inhalation Hazard, 8—Corrosive material, Inhalation Hazard Zone B.

Spill Handling:

Bromine trifluoride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

When spilled on land

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2

When spilled in water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 2.5/4.1

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Bromine Trifluoide does not burn but may ignite combustible materials. Do not use water or foam. Use dry chemical or CO_2 extinguishers. Thermal decomposition products may include hydrogen fluoride and hydrogen bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F+ (in acetone), Xi; risk phrases: R12 (in acetone); R23/24/25; R34; R36/37/38; R52; safety phrases: S24/25; S26; S36/37/39; S41 (see Appendix 4).

Description: A highly flammable, clear, colorless liquid. On standing, turns violet rapidly, even in the absence of air. On long standing it will decompose to a black resinous mass[101]. Molecular weight = 136.98; Specific gravity (H_2O:1) = 1.634 @ 23°C; boiling point = 136.1°C @ 760.0 mmHg; freezing/melting point = −36.5°C; vapor pressure = 90 mmHg @ 20°C; Flash point = 51.1 C; (in acetone) −20°C. Autoignition temperature (in acetone) => 450°C. Hazard identification (based on NFPA-704 M Rating System): (in acetone) Health 1; flammability 3; reactivity 1 ₩. Explosive limits: LEL: 2.8%, UEL: 12.8%. Sinks in water. Poor solubility in water. May form explosive mixture with air.

Potential Exposure: Used in organic synthesis, to make other chemicals; as a chemical war gas.

Incompatibilities: Decomposes upon standing. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.011_A}$ ppm

PAC-2: $\mathbf{0.33_A}$ ppm

PAC-3: $\mathbf{0.98_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

Permissible Concentration in Water:

Determination in Water: Aquatic toxicity: TLm96: 10−100 ppm[136] Octanol−water coefficient: Log $K_{ow} = 0.1$ Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin or eye contact, ingestion

Harmful Effects and Symptoms

Eye irritant-severe; respiratory irritant-acute, severe, or moderate but not mild effects; Skin irritant-severe; gastrointestinal tract-acute effects

Short-Term Exposure: Very toxic by inhalation. Contact with the liquid causes painful burns. A violent lachrymator—Low concentrations are very irritating to the eyes. Vapors cause severe irritation of eyes and throat and can cause eye and lung injury. They cannot be tolerated even at low concentrations. Severe skin irritant. Causes second and third degree burns on short contact and is very injurious to the eyes.

Long-Term Exposure: Frequent or prolonged exposure may have adverse health effects.

Medical Surveillance: Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: SCBA, chemical-resistant gloves, rubber boots, full protective clothing.

Respirator Selection: Where risk assessment shows air-purifying respirators are appropriate, use a full-face respirator type (N100) United States or Type P3 (EN-143) respirators as backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Red: Flammability Hazard (in acetone): Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1569 Bromoacetone, Hazard class 6.1; Labels: 6.1—Poison Inhalation Hazard; 3—Flammable liquid. Hazard, Inhalation Hazard Zone B. PG II.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 1.2/1.9
Night 2.3/3.6

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Highly flammable (in acetone). Thermal decomposition products may include hydrogen bromide gas and oxides of carbon. Extinguish with CO_2, dry chemical, or foam. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number P017, must conform with USEPA regulations in storage, transportation, treatment and disposal of waste. A good candidate for liquid injection incineration at a temperature range of 650 to 1600°C and a residence time of 0.1 to 2 seconds. A good candidate for rotary kiln incineration at a temperature range of 820 to 1600°C and residence times of seconds for liquids and gases, and hours for solids. A good candidate for fluidized bed incineration at a temperature range of 450 to 980°C and residence times of seconds for liquids and gases, and longer for solids[USEPA].

RTECS Number: CY9000000
UN/NA & ERG Number: UN2514/130
EC Number: 203-623-8 [*Annex I Index No.:* 602-060-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, May cause harm to the unborn child.

Safe Drinking Water Act, 55FR1470 Priority List; 40CFR 141.40(e), re: community and noncommunity water systems.

TSCA 40CFR766.38 precursor chemical substances reporting.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R10; R38; R51/53; R61; safety phrases: S2; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Bromobenzene is a flammable, clear, colorless mobile liquid with a pleasant odor. Molecular weight = 157.01; Specific gravity (H_2O:1) = 1.5 @ 20°C; boiling point = 156°C; freezing/melting point = −31°C; Flash point = 51°C; Autoignition temperature = 565°C; vapor pressure = 7.5 mmHg @ 35°C. Explosive Limits in air: LEL: 6%; UEL: 36.5%[icsc]. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0 ₩. Very slightly soluble in water; solubility = 0.04% @ 25°C.

Potential Exposure: Bromobenzene is used as an intermediate in organic synthesis, and as an additive in motor oil and fuels. During chlorination water treatment, bromobenzene can be formed in small quantities.

Incompatibilities: May form explosive mixture with air. Incompatible with strong oxidizers, alkaline earth metals (barium, calcium, magnesium, strontium, etc.), metallic salts; with risk of violent reactions. May accumulate static electrical charges; may cause ignition of its vapors.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 0.96 ppm
PAC-2: 11 ppm
PAC-3: 240 ppm

Hungary: TWA 3 milligram per cubic meter; STEL 6 milligram per cubic meter [skin] 1993; Russia: STEL 3 milligram per cubic meter, 1993

Determination in Water: Octanol−water coefficient: Log K_{ow} => 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Observations in Man: Bromobenzene irritates the skin and is a CNS depressant in humans. In view of the relative paucity of data on the carcinogenicity, teratogenicity, and long-term oral toxicity of bromobenzene, estimates of the effects of chronic oral exposure at low levels cannot be made with any confidence. It is recommended that studies to produce such information be conducted before limits in drinking water can be established. Since bromobenzene was negative on the Salmonella/microsome mutagenicity test, there should be less concern than with those substances that are positive. LD_{50} = (oral-rat) 2699 mg/kg (slightly toxic)[9].

Short-Term Exposure: Irritates eyes, skin and respiratory tract. Exposure can cause dizziness, lightheadedness and unconsciousness.

Long-Term Exposure: May cause liver and kidney damage.

Points of Attack: Skin, liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. ACGIH recommends polyvinyl alcohol or Viton as protective materials. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with bromobenzene all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerated area away from incompatible materials listed above. Protect from light[52]. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2514 Bromobenzene, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Follow by washing spill area with alcohol then with soap and water. Do not flush spilled material into sewer. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon and hydrogen bromide. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[24].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Bromodichloromethane is a liquid. Molecular weight = 163.83; specific gravity (H_2O:1) = 1.97; boiling point = 87.2°C; freezing/melting point = −55°C; flash point = −88°C. Soluble in water.

Potential Exposure: This compound may find application in organic synthesis.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air
Odor threshold = ~1675 milligram per cubic meter.
PAC Ver. 29[138]
PAC-1: 1.3 milligram per cubic meter
PAC-2: 14 milligram per cubic meter
PAC-3: 85 milligram per cubic meter
DFG MAK: [skin]; Carcinogen Category 3B

Permissible Concentration in Water: The MCL for TTHMs (including bromodichloromethane) in drinking water has been set by the United States Environmental Protection Agency at 0.10 mg/L (44 RF 68624). Illinois and Vermont have set guidelines for Bromodichloromethane in drinking water[61]. Illinois @ 1.0 μg/L and Vermont @ 100 μg/L.

Determination in Water: Gas chromatography (EPA Method 601) or GC plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log K_{ow} =< 2.0. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms
Bromodichloromethane is acutely toxic to mice. It was mutagenic in the Salmonella typhimurium TA 100 bacterial test system and carcinogenic in mice with the same qualification for result significance as for dichloromethane noted. Positive correlations between cancer mortality rates and levels of brominated trihalomethanes in drinking water in epidemiological studies have been reported. LD_{50} = (oral-rat) 916 mg/kg (slightly toxic)[9].

Short-Term Exposure: This material irritates the eyes, nose and mucous membranes[52].

Long-Term Exposure: May cause cancer in humans.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerated space in a tightly closed container. Protect from light[52]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling:
Toxic liquids, organic, n.o.s.
Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.2/0.3

Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300

Then: Protect persons downwind (mi/km)

Day 1.1/1.8

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Contain and isolate spill to limit spread. Construct clay−bentonite dams to isolate the spill. Treatment alternatives for contaminated waste include activated charcoal treatment. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not combustible. Use extinguishers suitable for surrounding fire. Thermal decomposition products may include hydrogen bromide, hydrogen chloride and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Package in epoxy-lined drums. Destroy by high-temperature incinerator equipped with an HCl scrubber.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Bromoform is a colorless (turns yellow on exposure to air) liquid. Sweet-smelling, chloroform-like odor. Molecular weight = 252.7; Specific gravity (H_2O:1) = 2.9; boiling point = 149.5°C; freezing/melting point = 8.3°C (to hexagonal crystals); vapor pressure = 5 mmHg @ 20°C; 7.5 mmHg @ 30.5°C; Hazard identification (based on NFPA-704M Rating System): Health 2; flammability 0; reactivity 0 ₩. Soluble in water; solubility = 0.1% @ 20°C.

Potential Exposure: Bromoform is used in pharmaceutical manufacturing; as an ingredient in fire-resistant chemicals and gauge fluids; and as a solvent for waxes, greases, and oils.

Incompatibilities: Heat causes bromoform to decompose forming toxic and corrosive hydrogen bromide and bromine. Bromoform is a weak acid. Reacts violently with oxidants, bases in powdered form. Reacts with chemically active metals (alkaline metals), powdered aluminum, potassium, sodium, zinc, and magnesium and acetone under basic conditions, causing fire and explosion hazard. Attacks some forms of plastic, rubber and coating. Corrosive to most metals.

Permissible Exposure Limits in Air

NIOSH IDLH = 850 ppm

Odor threshold = 0.44 ppm.

Conversion factor: 1 ppm = 10.34 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.5 ppm/5 milligram per cubic meter TWA [skin]

NIOSH REL: 0.5 ppm/5 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.5 ppm/5.2 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 1.5 ppm

PAC-2: 6.8 ppm

PAC-3: 41 ppm

DFG MAK: Carcinogen Category 3B

Australia: TWA 0.5 ppm (5 milligram per cubic meter) [skin] 1993; Austria: MAK 0.5 ppm (5 milligram per cubic meter), 1999; Belgium: TWA 0.5 ppm (5.2 milligram per cubic meter) [skin] 1993; Denmark: TWA 0.5 ppm (5 milligram per cubic meter) [skin] 1999; Finland: TWA 0.5 ppm (5 milligram per cubic meter); STEL 1.5 ppm (15 milligram per cubic meter) [skin] 1999; France: VME 0.5 ppm (5 milligram per cubic meter) [skin] 1999; the Netherlands: MAC-TGG 5 mg/m^3 [skin] 2003; the Philippines: TWA 0.5 ppm (5 mg/m^3) [skin] 1993; Poland: TWA 5 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter, 1993; Switzerland: MAK-W 1000 ppm (5600 milligram per cubic meter), 1999; United Kingdom: TWA 0.5 ppm (5.3 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for bromoform in ambient air[60] ranging from 50 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 110 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated, or[18] OSHA Analytical Method #7, Organic Vapors.

Permissible Concentration in Water: United States National Primary Drinking Water Regulations: n/a mg/L; MCL = 0.080 mg/L, as TTHMs. See Regulatory Authority and Advisory Information above. Mexico's drinking water criteria is 0.002 mg/L. This substance is highly persistent; bioaccumulation or risk of cancer, reduce exposure by humans to minimum. Two states have set guidelines for bromoform in drinking water: 1.0 μg/L in Illinois and 40 μg/L in Maryland[61].

Determination in Water: Gas chromatography (EPA Method 601) or GC plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log K_{ow} = 2.4. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Can cause irritation to the nose and throat, tearing, reddening of the face, dizziness, and death. Exposure of dogs to 7000 ppm for 8 minutes causes death. *Skin:* Can be absorbed. Large quantities can lead to symptoms listed under ingestion. *Eyes:* Can cause irritation and tearing. *Ingestion:* Causes burning of mouth and throat. Can cause headache, dizziness, disorientation, slurred speech, troubled breathing, tremors, and unconsciousness. The estimated lethal dose is 1/3 ounce for a 150-pound adult. However, LD_{50} = (oral−rat) 1147 mg/kg (slightly toxic)[9].

Long-Term Exposure: Bromoform can cause liver damage. May have an effect on the nervous system. Repeated exposure can cause skin rash. Has caused cancer in laboratory animals; whether it does so in humans is unknown. Very irritating substances, such as bromoform may affect the lungs.

Points of Attack: Skin, liver, kidneys, respiratory system, lungs, central nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Consider the points of attack in preplacement and periodic physical examinations. Liver function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves; Viton gloves, suits. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: OSHA: *12.5 ppm:* Sa:Cf$^£$ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv$^£$ (APF = 25) [any PAPR with organic vapor cartridge(s)]. *25 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv$^£$ (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *850 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Bromoform must be stored to avoid contact with incompatible materials listed above. Store in tightly closed containers in a cool well-ventilated area away from heat and light.

Shipping: UN2515 Bromoform, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Bromoform itself does not burn. Thermal decomposition products may include bromine and hydrogen bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Purify by distillation and return to suppliers[22]. Alternatively, Inclinerate with excess fuel.

1-Bromo-3-Methylbutane B:0715

Formula: $C_5H_{11}Br$

Synonyms: 1-Bromo-3-metilbutano (Spanish); 4-bromo-2-methylbutane; bromo-1 méthyl-3 butane (French); Butane, 1-bromo-3-methyl-; Isoamyl bromide; Isobutylmethyl bromide; Isopentyl bromide; 3-methyl-1-bromobutane; 3-methylbutyl bromide

CAS Registry Number: 107-82-4

HSDB Number: 7381

RTECS Number: EJ6230000

UN/NA & ERG Number: UN2341/130

EC Number: 203-522-9

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Environmental hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn, Xi, N; risk phrases: R10; R22; R36/37/38, R51/53; R52/53; safety phrases: S16; S26; S29/35; S36/37/39; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Clear, colorless, flammable liquid. Molecular weight = 151.05; Specific gravity (H_2O:1) = 1.207 @ 20°C; boiling point = −119−120°C; freezing/melting point = −112°C; vapor pressure = 35 mmHg @ 25°C; flash point = 72°C. Henry's Law constant = 4×10^{-2} atm m^3/mol @ 25°C (est)[72]; slightly soluble in water; solubility = 2 mg/L @ 20°C. Denser than water.

Potential Exposure: 1-Bromo-3-methylbutane is a halogenated aliphatic compound.

Incompatibilities: Vapor may form explosive mixture with air. 1-Bromo-3-methylbutane is highly flammable. Keep away from heat and direct sunlight. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:
PAC* Ver. 29[138]
PAC-1: 6 ppm
PAC-2:66 ppm
PAC-3:390 ppm

Determination in Water: Octanol−water coefficient: Log K_{ow} => 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin contact (absorbed through the skin), ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Vapors may cause dizziness or suffocation. A systemic toxin; may cause toxic effects if inhaled or absorbed through skin. Inhalation or contact with material may irritate or burn skin and eyes. LD_{50} = (oral-rat) >5 g/kg. Skin irritant, moderate; respiratory irritant-acute, severe, or moderate but not mild effects; eye irritant-moderate.

Long-Term Exposure: Repeated or prolonged exposure may cause health effects. Systemic toxin, chronic effects[138].

Points of Attack: Systemic toxin, chronic effects, skin, respiratory system.

Medical Surveillance: Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. Wash skin with soap and water. In case of burns, immediately cool affected skin for as long as possible with cold water. Do not remove clothing if adhering to skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Skin protection: Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands. Body Protection: Complete suit protecting against chemicals, Flame retardant antistatic protective clothing, the type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where risk assessment shows APRs are appropriate use a full-face respirator with multipurpose combination (US) or type ABEK (EN 14387) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Storage: Store in a cool place, preferably refrigerated. (1) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (3) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2341 1-bromo-3-methylbutane, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area for at least 50 m/50 ft. in all directions. *Large spill*: Consider initial downwind evacuation for at least 300 m/1000 ft. *Eliminate* all ignition sources (no smoking, flares, sparks or flames in immediate area). All equipment used when handling the product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. A vapor suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Use clean nonsparking tools to collect absorbed material. *Large spill:* Dike far ahead of liquid spill for later disposal. Water spray may reduce vapor; but may not prevent ignition in closed spaces.

Fire Extinguishing: Thermal decomposition products may include irritation, toxic and corrosive fumes of hydrogen bromide and oxides of carbon. Vapors may form explosive mixture with air. Vapors may travel to source of ignition and flashback. This chemical's vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapor explosion hazard indoors, outdoors or in sewers. Runoff to sewer may create fire or explosion hazard. Containers may explode when heated. Liquid is heavier than water. Runoff from fire control or dilution water may cause pollution. *Caution*: hydrogen bromide has a very low flash point: Use of water spray when fighting fire may be inefficient. *Small fire*: Dry chemical, CO_2, water spray or regular foam. *Large fire:* Water spray, fog or regular foam. Do not use straight streams. Move containers from fire area if you can do it without risk. *Fire involving tanks or car/trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: This material is highly flammable. Offer surplus and nonrecyclable material to a licensed disposal facility. Carefully dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. Contact a licensed professional waste disposal service to dispose of this material. All federal, state, and local environmental regulations must be observed.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, N, Xi, Xn; risk phrases: R10, R22; R38; R41; R43; R50/53; R65; R67; safety phrases: S16; S26; S29/35; S45; S36/37/39; S45; S60, S61,S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water[S-A].

Description: 4-Bromophenyl phenyl ether is a brominated diphenylether and a liquid at common ambient temperatures. Molecular weight = 249.1; Specific gravity (H_2O:1) = 1.61 @ 20°C); boiling point = 305°C; 310.14°C; freezing/melting point = 18.72°C; vapor pressure = 1.5×10^{-3} mmHg @ 20°C; Flash point => 110°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0 ₩. Poor solubility in water; solubility = 4.8 mg/L @ 25°C.

Potential Exposure: Very little information on 4-bromophenyl phenyl ether exists. It is pre pared by brominating diphenyl her with Br_2 @ 95−100°C in carbon tetrachloride[United States Environmental Protection Agency, 1986]. 4-Bromophenyl phenyl ether has been identified in raw water, in drinking water and in river water.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.33 milligram per cubic meter

PAC-2: 3.6 milligram per cubic meter

PAC-3: 21 milligram per cubic meter

Permissible Concentration in Water: *Freshwater Aquatic Life:* For 4-bromophenyl phenyl ether the criterion to protect freshwater aquatic life as derived using the guidelines is 6.2 μg/L as a 24 hour average and the concentration should not exceed 14 μg/L at any time. *Saltwater Aquatic Life:* For saltwater aquatic life, no criterion for 4-bromophenyl phenyl ether can be derived using the guidelines, and there is insufficient data to estimate a criterion using other procedures. *Human Health:* Because of a lack of adequate toxicological data on nonhuman mammals and humans, protective criteria cannot be derived at this time for this compound.

Determination in Water: *p*-Monobromodiphenyl ether (MBDE) can be determined by the standard United States Environmental Protection Agency Method 611-Haloethers. Chromatographic conditions are described in United States Environmental Protection Agency (1986). The limit of determination in municipal and industrial waste waters is 2.3 μg/L. Octanol−water coefficient: Log K_{ow} => 4. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. According to United States Environmental Protection Agency (1986), there are monitoring data for *p*-MBDE in water in the USA. The mean concentration was 0.2 mg/L (range 0−202.7 mg/L, 2193 listings) in water.

Harmful Effects and Symptoms

4-Bromophenyl phenyl ether has been tested in the pulmonary adenoma assay, a short-termed carcinogenicity assay. Although the results were negative, several known carcinogens also gave negative results. No other health effects were available. Skin contact can cause tissue defatting and dehydration leading to dermatitis.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include hydrogen bromide and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Avoid release to the environment. High-temperature incineration with alkaline flue gas scrubbing.

Regulatory Authority and Advisory Information

Hazard Alert: Poison (Category 4), Neurotoxin (cumulative), Suspected reprotoxic hazard, Suspected of causing genetic defects.

WHO ADI (RfD) = 0.04 mg/kg/day[72]

DOT Inhalation Hazard Chemicals as organophosphates

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R22; R33; R50/R53; R62; safety phrases: S2; S29; S41; S46; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: White to slightly yellow crystalline solid. Commercially available as emulsifiable concentrate, dustable powders, wettable powders, granules, animal dips, fogging concentrates, and coarse powders. Molecular weight = 365.98; boiling point = 142°C @ 0.1 mmHg[Merck]; Melting point: 53°C; vapor pressure = 1×10^{-4} mmHg @ 25°C. Low solubility in water. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: Organophosphate insecticide, Acaricide Bromophos is a broad spectrum, noncumulative nonsystemic organophosphorus insecticide. It is used on field crops, vegetable and fruit crops, on ornamentals, and on grain storage. It is also used as a sheep dip

Incompatibilities: Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. May react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate. In the presence of strong reducing agents such as hydrides, organophosphates form highly toxic and flammable phosphine gas. Contact with oxidizers can cause the release of toxic oxides of phosphorus.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV(18), Method #5600, Organophosphorus Pesticides

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: EAD Method 1657. The determination of organophosphorus pesticides in municipal and industrial wastewater by GC. Detection limit = 6.0 ηg/L. Octanol−water coefficient: Log K_{ow} = 5.2. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption, ingestion, eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May be absorbed through unbroken skin. Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation;

dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Absorbed in the respiratory and gastrointestinal tracts. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. LD_{50} (oral, rat) = 1600−4000 mg/kg; LD_{50} (dermal, rat) => 5000 mg/kg[193].

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. *If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water do NOT induce vomiting but immediately administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *unconscious or having convulsions,* do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Notes to physician or authorized medical personnel*: N-methylpyridinium-2-aldoxime (2-PAMCI) when used in conjunction with atropine reacts with the phosphorylated cholinesterase, thereby restoring normal activity to by removing the phosphorylating group. The combination of these two chemicals is synergistic and must be administered within minutes to a few hours following exposure (depending on the specific agent) to be effective. Give 2-PAMCI (Pralidoxime; Protopam), 2.5 g in 100 mL of sterile water or in 5% dextrose and water, intravenously, slowly, in 15−30 minutes; if sufficient fluid is not available, give 1 g of 2-PAMCI in 3 mL of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur. Also Diazepam, an anticonvulsant, might be considered

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN 149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code—Blue (*dry, solid material*): Health Hazard/Poison: Store the dry material in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Color code—Red Stripe (*dissolved material in a flammable liquid carrier*): Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from chlorine compounds, oxidizing agents; and combustible materials. Sources of ignition, such as smoking and open flames are prohibited where their chemical is handled, used, or stored, Use only non-sparking tools and equipment, especially when opening and closing containers. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, Notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, hydrogen bromide and oxides of phosphorus, sulfur, nitrogen and carbon. This chemical may be flammable. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Bromophos-ethyl B:0727

Formula: $C_{10}H_{12}BrCl_2O_3PS$

Synonyms: S2225; 4-Bromo-2,5-dichloropheno 1-*O*-ester with *O,O*-diethyl phosphoro thioate; *O*-(4-Bromo-2,5-dichlorophenyl) *O,O*-diethyl phosphorothioate; CELA S-2225; *O,O*-diaethyl-*O*-(4-brom-2,5-dichlor)-phenyl-monothiophosphat (German); *O,O*-Diaethyl-*O*-(2,5-dichlor-4-bromphenyl)-thionophosphat(German); *O,O*-Diethyl *O*-2,5-dichloro-4-b romophenyl-phosphorothioate; *O,O*-Diethyl *O*-(2,5-dichloro-4-bromophenyl)thiophosphate; ENT 27,258; Ethyl bromophos; Filariol; Nexagan; OMS-659; Phosphorothioic acid, *O*-(4-bromo-2,5-dichlorophenyl) *O,O*-diethyl ester; Thiophosphate de *O,O*-diethyle et de *O*-(2,5-dichloro-4-bromo) phenyle (French)

CAS Registry Number: 4824-78-6

HSDB Number: 6574

RTECS Number: TE7000000
UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152
EC Number: 225-399-0 [*Annex I Index No.:* 015-064-00-5]
Regulatory Authority and Advisory Information
Hazard Alert: Poison (Category 3), Environmental hazard, Neurotoxin (cumulative), Environmental hazard. Agricultural chemical.
WHO ADI (RfD) = 0.003 mg/kg/day
DOT Inhalation Hazard Chemicals as organophosphates
United States DOT Regulated Marine Pollutant (49CFR 172.101, Appendix B), severe pollutant
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, N; risk phrases: R21; R25; R33; R50/53; safety phrases: S1/2; S28; S29; S36/37; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Colorless to pale-yellow liquid. Molecular weight = 394.05; Specific gravity (H_2O:1) = 1.53 @ 20°C; boiling point = $>$375°C; vapor pressure = 6.5×10^{-7} mmHg @ 25°C. Practically insoluble in water.
Potential Exposure: Organophosphate insecticide. Not registered for use in the United States
Incompatibilities: May react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate, sulfur, and organometallic compounds. In the presence of strong reducing agents such as hydrides, organophosphates form highly toxic and flammable phosphine gas. Contact with oxidizers can cause the release of toxic oxides of phosphorus.
Permissible Exposure Limits in Air: A possible respiratory toxin.
Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSHIV, Method #5600, Organophosphorus Pesticides [18].
Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.
Determination in Water: EAD Method 1657. The determination of organophosphorus pesticides in municipal and industrial wastewater by GC. Detection limit = 6.0 ηg/L. Octanol−water coefficient: Log K_{ow} = 6.2. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.
Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact
Harmful Effects and Symptoms
Short-Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. LD_{50} (oral, rat) = 52 mg/kg.
Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.
Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase
Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure
First Aid: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate/carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do not induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 ounces of water do not induce vomiting but immediately administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *unconscious or having convulsions,* do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water*. Do not give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.

If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 g) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Notes to physician or authorized medical personnel*: *N*-methylpyridinium-2-aldoxime (2-PAMCI) when used in conjunction with atropine reacts with the phosphorylated cholinesterase, thereby restoring normal activity to by removing the phosphorylating group. The combination of these two chemicals is synergistic and must be administered within minutes to a few hours following exposure (depending on the specific agent) to be effective. Give 2-PAMCI (Pralidoxime; Protopam), 2.5 g in 100 mL of sterile water or in 5% dextrose and water, intravenously, slowly, in 15−30 minutes; if sufficient fluid is not available, give 1 g of 2-PAMCI in 3 mL of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur. Also Diazepam, an anticonvulsant, might be considered

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. One recommendation is the use of DuPont Tychem suit fabrics[101]. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Organophosphorus compounds

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous and corrosive gases are produced in fire including hydrogen chloride and oxides of phosphorus, sulfur, nitrogen and carbon. May be fatal if inhaled, ingested or absorbed through skin. Inhalation or contact with some of these materials will irritate or burn skin and eyes. Vapors may cause dizziness or suffocation. Small fires: dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destruction by alkali hydrolysis or incineration. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class) (2-*bromopropane*): 2-Hazard to waters; (1-*bromopropane*); 1-Low hazard to water

Description: 1-Bromopropane is a volatile, colorless to pale-yellow liquid. It is toxic and highly flammable. Strong characteristic odor. Molecular weight = 123.1; Specific gravity (H_2O:1) = 1.35 @ 20°C; boiling point = 71°C; freezing/melting point = −110°C; vapor pressure = 111 mmHg @ 17.8°C; Flash point = −10°C (cc); Autoignition temperature = 490°C. Explosive Limits in air: LEL: 4.6%, 46,000 ppm[138]; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): (as *n*-propyl bromide): Health 2; flammability 3; reactivity 0 ₩. Soluble in water; solubility = 0.25% @ 20°C (1-bromopropane).

2-Bromopropane is a flammable liquid. Molecular weight = 122.98; Specific gravity (H_2O:1) = 1.31 @ 20°C; boiling point = 59.4°C; freezing/melting point = −89°C; vapor pressure = 216 mmHg @ 25°C; Flash point =< 24°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 3; reactivity 0 ₩. Slightly soluble in water.

Potential Exposure: Touted as a green chemical alternative. 1-Bromopropane (1-BP) is a solvent that is used in degreasing, dry cleaning, spray adhesives, and aerosol solvents. 1-Bromopropane used in many commercial industries; used as a cleaner for optics, electronics, and metals and as a solvent for aerosol-applied adhesives, such as those used in foam cushion manufacturing. Workers in certain occupations, such as sprayers in the adhesive industry and workers at polyurethane foam furniture cushion manufacturing facilities, are potentially exposed to much higher levels of 1-bromopropane than the general population. Workers in the foam adhesives industry are exposed to 1-bromopropane at levels that are similar to those that caused cancer in experimental animals. It is also used in dry cleaning and solvent sprays for aircraft maintenance, asphalt production, and synthetic fiber manufacturing. In recent years, 1-bromopropane use has increased, as a result of new industrial and commercial applications as a substitute for ozone-depleting chemicals or suspected carcinogens. For example, 1-bromopropane has been used to replace perchloroethylene, a health and environmental hazard, in dry cleaning[NTP, Fact Sheet: October 2014].

Incompatibilities: May form explosive mixture with air. Contact with strong oxidizers may cause fire and explosion.

Permissible Exposure Limits in Air

1-Bromopropane

ACGIH TLV[1]: 0.1 ppm TWA

PAC Ver. 29[138]

106-94-5, 1-bromopropane

PAC-1: 0.3 ppm

PAC-2: 120 ppm

PAC-3: 700 ppm

75-26-3, 2-bromopropane

PAC-1: 120 ppm

PAC-2: 1300 ppm

PAC-3: 1400 ppm

Determination in Air: OSHA Method 1017 (September 2013), 1-Bromopropane, 2-Bromopropane

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 2.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes and skin. Exposure can cause dizziness, lightheadedness and unconsciousness. Very high exposures can cause death.

Long-Term Exposure: Repeated or high exposures may cause liver and lung damage. May be a developmental toxicant.

Points of Attack: Liver, lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. Lung and liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Protect against physical damage. Outside or detached storage is preferred. Prior to working with Bromopropane all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN23442-Bromopropanes, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquid in vermiculite, dry sand; earth or similar material and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen bromide and oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazard symbols, risk, & safety statements: (*anhydrous*) Hazard symbol: T + , N; risk phrases: R26/28; R52/53; safety phrases: S1/2; S13; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Brucine is colorless to white, odorless, crystalline solid with a very bitter taste. Molecular weight = 394.46; boiling point = 470°C; freezing/melting point = 178°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0 ₩. Poor solubility in water; solubility = 1 g/1320 mL.

Potential Exposure: Brucine is used as denaturant for Ethanol, also resolving agent for isomer separation; in the manufacture of other chemicals, in perfumes, as a medication for animals, and as a poison for rodents. It is an alkaloid, produced from strychnos seeds.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Finely dispersed material in air can cause dust explosions.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

357-57-3

PAC-1: 0.29 milligram per cubic meter

PAC-2: 3.2 milligram per cubic meter

PAC-3: 36 milligram per cubic meter

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and respiratory tract. Exposure can cause headache, nausea, vomiting, ringing in the ears; disturbed vision; restlessness, excitement, twitching and convulsions, seizures; breathing difficulties. Severe poisoning can cause paralysis, unconsciousness and death. The probable fatal dose in adult is estimated @ 1 g (Gosselin, 1984).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Protect against physical damage. Outside or detached storage is preferred. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with brucine all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers.

Shipping: UN1570 Brucine, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Brucine may burn but does not readily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: Not assigned

Regulatory Authority and Advisory Information

Hazard Alert: Suspected reprotoxic hazard, Agricultural chemical.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Description: White crystalline powder. Molecular weight = 305.44; Specific gravity (H_2O:1) = 1.178 @ 20°C; boiling point = 350°C; freezing/melting point = 105−106°C; vapor pressure = 2×10^{-6} mmHg @ 25°C; Flash point = °C. Very slightly soluble in water.

Potential Exposure: Insecticide, acaricide, insect growth regulator. For insect control in food crops and greenhouse ornamentals.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log K_{ow} => 4.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Ingestion, inhalation, dermal contace, absorbed through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Causes moderate eye, skin, and possibly respiratory irritation. Harmful if swallowed. LD_{50} (oral, rat) => 3 g/kg; LD_{50} (dermal, rat) => 5 g/kg.

Long-Term Exposure: Ingestion of excessive amounts buprofezin may include subdued mood and diminished muscular coordination. May cause a slightly enlarged abdomen.

Points of Attack: May affect the chromosomes; breakdown of the DNA.

Medical Surveillance: Comprehensive physical examination with emphasis on the genito-urinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum FSH, and serum LH, may be carried out if, in the opinion of a physician, they are indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid but does not readily ignite. Decomposes at about 200°C releasing toxic oxides of nitrogen, sulfur, and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft. for liquids and at least 25 m/75 ft. for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mile in all directions; also, consider initial evacuation for 800 m/0.5 mile in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen; IARC: Human Sufficient Evidence; Animal Limited Evidence*, carcinogenic to humans*, Group 1, 1998

California proposition 65 Chemical[102]: Cancer 2/27/1987.

Hazard Alert: Poison, Combustible, Poison.

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R45; R23/24/25; R26/27/28; R36/37/38; R39/23/24/25; R46; R63; safety phrases: S7; S16; S28; S36/37; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Busulfan is a white crystalline powder. Molecular weight = 246.3; freezing/melting point = 114–118°C. ₩. Decomposes in moist air and water; may release hydrogen sulfide.

Potential Exposure: A potential danger to those involved in the manufacture, formulation or use of this compound which finds application as an insect sterilant, and as a chemotherapeutic agent taken orally to treat some kinds of leukemia.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, moist air, and water.

Permissible Exposure Limits in Air

No standards or PAC available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin causing rash. Exposure can cause nausea, vomiting, diarrhea, and seizures.

Long-Term Exposure: A carcinogen in humans, causes leukemia, kidney, and uterine cancer. A probable teratogen in humans. May damage the developing fetus. May cause testes damage in males (decrease sperm count, cause impotence), and decrease fertility in females. Long-term exposure may result in cataracts, lung irritation; permanent lung scarring; bone marrow damage; liver damage. Symptoms of exposure include bleeding tendencies, decreased leucoyte count or depressed bone marrow activity[52].

Points of Attack: See above.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. CBC, chest X-ray, lung function tests, liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately with water or normal saline for 20−30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a refrigerator and protect from exposure to oxidizers or moisture[52]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict Persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of sulfur and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: 1,3-Butadiene is a toxic and extremely flammable, colorless, liquefied gas. Gasoline-like odor. Molecular weight = 54.1; Specific gravity (H_2O:1) = 0.62; boiling point = −4.4°C; freezing/melting point = −109°C; vapor pressure = 2.4 mmHg @ 20°C; 750 mmHg @ −4.7°C; Flash point = −76°C (liquid); Autoignition temperature = 420°C. The explosive limits are: LEL: 2.0%, 20,000 ppm[138]; UEL: 11.5%[17]. Hazard identification (based on NFPA −704 M Rating System): Health 2; flammability 4; reactivity 2 ₩. Floats and boils on water; practically insoluble; solubility = 0.1%.

Potential Exposure: 1,3-Butadiene is used chiefly as the principal monomer in the manufacture of many types of synthetic rubber and other chemicals. Butadiene is finding increasing usage in the formation of rocket fuels, plastics, and resins.

Incompatibilities: Self-reactive. May form explosive peroxides on exposure to air. High heat can cause a violent chemical reaction that will cause container rupture. Fires, explosions, or hazardous polymerization may result from contact with air, strong oxidizers; strong acids; ozone, rust, nitrogen dioxide, phenol, chlorine dioxide, crotonaldehyde, or a free radical polymerization initiator, such as hydroquinone. Unsafe in contact with acetylide-forming materials, such as monel, copper, and copper alloys (piping material for this gas must not contain more than 63% copper). Add inhibitor (such as tributylcatechol) to prevent self-polymerization and monitor to insure effective levels are maintained at all times. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 ppm [LEL]

Odor Threshold = 0.45 ppm.

Conversion factor: 1 ppm = 2.21 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 ppm/2.21 milligram per cubic meter TWA; 5 ppm/11.05 milligram per cubic meter STEL (see CFR291910.1061 & CFR291910.19)

NIOSH REL: Potential occupational carcinogen. Reduce exposures to the lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 2 ppm/4.4 milligram per cubic meter TWA; Suspected Human Carcinogen

PAC* Ver. 29[138]

PAC-1: $\mathbf{670_A}$ ppm

PAC-2: $\mathbf{5300_A}$ ppm [**>=** 10% LEL, lower explosive limit but <50% LEL]

PAC-3: $\mathbf{22{,}000_A}$ ppm (>LEL, lower explosive limit)

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 2

Australia: TWA 10 ppm (22 milligram per cubic meter), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 10 ppm (22 milligram per cubic meter), carcinogen, 1993; Denmark: TWA 10 ppm (22 milligram per cubic meter), 1999; Finland: TWA 50 ppm (73 milligram per cubic meter), carcinogen, 1999; France: VME 10 ppm (36 milligram per cubic meter), 1993; Hungary: STEL 10 milligram per cubic meter, carcinogen, 1993; the Netherlands: MAC-TGG 46.2 milligram per cubic meter, 2003; Norway: TWA 1 ppm (2.2 milligram per cubic meter), 1999; the Philippines: TWA 1000 ppm (2200 milligram per cubic meter), 1993; Poland: MAC (TWA) 10 milligram per cubic meter; STEL 40 milligram per cubic meter, 1999; Russia: STEL 100 mg/m^3, 1993; Sweden: NGV 10 ppm (20 milligram per cubic meter), KTV 20 ppm (40 milligram per cubic meter), carcinogen, 1999; Switzerland: MAK-W 5 ppm (11 milligram per cubic meter), carcinogen, 1999; Turkey: TWA 1000 ppm (2200 milligram per cubic meter), 1993: United Kingdom: TWA 10 ppm (22 milligram per cubic meter), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. The Czech Republic[35] has set a very stringent TWA of 20 milligram per cubic meter with a ceiling value of 40 milligram per cubic meter. Several states have set guidelines or standards for butadiene in ambient air[60] ranging from zero (North Dakota) to 0.003 μ/m^3 (Michigan) to 0.035 μ/m^3 (Massachusetts and North Carolina) to 220 μ/m^3 (Virginia) to 22,000 μ/m^3 (Connecticut) to 52,400 μ/m^3 (Nevada).

Determination in Air: Adsorption by charcoal tube; workup with CH_2C_{12}; analysis by GC/flame ionization detection Use NIOSH Analytical Method #1024[18] or OSHA Analytical Method ID-56.

Permissible Concentration in Water: Federal Drinking Water Guidelines: State Drinking Water Guidelines: New Hampshire 0.019 μg/L. Russia[43] set a MAC of 0.05 mg/m^3 in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} =< 2.0$.

Routes of Entry: Inhalation of gas or vapor, eye and/or skin contact.

Harmful Effects and Symptoms

Initial signs and symptoms of exposure include blurred vision, nausea, prickling and dryness of the mouth, throat, and nose, followed by fatigue, headache, vertigo, decreased blood pressure and pulse rate, unconsciousness, and respiratory paralysis. Concentrations above 8000 ppm may cause narcotic effects, dizziness, headache, drowsiness, and loss of consciousness. Death can result 23 minutes after inhaling air containing 25% butadiene. It is a CNS depressant in high concentrations. It may be irritating and cause burns to skin, mucous membranes and eyes. Contact with the liquid may cause frostbite. It can asphyxiate by the displacement of air.

Short-Term Exposure: 1,3-Butadiene irritates the eyes, skin, and respiratory tract. Rapid evaporation of the liquid may cause frostbite. Inhalation of the vapors may cause effects on the CNS; sleepiness, and loss of consciousness. Very high exposures may cause death.

Long-Term Exposure: This chemical is a probable carcinogen in humans; it may have effects on the bone marrow and liver. There is limited evidence that this chemical is a teratogen in animals, and that it may also damage the testes and ovaries. It may cause heritable genetic damage in humans. Animal tests show that this substance may cause toxic effects upon human reproduction. See also NIOSH Profile (Alkenes), SRI, 2/77. NIOSH Current Intelligence Bulletin 41, 1984.

Points of Attack: Eyes, respiratory system; central nervous system; reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH, may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do not attempt to remove frozen clothing from frostbitten areas. If frostbite has not occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. NIOSH recommends: **8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm^2/min): Viton gloves, suits, Saranex, Barricade-coated suits; CPF3 suits; Responder suits, Trellchem HPS suits; Trychem 1000 suits; **4 hours:** (At least 4 but <8 hours of resistance to breakthrough $>0.10.1$ μg/cm^2/min): Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 1,3-Butadiene (1910.1051) < or = 5 ppm (parts per million): Air-purifying half-mask or full-facepiece respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every 4 hours. < or = 10 ppm: Air-purifying half-mask or full-facepiece respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every 3 hours. < or = 25 ppm: (1) Air-purifying half-mask or full-facepiece respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every 2 hours; (2) Any PAPR equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every[1] hour; or (3) Continuous-flow supplied-air respirator equipped with a hood or helmet. < or = 50 ppm (1): Air-purifying full-facepiece respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every[1] hour; or (2) PAPR equipped with a tight-fitting facepiece and approved butadiene or organic vapor cartridges. PAPR cartridges shall be replaced every[1] hour. < or = 1000 ppm supplied-air respirator equipped with a half-mask or full facepiece and operated in a pressure-demand or other positive-pressure mode. >1000 ppm, unknown concentration, or firefighting (1) SCBA equipped with a full facepiece and operated in a pressure-demand or other positive-pressure mode; or (2) Any supplied-air respirator equipped with a full facepiece and operated in a pressure-demand or other positive-pressure mo de in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. Escape from IDLH conditions (IDLH is 2000 ppm) (1) Any positive-pressure se lf-contained breathing apparatus with an appropriate service life; or (2) Any air-purifying full-facepiece respirator equipped with a front-or back-mounted butadiene or organic vapor canister.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Outdoor or detached storage is preferred. Store cylinders upright. Prior to working with 1,3-butadiene, all handlers should be trained on its proper handling and storage. Do not store uninhibited 1,3-butadiene. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above, heat and sunlight. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drum s must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1010 Butadienes, stabilized or Butadienes and Hydrocarbon mixture, stabilized, containing more than 40% butadienes, Hazard Class: 2.1; Labels: 2.1—Flammable gas Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse gas. Attempt to stop leak if without hazard. Use water spray to knock down vapors. Avoid breathing vapors. Keep upwind. Do not handle broken packages without protective equipment. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. See respirator selection for *>1000 ppm; Unknown concentration, or firefighting.* This chemical is an extremely flammable liquid. Let tank car, tank truck or storage tank burn unless leak can be stopped; with smaller tanks or cylinders, extinguish/isolate from other flammables. Stop flow of gas before extinguishing fire. *Small fires:* dry chemical or carbon dioxide. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Stay away from ends of tanks. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Cool container with water using unmanned device until well after fire is out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Butadiene vapors are uninhibited and may form polymers in vents or flame arresters of storage tanks, resulting in stoppage of vents. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Butane is a colorless, extremely flammable, liquefied, compressed gas. A liquid below 30°F/ −1.1°C. Natural gas-like odor. Odor threshold: 204 ppm. Molecular weight = 58.12; Specific gravity (H_2O:1) = 0.599; Relative vapor density (air = 1) = 2.11; boiling point = −0.5°C; freezing/melting point = −135°C; vapor pressure = 1520 mm Hg @ 18.8°C; The explosive limits are: LEL: 1.6%, 16,000 ppm[138]; UEL: 8.4%; Flash point = −60°C (flammable gas); Autoignition temperature = 287°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 4; reactivity 0 ₩. Practically insoluble in water; solubility = 6×10^{-3} @ 20°C.

Potential Exposure: Butane is used as a raw material for butadiene, as a fuel for household or industrial purposes (alone or in admixture with propane). It is also used as an extractant, solvent, and aerosol propellant. It is used in plastic foam production as a replacement for fluorocarbons.

Incompatibilities: Strong bases, strong oxidizers (e.g., nitrates & perchlorates), chlorine, fluorine, (nickel carbonyl + oxygen).

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.38 milligram per cubic meter @ 25°C & 1 atm

Odor threshold: 204 ppm.

OSHA PEL: None

NIOSH REL: 800 ppm/1900 milligram per cubic meter TWA

ACGIH TLV[1]: 800 ppm TWA
PAC* Ver. 29[138]
106-9-8 &75-28-5
PAC-1: **5500**$_{\mathbf{A}}$ ppm [>= 10% LEL, lower explosive limit but <50% LEL]
PAC-2: **17,000**$_{\mathbf{A}}$ ppm (higher than LEL, lower explosive limit)
PAC-3: **53,000**$_{\mathbf{A}}$ ppm (>LEL, lower explosive limit)
*AEGLs are marked with a subscript "**A**" and correspond to 60 minutes values.

DFG MAK: 1000 ppm (2400 milligram per cubic meter) (both isomers)

Australia: TWA 800 ppm (1900 milligram per cubic meter), 1993; Austria: MAK 800 ppm (1900 milligram per cubic meter) (all isomers), 1999; Belgium: TWA 800 ppm (1900 milligram per cubic meter), 1993; Denmark: TWA 500 ppm (1200 milligram per cubic meter), 1999; Finland: TWA 800 ppm (1900 milligram per cubic meter); STEL 1000 ppm (2350 milligram per cubic meter), 1999; France: VME 800 ppm (1900 milligram per cubic meter), 1999; Hungary: TWA 300 milligram per cubic meter; STEL 900 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 1430 milligram per cubic meter, 2003; Japan: 500 ppm (1200 milligram per cubic meter), 1999; Norway: TWA 250 ppm (600 milligram per cubic meter), 1999; Poland: TWA 1900 milligram per cubic meter; STEL 3000 milligram per cubic meter, 1999; Russia: TWA 500 ppm; STEL 300 milligram per cubic meter, 1993; Switzerland: MAK-week 800 ppm (1900 milligram per cubic meter), 1999; United Kingdom: TWA 600 ppm (1450 milligram per cubic meter); STEL 750 ppm (1810 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 800. Several states have set forth guidelines or standards for butane in ambient air[60] ranging from 19 milligram per cubic meter (North Dakota) to 32 milligram per cubic meter (Virginia) to 38 milligram per cubic meter (Connecticut) to 45.2 milligram per cubic meter (Nevada).

Determination in Air: OSHA Analytical Method 56.

Permissible Concentration in Water: No criteria set but EPA[32] has suggested an ambient limit of 19,000 μg/L based on health effects.

Determination in water: Octanol–water coefficient: Log $K_{ow} = \sim 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Butane is not characterized by its toxicity but rather by its narcosis-producing potential at high exposure levels.

Short-Term Exposure: Can cause headache, lightheadedness, drowsiness, and unconsciousness from lack of oxygen. Contact with the liquid can cause frostbite.

First Aid: Move victim to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. Clothing frozen to the skin should be thawed before being removed. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. NIOSH recommends: **8 hours** (At least 4 but <8 hours of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Butyl, Teflon gloves, suits, boots; 4H and Silver Shield gloves; Barricade-coated suits; CPF3 suits; Trychem 1000 suits; **4 hours:** (at least 4 but <8 hours of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Responder suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Large amounts of butane (800 ppm and above) will replace the amount of available oxygen and lead to suffocation. Oxygen content should never be below 19%. Use NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with butane all handlers should be trained on its proper handling and storage. All appropriate sections of the OSHA Standard 1910.111, Storage, Handling of Liquefied Petroleum Gases must be followed. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above, and heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1011-Butane see also Petroleum gases, liquefied, Hazard Class: 2.1; Labels: 2.1—Flammable gas. UN1075-Petroleum gases, liquefied or Liquefied petroleum gas, Hazard Class: 2.1; Labels: 2.1—Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Keep the gas concentration below the explosive limit range by forced ventilation[22]. Stop the flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air. Repair leak or allow cylinder to dissipate to the atmosphere. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Butane is a flammable gas. In case of fire, stop the flow of gas if it can be done safely. Use dry chemical, carbon dioxide; or halon extinguishers. Use water to keep fire-exposed containers cool and to protect personnel doing the shut-off. If a leak or spill has caught fire, use water spray to disperse gas and to protect personnel shutting off leak. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Controlled incineration. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Butanedione is a yellow-green, mobile liquid with a chlorine-like odor. Molecular weight = 86.1; Specific gravity (H_2O:1) = 0.99 @ 15°C; boiling point = 88°C; freezing/melting point = −2.4°C; vapor pressure = 57 mmHg @ 25°C; Flash point = 27°C; Autoignition temperature = 365°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Highly soluble in water.

Potential Exposure: Butanedione is used as an aroma carrier food additive in butter, vinegar, coffee and other foods.

Incompatibilities: Butanedione Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. High heat may cause violent combustion or explosion.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.02 milligram per cubic meter

PAC-2: 120 milligram per cubic meter

PAC-3: 310 milligram per cubic meter

Determination in water: Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. Octanol−water coefficient: Log K_{ow} = −1.32.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Butanedione can affect you when breathed in. Exposure can irritate the eyes, nose and throat.

Contact can irritate the skin. May have a narcotic effect on the nervous system.

Long-Term Exposure: Repeated exposure may affect the blood count and nervous system. Repeated or prolonged contact may cause skin sensitization.

Points of Attack: Skin, eyes, respiratory system; blood, nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: CBC. Consider nerve conductions studies. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with Butanedione. Wear solvent-resistant gloves and clothing.

Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures to butanedione exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Butanedione is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of butanedione should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs and flame arresters. Use only nonspeaking tools and equipment, especially when opening and closing containers of Butanedione. Wherever butanedione is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2346 Butanedione, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep Butanedione out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Butanedione is a flammable liquid. Decomposition products include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

As glycol ethers:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono-and di-ethers of ethylene glycol, diethyl glycol, and triethylene glycol $R\text{-}(OCH_2CH_2)_n\text{-}OR'$ where $n = 12$, or 3; $R =$ alkyl or aryl groups; $R' = R$, H, or groups which, when removed, yield glycol ethers with the structure: $R\text{-}(OCH_2CH)_n{-}OH$. Polymers are excluded from the glycol category.

EPCRA Section 313: Certain glycol ethers are covered. $R\text{-}(OCH_2CH_2)_n\text{-}OR'$; Where $n = 12$ or 3; $R =$ alkyl C_7 or less; or $R =$ phenyl or alkyl substituted phenyl; $R' + H$, or alkyl C_7 or less; or OR′ consisting of carboxylic ester, sulfate, phosphate, nitrate or sulfonate. Form R *de minimis* concentration reporting level: 1.0%.

Description: 2-Butoxy ethanol is a colorless liquid with a mild, ether like odor. Molecular weight = 118.20; Specific gravity (H_2O:1) = 0.90; boiling point = 171°C; freezing/melting point = −74.8°C; vapor pressure = 0.8 mmHg @ 20°C; Relative vapor density (air = 1) = 4.1; Flash point = 61°C (cc); Autoignition temperature = 238°C. Explosive limits = LEL 1.1% @ 93°C; 11,000 ppm[138]; UEL 12.7% @ 135°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 0 ₩. Soluble in water.

Potential Exposure: This material is used as a solvent for resins in protective coatings; lacquers, varnishes and enamels. It is also used in varnish removers and in dry cleaning compounds.

Incompatibilities: May form explosive mixture with air. Can form unstable and explosive peroxides; check for peroxides prior to distillation; render harmless if positive. Decomposes, producing toxic fumes. Violent reaction with strong caustics and strong oxidizers. Attacks some coatings, plastics and rubber. Attacks metallic aluminum at high temperatures.

Permissible Exposure Limits in Air

Determination in Air: Use NIOSH Analytical Method #1403[18], OSHA Analytical Method 83.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: $\text{Log } K_{ow} = 0.830$. Unlikely to bioaccumulate in marine organisms. EC_{50} [daphnia magna (water flea), 24 hour] = 1.815 mg/L.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Irritation of eyes, nose and throat; hemolysis, hemoglobinuria. LD_{50} = (oral-rat) 1480 mg/kg (slightly toxic).

Short-Term Exposure: This chemical irritates the eyes, skin, and respiratory tract. High exposure caused dizziness, lightheadedness, and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure could cause CNS depression and liver and kidney damage

Long-Term Exposure: The liquid defats the skin. This chemical can break down red blood cells, and cause anemia; effects the hematopoietic system, resulting in blood disorders. It can also damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system; central nervous system; hematopoietic system; blood, kidneys, liver, lymphoid system

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests, urinalysis and kidney function tests. CBC with reticulocyte count. Liver function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Butyl, Viton gloves, suits, Saranex. **4 hours:** (At least 4 but <8 hours of resistance to breakthrough >0.1 $0.1\ \mu g/cm^2/min$): 4H and Silver Shield gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa* (APF = 10) (any supplied-air respirator). *125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any PAPR with organic vapor cartridge(s)]. *250 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv* (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area. Keep in dark due to possible formation of explosive peroxides. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3—Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Enter spill area from upwind side. Establish forced ventilation to keep levels below explosive limit. Use absorbent material to permit spill removal to vapor-tight plastic bags for eventual disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol-resistant foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Butoxyl B:0800

Formula: $C_7H_{14}O_3$; $CH_3COOCH_2CH_2CH(OCH_3)CH_3$

Synonyms: Acetic acid 3-methoxybutyl ester; 3-Methoxybutyl acetate; Methyl-1,3-butylene glycol acetate

CAS Registry Number: 4435-53-4

RTECS Number: EL4725000

UN/NA & ERG Number: UN1993 (flammable liquids, n.o.s.)/128

EC Number: 224-644-9

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Irritant.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R10; R36/37/38; safety phrases: S26; S36; (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Butoxyl is a colorless liquid. Sharp odor. Molecular weight = 146.19; Specific gravity (H_2O:1) = 0.96; boiling point = 169–173°C; Melting/Freezing point ≤ -80°C; Flash point = 62°C (cc); 77°C[17]. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 2; reactivity 1 ₩. Slightly soluble in water; solubility = 30 g/L.

Potential Exposure: A potential danger to those involved in the use of this material as a cleaning solvent and as a component in varnishes and casting molds.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, skin absorption, Ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Butoxyl can be an eye irritant. High vapor levels can cause dizziness. LD_{50} = (oral-rat) 4210 mg/kg (slightly toxic)[9].

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly immediately after exposure to Butoxyl and at the end of the work-shift. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of Butoxyl to potentially exposed workers.

Respirator Selection: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Butoxyl must be stored to avoid contact with Oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Butoxyl is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1993 Butoxyl, Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3—Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 251-607-4

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Possible sensitization hazard (skin), Environmental hazard, Agricultural chemical.

Marine pollutant, IMO/IMDG

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xn, Xi; risk phrases: R22; R24; R36/37/38; R43; R50/53; safety phrases: S26; S36/37/39; S29/35; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Butralin is a yellow−orange crystalline solid or liquid. Commercial product is available as an emulsifiable concentrate. Molecular weight = 295.34; Specific gravity (H_2O:1) = 1.05 @ 20°C; Flash point => 100°C; 65°C (cc) [MSDS]. Henry's Law constant = 4.9×10^{-6} atm m^3/mol @ 25°C (est)[83]. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0 ₩. Slightly soluble in water; solubility =< 1.0 ppm. Some formulations may contain petroleum distillate. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: 2,6-Dinitroaniline herbicide; plant growth regulator. Butralin is used as a plant grow regulator on tobacco after the tobacco is topped. All tobacco is topped to stimulate desirable chemical and physical characteristics but also stimulates the growth of suckers. It may be used on food crops, broad leaf weeds and ornamentals in some countries. Butralin is been found effective in destroying opium poppy crops. All uses on food crops were canceled in January, 1991, and all uses on turf and ornamental grasses were voluntarily canceled in March, 1997. Actively registered for use in the United States Not approved for use in EU countries.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log K_{ow} => 4.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold): Intermediate—42.17178 ppb, MATC.

Routes of Entry: Inhalation, dermal contact, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: May cause irritation to the eyes, skin, or respiratory tract. May be toxic if ingested or upon dermal and/or eye contact. LD_{50} (oral, rat) = 1.5−2.5 g/kg; LD_{50} (dermal, rabbit) = 200 mg/kg[9].

Long-Term Exposure: May cause reproductive and fetal effects. Human toxicity (long-term): Low−70.00 ppb, Health advisory.

Points of Attack: Reproductive cells, chromosomes/DNA.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Dinitroanilines react with cellulose-based and expanded polymeric absorbents[88]. Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/ Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: For nuisance exposures use type P95 (US) or type P1 (EU EN 143) particle respirator. For higher level use type OV/AG/P99 (US) or type ABEK-P2 (EU EN 143) respirator cartridges. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Storage: (1) Color code—Blue: Health Hazard/Toxics/ Poisons: Store in a secure poison location.(2) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from chlorine compounds, oxidizing agents; and combustible materials. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames are prohibited where their chemical is handled, used, or stored, Use only nonsparking tools and equipment, especially when opening and closing containers. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded.: Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN1596 Dinotoanilines, Hazard Class: 6.1; Labels: 6.1—Poisonous materials. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: For dinitroaniline solids, isolate spill or leak area in all directions for at least 50 m/150 ft. Increase, in the downwind direction, as necessary. *If tank, rail car or tank truck is involved in spill*, *isolate* for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft. for liquids and at least 25 m/75 ft. for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Contact a licensed disposal facility about surplus and nonrecyclable solutions. Burn in a chemical incinerator equipped with an afterburner and scrubber. Extra care must be exercised as the material in an organic solvent is highly flammable. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Do not reuse container.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (*n-, iso-, tert-*)

Description: Butyl acetates are colorless or yellowish liquids with pleasant, fruity odors. There are 4 isomers. Molecular weight = (all isomers) 116.17.

n-Isomer: Specific gravity (H_2O:1) = 0.87; Specific gravity (H_2O:1) = 0.88; boiling point = 126−127°C; freezing/melting point = −77°C; vapor pressure = 6 mmHg @ 20°C; Flash point = 22°C; Autoignition temperature = 370°C. Flammable Limits in Air: LEL: 1.4%; 14,000 ppm; UEL: 7.6%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Soluble in water; solubility in water = 0.9% @ 20°C.

sec-isomer: Specific gravity (H_2O:1) = 0.87; boiling point = 112°C; Freezing/Melting point = −99.4°C; vapor pressure = 10 mmHg @ 20°C; Relative vapor density (air = 1) = 4.0; Flash point = 19°C (cc); Flammable Limits in Air: LEL: 1.7%, UEL: 9.8%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Slightly soluble in water; solubility in water = 0.8% @ 20°C.

tert-isomer: Specific gravity (H_2O:1) = 0.87; boiling point = 97.8°C; vapor pressure = 47 mmHg @ 25°C. Flammable Limits in Air: LEL: 1.3%, 13,000 ppm. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Insoluble in water.

iso-isomer: Specific gravity (H_2O:1) = 0.87 @ 20°C; boiling point = 116.5°C; freezing/melting point = −98.8°C; vapor pressure = 17 mmHg @ 20°C; 7.5 mmHg @ 10°C; Flash point = 18°C (cc); Autoignition temperature = 421°C; Flammable Limits in Air: LEL: 1.3%, UEL: 10.5%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Slightly soluble in water; solubility = 0.6% @ 20°C.

Potential Exposure: *n*-Butyl acetate is an important solvent in the production of lacquers, leather and airplane dopes, and perfumes. It is used as a solvent and gasoline additive. *sec*-Butyl acetate is used as a widely used solvent for nitrocellulose, nail enamels and many different purposes. *tert*-Butyl acetate is common industrial solvent used in the making of lacquers, artificial leather, airplane dope, perfume; and as a food additive. Isobutyl acetate is used as a solvent and in perfumes and artificial flavoring materials.

Incompatibilities: All butyl acetates are incompatible with nitrates, strong oxidizers; strong alkalies; strong acids. Butyl acetates may form explosive mixture with air; reacts with water, on standing, to form acetic acid and *n*-butyl alcohol. Violent reaction with strong oxidizers and potassium-*tert*-butoxide. Dissolves rubber, many plastics, resins and some coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.03 milligram per cubic meter (*n*-isomer); 1 ppm = 4.75 milligram per cubic meter (all other @ 25°C & 1 atm isomers)

Several states have set guidelines or standards for butyl acetates in ambient air[60] as follows (all values in milligram per cubic meter):

State	*n-*	*sec-*	*tert-*	*iso-*
Connecticut	14.2	19.0	19.0	14.0
Florida 14.2	–	–	14.0	
Massachusetts	–	–	–	0.97
Nevada 16.9	22.6	22.6	16.67	
New York	14.2	–	–	14.0
South Dakota	14.2	–	–	–
Virginia 12.0	15.0	15.0	12.0	–

Determination in Air: Adsorption of charcoal, workup with CS_2, analysis by GC. Use NIOSH Analytical Method #1450 (Esters I), #1405, #2549 Volatile Organic Compounds[18] (screening), and OSHA Analytical Method 7 Organic Vapors.

Permissible Concentration in Water: Russia[43] cites an MAC in water used for domestic purposes of 0.1 mg/L (for any isomer).

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 1.60$ (*n*-); 1.5 (*sec*-). Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Passes through the unbroken skin.

Harmful Effects and Symptoms

Headaches, drowsiness, eye irritation; irritation of skin, and upper respiratory system. Humans and animals that inhale comparatively low doses of *n*-butyl acetate experience irritation of the nasal and respiratory passages and of the eyes. At higher concentrations narcosis takes place, and repeated exposures have resulted in renal and blood changes in experimental animals.

Short-Term Exposure: The substance irritates the eyes, skin, and respiratory tract. High exposures, above the occupational exposure levels, can cause weakness, head ache, and drowsiness; and may cause unconsciousness.

Long-Term Exposure: *n*-Butyl acetate may cause skin allergy. *n*-Butyl acetate has been shown to damage the developing fetus in animals. Prolonged and repeated exposure to butyl acetates can cause defatting, drying and cracking of the skin. Although many solvents and petroleum-based products cause lung, brain and disturbed sleep; these chemicals have not been adequately evaluated to determine these effects. See also NIOSH Profiles: Acetates, SRI, 2/77; *n*-Butyl acetate, SRC, 12/79; Paint and allied products manufacturing, FIRL, 4/78 and SRI, 2/7; Spray painting, FIRL, 4/78

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: Consider initial effects on skin and respiratory tract in any preplacement or periodical examinations, as well as liver, lung, and kidney function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of salt water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. **8 hours** (At least 4 but <8 hours of resistance to breakthrough >0.1 0.1 $\mu g/cm^2/min$): 4H and Silver Shield gloves. **4 hours:** (At least 4 but <8 hours of resistance to breakthrough $>0.10.1$ $\mu g/cm^2/min$): polyvinyl alcohol gloves; Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *n-isomer:* OSHA: *1500 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or Sa* (APF = 10) (any supplied-air respirator). *1700 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any PAPR with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

sec-isomer*: 1700 ppm:* Sa:Cf$^{£}$ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or

PaprOv£ (APF = 25) [any PAPR with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

tert-isomer*: 1500 ppm:* Sa:Cf£ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv£ (APF = 25) [any PAPR with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

iso-isomer*: 1300 ppm:* Sa:Cf£ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrOv (APF = 10) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or PaprOv£ (APF = 25) [any PAPR with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl acetates all handlers should be trained on its proper handling and storage. Before entering confined space where these chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1123 Butyl acetates, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Vapor build-up may cause suffocation. For small quantities absorb on paper towels. Evaporate in a safe place (such as a fume hood). Allow sufficient time for the evaporated vapors to completely clear the hood duct work. Burn the paper in a suitable location away from combustible materials. Or, absorb liquids in activated carbon, vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals are flammable liquids. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water may be used as a fog to control heat and to dilute vapors and wash them from the air. Use water fog in conjunction with alcohol foam, dry chemical or carbon dioxide as extinguishing agents. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Container may explode in fire. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. See also "Spill Handling" section above.

Butyl acid Phosphate B:0820

Formula: $C_8H_{21}O_4P$; $(C_4H_9O)_2PH(OH)_2$

Synonyms: Acid butyl phosphate; *n*-Butyl acid phosphate; Butyl phosphoric acid; Phosphoric acid, dibutyl ester

CAS Registry Number: 12788-93-1

RTECS Number: TB8490000

UN/NA & ERG Number: UN1718/153; UN3265/153

EC Number: 235-826-2

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Toxic, Corrosive

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R36/37/38; R41; safety phrases: S24/25; S41 (see Appendix 4)

Description: Butyl acid phosphate is a clear white liquid. Molecular weight = 153.08; Flash point = 110°C. Hazard identification (based on NFP A-704M Rating System): Health 2; flammability 1; reactivity 1 ₩. Insoluble in water.

Potential Exposure: It is used in industrial chemicals manufacture.

Incompatibilities: Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101] Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Butyl acid phosphate can affect you when breathed in. Contact can severely irritate the eyes, skin and respiratory tract. Can cause permanent eye damage. Inhalation can irritate the nose, throat, and lungs, causing difficult breathing and shortness of breath. Toxic; inhalation, ingestion or skin contact with material may cause severe injury or death. Contact with molten substance may cause severe burns to skin and eyes. Avoid any skin contact. Effects of contact or inhalation may be delayed[31,136].

Long-Term Exposure: Repeated or prolonged contact can cause skin rash. Very irritating substances, such as butyl acid phosphate may affect the lungs.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. If pulmonary edema develops from high exposure, medical observation is recommended for 24 to 48 hours.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to Butyl acid phosphate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Store in tightly closed containers is a cool, well-ventilated area away from potentially high heat sources. Prior to working with butyl acid phosphate you should be trained on its proper handling and storage.

Shipping: UN1718 Butyl acid phosphate, Hazard class: 8; Labels: 8—Corrosive material. UN326 Corrosive liquid, acidic, organic, n.o.s.; Hazard class: 8; Labels: 8—Corrosive material, technical name required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of phosphorus and carbon. Runoff from fire control or dilution water may be corrosive and/or toxic and cause pollution. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

n-Butyl Acrylate B:0830

Formula: $C_7H_{12}O_2$; $CH_2{=}CHCOOC_4H_9$

Synonyms: Acrilato de *n*-butilo (Spanish); Acrylic acid *n*-butyl ester; Acrylic acid, butyl ester; *n*-Butyl acrylate; *normal*

Butyl acrylate; Butylacrylate, inhibited; Butyl 2-propenoate; 2-Propenoic acid, butyl ester

CAS Registry Number: 141-32-2

HSDB Number: 305

RTECS Number: UD3150000

UN/NA & ERG Number: UN2348/129 (P)

EC Number: 205-480-7 [*Annex I Index No.:* 607-062-00-3]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Limited Evidence; Human No Adequate Data*, not classifiable as carcinogenic to humans*, Group 3.

Hazard Alert: Flammable, Sensitization hazard (skin), Possible risk of forming tumors, Suspected of causing genetic defects, Polymerization hazard (nonstabilized), Primary irritant (w/o allergic reaction), environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; NPRI

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R11; R19; R21/22/23; R36/37/38; R43; R62; safety phrases: S2; S9; S29/35; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Butyl acrylate is a colorless liquid. Molecular weight = 128.17; specific gravity (H_2O:1) = 0.89 @ 20°C; boiling point = 145−148°C; freezing/melting point = −64.6°C; vapor pressure = 4 mmHg @ 20°C; relative vapor density (air = 1) = 4.4; flash point = 29°C; vapor pressure = 7.5 mmHg @ 30.4°C; Autoignition temperature = 292°C. Explosive limits in air: LEL: 1.3%; UEL: 9.9%[17]. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 2 ₩. Slightly soluble in water; solubility in water = 0.14%.

Potential Exposure: Butyl acrylate is a monomer, used in the production of polymers, copolymers, and resins; solvent for coatings; adhesives, paints and binders.

Incompatibilities: May form explosive mixture with air. Heat, sparks, open flame, light, reducing agents; or peroxides may cause explosive polymerization. Incompatible with strong acids; amines, halogens, hydrogen compounds, oxidizers, sunlight, or other catalysts.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.24 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 10 ppm/55 milligram per cubic meter TWA

ACGIH TLV[1]: 2 ppm; 11 milligram per cubic meter TWA [sensitizer]; not classified as a human carcinogen

PAC* Ver. 29[138]

PAC-1: $\mathbf{8.3_A}$ ppm

PAC-2: $\mathbf{130_A}$ ppm

PAC-3: $\mathbf{480_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 2 ppm/11 milligram per cubic meter TWA; Peak Limitation Category I(2) *as acrylic acid, n-butyl ester*

Australia: TWA 10 ppm (55 milligram per cubic meter), 1993; Austria: MAK 10 ppm (55 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (52 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (55 milligram per cubic meter), 1999; Finland: TWA 10 ppm (55 milligram per cubic meter); STEL 20 ppm (110 milligram per cubic meter) [skin] 1999; France: VME 10 ppm (55 milligram per cubic meter), 1999; Hungary: TWA 20 milligram per cubic meter; STEL 40 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 11 milligram per cubic meter, 2003; Norway: TWA 10 ppm (55 milligram per cubic meter), 1999; Poland: TWA 20 milligram per cubic meter; STEL 70 milligram per cubic meter, 1999; Russia: STEL 10 milligram per cubic meter, 1993; Sweden: NGV 10 ppm (50 milligram per cubic meter), KTV 15 ppm (80 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (55 milligram per cubic meter), KZG-W 20 ppm (110 milligram per cubic meter), 1999; United Kingdom: TWA 10 ppm (53 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Some states have set guidelines or standards for Butyl acrylate in ambient air[60] ranging from 900 μ/m^3 (Virginia) to 1100 μ/m^3 (Connecticut) to 1310 μ/m^3 (Nevada).

Determination in Air: See OSHA Analytical Method PV2011, butyl acrylate

Permissible Concentration in Water: Russia[43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.4. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion, skin and eye contact.

Harmful Effects and Symptoms

n-Butyl acrylate was found to be but moderately irritating to the skin. As an eye irritant it produced corneal necrosis in an unwashed rabbit eye, similar to that produced by ethyl alcohol. Exposure of rats @ 1000 ppm for 4 hours proved lethal to 5 of 6 rats exposed; however, rats survived a 30-minutes exposure to 7000 ppm. There is a close similarity in toxic response by inhalation, skin and eye to methyl acrylate. LD_{50} = (oral-rat) 900 mg/kg (slightly toxic).

Short-Term Exposure: This chemical can pass through the skin. The substance severely irritates the eyes, skin and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High exposure may cause liver damage.

Long-Term Exposure: May cause liver and lung damage. May cause skin sensitization and allergy. Similar solvents and petroleum-based chemicals have been shown to cause brain and nerve damage.

Points of Attack: Skin, eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Interview for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. **8 hours**: (At least 4 but <8 hours of resistance to breakthrough >0.1 0.1 $\mu g/cm^2/min$): 4H and Silver Shield gloves, Responder suits; Trychem 1000 suits; **4 hours:** (At least 4 but <8 hours of resistance to breakthrough >0.1 0.1 $\mu g/cm^2/min$): Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the *NIOSH/NPPTL Certified Equipment List*, which is available on the NIOSH Web site

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with Butyl acrylate all handlers should be trained on its proper handling and storage. Do not store unless stabilized. Before entering confined space where Butyl acrylate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated, fireproof area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2348 Butyl acrylate, stabilized, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover liquids with dry lime or soda ash; or absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible and highly reactive liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): (*all-isomers*) 1-Low hazard to water.

Description: There are four isomers. *n*-and *sec*-Butyl alcohols, are colorless liquids with strong, sweet, alcoholic odor. *tert*-Butyl alcohol is a colorless crystalline powder or liquid (above 26°C) with a camphor-like odor. It is often used in aqueous solution. *iso*-butyl alcohol is a colorless liquid with a mild, sweet, and musty odor. Molecular weight (all isomers) = 74.12.

n-isomer: Boiling point = 117°C; freezing/melting point = −90°C; Specific gravity (H_2O:1) = 0.81; vapor pressure = 6 mmHg @ 20°C; relative vapor density (air = 1) = 2.6; relative density of vapor/air-mixture @ 20°C (air = 1) = 1.01; Flash point = 35°C (cc); Autoignition temperature = 345°C. Explosive limits in air: LEL: 1.4%; UEL: 11.2%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Soluble in water; solubility in water = 9% @ 20°C.

sec-isomer: Boiling point = 100°C; freezing/melting point = −115°C; specific gravity (H_2O:1) = 0.81; vapor pressure = 12 mmHg @ 20°C; relative vapor density (air- = 1) = 2.55; relative density of vapor/air-mixture @ 20°C (air = 1) = 1.03; flash point = 24°C (cc); Autoignition temperature = 406°C. Explosive limits in air: LEL: 1.7%; UEL: 9.0%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Solubility in water = 16% @ 20°C.

tert-isomer: Boiling point = 83°C; freezing/melting point = 25°C; Specific gravity (H_2O:1) = 0.79 (solid); vapor pressure = 42 mmHg @ 25°C; Relative vapor density (air = 1) = 2.6; Relative density of vapor/air-mixture @ 20°C (air = 1) = 1.06; Flash point = 11°C (cc); Autoignition temperature = 470°C. Explosive limits in air: LEL: 2.4%; UEL: 8.0%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Good solubility in water; solubility in water = 4.

iso-isomer: Boiling point = 108°C; freezing/melting point = −102°C; Specific gravity (H_2O:1) = 0.80; vapor pressure = 9 mmHg @ 20°C; Relative vapor density (air- = 1) = 2.55; Relative density of vapor/air-mixture @ 20°C (air = 1) = 1.02; Flash point = 28°C (cc); Autoignition temperature = 415°C; Explosive limits in air: LEL: 1.2%; 12,000 ppm[138]; UEL: 10.9%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3; reactivity 0 ₩ Solubility in water = 9% @ 20°C.

Potential Exposure: Butyl alcohols are used as solvents for paints, lacquers, varnishes, natural and synthetic resins, gums, vegetable oils, dyes, camphor, and alkaloids. They are also used as an intermediate in the manufacture of pharmaceuticals and chemicals; in the manufacture of artificial leather, safety glass; rubber and plastic cements, shellac, raincoats, photographic films, perfumes; and in plastic fabrication.

Incompatibilities: Butyl alcohols may form explosive mixture with air. In all cases they are Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some plastics, rubber and coatings. *n*-Butanol is incompatible with strong acids; halogens, caustics, alkali metals; aliphatic amines; isocyanates. *sec*-Butanol forms an explosive peroxide in air. Ignites with chromium trioxide. Incompatible with strong oxidizers; strong acids; aliphatic amines; isocyanates, organic peroxides. *tert*-Butanol is incompatible with strong acids (including mineral acid), including mineral acids; strong oxidizers or caustics, aliphatic amines; isocyanates, alkali metals (i.e., lithium, sodium, potassium, rubidium, cesium, francium). *iso*-Butanol is incompatible with strong acids; strong oxidizers; caustics, aliphatic amines; isocyanates, alkali metals and alkali earth. May react with aluminum at high temperatures.

Permissible Exposure Limits in Air

Several states have set guidelines or standards for butyl alcohols in ambient air[60] as follows (all values in milligram per cubic meter):

State	***n-***	***sec-***	***tert-***	***iso-***
Connecticut	6.0	6.1	–	–
Massachusetts	0.021	–	–	0.021
Nevada 3.57	7.26	–	–	
New York	3.0	–	–	–
South Dakota	3.0	–	–	–
Virginia 1.25	3.05	–	2.5	

NIOSH 1405, 1450; OSHA 7 (*n*-, *sec*-and *iso*-isomers); NIOSH 1450; OSHA 7 (*tert*-isomer)[18]

Permissible Concentration in Water: No criteria set, but EPA has suggested[32] ambient limits as follows based on health effects: *n*-isomer 2070 μg/L; *sec*-6200 μg/L*; iso*-2070 μg/L*; tert*-4140 μg/L Russia[43] set a MAC for butyl alcohol of 1.0 mg/mL in water bodies used for domestic purposes and 0.03 mg/L in water bodies used for fishery purposes[35].

Determination in water: Octanol−water coefficient: Log K_{ow} = All isomers are < 1.0 as follows: 0.9 (*n*-isomer); 0.6 (*sec*-isomer); 0.4 (*tert*-isomer); 0.8 (*iso*-isomer)

Routes of Entry: Ingestion, inhalation, skin and/or eye contact. Passes through the unbroken skin (*n*-, *iso*-isomer).

Harmful Effects and Symptoms

Short-Term Exposure: The vapors of butyl alcohols irritate the eyes and respiratory tract. They can irritate the skin and cause rash or burning feeling on contact. May affect the CNS. Exposure to high concentrations could cause headache, nausea, vomiting, and dizziness. Exposure to high levels of the *n*-isomer may cause unconsciousness and may lead to irregular heartbeat. The oral LD_{50} value for rats for the various isomers are as follows: (*n*-isomer) 790 mg/kg; (*sec*-isomer) 6480 mg/kg; (*iso*-isomer) 2460 mg/kg; (*tert*-isomer) 3500 mg/kg.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis, drying and cracking of the skin. Exposure to the *n*-isomer can damage the liver, heart, and kidneys; cause hearing loss and affect sense of balance.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: *n-isomer*: whole blood (chemical/metabolite). Expired air; Liver and kidney function tests, hearing test (audiogram) and test for balance, EKG test. *tert-isomer:* Liver and kidney function tests. *iso-isomer:* Evaluate for brain effects and possible neuropsychological testing.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact.

n-isomer: **8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm^2/min): Butyl, Teflon gloves, suits, boots; Viton gloves, suits; 4H and Silver Shield gloves; Barricade-coated suits; CPF3 suits; Responder suits. **4 hours:** (At least 4 but <8 hours of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Neoprene rubber gloves, suits, boots. *sec-isomer*: **(8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm^2/min): 4 H and Silver Shield gloves. **4 hours:** (At least 4 but <8 hours of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Butyl, Nitrile.

Iso-isomer: Prevent skin contact. **8 hours**: butyl rubber gloves, suits, boots; Neoprene rubber gloves, suits, boots; Viton gloves, suits; Responder suits. **4 hours**: nitrile rubber gloves, suits, boots; 4 H and Silver Shield gloves

tert-isomer: **8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm^2/min): Butyl, 4H and Silver Shield gloves, Responder suits All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *n-isomer: 1250 ppm:* Sa:Cf$^{£}$ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv$^{£}$ [any PAPR with organic vapor cartridge(s)]. *1400 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv$^{£}$ [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

*Substance causes eye irritation or damage; eye protection needed.

sec-isomer: NIOSH: *1000 ppm:* CcrOv* [any chemical cartridge respirator with organic vapor cartridge(s)]; or SA* (any supplied-air respirator). *2000 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any PAPR with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into* *unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

*Substance reported to cause eye irritation or damage; may require eye protection.

iso-isomer: 500 ppm: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *1250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]. *1600 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

tert-isomer: 1600 ppm: Sa:Cf$^{£}$ (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PaprOv$^{£}$ [any PAPR with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl alcohols all handlers should be trained on its proper handling and storage. Before entering confined space where these may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1120 Butanols, Hazard Class: 3; Labels: 3—Flammable liquid. UN1212 Isobutanol or Isobutyl alcohol, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in activated charcoal, vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. The *tert*-isomer may be in powdered form; collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Butyl alcohols are flammable liquids (*tert*-isomer may also be a flammable solid). Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers (recommended). Water may be ineffective because of low flash point. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, or bury absorbed waste in an approved land fill[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Butyl amines are highly flammable, colorless liquids (*n*-turns yellow on standing) with ammoniacal or fish-like odors. *n*-isomer: Molecular weight = 73.2; Specific gravity (H_2O:1) = 0.76; boiling point = 78°C; freezing/melting point = −43.9°C; Relative vapor density (air = 1) = 2.5; vapor pressure = 82 mmHg @ 20°C; 93 mmHg @ 25°C; Relative density of vapor/air-mixture @ 20°C (air = 1) = 1.2; Flash point = −12°C (cc); Autoignition temperature = 312°C.

Explosive limits in air: LEL: 1.7%, 17,000 ppm[138]; UEL: 9.8%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 0 ₩. Soluble in water; solution is highly basic. *sec*-isomer: Molecular weight = 73.16; Specific gravity (H_2O:1) = 0.72 @ 20°C; boiling point = 63°C; freezing/melting point = −104°C; vapor pressure = 178 mmHg @ 25°C; relative vapor density (air = 1) = 2.5; flash point = −9°C (cc); explosive limits in air: LEL: 1.7%, 17,000 ppm[138]; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 0 ₩. Soluble in water. *tert*-isomer: Colorless liquid. Strong amine odor. Molecular weight = 73.14; Specific gravity (H_2O:1) = 0.73 @ 20°C; boiling point = 44−46°C; freezing/melting point = −67.3°C; Relative vapor density (air = 1) = 2.5; vapor pressure = 292 mmHg @ 20°C; Relative density of vapor/air-mixture @ 20°C (air = 1) = 1.6; flash point = −9°C (cc); Autoignition temperature = 380°C. Explosive limits in air: LEL: 1.7% @ 100°C; UEL: 8.9%@100°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 4; reactivity 0 ₩. Soluble in water. *iso*-isomer: Molecular weight = 73.14; boiling point = 63°C; Specific gravity (H_2O:1) = 0.724 @ 20°C; relative vapor density (air = 1) = 2.5; flash point = −9°C (cc); Autoignition temperature = 377.8°C. Explosive limits in air: LEL: 3.4%; UEL: 9.0% Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 3; reactivity 0 ₩. Soluble in water.

513-49-5*, (S)-sec-isomer*: Molecular weight = 73.16; specific gravity (H_2O:1) = 0.724 @ 20°C; boiling point = 63°C; freezing/melting point = −104°C; vapor pressure = 0.0724 mmHg @ 20°C. Explosive limits in air: LEL: 1.7%, 17,000 ppm.

110-68-9, *Methylbutylamine, N*: Molecular weight = 87.19; Specific gravity (H_2O:1) = 0.734 @ 20°C; boiling point = 217°C; freezing/melting point = −75°C; explosive limits in air: LEL: 2.7%, 22,000 ppm.

102-82-9, tri-N-isomer, Tributylamine: Molecular weight = 185.4; specific gravity (H_2O:1) = 0.793 @ 25°C; boiling point = 91°C; explosive limits in air: LEL: 2.7%, 22,000 ppm.

Potential Exposure: Alert: (*n*-isomer): Possible risk of forming tumors, suspected of causing genetic defects, suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), (*sec*-isomer): Drug. *n*-Butylamine is used in pharmaceuticals; dyestuffs, rubber, chemicals, emulsifying agents; photography, desizing agents for textiles; pesticides, and synthetic agents. *sec*-Butylamine is used as a fungistate. *tert*-Butylamine is used as a chemical intermediate in the production of *tert*-Butylaminoethyl methacrylate (a lube oil additive); as an intermediate in the production of rubber and in rust preventatives and emulsion deterrents in petroleum products. It is used in the manufacture of several drugs.

Incompatibilities: May form explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. *n*-Butylamine is a weak base; reacts with strong oxidizers and acids, causing fire and explosion hazard. Incompatible with organic anhydrides; isocyanates, vinyl acetate; acrylates, substituted allyls; alkylene oxides; epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks some metals in presence of moisture. The *tert*-isomer will attack some forms of plastics.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.99 milligram per cubic meter @ 25°C & 1 atm

109-73-9, n-isomer

NIOSH IDLH = 300 ppm

Odor threshold = 0.24−13.9 ppm.

OSHA PEL: 5 ppm/15 milligram per cubic meter Ceiling Concentration [skin

NIOSH REL: 5 ppm/15 milligram per cubic meter Ceiling Concentration [skin]

Determination in Air: Adsorption on H_2SO_4 treated silica gel, desorption with 50% methanol, analysis by gas chromatography/flame ionization detection, see NIOSH (IV) #2012.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested ambient water limits for butyl amines (*n*-, *iso*-, or *tert*-isomer) as 207 μg/L based on health effects.

Determination in Water: Octanol–water coefficient: Log K_{ow} (*n*-isomer) = 0.9; (*tert*-isomer) = 0.4.

Routes of Entry: Inhalation and percutaneous absorption, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with butylamine can irritate and burn the eyes with possible permanent damage. Skin contact can cause irritation, burns and blisters. Inhalation can cause nose and throat irritation, "flushed" feeling, headache, dizziness, coughing, shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. The LD_{50} rat value range from 78 mg/kg (*tert*) to 366 mg/kg (*n*-butyl) and all 4 are designated moderately toxic.

Long-Term Exposure: Repeated exposure may cause itching and skin rash. May cause bronchitis to develop with phlegm, and/or shortness of breath. Exposure to high levels of isobutylamine can affect the heart.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Rinse out mouth and *do not* induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. *n-isomer:* **8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm^2/min): Responder suits; Trychem 1000 suits; **4 hours:** (At least 4 but <8 hours of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Trellchem HPS suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *n*-isomer: *50 ppm:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa* (APF = 10) (any supplied-air respirator). *125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS* (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]. *250 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *300 ppm:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Store in a refrigerator.

Keep under an inert atmosphere for long-term storage[52]. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1125 *n*-Butylamine, Hazard Class: 3; Labels: 3—Flammable liquid, 8—Corrosive material. UN2014 Isobutylamine, Hazard Class: 3; Labels: 3—Flammable liquid, 8—Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated Waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

EC Number: 217-916-3

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Environmental hazard.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.003; Nonwastewater (mg/kg), 1.4.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: N, Xn; risk phrases: R20; R36/37/38; R51/53; safety phrases: S16; S26; S29/35; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Butylate is a clear liquid with an aromatic odor. Molecular weight = 217.4; Specific gravity (H_2O:1) = 0.94; boiling point = 130°C @ 10 mmHg @ 20°C; vapor pressure = 1×10^{-3} mmHg. Low solubility in water; solubility = 44 mg/L.

Potential Exposure: A thiocarbamate herbicide. A potential danger to those involved in the manufacture, formulation or application of this carbamate herbicide which is used to control weed seeds in the soil prior to sowing crops.

Incompatibilities: Thiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of thiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Many materials in this group slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of thiocarbamates with aldehydes, nitrides, and hydrides. Thiocarbamates are incompatible with acids, peroxides, and acid halides.

Permissible Exposure Limits in Air

No standards or PAC available.

Permissible Concentration in Water: A NOAEL in the range of 24−40 mg/kg body weight/day/has been determined by United States Environmental Protection Agency. This leads to derivation of a 10-day Health advisory: for Butylate of 2.4 mg/L and a lifetime Health advisory: of 0.05 mg/L for a 70-kg man. Wisconsin has set a guideline for Butylate in drinking water of 200 μg/L[61].

Determination in Water: Analysis of Butylate is by a GC method applicable to the determination of certain nitrogen- and phosphorus-containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen-phosphorus detector. The method detection limit has not been determined for Butylate, but it is estimated that the detection limits for analytes included in this method are in the range of 0.1−2 μg/L. Fish Tox: 22.61732000 ppb MATC (INTERMEDIATE).

Harmful Effects and Symptoms

Applying the criteria described in EPA's guidelines for assessment of carcinogenic risk, butylate may be placed in Group C: a possible human carcinogen. This category is for substances that show limited evidence of carcinogenity in animals and inadequate evidence in humans. LD_{50} (rat) = 4000 mg/kg (slightly toxic).

Long-Term Exposure: Human Tox = 400.00000 ppb Health advisory: (VERY LOW).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH Web site.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry place.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 400.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen, sulfur and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcingenicity: NTP, 11th Report, Reasonably anticipated to be a human carcinogen; IARC, Group 2B: The agent is possibly carcinogenic to humans.

California Proposition 65 Chemical[102]: Cancer, 1/1/1990

Hazard Alert: Combustible, Sensitization hazard, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard. Listed for Tier1 screening as an endocrine disruptor[88].

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn; risk phrases: R45; R20; R36/37/38; R40; R43; R62; R63; safety phrases: S26; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water. (est.)

Description: Combustible white, beige or slightly yellow waxy solid. Aromatic odor. Slightly bitter, burning taste. Molecular weight = 180.27; boiling point = 264−270°C @ 733 mmHg; freezing/melting point = 47.8−55°C; flash point = 156°C; Soluble in water; solubility =< 1 mg/mL @ 20°C[88].

Potential Exposure:

Incompatibilities: Butylated hydroxyanisole degrades with prolonged exposure to sunlight. Exhibits antioxidant properties and synergism with acids, BHT, propyl gallate, hydroquinone, methionine, lecithin and thiodipropionic acid. It exhibits antioxidant properties as a scavenger of free radicals. It is incompatible with oxidizing agents and ferric salts[101].

Determination in Water: Log K_{ow} => 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms.
Routes of Entry: Eyes, skin, ingestion
Harmful Effects and Symptoms
Short-Term Exposure: Toxic by ingestion. Symptoms of exposure to butylated hydroxyanisole may include exacerbation of vasomotor rhinitis, conjunctival irritation and redness, asthma, facial flushing, marked diaphoresis, headaches, dull retrosternal pain and somnolence[101].
Long-Term Exposure: A possible carcinogen. May cause allergic contact dermatitis and hypersensitivity reactions following skin contact or inhalation. Possible tumorigen, mutagen, birth defects, based on animal studies.
Points of Attack: Skin, lungs, reproductive system.
Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, spermcount, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. If skin or lung sensitization is suspected, consider evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.
First Aid: *Eyes:* first check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20 to 30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin:* immediately flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. Immediately call a hospital or poison control center even if no symptoms (such as redness or irritation) develop. Immediately transport the victim to a hospital for treatment after washing the affected areas. *Inhalation:* immediately leave the contaminated area; take deep breaths of fresh air. Immediately call a physician and be prepared to transport the victim to a hospital even if no symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA should be used; if not available, use a level of protection greater than or equal to that advised under protective clothing. *Ingestion:* do not induce vomiting. If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and immediately call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. Do not induce vomiting. Immediately transport the victim to a hospital. *Other:* since this chemical is a known or suspected carcinogen you should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician will depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure[101].
Personal Protective Methods: If Tyvek-type disposable protective clothing is not worn during Handling of this chemical, wear disposable Tyvek-type sleeves taped to your gloves (minimal protection).
Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).
Storage: Color code—Blue: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry place or refrigerator away from incompatible materials.
Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.
Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Small spills and leakage: should a spill occur while you are handling this chemical, first remove all sources of ignition, then you should dampen the solid spill material with 60%−70% ethanol and transfer the dampened material to a suitable container. Use absorbent paper dampened with 60%−70% ethanol to pick up any remaining material. Seal the absorbent paper, and any of your clothes, which may be contaminated, in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60%−70% ethanol followed by washing with a soap and water

solution. Do not reenter the contaminated area until the Safety Officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Fires involving this compound can be controlled with a dry chemical, carbon dioxide or Halon extinguisher.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R61; R50/53; R50; R62; R63; safety phrases: S29; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Butyl benzyl phthalate is a clear, oily liquid with a slight odor. Molecular weight = 312.39; Specific gravity (H_2O:1) = 1.16; boiling point = 370°; freezing/melting point = −34.7°C; relative vapor density (air = 1): 10.8; vapor pressure = very low; Flash point = 199°C; Autoignition temperature = 422°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0 ₩. Practically insoluble in water.

Potential Exposure: Butyl benzyl phthalate is used as a plasticizer for polyvinyl and cellulosic resins. It is also used as an organic intermediate.

Incompatibilities: Incompatible with strong acids; nitrates, oxidizers. Destructive to rubber and paint.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PA C-1: 15 milligram per cubic meter

PA C-2: 77 milligram per cubic meter

PA C-3: 460 milligram per cubic meter

Denmark: TWA 3 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter, 1993; Sweden: NGV 3 milligram per cubic meter, KTV 5 milligram per cubic meter, 1999; United Kingdom: TWA 5 milligram per cubic meter, 2000. Two states have set guidelines or standards for butyl benzyl phthalate in ambient air[60], New York and Florida: 100 μm^3

Permissible Concentration in Water: No criteria set. Butyl phthalate esters in general are classified as priority toxic pollutants by EPA[6]. Listed by Mexico for waste water as phthalate esters.

Determination in Water: Octanol−water coefficient: Log K_{ow} => 4.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, can be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and the respiratory tract. Skin contact may cause a burning sensation. High levels of this chemical may cause dizziness and lightheadedness. LD_{50} = (oral-rat) 2330 mg/kg (slightly toxic).

Long-Term Exposure: May affect liver and kidney function. Repeated exposure may damage the nervous system; causing weakness, "pins and needles," and poor coordination in arms and legs. May affect the endocrine system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. Liver and kidney function tests. Examination of the nervous system; including nerve conduction tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for 20−30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where there is potential exists for exposure, the following might be considered: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry place or refrigerator away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Water may cause frothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full

facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Atomize into an incinerator together with a flammable solvent[22].

Regulatory Authority and Advisory Information

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard Alert: Highly flammable, Suspected of causing genetic defects, Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, N, Xi; risk phrases: R11; R36/38; R51/53; R62; safety phrases: S16; S21; S26; S29/35; S37/39; S45; S61; 41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Butyl bromide is a highly flammable, colorless liquid with a pleasant odor. Molecular weight = 137.04. Specific gravity (H_2O:1) = 1.28 @ 20°C; boiling point = 101.3°C; freezing/melting point = −112.4; vapor pressure = 42 mmHg @ 25°C; vapor density (air = 1) = 4.68; flash point = 17.2°C (*n*-); 21°C (*sec*-isomer). Autoignition temperature = 269°C. Explosive limits: LEL: 2.5% @ 100°C; UEL: 6.6% @ 100°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Insoluble in water.

Potential Exposure: Butyl bromide is used to make other chemicals, including pharmaceuticals.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May accumulate static electrical charges and cause ignition of its vapors.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 4.4 ppm

PAC-2: 49 ppm

PAC-3: 290 ppm

Determination in Water: Toxic to aquatic organisms.

Routes of Entry: Inhalation, ingestion (*sec*-butyl bromide passes through the skin)

Harmful Effects and Symptoms

Short-Term Exposure: Causes eye, skin and respiratory tract irritation. Inhalation can cause coughing, wheezing and/or shortness of breath. High levels can cause you to feel dizzy, lightheaded, and to pass out. Very high levels can cause death.

Long-Term Exposure: Repeated exposure may cause liver and kidney damage. There is limited evidence that Butyl bromide may damage the developing fetus.

Points of Attack: Liver, kidney.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: liver function tests; kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to Butyl bromide, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA approve SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with Butyl bromide all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Butyl bromide is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of Butyl bromide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Butyl bromide.

Shipping: UN1126 & UN23391- & 2-Bromobutane, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen bromide and oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity; NCI: Carcinogenesis studies (gavage); no evidence: mouse, rat.

Hazard Alert: Extremely flammable, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: (*n-isomer*) Hazard symbol: F+; risk phrases: R12; R51; R62; R63; safety phrases: S2; S9; S16; S29; (*sec-isomer*): Hazard symbol: F; risk phrases: R11; R51; R62; R63; safety phrases: S2; S7/9; S16; S29; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): (*n-& sec-butyl-isomers*) 2-Hazard to water.

Description: Butyl chloride is a highly flammable, clear, colorless liquid. Molecular weight = 92.6 (*n*-and *sec*-isomers); Specific gravity (H_2O:1) = 0.89 @ 15°C (*n*-); 0.8.73 (*sec*-); boiling point = 77°C; 69°C (*sec*-isomer); freezing/melting point = −123°C; vapor pressure = 80 mmHg @ C; Flash point = −9°C (*n*-isomer); −10°C (*sec*-isomer)

Relative vapor density (air = 1) = 3.2 (*n*-and *sec*-isomers); vapor pressure = 81 mmHg @ 20°C; Autoignition temperature = 240°C. Explosive limits: LEL: 1.8%; UEL: 10.1%. Insoluble in water. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 4; reactivity 0 ₩; (*sec*-)Health 2; flammability 4; reactivity 0 ₩. Practically insoluble in water; solubility = 0.7% @ 12°C.

Potential Exposure: Butyl chloride is used as a solvent; as a medicine to control worms, and to make other chemicals.

Incompatibilities: Vapor may form explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Water contact slowly forms hydrochloric acid. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alkaline earth, and alkali metals; finely divided metal. Attacks metals in presence of moisture. Attacks some plastics, rubber, or coatings.

Permissible Exposure Limits in Air

PAC-1: 4.1 ppm

PAC-2: 45 ppm

PAC-3: 340 ppm

78-86-4 (sec-)

PAC-1: 0.34 ppm

PAC-2: 3.8 ppm

PAC-3: 340 ppm

Norway: TWA 0.5 ppm (1.5 milligram per cubic meter), 1999; Russia: STEL 0.5 milligram per cubic meter, [skin], 1993

Determination in Water: Toxic to aquatic organisms.

Determination in water: Octanol−water coefficient: Log K_{ow} = 2.6.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Butyl chloride can affect you when breathed in. High levels can cause you to feel dizzy, lightheaded, and pass out. Very high levels can affect the nervous system and cause death. *sec*-Butyl chloride and *tert*-butyl chloride may have similar effects.

Long-Term Exposure: Unknown at this time. May affect the nervous system.

Points of Attack: Eyes, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to Butyl chloride, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Butyl chloride is incompatible with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates). Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Butyl chloride is handled, used, or stored. Metal containers involving the transfer of five gallons or more of Butyl chloride should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of Butyl chloride.

Shipping: UN1127 Chlorobutanes require, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phosgene. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 208-840-1

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Flammable liquid, Corrosive, Dangerously water reactive, Possible environmental hazard.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazard symbols, risk, & safety statements: Hazard symbol: F, T+, C, N; risk phrases: R11; R20; R23; R24; R26; R34; R35; R36/37/38; R51; safety phrases: S26; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: A combustible, colorless to light-colored liquid. Molecular weight = 136.58; specific gravity (H_2O:1) = 1.04 @ 20°C; 1.053; boiling point = 128.7°C; vapor pressure = 16.5 mmHg @ 0°C; relative vapor density (air = 1) = 4.7; Flash point = 27°C. Insoluble and sinks in water. Decomposes exothermically in water, releasing hydrogen chloride fumes.

Potential Exposure: This is a high volume chemical with production exceeding 1 million pounds annually in the U.S [Scorecard]. No specific use found.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alcohols, ethers, amines. Forms explosive mixture with air above flash point (27°C). Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Decomposes exothermically in water. Reacts with moisture in air to produce highly corrosive and toxic fumes of hydrogen chloride gas.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 0.6 ppm

PAC-2: $\mathbf{2.2}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{6.7}_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.2 ppm, 1.1 milligram per cubic meter; Peak limitation category I(2); Pregnancy risk group C

Permissible Concentration in Water:

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.53. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Very corrosive to skin, eyes, and mucous membranes. Very toxic by ingestion, inhalation and skin absorption. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Eye irritant-severe; respiratory irritant-acute, severe, or moderate but not mild effects; Skin irritant-severe; gastrointestinal tract-acute effects

Long-Term Exposure: Repeated or prolonged exposure may cause lung damage.

Points of Attack: Respiratory system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Rinse out mouth and *do not* induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. Rest and medical observation is essential. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to this chemical, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: PIH; check oxygen content prior to entering storage area. Poison, Corrosive, flammable liquid. (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (3) Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition.

Shipping: UN2742 Chloroformates, toxic, corrosive, flammable, n.o.s., Hazard class: 6.1; Labels: 6.1—Poison Inhalation Hazard, 8—Corrosive material; 3—Flammable liquid; Technical Name Required, Potential Inhalation Hazard (Special Provision 5). PG II. UN3390 Toxic by inhalation liquid, corrosive, n.o.s. with an LC_{50} $\leq 1000\ mL/m^3$ and saturated vapor concentration ≥ 10 LC_{50}, Hazard Class: 6.1; Labels: 6.1—Poisonous materials, 8—Corrosive material, Technical Name Required, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.4/0.6

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Reacts violently with water. Thermal decomposition products may include phosgene, hydrogen chloride, and oxides of carbon. *Note*: Most foams will react with the material and release corrosive/toxic gases. *Small fire*: Use carbon dioxide, dry chemical, dry sand, alcohol-resistant foam. *Large fire*: Water spray, fog or alcohol-resistant foam.

For chlorosilanes, do not use water; use AFFF alcohol-resistant medium-expansion foam. Move containers from fire area if you can do it without risk. Use water spray or fog; do not use straight streams. *Fire involving tanks or car/trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers.

Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire[31].

Disposal Method Suggested: Disposal of unused product must be undertaken by qualified personnel who are knowledgeable in all applicable regulations and follow all pertinent safety precautions including the use of appropriate protective equipment. For proper handling and disposal, always comply with federal, state, and local regulations.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: *tert*-Butyl chromate is a highly flammable, clear, colorless, hygroscopic, corrosive, flammable liquid or red crystals from petroleum ether. Solution in carbon tetrachloride is highly flammable. Molecular weight = 230.3; freezing/melting point = −5 to 0°C; −2.8°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 1; 3 (in carbon tetrachloride solution); reactivity 1 ₩ (Oxidizer)[70]. Soluble in water (hydrolyzed).

Potential Exposure: Butyl chromate is used in specialty reactions as an organic source of chromium; in making catalysts; and as a curing agent for urethane foams.

Incompatibilities: *tert*-Butyl chromate is a strong oxidizer; reacts violently with reducing agents (such as lithium, sodium, aluminum and their hydrides and hydrazine); combustible materials. Water solutions of *tert*-butyl chromate react violently with strong bases. Incompatible with strong acids (i.e., hydrochloric, sulfuric and nitric); alcohols, and easily oxidized materials, such as paper, wood, sulfur, aluminum and plastics.

Permissible Exposure Limits in Air

NIOSH IDLH = 15 mg[Cr(VI)]/m; 30 milligram per cubic meter (as CrO_3)

OSHA PEL: 0.005 mg$[CrO_3]/m^3$ [skin] see 29CFR1910.1026

NIOSH REL: 0.001 mg$[CrO_3]/m^3$ TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See NIOSH Pocket Guide, Application A & C.

ACGIH TLV[1]: 0.01 mg[CrO_3]/m^3 Ceiling concentration [skin], Confirmed Human Carcinogen; BEI issued
No PAC available.

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 2; TRK: 0.05 mg [Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

Denmark: TWA 0.5 mg[Cr]/m^3, 1999; France: VLE 0.1 milligram per cubic meter, [skin], 1999; Japan: 0.5 mg [Cr]/m^3, 1999; the Philippines: TWA 0.1 milligram per cubic meter, [skin], 1993; Switzerland: TWA 0.05 milligram per cubic meter, [skin], 1993; Thailand: TWA 0.1 milligram per cubic meter, 1993; United Kingdom: TWA 0.5 mg[Cr]/m^3, carcinogen, 2000; the Netherlands: MAC 0.1 milligram per cubic meter, [skin], 2003: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.1 milligram per cubic meter [skin]. Several states have set guidelines or standards for *t*-butyl chromate in ambient air[60] ranging from 0.5 μ/m^3 (Virginia) to 1.0 μ/m^3 (North Dakota) to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101, and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible concentration in Water: The EPA[6] has designated chromium as a priority toxic pollutant. State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr(VI)]/L.

Routes of Entry: Inhalation, skin absorption, ingestion and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause severe eye and skin irritation and acid like burns with possible permanent damage to the eyes. Inhalation can cause irritation of the respiratory tract with coughing and wheezing. Exposure can cause head ache, nausea, vomiting, diarrhea, and wheezing. Higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Hexavalent chromium compounds have been determined to be human carcinogens. May cause lung cancer. Breathing this chemical can cause a hole in the "bone" dividing the inner nose (septum), sometime with discharge, bleeding and/or formation of a crust. *tert*-butyl chromate can cause allergies to the skin and lung. Prolonged skin contact can cause, burns, blisters and deep necrotic ulcers. Can cause liver and kidney damage.

Points of Attack: Respiratory system, lungs, skin, eyes, central nervous system.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, CBC; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Consider the points of attack in preplacement and periodic physical examinations: Examination of the skin and nose. Evaluation by a qualified allergist. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Liver and kidney function tests. Urine test for chromates (chemical metabolite). This test is most accurate shortly after exposure. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: In case of fume inhalation, treat pulmonary edema. Consider administering prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics.

Personal Protective Methods: Wear appropriate clothing to prevent any possibility of skin contact. Gloves: Silver Shield/4H; Coveralls: DuPont Tychem CSM, Responder, and TK (for *known carcinogens*). Prevent skin contact (as chromic acid and chromates). **8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm^2/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex-coated suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough $>0.10.1$ μg/cm^2/

min): butyl rubber gloves, suits, boots; Viton gloves, suits. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated and daily at the end of each work shift. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129, chromium(VI).

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Yellow Stripe: Reactivity Hazard (strong oxidizer); Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with *tert*-butyl chromate all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in an explosion-proof refrigerator away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9—Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, sand, water spray; or foam extinguishers. Thermal decomposition products may include oxides of chromium and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard symbols, risk, & safety statements: (106-88-7) Hazard symbol: F, Xn, N; risk phrases: R11; R19; R20/21/22; R36/37/38; R40; R52/53; R62; R63; safety phrases: S2; S9; S16; S21; S29; S36/37; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Butylene oxide is a watery-white liquid with and ethereal odor. Molecular weight = 72.1 (1,2-and 2,3-isomers); Specific gravity (H_2O:1) = 0.83; boiling point = 63.3°C; freezing/melting point = −130°C; vapor pressure = 142 mmHg @ 20°C; 176 mmHg @ 25°C relative vapor density (air = 1) = 2.2; relative density of the vapor/air-mixture @ 20°C (air = 1) = 1.3; Flash point = −22°C; Autoignition temperature = 439°C. Explosive limits in air: LEL: 1.7%; UEL: 19%. Hazard identification (based on NFPA-704 M Rating System) Health 2; flammability 3; reactivity 2 ₩. Soluble in water; solubility = 9.5% @ 25°C.

Potential Exposure: It is used as a stabilizer in chlorinated solvents, and to make other chemicals, such as gasoline additives.

Incompatibilities: May form explosive mixture with air. Unless inhibited, can form unstable and explosive peroxides. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Polymerization will occur in the presence of acids, strong bases and chlorides of tin, iron and aluminum. Storage tanks and other equipment should be absolutely dry and free from air, ammonia, acetylene, hydrogen sulfide, rust and other contaminants. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some plastics. May accumulate static electric charges that can result in ignition of its vapors. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

106-88-7

PAC-1: $\mathbf{72}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{140}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{330}_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minutes values.

DFG MAK: [skin] Carcinogen Category 2

Austria: [skin], carcinogen, 1999

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.4. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Butylene oxide can cause severe irritation of the eyes, skin, and respiratory tract, with coughing and/or shortness of breath. High exposures can cause dizziness, lightheadedness and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: 1,2-Butylene oxide is possibly carcinogenic to humans. It may cause mutations and damage to the developing fetus. Prolonged or repeated skin contact may cause blisters or other disorders. 2,2-Butylene oxide may affect the nervous system.

Points of Attack: Skin, lungs, central nervous system; reproductive system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical acid all handlers should be trained on its proper handling and storage. Protect against physical damage. Store only if inhibited. Outside or detached storage is preferred. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3022 1,2-Butylene oxide, stabilized, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquid in vermiculite, dry sand; earth or similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Butyl Ether B:0920

Formula: $C_8H_{18}O$; $C_4H_9OC_4H_9$

Synonyms: 1-Butoxybutane; Di-*n*-butyl ether; Dibutyl ether; Dibutyl oxide; Ether butylique (French); 1,1′-Oxybis (butane); 1,1-Oxybis-butane

CAS Registry Number: 142-96-1
HSDB Number: 306 as dibutyl ether
RTECS Number: EK5425000
UN/NA & ERG Number: UN1149/128
EC Number: 205-575-3 [*Annex I Index No.:* 603-054-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi, N; risk phrases: R11; R 36/37/38; R52/53; safety phrases: S2; S21; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Butyl Ether is a flammable, colorless liquid with a mild, ethereal odor. Molecular weight = 130.3. Boiling point = 142°C; specific gravity (H_2O:1) = 0.77; freezing/melting point = −985°C; Vapor pressure = 8 mmHg @ 25°C; relative vapor density (air = 1) = 4.48; flash point = 25°C; Autoignition temperature = 194°C. Explosive limits: LEL: 1.5%, 15,000 ppm; Explosive limits in air: LEL: 7.6%. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 3; reactivity 1 ₩. Insoluble in water.

Potential Exposure: It is used as a solvent for hydrocarbons, fatty materials; extracting agent in used metals separation; solvent purification, making other chemicals.

Incompatibilities: May form explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Incompatible with strong acids; oxidizers. Contact with air or light may form unstable and explosive peroxides, especially anhydrous form.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 2.6 ppm
PAC-2: 29 ppm
PAC-3: 170 ppm

Determination in Water: Octanol−water coefficient: Log K_{ow} => 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation of vapor, skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: May be poisonous if inhaled or absorbed through skin. Inhalation of vapors may cause dizziness or suffocation. Skin or eye contact may cause irritation. Repeated or prolonged skin contact may cause rash. The vapor irritates the nose, throat and bronchial tubes and may cause nose bleeds, hoarseness, cough, phlegm and/or tightness in the chest. Overexposure can also cause headache and make you feel dizzy and lightheaded. Higher levels can cause unconsciousness and even death.

Points of Attack: Skin, eyes, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to butyl ether, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl ether all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Butyl ether must be stored in a cool, dark place, separated from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where Butyl ether is handled, used or stored. Metal containers involving the transfer of 5 gallons or more of butyl ether should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Butyl ether.

Shipping: UN1149 Butyl ethers & Dibutyl ethers, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

TSCA: 716.120(c); 40CFR712.30(d)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R10; R20/22; R37; R40; R43; R52/53; R62; R63; R68; safety phrases: S2; S24/25; S36/37; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *n*-Butyl glycidyl ether is a colorless liquid with slight irritating odor. Molecular weight = 130.2; specific gravity (H_2O:1) = 0.92 @ 20°C; boiling point = 169°C; relative vapor density (air = 1) = 4.5; vapor pressure = 3.2 mmHg @ 25°C; flash point = 58°C. Explosive limits in air: LEL: 11,580 ppm; soluble in water; solubility 2% @ 20°C.

Potential Exposure: NIOSH has estimated human exposures @ 18,000. Used as reactive diluent for epoxy resins, flooring, laminating, and electrical; and as a stabilizer, viscosity-reducing agent, as acid acceptor for solvents; and as a chemical intermediate.

Incompatibilities: May form explosive mixture with air. Air and light form unstable and explosive peroxides. Contact with strong oxidizers may cause fire and explosions. Contact with strong caustics may cause polymerization. Attacks some plastics and rubber.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 ppm

Conversion factor: 1 ppm = 5.33 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 50 ppm/270 milligram per cubic meter TWA

NIOSH REL: 5.6 ppm/30 milligram per cubic meter [15-minutes] Ceiling Concentration

ACGIH TLV[1]: 3 ppm/16 milligram per cubic meter [skin, sensitizer]

PAC Ver. 29[138]

PAC-1: 9 ppm

PAC-2: 580 ppm

PAC-3: 3500 ppm [>= 10% LEL, lower explosive limit but <50% LEL]

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 3B; Germ Cell Mutation Category 2

Australia: TWA 25 ppm (135 milligram per cubic meter), 1993; Austria: Suspected: carcinogen, 1999; Belgium: TWA

25 ppm (133 milligram per cubic meter), 1993; Denmark: TWA 6 ppm (30 milligram per cubic meter), 1999; Finland: STEL 25 ppm (135 milligram per cubic meter), [skin], 1999; France: VME 25 ppm (135 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 135 milligram per cubic meter, 2003; the Philippines: TWA 50 ppm (270 milligram per cubic meter), 1993; Sweden: NGV 10 ppm (50 milligram per cubic meter), TKV 15 ppm (80 milligram per cubic meter), 1999; Switzerland: MAK-W 25 ppm (135 milligram per cubic meter), KZG-W 50 ppm (270 milligram per cubic meter), [skin], 1999; Turkey: TWA 50 ppm (270 milligram per cubic meter), 1993; United Kingdom: TWA 25 ppm (135 milligram per cubic meter), 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 25 ppm. Several states have set guidelines or standards for butyl glycidyl ether in ambient air[60] ranging from 1.35 milligram per cubic meter (Connecticut and North Dakota) to 2.25 milligram per cubic meter (Virginia) to 3.21 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #1616 and OSHA Analytical Method 7, Organic Vapors.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of eyes, skin, and respiratory tract with wheezing and coughing. Exposure can cause headache, lightheadedness, dizziness, lack of coordination; and fainting. High levels can cause unconsciousness and even death. LD_{50} = (oral-rat) 2050 mg/kg (slightly toxic).

Long-Term Exposure: There is limited evidence that this chemical can cause mutations. *n*-Butyl glycidyl ether may cause skin allergy. DFG lists danger of skin and respiratory sensitization. May cause lung and liver disorders.

Points of Attack: Eyes, skin, respiratory system; central nervous system. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Evaluation by a qualified allergist. Pulmonary function tests, expired air. Liver function tests. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *56 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *140 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]. *250 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where *n*-butyl glycidyl ether may be present, check to make sure that an explosive concentration does not exist. Store in a fireproof refrigerator in tightly closed containers under an inert atmosphere[52], separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3—Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb spills with paper or other absorbent material. Seal in vapor-tight plastic bags or sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray, alcohol, or polymer foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[24].

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Highly flammable liquid, Polymerization hazard, Dangerously water reactive, Sensitizer (lungs), Electrostatic hazard.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, T+; risk phrases: R11; R19; R21/22; R26; R34; R37; R42/42; safety phrases: S21; S23; S26; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1—Low hazard to water.

Description: Colorless, flammable liquid. Molecular weight = 99.13; specific gravity (H_2O:1) = 0.88 @ 20°C; boiling point = 115°C; freezing/melting point = −73°C; vapor pressure = 18 mmHg @ 25°C; relative vapor density (air = 1) = 3.00; flash point = 18.9°C; Autoignition temperature => 400°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 2 ₩ (dangerously water reactive). Henry’s Law constant = 2.1×10^{-3} atm m^3/mol @ 25°C (est.)[72]. Slightly soluble in water; solubility = 1.4×10^3 mg/L @

25°C (est.)[72]. Reaction with water can release hydrogen cyanide.

Potential Exposure: *N*-Butyl isocyanate is used as a reagent in organic synthesis; used as intermediates in production of pharmaceuticals, carbamate and urea insecticides, and fungicides. It is also used in the production of sulfonylurea antidiabetic drugs[72].

Incompatibilities: Vapor may form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acylchlorides may cause explosive polymerization. Contact with metals may evolve flammable hydrogen gas. Attacks some plastics, rubber and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air:
PAC* Ver. 29[138]
PAC-1: $\mathbf{0.01_A}$ ppm
PAC-2: $\mathbf{0.083_A}$ ppm
PAC-3: $\mathbf{0.25_A}$ ppm
*AEGLs are marked with a subscript "**A**" and correspond to 60 minutes values.

Permissible Concentration in Water: Soluble in water, reacts slowly

Determination in Water: Octanol–water coefficient: Log $K_{ow} = < 2.26$ (est.)[72]. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion or skin/eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Toxic. Inhalation, ingestion or contact (skin, eyes) with vapors or substance may cause severe injury, burns or death. Reaction with water or moist air will release toxic, corrosive or flammable gases. Eye irritant-severe; Eye-acute effects other than irritation; Respiratory irritant-acute, severe, or moderate but not mild irritant effects; Skin irritant-severe; Nervous system toxin-acute effects; Narcotic; Respiratory toxin-acute effects other than severe or moderate irritation; Gastrointestinal tract-acute effects[138]. LD_{50} = (oral-rat) 600 mg/kg.

Long-Term Exposure: Respiratory toxin-chronic effects; Respiratory sensitizer

Points of Attack: Lungs

Medical Surveillance: Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Lung function test.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations *only*; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: Where there is potential exists for exposure to butyl isocyanate use respirators and components tested and approved under appropriate government standards: NIOSH/MSHA or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous flow mode.

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet at 2–8°C. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Keep away from moisture, water, steam. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a fireproof refrigerator in tightly closed containers under an inert atmosphere[52], separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2485 *n*-Butyl isocyanate, Hazard Class: 6.1; Labels: 6.1—Poison Inhalation Hazard, 3—Flammable liquid. Hazard, Inhalation Hazard Zone B. PGI.

Spill Handling:

***n*-Butyl isocyanate**

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.5/0.8
Night 1.1/1.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 2.5/4.1
Night 4.2/6.8

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill:* Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Stop the release if it can be done safely from a distance. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors-contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Consider application of alcohol-resistant (AFFF) foam to large areas of spilled liquid to control vapors. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Highly flammable, easily ignited by heat, sparks or flames. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Substance will slowly react with water, releasing flammable hydrogen gas. *Note:* Most foams will react with this chemical, releasing toxic and corrosive gases. *Small fire*: Use CO_2, dry chemical, dry sand, alcohol-resistant foam. Containers may explode when heated or if contaminated with water. Vapors may form explosive mixture with air: indoors, outdoors and sewers explosion hazards. Vapors are heavier than air; they will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flashback. Runoff from fire control or dilution water may be corrosive and/or toxic and cause pollution. Stay upwind and uphill. Remove all ignition sources. All equipment used to handle this material must be grounded. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. Wear positive-pressure, SCBA. Wear chemical protective clothing which is specifically recommended by the manufacturer. Structural firefighter's protective clothing provides only limited protection. *Small fire*: Extinguish with *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. *Large fire*: Use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. Always stay away from ends of tanks, especially when engulfed in flames. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. Use a licensed professional waste disposal service to dispose of this material. *Caution:* this chemical is highly flammable with a low flash point (<20°C). Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: A clear, colorless, flammable liquid. Pungent odor. Molecular weight = 99.13; Specific gravity (H_2O:1) = 0.867 @ 25°C; boiling point = 85.5°C; relative vapor density (air = 1) = 3.00; flash point = −3.5°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 3; reactivity 2 ₩ (dangerously water reactive). Less dense than water; insoluble. Slow reaction with water is dangerous.

Potential Exposure: *tert*-Butyl isocyanate is used as a reagent in organic synthesis; used as intermediates in production of pharmaceuticals and other chemicals.

Incompatibilities: Highly flammable liquid and vapor; forms explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acyl-chlorides may cause explosive polymerization. Attacks some plastics, rubber and coatings. Contact with metals may evolve flammable hydrogen gas. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 0.0099 milligram per cubic meter
PAC-2: 0.11 milligram per cubic meter
PAC-3: 0.65 milligram per cubic meter

Determination in Water: Octanol−water coefficient: Log K_{ow} = Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Ingestion, inhalation, skin/eye absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Very toxic and corrosive by inhalation, ingestion and skin or eye absorption. May be fatal if inhaled. Extremely irritating and possibly destructive, possibly burns, to the skin, eyes and upper respiratory tract. May cause inflammation, spasms, cough, wheezing and shortness of breath. Exposure may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Nausea, allergy of skin and lungs, and severe headache can occur. Poisonous if ingested. LD_{50} = (oral-rat) <400 mg/kg.

Long-Term Exposure: May cause skin and respiratory tract sensitization, allergies.

Points of Attack: Skin, lungs and respiratory tract.

Medical Surveillance Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose lung and/or skin allergy.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations *only*; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: Wear positive pressure SCBA. Where there is potential exists for exposure to butyl isocyanate use respirators and components tested and approved under appropriate government standards: NIOSH/MSHA or European Standard EN149-approved [ABEK (EN 14387)] supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous flow mode.

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet at 2−8°C. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Keep away from moisture, water, steam. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a fireproof refrigerator in tightly closed containers under an inert atmosphere[52], separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2484 *tert*-Butyl isocyanate, Hazard class: 6.1; Labels: 6.1—Poison Inhalation Hazard, 3—Flammable liquid. Inhalation Hazard Zone A. PGI.

Spill Handling:

tert-Butyl isocyanate

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908)548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 1.7/2.7

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 2000/600
Then: Protect persons downwind (mi/km)
Day 4.5/7.24
Night 7+/11.27

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Vapors heavier than air. Thermal decomposition products may include toxic oxides of nitrogen and carbon. Highly flammable: Easily ignited by heat, sparks or flames. Vapors may form explosive mixture with air:indoors, outdoors, and sewers explosion hazards. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flashback. Those substances designated with a (P) may polymerize explosively when heated or involved in a fire. Substance will react with water (some violently) releasing flammable, toxic or corrosive gases and runoff. Contact with metals may evolve flammable hydrogen gas. Containers may explode when heated or if contaminated with water.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. Use a licensed professional waste disposal service to dispose of this material. *Caution:* this chemical is highly flammable with a very low flash point (−3.5°C). Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Butyl Isovalerate B:0940

Formula: $C_9H_{18}O_2$: $CH_3CH_2CH(CH_3)COOC_4H_9$

Synonyms: Butanoic acid, 3-methyl-, butyl ester*;* *n*-Butyl isopentanoate*;* *n*-Butyl isovalerate; Butyl isovalerianate; Butyl 3-methyl-butyrate; Isovaleric acid, butylester

CAS Registry Number: 109-19-3

HSDB Number: 6383

RTECS Number: NY1502000

UN/NA & ERG Number: UN1993 (flammable liquids, n.o.s.)/128; UN3272 (Esters, n.o.s.)/127

EC Number: 203-654-7

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R10; R36/37/38; R51; safety phrases: S26; S36; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Butyl Isovalerate is a clear liquid. Molecular weight = 158.27; specific gravity = 0.87.4@ 20°C; boiling point = 150°C; flash point = 53°C. Hazard identification (based on NFPA 704 M Rating System): Health 0; flammability 2; reactivity 0 ₩. Very slightly soluble in water.

Potential Exposure: May be used as a specialty solvent; food additive.

Incompatibilities: Vapor may form explosive mixture with air. Reaction, possibly violent, on contact with oxidizers. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Toxic to aquatic organisms. Octanol−water coefficient: Log $K_{\mathrm{ow}} = < 3.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Avoid skin and eye contact. Do not inhale mists or vapors. Symptoms include headache; muscle weakness; giddiness, nausea, vomiting, confusion, delirium, coughing, labored and difficult breathing; coma and even death. This ester is a skin irritant, and has a high oral toxicity; the oral LD_{50} for rabbit is 8.2 mg/kg. Toxicity information of this chemical is grouped with *n*-butyl acetate. It is classified as moderately toxic. Probable oral lethal dose for humans is 0.5−5 g/kg (between 1 ounce and a pint) for a 150 lb person. It is a mild irritant and central nervous depressant. Also, it is less toxic than the parent alcohol.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective, thick nitrile rubber or latex gloves and clothing to prevent any reasonable probability of skin or eye contact. Avoid the use of natural rubber, textile, leather or other synthetic material (e.g., PVC, butyl rubber, etc.) gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where butyl isovalerate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3272 Ethers, n.o.s., Hazard class: 3; Labels: 3—Flammable liquid. UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3—Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R10; R36/37/38; safety phrases: S26; S36; S37/38 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Butyl lactate is a liquid. Molecular weight = 146.19; boiling point = 170°C @ 760 mmHg; freezing/melting point = −43°C; flash point = 71°C (oc)[17]. Autoignition temperature = 340−382°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 2; reactivity 0 ₩. Slightly soluble in water.

Potential Exposure: Butyl lactate is used in making paints, inks, perfumes, dry cleaning fluids; as a resin solvent in varnishes and lacquers.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 ppm/25 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/30 milligram per cubic meter TWA

Australia: TWA 5 ppm (25 milligram per cubic meter), 1993; Belgium: TWA 5 ppm (30 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (25 milligram per cubic meter), 1999; Finland: TWA 1 ppm (6 milligram per cubic meter); STEL 3 ppm (18 milligram per cubic meter), 1999; France: VME 5 ppm (25 milligram per cubic meter), 1999; Norway: TWA 5 ppm (25 milligram per cubic meter), 1999; Switzerland: MAK-W 5 ppm (30 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 20 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 ppm.

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation to the eyes, skin, nose, throat, and may cause headaches and cough. Symptoms may also include drowsiness, CNS depression; nausea, vomiting. At concentrations of 7 ppm with short peaks of 11 ppm, workers experienced headaches, upper respiratory system irritation and coughing. Some complained of sleepiness and headache in the evening after work and occasional nausea and vomiting was experienced. When exposures were below 1.4 ppm, however, no symptoms were manifested.

Long-Term Exposure: Headaches, feeling sleepy, and nausea may develop in the evening after exposure during the day.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where butyl lactate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: A UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3—Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xn; risk phrases: R11; R20/22; R21/22; R36/37/38; R50; R62; safety phrases: S9; S16; S21; S23; S26; S33; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Butyl mercaptan is a flammable, colorless liquid with a strong, skunk-like odor. The Odor Threshold in air is 0.00097 ppm. Molecular weight = 90.19; Specific gravity (H_2O:1) = 0.83 @ 20°C; boiling point = 99°C;

freezing/melting point = −116°C; vapor pressure = 35 mmHg @ 20°C; 75 mmHg @ 34.5°C; relative vapor density (air = 1) = 3.1; Flash point = 2°C (cc)[17]; Autoignition temperature ≤225°C. Explosive limits: LEL: 1.4%; UEL: 10.2%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 0 ₩. Slightly soluble in water; solubility = 0.06% @ 20°C.

Potential Exposure: The major use is in the production of organophosphorus compounds, thiolcarbamates; more specifically insecticides, herbicides, acaricides, and defoliants.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some plastics and rubber.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

OSHA PEL: 10 ppm/35 milligram per cubic meter TWA

NIOSH REL: 0.5 ppm/1.8 milligram per cubic meter [15-minutes] Ceiling Concentration

ACGIH TLV[1]: 0.5 ppm/1.8 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 4.5 ppm

PAC-2: 50 ppm

PAC-3: 2500 ppm [>= 10% LEL, lower explosive limit but <50% LEL]

DFG MAK: 0.5 ppm/1.9 milligram per cubic meter TWA; Peak limitation II(2)

Austria: MAK 0.5 ppm (1.5 milligram per cubic meter), 1999; Denmark: TWA 0.5 ppm (1.5 milligram per cubic meter), 1999; Finland: TWA 0.5 ppm (1.5 milligram per cubic meter); STEL 1.5 ppm (4.5 milligram per cubic meter), 1999; France: VME 0.5 ppm (1.5 milligram per cubic meter), 1999; India: TWA 0.5 ppm (1.5 milligram per cubic meter), 1993; Poland: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 1.5 milligram per cubic meter, 2003; Switzerland: MAK-W 0.5 ppm (1.9 milligram per cubic meter), KZG-W 1 ppm (3.8 milligram per cubic meter), 1999; Turkey: TWA 10 ppm (35 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: 0.5 ppm TLV. Several states have set guidelines or standards for butyl mercaptan in ambient air[60] ranging from 5 μ/m^3 (New York) to 15 μ/m^3 (North Dakota and South Carolina) to 25 μ/m^3 (Virginia) to 30 μ/m^3 (Connecticut) to 36 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #2525 and #2542

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient water limit of 21 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Octanol−water coefficient: Log $K_{ow} = 2.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

In animals-narcosis, in coordination, weakness; cyanosis, pulmonary irritation, eye irritation; paralysis. LD_{50} = (oral-rat) 1500 mg/kg (slightly toxic).

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact can cause a skin rash. The substance may affect the thyroid gland. High concentrations can cause weakness, nausea, dizziness, headache, and confusion. Very high concentrations (above the occupational exposure limit) exposure may affect the CNS and cause unconsciousness. In animals: narcosis, loss of coordination; lassitude (weakness, exhaustion); cyanosis, pulmonary irritation; liver, kidney damage

Long-Term Exposure: Repeated exposure can cause skin rash and affect eyes, skin, respiratory system; CNS; liver, and kidneys

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *5 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *12.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]. *25 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *500 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store in tightly closed containers in a cool, well-ventilated area away from heat, oxidizers, or acids.

Shipping: UN2347 Butyl mercaptan, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stop discharge if possible. Evacuate area in case of large spill. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of sulfur and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam (preferred) extinguishers. Water may be ineffective in firefighting. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (1093°C) followed by scrubbing with a caustic solution.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Butyl methacrylate is a flammable, colorless liquid with a mild odor. Molecular weight = 142.22; specific gravity (H_2O:1) = 0.884 @ 20°C; boiling point = 163°C; freezing/melting point = −75°C; relative vapor density (air = 1) = 4.9; vapor pressure = 2 mmHg @ 20°C; flash point = 52°C (oc); Autoignition temperature = 294°C.

Explosive limits: LEL: 2.8%, 28,000 ppm[138]; UEL: 8%. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0 ₩. Practically insoluble in water; solubility = 0.6% @ 20°C.

Potential Exposure: Butyl methacrylate is used in resins, solvents, coatings, adhesives, dental materials and textile emulsions.

Incompatibilities: Forms an explosive mixture with air. Unless inhibitor is maintained at the proper level, oxidizers, heat, ultraviolet light, contamination, or moisture may cause polymerization. May accumulate static electrical charges and cause ignition of its vapors.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 19 milligram per cubic meter

PAC-2: 210 milligram per cubic meter

PAC-3: 1300 milligram per cubic meter

DFG MAK: [skin] Danger of skin sensitization.

Denmark: TWA 50 ppm (290 milligram per cubic meter), 1999; Russia: STEL 30 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (300 milligram per cubic meter), KTV 75 ppm (450 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 59 milligram per cubic meter, 2003.

Determination in Air: No criteria set.

Determination in water: No criteria set. Octanol−water coefficient: Log $K_{ow} = 2.26-3.01$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes and skin. Inhalation can irritate the respiratory tract with coughing, wheezing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Butyl methacrylate may cause skin allergy. There is limited evidence that this chemical is teratogen in animals.

Points of Attack: Skin, reproductive system.

Medical Surveillance: Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Protect against physical damage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Outside or detached storage is preferred. Prior to working with butyl methacrylate all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above, light and heat. Butyl methacrylate should be kept refrigerated and inhibited with 10 ppm hydroquinone monomethylether.

Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2227 Butyl methacrylate, stabilized, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquid in vermiculite, dry sand; earth or similar material and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazard Alert: *all isomers*: Poison, Combustible, Corrosive; *p-tert*-isomer: Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), (*o-sec*-and *o-tert*-isomers): Primary irritant (w/o allergic reaction), Environmental hazard.

o-sec-isomer: United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Canceled (*p-tert-isomer*)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. (*o-sec*-; *p-tert*-; *p*-; *o*-; *m*-; *p-tert*-isomers).

Hazard symbols, risk, & safety statements: Hazard Symbol: C; risk phrases; R20/21/22; R34; R62-(*p-tert*-isomer); safety phrases: S26; S27; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*o-, sec*-and *o-tert-isomers*)

Description: The butylphenols include several isomers. Solid butylphenols (28805-86-9) generally have properties similar to the above: Molecular weight = 150; specific gravity (H_2O:1) = 1037 @ 25°C; boiling point = 240°C @ 750 mmHg; freezing/melting point = 97−99°C; flash point = 113°C. The two most highly regulated are o-*sec*-butylphenol and *p-tert*-butylphenol. Their properties are as follows: *o-sec-isomer* (89-72-5): Colorless liquid or solid (below 16°C). Molecular weight = 150.22; boiling point = 108°C; Flash point = 108°C. Insoluble in water. *p-tert-isomer* (98-54-4): White crystalline solid. Molecular weight = 150.24; boiling point = 237°C; freezing/melting point = 97°C; flash point = 115°C (oc); Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0 ₩. Insoluble in water.

Potential Exposure: Butylphenols may be used as intermediates in manufacturing varnish and lacquer resins; as a germicidal agent in detergent disinfectants; as a pour point depressant, in motor-oil additives; de-emulsifier for oil; soap-antioxidant, plasticizer, fumigant, and insecticide.

Incompatibilities: Vapors may form explosive mixture with air. These phenol/cresol materials can react with oxidizers; reaction may be violent. Incompatible with strong reducing substances such as hydrides, nitrides, alkali metals, and sulfides. Flammable gas (H_2) is often generated, and the heat of the reaction may cause the gas to ignite and explode. Heat is also generated by the acid-base reaction with bases; such heating may initiate polymerization of the organic compound. React with boranes, alkalies, aliphatic amines, amides, nitric acid, sulfuric acid. Phenols are sulfonated very readily (for example, by concentrated sulfuric acid at room temperature). These reactions generate heat. Phenols are also nitrated very rapidly, even by dilute nitric acid and can explode when heated. Many phenols form metal salts that may be detonated by mild shock[101].

Permissible Exposure limits in Air

Conversion factor: 1 ppm = 6.14 milligram per cubic meter @ 25°C & 1 atm

89-72-5, o-sec-isomer

OSHA PEL: None

NIOSH REL: 5 ppm/30 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 5 ppm/31 milligram per cubic meter TWA [skin]

Australia: TWA 5 ppm (30 milligram per cubic meter), [skin], 1993; Austria: MAK 5 ppm (30 milligram per cubic meter), 1999; Belgium: TWA 5 ppm (31 milligram per cubic meter), [skin], 1993; Denmark: TWA 5 ppm (30 milligram per cubic meter), [skin], 1999; France: VME 5 ppm (30 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 5 ppm (30 milligram per cubic meter), [skin], 1999; United Kingdom: TWA 5 ppm (31 milligram per cubic meter), [skin], 2000; the Netherlands: MAC-TGG 30 milligram per cubic meter, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam, Israel: TWA 5 ppm [skin]

98-54-4, p-tert-isomer

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 40 milligram per cubic meter

PAC-3: 240 milligram per cubic meter

DFG MAK: 0.080 ppm/0.5 milligram per cubic meter TWA; Peak Limitation Category II(2); [skin] Danger of skin sensitization; Pregnancy Risk Group D

Australia: TWA 10 ppm (60 milligram per cubic meter); STEL 20 ppm, 1993; Austria: MAK 0.08 ppm (0.5 milligram per cubic meter), [skin], 1999; Denmark: TWA 0.08 ppm (0.5 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 0.08 ppm (0.5 milligram per cubic meter), LZG-(week) 0.4 ppm, [skin], 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2000

Several states have set guidelines or standards for the o-*sec*-isomer in ambient air[60] ranging from 300 μ/m^3 (North Dakota) to 500 μ/m^3 (Virginia) to 600 μ/m^3 (Connecticut) to 714 μ/m^3 (Nevada).

Determination in Air: OSHA Method: PV2085 (*p-tert*-isomer)

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: $\text{Log } K_{ow} = 2.4 - > 3.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation may cause irritation to nose, throat and lungs. Sensitization may occur. Skin contact studies with animals suggest that severe irritation at concentrations above 10% may occur. May cause rash, redness and irritation, especially when skin is wet. Absorption is significant and contact may lead to allergic reaction. Eye studies with animals suggest that severe irritation may occur. Ingestion studies on animals suggest that 8 oz. may be lethal to a 150 lb person. Toxicity by Ingestion: Grade 2; LD_{50} = (rat, oral) 3250 mg/kg[136]

Long-Term Exposure: May cause skin color changes by contact or inhalation of levels between 10 and 100 ppm. Allergy may develop after repeated exposure. Liver damage may also occur. There is limited evidence that butylphenol causes skin cancer in animals. Repeated or prolonged skin contact can cause skin ulcers and lead to permanent loss of skin pigment in affected areas.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *No respirator listed by NIOSH for Butylphenols*. If misting or vapor occur consider using a NIOSH/MSHA (US) or EN 149 (Europe)-approved organic cartridge respirator or NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with butyl phenol all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2430 Alkylphenols, solid, n.o.s. (including C2-C12 homologues), Hazard class: 8; Labels: 8—Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Butylphenol is combustible. Use dry chemical, carbon dioxide; or foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R18; R36/37/38; safety phrases: S2 (in consumer products); S16; S21; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Butyl propionate is a flammable, colorless to straw-yellow liquid with an apple-like odor. Molecular weight = 130.2; boiling point = 145°C; specific gravity

(H_2O:1) = 0.89 @ 0°C; melting/freezing point = −90°C; vapor pressure = 2.9 mmHg @ 20°C; relative density @ 20°C of the saturated vapor/air-mixture (air = 1) = 1.01; flash point = 32°C; Autoignition temperature = 426°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 3; reactivity 0 ₩. Practically insoluble in water.

Potential Exposure: It is used as a solvent or lacquer thinner; and in perfumes and flavorings.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 34 milligram per cubic meter

PAC-2: 370 milligram per cubic meter

PAC-3: 990 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: The substance irritates the eyes, skin, and the respiratory tract.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. Regulatory Authority and Advisory Information

Carcinogenicity: IARC: is not classifiable as to its carcinogenicity to humans., Group 3, 1999.

List 1, DEA chemical code 2011 (Title 21 CFR1310.02) *gamma*-Butyrolactone (GBL; Dihydro-2 (3H)-furanone; 1,2-Butanolide; 1,4-Butanolide; 4-Hydroxybutanoic acid lactone; *gamma*-hydroxybutyric acid lactone)

Hazard Alert: Poison, Flammable, Narcotic, Cholinesterase toxin, Neurotoxin; Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: (106-88-7) Hazard symbol: F, Xn, N; risk phrases: R10; R22; R36; R62; R63; safety phrases: S26; S36; S39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Oily, colorless, clear liquid. Faint, pleasant odor. Molecular weight = 86.1; Specific gravity (H_2O:1) = 1.129 @ 20°C; 1.41 @ 0°C; boiling point = 204−205°C @ 760 mmHg; freezing/melting point = −45°C; vapor pressure = < 1 mmHg @ 25°C; relative vapor density (air = 1) = 3; Henry's Law constant = 5.3×10^{-8} atm m^3/mol @ 25°C (est)[72]. Flash point = 98.3°C; Autoignition temperature −450°C; explosive limits: LEL: 1.4%, 14,000 ppm; UEL 6.9%; Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 2; reactivity 0 ₩. Soluble in water; solubility ≥ 100mg/L @ 12.90°C. Hygroscopic; volatile on contact with steam.

Potential Exposure: Used as a chemical intermediate for making other chemicals, including pesticides, cosmetics, and pharmaceuticals; as a solvent for paint, nail polish removers, and industrial chemicals. Used in electronics, drilling and petroleum industries as a stabilizer and solvent. Used as a flavoring agent in various foods and beverages, including grains and breakfast foods, candy, and alcoholic and nonalcoholic drinks. Drug of abuse: the United States Food and Drug Administration has warned the public not to purchase or consume products, containing *gamma*-butyrolactone (GBL). FDA has also asked the companies that manufacture these products to voluntarily recall them. The agency has received reports of serious health problems—some that are potentially life-threatening—associated with the use of these products. Although labeled as dietary supplements and marketed under various brand names, these products are illegally marketed unapproved new drugs. False advertising claims include building muscles, improved physical performance, enhanced sex, reduced stress and induced sleep.

Incompatibilities: 4-Butyrolactone is incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, alcohols, amines, strong and inorganic acids, strong bases. Rapidly hydrolyzed by bases and slowly hydrolyzed by acids. It is hygroscopic and volatile with steam. Combustible; vapor may form explosive mixture with air.

Permissible Exposure Limits in Air:

PAC Ver. 29[138]

PAC-1: 3.6 milligram per cubic meter

PAC-2: 39 milligram per cubic meter

PAC-3: 310 milligram per cubic meter

Determination in Air: Gas chromatography.

Permissible Concentration in Water: Colorimetric titration

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin and eye contact. May be absorbed through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Toxic, may be harmful if inhaled, swallowed or absorbed through skin. Avoid any eye or skin contact. Effects of contact or inhalation may be delayed. Eye contact may cause serious damage. Vapor may act as an anesthesia, causing dizziness and sleepiness; high levels may cause victim to pass out. Department of Energy profile: Cholinesterase toxin; Eye irritant-severe; Eye-acute effects other than irritation; Respiratory irritant-acute, severe, or moderate but not mild irritant effects; Skin irritant-severe; Heart cardiovascular system-acute effects; Brain-acute effects CNS-acute effects; Narcotic; Nervous system toxin-acute effects.[138] LD_{50} = (oral-rat) >1.5 g/kg. LD_{50} = (inhalation-rat) >5 g/m^3/4H.

Long-Term Exposure: May be narcotic; neurotoxic. Based on animal studied, it may be a tumorigen, mutagen and a reproduction hazard.

Points of Attack: Eyes, central nervous system, Reproductive system.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. Eye examination. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: *Eyes*: first check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20 to 30 minutes. Simultaneously, call a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: immediately flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, immediately call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation*: immediately leave the contaminated area; take deep breaths of fresh air. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician and be prepared to transport the victim to a hospital. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA should be used; if not available, use a level of protection greater than or equal to that advised under protective clothing. *Ingestion*: *do not induce vomiting*. If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and immediately call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. *Do not induce vomiting*. Immediately transport the victim to a hospital.

Personal Protective Methods: Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: Where the neat test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with an organic vapor/acid gas cartridge (specific for organic vapors, HCl, acid gas and SO_2) with a dust/mist filter.

Storage: Color code—Blue: Health Hazard: Store in a secure poison location away from sources of ignition, under refrigerated temperatures (darkens with heat) and protect from contact with moisture, inorganic acids, amines, alcohols, bases and oxidizers. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Listed by some sources as unregulated. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1—Poisonous materials, Technical Name Required.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft. for liquids and at least 25 m/75 ft. for solids. Keep unauthorized personnel away. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind. Keep out of low areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Combustible. Thermal decomposition products include oxides of carbon. Containers may explode when heated. Runoff from fire control or dilution water may be corrosive and/or toxic and may cause pollution. Runoff may pollute waterways. If tank, rail car or tank truck is involved in a fire, isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small Fire*: Fires involving this material can be controlled with a dry chemical, carbon dioxide or Halon extinguisher. *Large Fire*: Water spray, fog or alcohol resistant foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. All federal, state, and local environmental regulations must be observed.

p-tert-Butyltoluene B:1000

Formula: $C_{11}H_{16}$; *p*-$CH_3C_6H_4C_4H_9$

Synonyms: *p*-Methyl-*tert*-butylbenzene; 1-Methyl-4-*tert*-butylbenzene; TBT

CAS Registry Number: 98-51-1

HSDB Number: 5008

RTECS Number: XS8400000

UN/NA & ERG Number: UN2667/152

EC Number: 202-675-9

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable liquid, Primary irritant (w/o allergic reaction), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xn; risk phrases: R10; R20/21/22; R23/24/25; R36/37/37; R50; safety phrases: S16; S26; S29; S36/37/39; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: *p-tert*-Butyltoluene is a colorless liquid. Aromatic gasoline-like odor. Molecular weight = 148.18; boiling point = 193-194°C; boiling point = 192.78°C; freezing/melting point = −52.2°C; vapor pressure = 0.68 mmHg @20°C; flash point = 57.8°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0 ₩. Insoluble in water.

Potential Exposure: This material is used as a solvent for resins and as an intermediate in organic synthesis.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 6.07 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/60 milligram per cubic meter TWA

NIOSH REL: 10 ppm/60 milligram per cubic meter TWA; 20 ppm/120 milligram per cubic meter STEL

ACGIH TLV[1]: 1 ppm/6.1 milligram per cubic meter TWA

No PAC available.

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 10 ppm (61 milligram per cubic meter); STEL 20 ppm, 1993; Austria: MAK 10 ppm (60 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (60 milligram per cubic meter), 1999; Finland: TWA 10 ppm (60 milligram per cubic meter); STEL 20 ppm (120 milligram per cubic meter) [skin] 1999; France: VME 10 ppm (60 milligram per cubic meter), 1999; Norway: TWA 10 ppm (60 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 6.1 milligram per cubic meter, 2003; Switzerland: MAK-W 10 ppm (60 milligram per cubic meter), KZG-W 20 ppm (120 milligram per cubic meter), 1999; Turkey: TWA 10 ppm (60 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 ppm. The state of Virginia has set a limit in ambient air[60] of 1.0 milligram per cubic meter. Several states have set guidelines or standards for this compound in ambient air[60] ranging from 600 to 1200 μ/m^3 (North Dakota) to 1000 μ/m^3 (Virginia) to 1200 μ/m^3 (Connecticut) to 1429 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 1501

Aromatic hydrocarbons or OSHA Analytical Method 7, Organic Vapors[18].

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract; dry nose and throat; and headaches; low blood pressure; tachycardia; abnormal cardiovascular system behavior; CNS depression; hematopoietic depression. LD_{50} = (oral-rat) 1500 mg/kg (slightly toxic). This chemical may cause effects on the CNS.

Long-Term Exposure: The liquid defats the skin, and may have effects on the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system; cardiovascular system; central nervous system; bone marrow, liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. CBC, electrocardiogram.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves; Viton gloves, suits. **4 hours:** (At least 4 but <8 hours of resistance to breakthrough >0.1 $0.1\ \mu g/cm^2/min$): nitrile, 4 H and Silver Shield gloves. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: *100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOv (APF = 25) [any PAPR with organic vapor cartridge (s)]; or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2667 Butyltoluenes, Hazard Class: 6.1; Labels: 6.1—Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably in admixture with a more flammable solvent[24].

Butyl Trichlorosilane B:1010

Formula: $C_4H_9Cl_3S$; $CH_3(CH_2)_3SiCl_3$

Synonym s: *n*-Butiltriclorosilano (Spanish); Butylsilicon trichloride*;* *n*-Butyltrichlorosilane

CAS Registry Number: 7521-80-4

HSDB Number: 283

RTECS Number: VV2080000

UN/NA & ERG Number: UN1747/155

EC Number: 231-38-3

Regulatory Authority and Advisory Information

Department of Homeland Security Screening TQ (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Flammable, Corrosive, Violently water reactive.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C; risk phrases: R10; R14; R34; safety phrases: S1; S26; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Butyl trichlorosilane is a colorless liquid. Molecular weight = 191.57. Specific gravity (H_2O:1) = 1.16 @ 20°C; boiling point = 149°C; flash point = 45°C (cc); 54°C (oc)[17]. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 2 ₩. Insoluble in water. Reacts violently with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: This is a raw material for silicone resin production.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids genera ting toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.6_A}$ ppm

PAC-2: $\mathbf{7.3_A}$ ppm

PAC-3: $\mathbf{33_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60 minutes values.

Routes of Entry: Inhalation, skin, eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Butyl trichlorosilane is a corrosive chemical and can cause severe eye burns leading to permanent damage. Contact can cause severe skin burns. Exposure to vapors can irritate the eyes, nose and throat. Butyl trichlorosilane can affect you when breathed in. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposure can cause a build-up of the fluid in the lungs (pulmonary edema). This can cause death.

Long-Term Exposure: Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of butyl trichlorosilane to potentially exposed workers.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl trichlorosilane all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1747 Butyl trichlorosilane, Hazard class: 8; Labels: 8—Corrosive material, 3—Flammable liquid.

Spill Handling:

Butyl trichlorosilane ***when spilled on water.***

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.1/1.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products include hydrogen chloride, chlorine, phosgene, and oxides of carbon. Use dry chemical or carbon dioxide. Foam extinguishers are not recommended. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

HSDB Number: 6384

RTECS Number: KN5900000

UN/NA & ERG Number: UN2352/127 (P)

EC Number: 203-860-7

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Polymerization hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F; risk phrases: R11; R19; R51; safety phrases: S9; S14; S16; S21; S33; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Butyl vinyl ether is an extremely flammable, colorless liquid. ether like odor. Molecular weight = 100.2; specific gravity (H_2O:1) = 0.8; boiling point = 94°C; freezing/melting point = −112.8°C; vapor density (air = 1) = 3.5; flash point = −9.4°C (oc);[17] Autoignition temperature = 255°C. Hazard identification (based on NFP A-704 M Rating System): Health 2; flammability 3; reactivity 1 ₩. Slightly soluble in water.

Potential Exposure: This material may be used in organic synthesis and in copolymer manufacture.

Incompatibilities: Vapors may form explosive mixture with air. Moderately explosive by spontaneous chemical reaction. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Able to form unstable peroxides, which can cause polymerization.

Permissible Exposure Limits in Air

No standards or PAC available.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May be poisonous if inhaled or absorbed through skin. Vapors may cause dizziness or suffocation. Contact may irritate or burn skin and eyes. LD_{50} = (oral-rat) 15,000 mg/kg.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister

having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).
Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl vinyl ether all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.
Shipping: UN2352 Butyl vinyl ether, stabilized, Hazard Class: 3; Labels: 3—Flammable liquid.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Stay upwind. Remove all ignition sources. Stop leak if you can do so without risk. Use water spray to reduce vapors. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Dangerous, fire risk. Thermal decomposition products may include oxides of carbon. For small fires use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. For large fires use water spray, fog, or alcohol foam. Move containers from fire area if you can do so without risk. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Controlled incineration.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Butyl Vinyl Ether, Washington, DC, Chemical Emergency Preparedness Program (October 31, 1985).

Butyraldehyde B:1030

Formula: C_4H_8O
Synonyms: Aldehyde butyrique (French); Butal; Butaldehyde; Butalyde; Butanal; Butirraldehido (Spanish); *n*-Butyl aldehyde; Butyl aldehyde; Butyral; Butyraldehyd (German); *n*-Butyraldehyde; Butyric acid; Butyric aldehyde; NCI-C56291
CAS Registry Number: 123-72-8
HSDB Number: 2798
RTECS Number: ES2275000
UN/NA & ERG Number: UN1129/129 (P)
EC Number: 204-646-6 [*Annex I Index No.:* 605-006-00-2]
Regulatory Authority and Advisory Information
Hazard Alert: Highly flammable, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Polymerization hazard.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; NPRI.
Hazard symbols, risk, & safety statements: Hazard symbol: F; risk phrases: R3; R11; R19; R36/37/38; R63; safety phrases: S2; S9; S21; S29; S33 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Butyraldehyde is a highly flammable, colorless liquid with a pungent odor. Molecular weight = 72.12; specific gravity (H_2O:1) = 0.79; boiling point = 75°C; freezing/melting point = −99°C; flash point = −6.7°C; relative vapor density (air = 1) = 2.5; Autoignition temperature = 218°C. Explosive limits in air: LEL: 1.9%; UEL: 12.5%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 3; reactivity 0 ₩. Slowly mixes with water; solubility = 7%.
Potential Exposure: Used in making synthetic resins, solvents, and plasticizers.
Incompatibilities: May form explosive mixture with air. Butyraldehyde can presumably form explosive peroxides, and may polymerize due to heat or contact with acids or alkalis. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, caustics, ammonia, aliphatic amines; alkanolamines, aromatic amines. May accumulate static electrical charges, and may cause ignition of its vapors. Possible self-reaction in air; undergoes rapid oxidation to

butyric acid in May corrode steel due to corrosive action of butyric acid.

Permissible Exposure Limits in Air

Odor threshold = 0.009 ppm.

PAC Ver. 29[138]

PAC-1: 75 ppm

PAC-2: 430 ppm

PAC-3: 830 ppm

Russia: STEL 5 milligram per cubic meter, [skin].

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} =< 1.2. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Butyraldehyde is corrosive. Irritates the eyes, skin, and respiratory tract. Eye or skin contact may cause burns and possible permanent damage. High exposure can cause dizziness and lightheadedness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Prolonged or repeated skin exposure may cause skin disorders. Testing has not been completed to determine the carcinogenicity of butyraldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Lungs, skin.

Medical Surveillance: Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Protect against physical damage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Outside or detached storage is preferred. Prior to working with Butyraldehyde all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1129 Butyraldehyde, Hazard Class: 3; Labels: 3—Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquid in vermiculite, dry sand; earth or similar noncombustible absorbent material and deposit in sealed containers. *Do not* use sawdust or other combustible absorbent. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated run off enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Butyric acid is a combustible, oily liquid with an unpleasant odor. The Odor Threshold is 0.0001 ppm[41]. Molecular weight = 88.12; specific gravity (H_2O:1) = 0.96; boiling point = 163.5°C; freezing/melting point = −7.87°C; vapor pressure = 0.44 mmHg @ 20°C; 1.65 @ 25°C; flash point = 72°C; Autoignition temperature = 440°C. Flammable Limits in Air: LEL: 2%; UEL: 10%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 0 ₩. Highly soluble in water.

Potential Exposure: In manufacture of butyrate esters, some of which go into artificial flavoring.

Incompatibilities: May form explosive mixture with air. Incompatible with sulfuric acid, caustics, ammonia, aliphatic amines; isocyanates, strong oxidizers; alkylene oxides; epichlorohydrin.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.4 ppm

PAC-2: 16 ppm

PAC-3: 110 ppm

The former-USSR-UNEP/IRPTC joint project MAC value is 2.5 ppm (10 milligram per cubic meter)[43] for workplace air. They also cite a momentary MAC value of 0.015 milligram per cubic meter and an allowable average daily MAC of 0.01 milligram per cubic meter in ambient air of residential areas.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: $\text{Log } K_{\text{ow}} = 0.8$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Butyric acid is a medium-strong corrosive acid. Can cause severe eye and skin irritation and burns leading to permanent damage. Inhalation can cause respiratory tract irritation, coughing, wheezing and/or shortness of breath. LD_{50} = (oral-rat) 2940 mg/kg (slightly toxic)[9].

Long-Term Exposure: Can affect the blood. Repeated exposures may cause bronchitis to develop with coughing, phlegm, and/or shortness of breath. May cause kidney damage.

Points of Attack: Skin, eyes and respiratory system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Protect against physical damage. Outside or detached storage is p referred. Prior to working with butyric acid all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2820 Butyric acid, Hazard class: 8; Labels: 8—Corrosive material. UN2529 Isobutyric acid, Hazard Class: 3; Labels: 3—Flammable liquid, 8—Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquid in vermiculite, dry sand; earth or similar material and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental

protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as dimethylarsinic acid

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0% as arsenic, water-soluble compounds, n.o.s.

Canada: Priority Substance List & Restricted Substances/Ocean Dumping *forbidden* (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R45; R27/28; R50/53; R62; R63; safety phrases: S13; S28; S29/35; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Cacodylic acid is a colorless, odorless, crystalline solid arsenic compound. Molecular weight = 138.02; boiling point = 200°C; freezing/melting point = 195°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 0[70]. Highly soluble in water.

Cacodylic acid, sodium salt (sodium cacodylate): Molecular weight = 159.99; freezing/melting point = 200°C. Hygroscopic.

Potential Exposure: Used as an herbicide, soil sterilant and in timber thinning. Has been used as a chemical warfare agent.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Aqueous solution reacts violently with chemically active metals releasing toxic arsenic fumes. Incompatible with oxidizers, sulfuric acid; caustics (strong bases), reducing agents; ammonia, amines, isocyanates, alkylene oxides; epichlorohydrin.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 2.8 milligram per cubic meter

PAC-2: 25 milligram per cubic meter

PAC-3: 140 milligram per cubic meter

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA

NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

PAC Ver. 29[138]

124-65-2 (sodium salt)

PAC-1: 3.2 milligram per cubic meter

PAC-2: 86 milligram per cubic meter

PAC-3: 510 milligram per cubic meter

Determination in Air: Filter; Reagent: Ion chromatography/hydride atomic absorption (AA): NIOSH IV [#5022, Arsenic, organo-][18].

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons. Federal Drinking Water Guidelines: EPA 10 μg/L; State Drinking Water Guidelines: Arizona 10 μg/L; Connecticut 10 μg/L. Toxic pollutant designated pursuant to Section 307 (a) (1) of the Clean Water Act and is subject to effluent limitations (arsenic and inorganic and organic arsenic) [40 CFR 401.15 (7/1/1987)]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: See OSHA Analytical Method ID-105 for arsenic. The AA graphite furnace technique is

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00003-X

often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is AA; another is inductively coupled plasma (ICP) optical emission spectrometry. Fish Tox = 2841.14769000 ppb MATC (VERY LOW).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact can also cause burning, itching, thickening, and color changes.

Long-Term Exposure: Certain other arsenic compounds have been identified as carcinogen. Although this chemical has not been identified as a carcinogen it should be handled with extreme caution. May cause an ulcer of the "bone" dividing the inner nose. It can cause disturbed sleep; thickening of the skin with patch areas of darkening and loss of pigment, or the development of white lines in the nails. May cause liver and kidney damage. Repeated exposure can lead to a metallic or garlic taste in the mouth; loss of appetite; nausea, vomiting, difficulty in swallowing; stomach pain; diarrhea, and possible death. *In animals*: Irritation skin, possible dermatitis; respiratory distress; diarrhea; kidney damage; muscle tremor, convulsions; possible gastrointestinal tract; reproductive effects; possible liver damage. Human Tox = 5.61798 ppb CHCL (Chronic Human Carcinogen Level) (HIGH).

Points of Attack: Skin, respiratory system; kidneys, central nervous system; liver, gastrointestinal tract; reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Test for urine arsenic. Levels should not be greater than 100 μg/g of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning, BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) [any self-contained breathing apparatus (SCBA) that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode]; or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cacodylic acid all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents; chemically active metals; strong bases; moisture, fertilizers, seeds, insecticides, and fungicides.

Shipping: UN1572 Cacodylic acid & UN1688 Sodium Cacodylate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3465 Organoarsenic compound, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required

Spill Handling:

Organoarsenic compound, solid or liquid

Initial isolation and protective action distances
Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 500/60
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills:* take up with sand or other noncombustible absorbent material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn, but does not readily ignite. Thermal decomposition products may include arsenic hydride, oxides of arsenic, metal, and carbon. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution-control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class):3-Severe hazard to waters.

Description: Cadmium is a bluish-white metal. Molecular weight = 112.4; boiling point = 765°C; freezing/melting point = 321°C; autoignition temperature (*metal dust*) = 250°C. Hazard identification (based on NFPA-704 M Rating System): (*powder*) Health 3, flammability 2, reactivity 0. Insoluble in water. The only cadmium mineral, greenockite (CdS), is rare; however, small amounts of cadmium are found in zinc, copper, and lead ores. It is generally produced as a by-product of these metals, particularly zinc. Cadmium is insoluble in water but is soluble in acids. "Cadmium dust" includes dust of various cadmium compounds, such as $CdCl_2$. "Cadmium fume" has the composition Cd/CdO.

Potential Exposure: Cadmium is a highly corrosion resistant and is used as a protective coating for iron, steel, and copper; it is generally applied by electroplating, but hot dipping and spraying are possible. Cadmium may be alloyed with copper, nickel, gold, silver, bismuth, and aluminum to form easily fusible compounds. These alloys may be used as coatings for other materials; welding electrodes, solders, etc. It is also utilized in electrodes of alkaline storage batteries, as a neutron absorber in nuclear reactors, a stabilizer for polyvinyl chloride plastics, a deoxidizer in nickel plating; an amalgam in dentistry; in the manufacture of fluorescent lamps, semiconductors, photocells, and jewelry, in process engraving, in the automobile and aircraft industries; and to charge Jones reductors. Various cadmium compounds find use as fungicides, insecticides, nematocides, polymerization catalysts, pigments, paints, and glass; they are used in the photographic industry and in glazes. Cadmium is also a contaminant of superphosphate fertilizers. Human exposure to cadmium and certain cadmium compounds occurs through inhalation and ingestion. The entire population is exposed to low levels of cadmium in the diet because of the entry of cadmium into the food chain as a result of its natural occurrence. Tobacco smokers are exposed to an estimated 17 μg/cigarette. Cadmium is present in relatively low amounts in the earth's crust; as a component of zinc ores, cadmium may be released into the environment around smelters.

Incompatibilities: Air exposure with cadmium powder may cause self-ignition. Moist air slowly oxidizes cadmium forming cadmium oxide. Cadmium dust is incompatible with strong oxidizers, ammonium nitrate; elemental sulfur; hydrazoic acid; selenium, zinc, tellurium. Contact with acids cause a violent reaction, forming flammable hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 9 mg [Cd]/m^3 (dust and fume)

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA [*Note:* The PEL applies to all cadmium compounds (as Cd).]

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level. [*Note:* The REL applies to all cadmium compounds (as Cd).]

ACGIH TLV[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood

PAC* Ver. 29[138]

PAC-1: **0.10**$_A$ mg/m

PAC-2: **0.76**$_A$ mg/m

PAC-3: **4.7**$_A$ mg/m

*AEGLs (Acute Emergency Guideline Levels) are in **bold face**. Subscript "A" signifies 60-minute AEGL.

Cadmium and inorganic compounds

DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A

Arab Republic of Egypt: TWA 0.05 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 milligram per cubic meter, 1993; Denmark: TWA 0.01 milligram per cubic meter, 1999; Finland: TWA 0.02 milligram per cubic meter, carcinogen, 1999; France: VME 0.05 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.005 milligram per cubic meter, 2003; Japan: 0.05 milligram per cubic meter, Group 1 carcinogen, 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; the Philippines: TWA 0.2 milligram per cubic meter, 1993; Poland: MAC (TWA) (*fume*) 0.02 milligram per cubic meter, MAC (STEL) (*fume*) 0.05 milligram per cubic meter, 1999; MAC (TWA) (*dust*): 0.04 milligram per cubic meter, MAC (STEL) (*dust:*) 0.2 milligram per cubic meter, 1999; Russia: TWA 0.01 milligram per cubic meter; STEL 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.05 milligram per cubic meter (total *dust*), 1999; Sweden: TWA 0.01 milligram per cubic meter (respirable *dust*), 1999; Switzerland: MAK-W 0.05 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.2 milligram per cubic meter; STEL 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.2 milligram per cubic meter, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. Several states have set guidelines or standards for cadmium in ambient air[60] ranging from 0 (North Dakota) to 0.0006 μ/m^3 (Rhode Island) to 0.0055 μ/m^3 (North Carolina) to 0.0056 μ/m^3 (Massachusetts) to 0.07 (Montana) to 0.12 μ/m^3 (Pennsylvania) to 0.25 μ/m^3 (South Carolina) to 0.4 μ/m^3 (Connecticut and South Dakota) to 0.8 μ/m^3 (Virginia) to 1.0 μ/m^3 (Nevada) to 2.0 μ/m^3 (New York).

Determination in Air: Collection of particles on a filter, workup with acid and measurement by AA has been specified by NIOSH. For *dust* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206; *fume*: NIOSH #7048, #7300, #7301, #7303, #7200 (Welding and Brazing Fume), and OSHA ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.005 mg[Cd]/L; MCLG, 0.005 mg[Cd]/L. State Drinking Water Standards: Arizona 10 μg/L; State Drinking Water Guidelines: Arizona 5 μg/L; Maine 5 μg/L; Minnesota 4 μg/L.

Determination in Water: Total cadmium may be determined by digestion followed by AA of colorimetric (Dithizone) analysis or by ICP Optical Emission Spectrometry. Dissolved cadmium is determined by 0.45 μ filtration followed by the previously cited methods.

Routes of Entry: Inhalation or ingestion of fumes or dust.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Dust may cause irritation of the nose and throat. Nonfatal lung inflammation has been reported from concentrations of 0.5−2.5 milligram per cubic meter. In 4−10 hours after exposure severe chest pain; with persistent cough and difficult breathing; headache, chills, muscle aches; nausea, vomiting, diarrhea. Fluid in the lungs (pulmonary edema) and dark-purple coloration of the skin may occur. Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Breathing becomes more difficult and is accompanied by wheezing or coughing of blood. Other symptoms which may occur 12−36 hours after exposure in addition to those above include dizziness, irritability, gastrointestinal disturbances; shortness of breath; fever, profuse sweating; exhaustion and inflammation of the lungs. Death may result within 7−10 days after exposure. The average concentrations of fume responsible for fatalities have been 40−50 milligram per cubic meter for 1 hour, 9 milligram per cubic meter for 5 hours, or 5 milligram per cubic meter for 8 hours. *Skin:* Absorption is negligible. *Eyes:* Cadmium compound dust may cause irritation. *Ingestion:* A dose of 15−30 mg (1/1000 oz) of metal or soluble compounds may cause increased salivation; choking, vomiting, abdominal pain; anemia, kidney malfunction; diarrhea; and persistent desire to empty the bladder. Symptoms may occur within 15−30 minutes after ingestion. May cause heart and lung failure.

Long-Term Exposure: Cadmium can cause kidney and possibly other organ damage. Continued exposure to low levels of cadmium in air may cause irreversible lung injury, abnormal lung function, and kidney disease. Other consequences of cadmium exposures are inflammation of the nose and throat, open sores in the nose, soreness; bleeding and reduced nose size; loss of sense of smell; damage to the olfactory nerve; yellow cadmium stains on teeth; sleeplessness, nausea; lack of appetite; weight loss; anemia, lung distention with scar formation; and liver damage. May cause bone disease characterized by softening, bending, and reduction in bone size. Difficulty walking; pain in back and extremities; and spontaneous fractures may result. Inhalation of 0.06−0.68 milligram per cubic meter for 4−8 years may cause throat irritation, cough, chest pain, upset stomach, and fatigue. Exposure to levels of 3.0−15.0 milligram per cubic meter of fumes or dust over a period of 20 years has caused lung distention, anemia; protein in urine and kidney dysfunction. Studies indicate that there is an increased incidence of prostatic cancer and possible kidney and respiratory cancer in cadmium workers. Cadmium causes birth defects in rats, mice, and hamsters; whether it does so in humans is not known.

Points of Attack: Kidney damage, respiratory system, lungs, prostate, blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. In preemployment physical examinations, emphasis should be given to a history of, or actual presence of: significant kidney disease, smoking history, and respiratory disease. A chest X-ray and baseline pulmonary function study is recommended. Periodic examinations should emphasize the respiratory system, including pulmonary function tests, kidneys and blood. A low molecular weight proteinuria may be the earliest indication of renal toxicity. The trichloroacetic acid test may pick this up, but more specific quantitative studies would be preferable. If renal disease due to cadmium is present, there may also be increased excretion of calcium, amino acids, glucose, and phosphates.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to physician:* For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Cadmium dust (metal) Prevent skin contact. Any barrier that will prevent contamination from the dry chemical. Wear protective eye protection, gloves, and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield to prevent any possibility of eye contact, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue (*carcinogen*): Health Hazard: Store in a secure poison location. Prior to working with cadmium all handlers should be trained on its proper handling and storage. Cadmium must be stored to avoid contact with sulfur, selenium, tellurium, ammonium nitrate, and hydrazoic acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Sources of ignition, such as smoking and open flames are prohibited where cadmium is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2570 Cadmium compounds, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable powder. Thermal decomposition products may include metal oxides. Use dry chemicals appropriate for metal fires, or dry sand. Use no other extinguishing agents. *Do not use water*. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: With cadmium compounds in general, precipitation from solution as sulfides, drying and return of the material to suppliers for recovery is recommended. Cadmium may be recovered from battery scrap as an alternative to disposal[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Cadmium Acetate C:0110

Formula: $C_4H_6CdO_4$; $Cd(C_2H_3O_2)_2$

Synonyms: Acetic acid, cadmium salt; Aceto cadmio (Spanish); Bis(acetoxy)cadmium; Cadmium(II) acetate; Cadmium diacetate; C.I. 77185

CAS Registry Number: 543-90-8

HSDB Number: 280

RTECS Number: EU9810000

UN/NA & ERG Number: UN2570/154

EC Number: 208-853-2

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Sufficient Evidence, *carcinogenic to humans*, Group 1; NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen

California Proposition 65 Chemical[102]: Cancer 10/1/1987

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

Clean Air Act: Toxic Pollutant (Section 401.15), Hazardous Air Pollutants (Title I, Part A, Section 112). *Note:* Includes any unique chemical substance that contains cadmium as part of that chemical's infrastructure

United States National Primary Drinking Water Regulations: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg [Cd]/L as Cadmium

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as cadmium acetate; NPRI; CEPA Priority Substance List, Ocean dumping prohibited, as cadmium compounds.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases:R45; R20/21/22; R25; R26; R46; R48/23/25; R50/53; R60; R61; R62; R63; safety phrases: S22; S28; R29; R35; S36/37; S45; S53; S60; S61; 41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Cadmium acetate is a colorless crystalline solid; freezing/melting point = 130°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Cadmium acetate is used in ceramics, textile dyeing, and printing and electroplating; and to make other acetate compounds.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water, and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates, and dithionites (releasing hydrogen sulfate and oxides of sulfur). Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 9 mg [Cd]/m^3
OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA
NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level.
ACGIH TLV[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood
PAC Ver. 29[138]
PAC-1: 0. 021 milligram per cubic meter
PAC-2: 1.6 milligram per cubic meter
PAC-3: 9.6 milligram per cubic meter
DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A
Arab Republic of Egypt: TWA 0.05 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 milligram per cubic meter, 1993; Denmark: TWA 0.01 milligram per cubic meter, 1999; Finland: TWA 0.02 milligram per cubic meter, carcinogen, 1999; France: VME 0.05 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.005 milligram per cubic meter, 2003; Japan: 0.05 milligram per cubic meter, Group 1 carcinogen, 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; the Philippines: TWA 0.2 milligram per cubic meter, 1993; Poland: MAC (TWA) *(fume)* 0.02 milligram per cubic meter, MAC (STEL) *(fume)* 0.05 milligram per cubic meter, 1999; MAC (TWA) *(dust):* 0.04 milligram per cubic meter, MAC (STEL) *dust* 0.2 milligram per cubic meter, 1999; Russia: TWA 0.01 milligram per cubic meter; STEL 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.05 milligram per cubic meter (total *dust*), 1999; Sweden: TWA 0.01 milligram per cubic meter (respirable *dust*), 1999; Switzerland: MAK-W 0.05 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.2 milligram per cubic meter; STEL 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.2 milligram per cubic meter, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. See also this section in the entry on Cadmium. North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μ/m^3.

Determination in Air: Collection of particles on a filter, workup with acid and measurement by AA has been specified by NIOSH. For *(dust):* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg[Cd]/L; State Drinking Water Standards: Arizona 10 μg/L; State Drinking Water Guidelines: Arizona 5 μg/L; Maine 5 μg/L; Minnesota 4 μg/L.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Cadmium Acetate can affect us when breathed in. Cadmium Acetate is a carcinogen; handle with extreme caution. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Risk is greatest near dust or fume from heating or grinding cadmium acetate.

Long-Term Exposure: Repeated lower exposure can cause permanent kidney damage, emphysema, low blood sugar, and/or lowered sense of smell. Serious damage can occur at levels below the PEL. See also entry on “Cadmium.”

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: Urine test for Cadmium (levels should be less than 10 μg/L of urine). Urine test for “low molecular weight proteins” (electrophoresis method best). urinalysis (UA). Complete blood count (CBC). Lung function test. These should be repeated after suspected overexposure. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Consider chest X-ray after acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning, do not use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: *Clothing:* Avoid skin contact with Cadmium Acetate. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. *Eye Protection:* Eye protection is included in the recommended respiratory protection.

Respirator Selection: $<$ or $= 50$ μg/m^3 Half-mask, air-purifying respirator (APR) equipped with a high-efficiency filter*. $<$ or $= 125$ μg/m^3 (1) Powered APR (PAPR) with a loose-fitting hood or helmet equipped with a high-efficiency filter* or (2) Supplied-air respirator with a loose-fitting hood or helmet facepiece operated in continuous-flow mode. $<$ or $= 250\ \mu g/m^3$ (1) Full-facepiece APR equipped with a high-efficiency filter*; (2) PAPR with a tight-fitting half-mask equipped with a high-efficiency filter*; or (3) Supplied-air respirator with a tight-fitting half-mask operated in continuous-flow mode. $<$ or $=$ $1250\ \mu g/m^3$ (1) PAPR with a tight-fitting full facepiece equipped with a high-efficiency filter* or (2) Supplied-air respirator with a tight-fitting full facepiece operated in continuous-flow mode. $<$ or $= 5000\ \mu g/m^3$ Supplied-air respirator with half-mask or full facepiece operated in pressure-demand or other positive-pressure mode. $>5000\ \mu g/m^3$ or unknown concentration (1) SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode or (2) Supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure mode and equipped with an auxiliary escape-type SCBA operated in pressure-demand mode. *Firefighting:* SCBA with full facepiece operated in pressure-demand or other positive-pressure mode. Note: Quantitative fit testing is required for all tight-fitting APRs where airborne concentration of cadmium exceeds 10 times the TWAP EL ($10 \times 5\ \mu g/m^3 = 50\ \mu g/m^3$). A full facepiece respirator is required when eye irritation is expected.

* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Prior to working with Cadmium Acetate all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and incompatible materials listed above. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2570 Cadmium compounds, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Cadmium acetate itself does not burn. Thermal decomposition products may include oxides of cadmium metal and oxides of carbon. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Precipitation as sulfide, drying and return to supplier[22]. Incineration is not recommended.

See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μ/m^3.

Determination in Air: Collection of particles on a filter, workup with acid and measurement by AA has been specified by NIOSH. For *(dust):* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg[Cd]/L; State Drinking Water Standards: Arizona 10 μg/L; State Drinking Water Guidelines: Arizona 5 μg/L; Maine 5 μg/L; Minnesota 4 μg/L.

Determination in Water: Total cadmium may be determined by digestion followed by AA of colorimetric (Dithizone) analysis or by ICP Optical Emission Spectrometry. Dissolved cadmium is determined by 0.45 μ filtration followed by the previously cited methods. See also Ref.[49].

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Cadmium bromide can affect you when breathed in. Cadmium bromide is a carcinogen; handle with extreme caution. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Risk is greatest near dust or fume from heating or grinding cadmium acetate.

Long-Term Exposure: Repeated exposures can cause anemia, permanent kidney damage; emphysema; low blood count and/or loss of sense of smell; fatigue; yellow staining of teeth. Cadmium bromide should be handled as a potential teratogenic agent and reproductive hazard, since several related cadmium compounds are known teratogens and decreases fertility in males and females. Repeated low exposures (below the OSHA PEL) can cause permanent kidney damage, which can go unnoticed without testing until severe. Kidney stones can also occur. Emphysema and/or lung scarring can occur from a single high exposure or repeated lower exposures. A recognized carcinogen of the connective tissue, lungs, and liver.

Points of Attack: Respiratory system; kidneys, liver.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Urine test for cadmium (levels should be less than 10 μg of cadmium per liter of urine). Urine test for low molecular weight proteins (electrophoresis method best). Urine analysis (UA). CBC. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. These should be repeated after suspected overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to physician:* For severe poisoning, do not use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: *Clothing:* Avoid skin contact with cadmium bromide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Eye protection is included in the recommended respiratory protection.

Respirator Selection: $<$ or $= 50\ \mu g/m^3$ Half-mask, APR equipped with a high-efficiency filter*. $<$ or $= 125\ \mu g/m^3$ (1) PAPR with a loose-fitting hood or helmet equipped with a high-efficiency filter* or (2) Supplied-air respirator with a loose-fitting hood or helmet facepiece operated in continuous-flow mode. $<$ or $= 250\ \mu g/m^3$ (1) Full-facepiece APR equipped with a high-efficiency filter*; (2) PAPR with a tight-fitting half-mask equipped with a high-efficiency filter*; or (3) Supplied-air respirator with a tight-fitting half-mask operated in continuous-flow mode. $<$ or $= 1250\ \mu g/m^3$ (1) PAPR with a tight-fitting full facepiece equipped with a high-efficiency filter* or (2) Supplied-air respirator with a tight-fitting full facepiece operated in continuous-flow mode. $<$ or $= 5000\ \mu g/m^3$ Supplied-air respirator with half-mask or full facepiece operated in pressure-demand or other positive-pressure mode. $>5000\ \mu g/m^3$ or unknown concentration (1) SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode or (2) Supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure mode and equipped with an auxiliary escape-type SCBA operated in pressure-demand mode. *Firefighting:* SCBA with full facepiece operated in pressure-demand or other positive-pressure mode. Note: Quantitative fit testing is required for all tight-fitting APRs where airborne concentration of cadmium exceeds 10 times the TWA PEL ($10 \times 5\ \mu g/m^3 = 50\ \mu g/m^3$). A full facepiece respirator is required when eye irritation is expected.

* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Prior to working with cadmium bromide all handlers should be trained on its proper handling and storage. Cadmium bromide must be stored to avoid contact with Potassium, since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN 2570 Cadmium compounds, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Cadmium bromide itself does not burn. Thermal decomposition products may include fumes of cadmium and bromine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%, as cadmium chloride; NPRI; CEPA Priority Substance List, Ocean dumping prohibited, as cadmium compounds.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R28; R22; R25; R26; R36/37/38; R45; R48/23/25; R50/53; R60; R61; R62; R63; safety phrases: S1; S22; S28; S29; S36/37/39; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Cadmium chloride is a colorless, odorless, crystalline solid, or powder. Molecular weight = 183.30; specific gravity (H_2O:1) = 4.06; boiling point = 964°C; freezing/melting point = 568°C; vapor pressure = 10 mmHg @ 656°C; hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water; solubility = 140 g/100 mL @ 20°C.

Cadmium chloride, hemipentahydrate: Molecular weight = 456.71; specific gravity (H_2O:1) = 3.33.

Potential Exposure: Cadmium chloride is used in dyeing and printing of fabrics; in electronic component manufacture; in photography; used as a pesticide and in nonpasture turf fungicides.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, sulfur, selenium, potassium.

Permissible Exposure Limits in Air

NIOSH IDLH = 9 mg [Cd]/m^3

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood

PAC Ver. 29[138]

10108-64-2

PAC-1: 0.16 milligram per cubic meter

PAC-2: 1.2 milligram per cubic meter

PAC-3: 7.6 milligram per cubic meter

7790-78-5, hemipentahydrate

PAC-1: 0.1 milligram per cubic meter

PAC-2: 0.77 milligram per cubic meter

PAC-3: 9.5 milligram per cubic meter

DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A

Arab Republic of Egypt: TWA 0.05 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 milligram per cubic meter, 1993; Denmark: TWA 0.01 milligram per cubic meter, 1999; Finland: TWA 0.02 milligram per cubic meter, carcinogen, 1999; France: VME 0.05 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.005 milligram per cubic meter, 2003; Japan: 0.05 milligram per cubic meter, Group 1 carcinogen, 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; the Philippines: TWA 0.2 milligram per cubic meter, 1993; Poland: MAC (TWA) (*fume*) 0.02 milligram per cubic meter, MAC (STEL) (*fume*) 0.05 milligram per cubic meter, 1999; MAC (TWA) (*dust*)*:* 0.04 milligram per cubic meter, MAC (STEL) *dust* 0.2 milligram per cubic meter, 1999; Russia: TWA 0.01 milligram per cubic meter; STEL 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.05 milligram per cubic meter (total *dust*), 1999; Sweden: TWA 0.01 milligram per cubic meter (respirable *dust*), 1999; Switzerland: MAK-W 0.05 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.2 milligram per cubic meter; STEL 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.2 milligram per cubic meter, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μ/m^3. Guidelines for cadmium chloride in ambient air have been set[60] ranging from 1.67 μ/m^3 (New York) to 5.0 μ/m^3 (Florida).

Determination in Air: Collection of particles on a filter, workup with acid and measurement by AA has been specified by NIOSH. For (*dust*): Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg[Cd]/L; State Drinking Water Standards: Arizona 10 μg/L; State Drinking Water Guidelines: Arizona 5 μg/L; Maine 5 μg/L; Minnesota 4 μg/L.

Determination in Water: Total cadmium may be determined by digestion followed by AA of colorimetric (Dithizone) analysis or by ICP Optical Emission Spectrometry. Dissolved cadmium is determined by 0.45 μ filtration followed by the previously cited methods[49].

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact can cause irritation. Cadmium chloride can cause severe irritation of the gastrointestinal tract and the respiratory tract. Inhalation can cause nose, throat, and lung irritation. Fumes can cause flu-like illness with chills, headache, aching muscles, and/or fever. Higher exposures can cause nausea, salivation, vomiting, cramps, diarrhea, and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Cadmium chloride is highly toxic. As little as 14.5 mg of Cd orally causes nausea and vomiting; 8.9 g has caused death. Cadmium salts cause cramps, nausea, vomiting, and diarrhea. Acute poisoning causes lung damage.

Long-Term Exposure: Cadmium can cause kidney damage. This chemical is a probable carcinogen in humans, with some evidence that it causes prostate and kidney cancer in humans, and it has been shown to cause lung and testes cancer in animals. It may also be a reproductive hazard in humans. Repeated low exposures may cause permanent kidney and liver damage, anemia, and/or loss of the sense of smell. Chronic poisoning damages kidneys, lungs, bones, and causes blood changes (anemia).

Points of Attack: See above on harmful effects and symptoms.

Medical Surveillance: Urine test for cadmium. Urine test for "low molecular weight proteins" to detect kidney damage. UA. CBC. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to physician:* For severe poisoning, do not use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, head gear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: < or = 50 μg/m^3 Half-mask, APR equipped with a high-efficiency filter*. < or = 125 μg/m^3 (1) PAPR with a loose-fitting hood or helmet equipped with a high-efficiency filter* or (2) Supplied-air respirator with a loose-fitting hood or helmet facepiece operated in continuous-flow mode. < or = 250 μg/m^3 (1) Full-facepiece APR equipped with a high-efficiency filter*; (2) PAPR with a tight-fitting half-mask equipped with a high-efficiency filter*; or (3) Supplied-air respirator with a tight-fitting half-mask operated in continuous-flow mode. < or = 1250 μg/m^3 (1) PAPR with a tight-fitting full facepiece equipped with a high-efficiency filter* or (2) Supplied-air respirator with a tight-fitting full facepiece operated in continuous-flow mode. < or = 5000 μg/m^3 Supplied-air respirator with half-mask or full facepiece operated in pressure-demand or other positive-pressure mode. >5000 μg/m^3 or unknown concentration (1) SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode or (2) Supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure mode and equipped with an auxiliary escape-type SCBA operated in pressure-demand mode. *Firefighting:* SCBA with full facepiece operated in pressure-demand or other positive-pressure mode. *Note:* Quantitative fit testing is required for all tight-fitting APRs where airborne concentration of cadmium exceeds 10 times the TWA PEL (10×5 μg/m^3 = 50 μg/m^3). A full facepiece respirator is required when eye irritation is expected.

* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Shipping: UN2570 Cadmium compounds, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use agent suitable for surrounding fire. Cadmium chloride itself does not burn. Thermal decomposition products may include hydrogen chloride and oxides of metal cadmium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is preferred to convert the salt to the nitrate, precipitate it with H_2S, filter, wash and dry the precipitate and return it to the supplier.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R26; R48/23/25; R50/53; R62; R63; R68; safety phrases: S29; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: Cadmium oxide forms brownish-red crystals or a yellow to dark brown amorphous powder. Molecular weight = 128.4; specific gravity (H_2O:1) = 8.15; freezing/melting point = 900°C (slow decomposition begins @ 700°C); sublimation point = 1559°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Very slightly soluble in water.

z-0013, dipotassium cadmium oxide: Molecular weight = 222.61; *disodium cadmium oxide*: Molecular weight = 190.39.

Potential Exposure: Cadmium oxide is used as an electroplating chemical and in the manufacture of semiconductors and cadmium electrodes; synthesis of other cadmium salts; a component of silver alloys, phosphorus, glass and ceramic glazes, semiconductors, and batteries. Used as a vermicide.

Incompatibilities: Oxides of cadmium react explosively with magnesium, especially when heated. Heat above 700°C causes slow decomposition. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); light metals: contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, hydrogen sulfide, hydrazine nitrate. May ignite combustibles, such as wood, paper, oil, etc.

North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μ/m^3. Several states have set guidelines or standards for cadmium oxide in ambient air[60] ranging from 0.167 μ/m^3 (New York) to 0.25 μ/m^3 (South Carolina) to 0.40 μ/m^3 (Virginia) to 0.5 μ/m^3 (Florida) to 1.0 μ/m^3 (Nevada).

Determination in Air: For (*dust*): use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg[Cd]/L; State Drinking Water Standards: Arizona 10 μg/L; State Drinking Water Guidelines: Arizona 5 μg/L; Maine 5 μg/L; Minnesota 4 μg/L.

Determination in Water: Total cadmium may be determined by digestion followed by AA of colorimetric (Dithizone) analysis or by ICP Optical Emission Spectrometry. Dissolved cadmium is determined by 0.45 μ filtration followed by the previously cited methods[49].

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact causes irritation. Inhalation can cause irritation of the nose and throat; irritation of the lungs with coughing and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Cadmium oxide can cause metal fume fever with chills, headache, aching muscles, metallic taste; and/or fever. Exposure can cause nausea, salivation, vomiting, cramps, and diarrhea. Symptoms for cadmium poisoning include metallic taste in the mouth, headache, shortness of breath; chest pain; cough with foamy or bloody sputum; pulmonary rales; weakness; leg pains and pulmonary edema. The lethal inhalation dose of cadmium oxide in humans is 2500 milligram per cubic meter for a minute exposure. Lethal exposure has been established @ 50 mg (cadmium)/m^3 for 1 hour for cadmium oxide dust and 0.5 hour for the fume. These concentrations may be inhaled without sufficient discomfort to warn worker of exposure. Acute exposure by inhalation may cause death by anoxia. The lowest human toxic inhalation concentration is 8630 μ/m^3/5 hours for the fume.

Long-Term Exposure: Lungs (tracheobronchitis, pneumonitis), kidneys (possible kidney stones), and liver may be affected or damaged by repeated or prolonged exposure. Cadmium oxide is probably carcinogenic to humans; there is some evidence of lung and prostate cancer. There is limited evidence that this chemical is a teratogen in animals. Long-term exposure can cause anemia, brittle and painful bones; loss of sense of smell; fatigue; and/or yellow staining of teeth. Cancer Site: (prostatic & lung cancer)[77].

Medical Surveillance: Urine test for cadmium. Urine test for "low molecular weight proteins" to detect kidney damage. UA. CBC. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Liver function tests. Consider chest X-ray following acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to Physician:* In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4–12 hours following exposure: it may last less than 36 hours.

Note to physician: For severe poisoning, do not use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Cadmium fume (CdO) Prevent skin contact. **8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm^2/min): Neoprene rubber gloves, suits, boots; nitrile rubber gloves, suits, boots. Persons with respiratory disorders should be excluded from contact with this material. A Class I, Type B, biological safety hood should be used when mixing, handling, or preparing cadmium oxide. Wear protective eye protection, gloves, and clothing to prevent any skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: < or = 50 μg/m^3 Half-mask, APR equipped with a high-efficiency filter*. < or = 125 μg/m^3 (1) PAPR with a loose-fitting hood or helmet equipped with a high-efficiency filter* or (2) Supplied-air respirator with a loose-fitting hood or helmet facepiece operated in continuous-flow mode. < or = 250 μg/m^3 (1) Full-facepiece APR equipped with a high-efficiency filter*; (2) PAPR with a tight-fitting half-mask equipped with a high-efficiency filter*; or (3) Supplied-air respirator with a tight-fitting half-mask operated in continuous-flow mode. < or = 1250 μg/m^3 (1) PAPR with a tight-fitting full facepiece equipped with a high-efficiency filter* or (2) Supplied-air respirator with a tight-fitting full facepiece operated in continuous-flow mode. < or = 5000 μg/m^3 Supplied-air respirator with half-mask or full facepiece operated in pressure-demand or other positive-pressure mode. >5000 μg/m^3 or unknown concentration (1) SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode or (2) Supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure mode and equipped with an auxiliary escape-type SCBA operated in pressure-demand mode. *Firefighting:* SCBA with full facepiece operated in pressure-demand or other positive-pressure mode. Note: Quantitative fit testing is required for all tight-fitting APRs where airborne concentration of cadmium exceeds 10 times the TWA PEL ($10 \times 5\ \mu g/m^3 = 50\ \mu g/m^3$). A full facepiece respirator is required when eye irritation is expected.

* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Prior to working with cadmium oxide all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area, away from magnesium, oxidizers, combustible materials; heat, moisture, and acids. Where this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2570 Cadmium compounds, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind and out of low areas. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid, but may increase fire activity. Use any extinguishing agent. Thermal decomposition products in fire include oxides of cadmium and oxygen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Form nitrate with HNO_3, precipitate with H_2S, filter, package and return to supplier.

New Jersey Department of Health and Senior Services and Senior Services, *Hazardous Substances Fact Sheet:* Cadmium oxide, Trenton, NJ (September 1998).

Cadmium Stearate C:0150

Formula: $C_{36}H_{72}CdO_4$; $Cd(C_{17}H_{36}COO)_2$

Synonyms: Alaixol II; Cadmium octadeconoate; Estearato de cadmio (Spanish); Kadmiumstearat (German); Octadecanoic acid, cadmium salt; Stearic acid, cadmium salt

CAS Registry Number: 2223-93-0

HSDB Number: 5529

RTECS Number: RG1050000

UN/NA & ERG Number: UN2570/154

EC Number: 218-743-6

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Sufficient Evidence, *carcinogenic to humans*, Group 1; NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen.

California Proposition 65 Chemical[102]: Cancer 10/1/1987

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112). Includes any unique chemical substance that contains cadmium as part of that chemical's infrastructure

United States National Primary Drinking Water Regulations: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg [Cd]/L as Cadmium

Clean Water Act: Toxic Pollutant (Section 401.15), as cadmium compounds

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as cadmium stearate; NPRI; CEPA Priority Substance List, Ocean dumping prohibited, as cadmium compounds.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R20/21/22; R50/53; safety phrases: S29; S45; S53; S60, S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Cadmium stearate is a crystalline solid. Molecular weight = 681.48; freezing/melting point = ~105°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0.

Potential Exposure: Used as a lubricant and stabilizer in polyvinyl chloride plastics[101].

Incompatibilities: Cadmium stearate has weak oxidizing or reducing powers. Redox reactions can however still occur[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 9 mg [Cd]/m^3

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood

PAC Ver. 29[138]

PAC-1: 0.61 milligram per cubic meter

PAC-2: 4.6 milligram per cubic meter

PAC-3: 28 milligram per cubic meter

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group: 3 A

Arab Republic of Egypt: TWA 0.05 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 milligram per cubic meter, 1993; Denmark: TWA 0.01 milligram per cubic meter, 1999; Finland: TWA 0.02 milligram per cubic meter, carcinogen, 1999; France: VME 0.05 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.005 milligram per cubic meter, 2003; Japan: 0.05 milligram per cubic meter, Group 1 carcinogen, 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; the Philippines: TWA 0.2 milligram per cubic meter, 1993; Poland: MAC (TWA) (*fume*) 0.02 milligram per cubic meter, MAC (STEL) (*fume*) 0.05 milligram per cubic meter, 1999; MAC (TWA) (*dust*): 0.04 milligram per cubic meter, MAC (STEL) *dust* 0.2 milligram per cubic meter, 1999; Russia: TWA 0.01 milligram per cubic meter; STEL 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.05 milligram per cubic meter (total *dust*), 1999; Sweden: TWA 0.01 milligram per cubic meter (respirable *dust*), 1999; Switzerland: MAK-W 0.05 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.2 milligram per cubic meter; STEL 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.2 milligram per cubic meter, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μ/m^3.

Determination in Air: Collection of particles on a filter, workup with acid and measurement by AA has been specified by NIOSH. For (*dust*): Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg[Cd]/L; State Drinking Water Standards: Arizona 10 μg/L; State Drinking Water Guidelines: Arizona 5 μg/L; Maine 5 μg/L; Minnesota 4 μg/L.

Determination in Water: Total cadmium may be determined by digestion followed by AA of colorimetric (Dithizone) analysis or by ICP Optical Emission Spectrometry. Dissolved cadmium is determined by 0.45 μ filtration followed by the previously cited methods[49].

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Acute poisoning produces severe nausea, vomiting, diarrhea, and abdominal and chest pains. Dry mouth, salivation, and metallic taste have been reported. If ingested, may result in exhaustion, collapse, shock, and death within a period of 24 hours. Acute toxicity most notably occurs secondary to cadmium ingestion or inhalation of cadmium fumes. Poisoning from inhalation is relatively rare but dangerous, having a mortality rate of about 15%. Toxic inhaled concentrations in humans have been reported @ 147 milligram per cubic meter/35 minutes and @ 1800 μ/m^3/2 years. LD_{50} (oral-rat) = 1125 mg/kg; the oral LD_{50} mouse is 590 mg/kg.

Long-Term Exposure: Cadmium can cause kidney damage. Yellow rings may be seen in teeth when chronically exposed to cadmium. A probable human carcinogen and teratogen.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning, do not use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: $<$ or $=$ $50\,\mu g/m^3$ Half-mask, APR equipped with a high-efficiency filter*. $<$ or $=$ $125\,\mu g/m^3$ (1) PAPR with a loose-fitting hood or helmet equipped with a high-efficiency filter* or (2) Supplied-air respirator with a loose-fitting hood or helmet facepiece operated in continuous-flow mode. $<$ or $=$ $250\,\mu g/m^3$ (1) Full-facepiece APR equipped with a high-efficiency filter*; (2) PAPR with a tight-fitting half-mask equipped with a high-efficiency filter*; or (3) Supplied-air respirator with a tight-fitting half-mask operated in continuous-flow mode. $<$ or $= 1250\,\mu g/m^3$ (1) PAPR with a tight-fitting full facepiece equipped with a high-efficiency filter* or (2) Supplied-air respirator with a tight-fitting full facepiece operated in continuous-flow mode. $<$ or $=$ $5000\,\mu g/m^3$ Supplied-air respirator with half-mask or full facepiece operated in pressure-demand or other positive-pressure mode. $>5000\,\mu g/m^3$ or unknown concentration (1) SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode or (2) Supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure mode and equipped with an auxiliary escape-type SCBA operated in pressure-demand mode. *Firefighting:* SCBA with full facepiece operated in pressure-demand or other positive-pressure mode. *Note:* Quantitative fit testing is required for all tight-fitting APRs where airborne concentration of cadmium exceeds 10 times the TWA PEL ($10 \times 5\,\mu g/m^3 = 50\,\mu g/m^3$). A full facepiece respirator is required when eye irritation is expected.

* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of $0.3\,\mu m$ in diameter or higher.

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Prior to working with Cadmium stearate all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area, away from incompatible materials. Where this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2570 Cadmium compounds, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Do not touch spilled material. Stay upwind, keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include metal oxides of cadmium and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds.
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R26; R48/23/25; R62; R63; R68; R50/53; safety phrases: S29; S53; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Cadmium sulfate is a white to colorless, odorless, crystalline substance. Molecular weight = 208.46; specific gravity (H_2O:1) = 4.69; freezing/melting point = 1000°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water; solubility = 76 g/100 mL @ 0°C.
Cadmium sulfate, hydrate: Molecular weight = 226.49; specific gravity (H_2O:1) = 3.79 @ 20°C.

Potential Exposure: It is used in pigments, electroplating; as a fungicide; and in synthetic and analytical chemistry. Also used in fluorescent screens; as an electrolyte.

Incompatibilities: Acts as a weak inorganic acid; neutralizes bases. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, sulfur, selenium, tellurium, zinc.

Permissible Exposure Limits in Air

See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μ/m^3.
7790-84-3, hydrate
PAC Ver. 29[138]
PAC-1: 0.1 milligram per cubic meter
PAC-2: 0.76 milligram per cubic meter
PAC-3: 11 milligram per cubic meter

Determination in Air: Collection of particles on a filter, workup with acid and measurement by AA has been specified by NIOSH. For (*dust*): Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg[Cd]/L; State Drinking Water Standards: Arizona

10 μg/L; State Drinking Water Guidelines: Arizona 5 μg/L; Maine 5 μg/L; Minnesota 4 μg/L.

Determination in Water: Total Cadmium may be determined by digestion followed by AA of colorimetric (Dithizone) analysis or by ICP Optical Emission Spectrometry. Dissolved Cadmium is determined by 0.45 μ filtration followed by the previously cited methods[49].

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes on contact. Inhalation irritates the nose, throat, and lungs with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Cadmium sulfate can cause nausea, salivation, vomiting; cramps and diarrhea; metal fume fever with flu-like symptoms; chills, headache, weakness; metallic tasted in the mouth.

Long-Term Exposure: Cadmium can cause kidney damage. Repeated exposure can cause anemia, brittle and painful bones; diminished or loss of the sense of smell; fatigue, and/or yellow staining of the teeth. May cause lung and prostate cancer; kidney damage with kidney stones; liver damage; lung damage with bronchitis, cough, phlegm, and/or shortness of breath. There is some evidence that cadmium sulfate is a teratogen in humans.

Points of Attack: Lungs, liver, kidneys, blood.

Medical Surveillance: Urine test for Cd (levels should be less than 10 μg/L of urine). Urine test for low molecular weight proteins (β-2-microglobulin) to detect kidney damage. CBC. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Liver function tests. Consider chest X-ray following acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to Physician:* In case of fume inhalation, treat for pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4–12 hours following exposure: it may last less than 36 hours.

Note to physician: For severe poisoning, do not use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should Wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: < or = 50 μg/m^3 Half-mask, APR equipped with a high-efficiency filter*. < or = 125 μg/m^3 (1) PAPR with a loose-fitting hood or helmet equipped with a high-efficiency filter* or (2) Supplied-air respirator with a loose-fitting hood or helmet facepiece operated in continuous-flow mode. < or = 250 μg/m^3 (1) Full-facepiece APR equipped with a high-efficiency filter*; (2) PAPR with a tight-fitting half-mask equipped with a high-efficiency filter*; or (3) Supplied-air respirator with a tight-fitting half-mask operated in continuous-flow mode. < or = 1250 μg/m^3(1) PAPR with a tight-fitting full facepiece equipped with a high-efficiency filter* or (2) Supplied-air respirator with a tight-fitting full facepiece operated in continuous-flow mode. < or = 5000 μg/m^3 Supplied-air respirator with half-mask or full facepiece operated in pressure-demand or other positive-pressure mode. >5000 μg/m^3 or unknown concentration (1) SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode or (2) Supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure mode and equipped with an auxiliary escape-type SCBA operated in pressure-demand mode. *Firefighting:* SCBA with full facepiece operated in pressure-demand or other positive-pressure mode. Note: Quantitative fit testing is required for all tight-fitting APRs where airborne concentration of cadmium exceeds 10 times the TWA PEL (10×5 μg/m^3 = 50 μg/m^3). A full facepiece respirator is required when eye irritation is expected.

* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Prior to working with Cadmium sulfate, all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and metals.

Shipping: UN2570 Cadmium compounds, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides cadmium and sulfur. Use dry chemical, carbon dioxide; water spray; or alcohol-resistant foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streamsare ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA (Section 313): Includes any unique chemical substance that contains cadmium as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: (inorganic compounds: 0.1%; organic compounds: 1.0%)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R45; R22; R48/23/25; R620; R63; R68; R53; safety phrases: S53; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Cadmium sulfide is an odorless, crystalline, lemon yellow to orange solid. Molecular weight = 144.46; specific gravity (H_2O:1) = 4.83; Sublimation point = 978°C. Insoluble in water.

Potential Exposure: Used in pigments; as an active ingredient in dandruff shampoos; making photoconductors, solar cells, and other electronic components.

Incompatibilities: Contact with water or moisture releases poisonous hydrogen sulfide gas. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, hydrogen azide, zinc, selenium, tellurium, and other metals, iodine monochloride.

Permissible Exposure Limits in Air

NIOSH IDLH = 9 mg [Cd]/m^3

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood

PAC Ver. 29[138]

PAC-1: 0.13 milligram per cubic meter

PAC-2: 0.98 milligram per cubic meter

PAC-3: 6 milligram per cubic meter

DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A

Arab Republic of Egypt: TWA 0.05 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 milligram per cubic meter, 1993; Denmark: TWA 0.01 milligram per cubic meter, 1999; Finland: TWA 0.02 milligram per cubic meter, carcinogen, 1999; France: VME 0.05 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.005 milligram per cubic meter, 2003; Japan: 0.05 milligram per cubic meter, Group 1 carcinogen, 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; the Philippines: TWA 0.2 milligram per cubic meter, 1993; Poland: MAC (TWA) (*fume*) 0.02 milligram per cubic meter, MAC (STEL) (*fume*) 0.05 milligram per cubic meter, 1999; MAC (TWA) (*dust*): 0.04 milligram per cubic meter, MAC (STEL) *dust* 0.2 milligram per cubic meter, 1999; Russia: TWA 0.01 milligram per cubic meter; STEL 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.05 milligram per cubic meter (total *dust*), 1999; Sweden: TWA 0.01 milligram per cubic meter (respirable *dust*), 1999; Switzerland: MAK-W 0.05 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.2 milligram per cubic meter; STEL 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.2 milligram per cubic meter, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μ/m^3.

Determination in Air: Collection of particles on a filter, workup with acid and measurement by AA has been specified by NIOSH. For (*dust*): Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCLG = 0.005 mg[Cd]/L; MCL = 0.005 mg[Cd]/L; State Drinking Water Standards: Arizona 10 μg/L; State Drinking Water Guidelines: Arizona 5 μg/L; Maine 5 μg/L; Minnesota 4 μg/L.

Determination in Water: Total cadmium may be determined by digestion followed by AA of colorimetric (Dithizone) analysis or by ICP Optical Emission Spectrometry. Dissolved cadmium is determined by 0.45 μ filtration followed by the previously cited methods[49].

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes on contact. Inhalation irritates the nose, throat, and lungs with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Cadmium sulfate can cause nausea, salivation, vomiting; cramps and diarrhea; metal fume fever with flu-like symptoms; chills, headache, weakness; metallic tasted in the mouth.

Long-Term Exposure: Cadmium can cause kidney damage. Repeated exposure can cause anemia, brittle and painful bones; diminished or loss of the sense of smell; fatigue; and/or yellow staining of the teeth. May cause lung cancer; kidney damage with kidney stones; liver damage, lung damage with bronchitis, cough, phlegm, and/or shortness of breath; damage to the testes; and may damage the developing fetus. There is some evidence that cadmium sulfate is a teratogen in humans.

Points of Attack: Lungs, liver, kidneys, blood.

Medical Surveillance: Urine test for Cd (levels should be less than 10 μg/L of urine). Urine test for low molecular weight proteins (β-2-microglobulin) to detect kidney damage. CBC. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Liver function tests. Consider chest X-ray following acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to Physician:* In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours.

Note to physician: For severe poisoning, do not use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: < or = 50 μg/m^3 Half-mask, APR equipped with a high-efficiency filter*. < or = 125 μg/m^3 (1) PAPR with a loose-fitting hood or helmet equipped with a high-efficiency filter* or (2) Supplied-air respirator with a loose-fitting hood or helmet facepiece operated in continuous-flow mode. < or = 250 μg/m^3 (1) Full-facepiece APR equipped with a high-efficiency filter*; (2) PAPR with a tight-fitting half-mask equipped with a high-efficiency filter*; or (3) Supplied-air respirator with a tight-fitting half-mask operated in continuous-flow mode. < or = 1250 μg/m^3 (1) PAPR with a tight-fitting full facepiece equipped with a high-efficiency filter* or (2) Supplied-air respirator with a tight-fitting full facepiece operated in continuous-flow mode. < or = 5000 μg/m^3 Supplied-air respirator with half-mask or full facepiece operated in pressure-demand or other positive-pressure mode. >5000 μg/m^3 or unknown concentration (1) SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode or (2) Supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure mode and equipped with an auxiliary escape-type SCBA operated in pressure-demand mode. *Firefighting:* SCBA with full facepiece operated in pressure-demand or other positive-pressure mode. *Note:* Quantitative fit testing is required for all tight-fitting APRs where airborne concentration of cadmium exceeds 10 times the TWA PEL ($10 \times 5\ \mu g/m^3 = 50\ \mu g/m^3$). A full facepiece respirator is required when eye irritation is expected.

* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Prior to working with Cadmium sulfide, all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, dark, well-ventilated area away from oxidizers and metals, strong acids; water or moisture, and other incompatible materials listed above.

Shipping: UN2570 Cadmium compounds, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Do not* use water. Use dry chemical extinguishers appropriate for metal fires. Thermal decomposition products may include sulfur oxides and hydrogen sulfide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Calcium C:0200

Formula: Ca
***Synonyms*:** Atomic calcium; Blood-coagulation factor IV; Calcicat; Calcio, pirofórico (Spanish); Calcio, metal yaleaciones de, pirofóricas (Spanish); Calcio, aleaciones de, pirofóricas (Spanish); Calcium metal, crystalline; Calcium element; Calcium alloys, pyrophoric; Calcium, alliages pyrophoriques de (French); Calcium, metal and alloys, pyrophoric; Calcium, métallique et alliages pyrophoriques de (French); Calcium, pyrophoric; Calcium, pyrophorique (French); Elemental calcium
CAS Registry Number: 7440-70-2
HSDB Number: 273
RTECS Number: EV8040000
UN/NA & ERG Number: UN1401/138; UN1855 (calcium, pyrophoric)/135
EC Number: 231-179-5 [*Annex I Index No.:* 020-001-00-X]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Pyrophoric (powder/fine dust), Violently reactive with water (emits flammable gas).

Hazard symbols, risk, & safety statements: Hazard symbol: F; risk phrases: R15/29; R17; safety phrases: S2; S8; S24/25; S43 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Calcium is a silvery-white metal when freshly cut, which tarnishes to a blue-gray color in air. It can also be found as a powder. Molecular weight = 40.1; specific gravity (H_2O:1) = 1.54; boiling point = 1485°C; freezing/melting point = 842°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 2. ₩ Violent reaction with water releasing flammable hydrogen gas.
Potential Exposure: Calcium is used as a raw material for aluminum, copper, and lead alloys.
Incompatibilities: Forms hydrogen gas on contact with air; finely divided material or dust may ignite spontaneously. A strong reducing agent; reacts violently with water, acids, strong oxidizers (such as chlorine, bromine, and fluorine), alkaline carbonates, dinitrogen tetroxide; halogenated hydrocarbons; lead chloride, halogens, alkaline hydroxides, oxygen, silicon, sulfur, chlorine, fluorine, chlorine trifluoride, and many other substances. Reacts with water to produce flammable hydrogen gas.

Permissible Exposure Limits in Air

PAC Ver. 27; No values found in Ver. 29[138]
PAC-1: 30 milligram per cubic meter
PAC-2: 330 milligram per cubic meter
PAC-3: 2000 milligram per cubic meter

Determination in Air: Use NIOSH (IV) Analytical Method # 7020 (Calcium).
Routes of Entry: Inhalation of dust.

Harmful Effects and Symptoms

Contact with the dust can severely irritate and burn the eyes and skin. Exposure to the dust can irritate the air passages and lungs. Calcium is a reactive chemical and is an explosion hazard.
Short-Term Exposure: Eye contact can cause irritation and possible permanent damage. Skin contact can cause irritation and burns. Inhalation can irritate air passages and lungs, causing coughing and difficult breathing.
Points of Attack: Eyes, skin, and respiratory system.
Medical Surveillance: Lung function tests are recommended on a preemployment and regular postemployment basis.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear chemical goggles and face shield when working with Calcium, unless full facepiece respiratory protection is worn.
Respirator Selection: Where there is potential exists for exposure to calcium, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high-efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.
Storage: Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Store in tightly closed containers in a cool, well-ventilated area away from water, moisture, oxidizers, and acids. Wherever calcium is used, handled, manufactured, or stored,

use explosion-proof electrical equipment and fittings. Store in kerosene or other neutral oil. Do not store large quantities of calcium in rooms with sprinkler systems. A detached fire resistant building is recommended for large storage.

Shipping: UN1401 Calcium, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material. UN 1855 Calcium, pyrophoric or Calcium alloys, pyrophoric, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Calcium dust may ignite spontaneously in air. In contact with water or moisture, calcium releases hydrogen gas which can be explosive. Thermal decomposition products include metal oxide. Containers may explode in fire. Fire may restart after it has been extinguished. Use dry graphite, soda ash; powdered salt or appropriate metal fire extinguisher. *Do not use water*, CO_2, or dry chemical extinguishers since they are ineffective. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Calcium metal may be burned in an open furnace[22].When burning calcium waste in a steel pan, dry steam may be directed to the waste with due care to avoid splashing.

Calcium Carbide C:0220

Formula: C_2Ca; CaC_2

Synonyms: Acetylongen; Calcium acetylide; Calcium dicarbide; Carbide, acetylenogen; Carbure de calcium (French); Carburo de calcio (Spanish)

CAS Registry Number: 75-20-7

HSDB Number: 1434

RTECS Number: EV9400000

UN/NA & ERG Number: UN1402/138

EC Number: 200-848-3 [*Annex I Index No.:* 006-004-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Dangerously water reactive (may cause spontaneous fire).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: F; risk phrases: R11; R14/15; R37/38; R41; safety phrases: S2; S8; S21; S26; S30; S39; S43 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Calcium carbide is a grayish-black granules, powder, or lumps. Slight garlic odor. Molecular weight = 64.1; specific gravity (H_2O:1) = 2.22; boiling point ≥ 447°C; freezing/melting point = about 2300°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 2 ₩ (water reactive).

Potential Exposure: A potential danger to those involved in the manufacture and handling of carbide and the generation of acetylene.

Incompatibilities: Water contact or moist air forms calcium hydroxide and explosive acetylene gas with risk of fire and explosion. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, hydrogen chloride, methanol, copper salt solutions, lead fluoride, magnesium, selenium, silver nitrate, iron trichloride, tin dichloride, sodium peroxide, stannous chloride, sulfur.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 120 milligram per cubic meter

PAC-2: 1300 milligram per cubic meter

PAC-3: 7900 milligram per cubic meter

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Irritation of skin, eyes, and respiratory tract. Inhalation of dust may cause lung edema.

Short-Term Exposure: Corrosive. Contact with eyes or skin causes severe irritation and burns with possible permanent eye damage and ulcers to the skin. Irritates the lungs with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Can irritate the lungs. Exposure may cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, and respiratory tract.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Prior to working with calcium carbide all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and without sprinkler protection and avoid contact with incompatible materials. Use only nonsparking tools and equipment especially when opening and closing containers of calcium carbide. Metal containers involving the transfer of this chemical should be grounded and bonded. Use explosion-proof electrical equipment in the carbide-handling area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1402 Calcium carbide, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Wet calcium carbide produces highly flammable acetylene gas. Dry calcium carbide itself is not flammable. *Do not use water*, foam, carbon dioxide, or halogen extinguishers on fire. Use dry chemical, sand, soda ash; or lime extinguishers. Thermal decomposition products may include oxides of calcium and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Mixing with large quantity of water using pilot flame to ignite evolved acetylene. Lime residue sent to landfill.

Calcium Carbonate C:0230

Formula: $CCaO_3$; $CaCO_3$

Synonyms: Agricultural limestone; Agstone; Aragonite; Atomit; Bell mine pulverized limestone; Calcite; Calcium (II)carbonate (1:1); Carbonic acid, calcium salt (1:1); Chalk; Domolite; Franklin; Limestone; Lithographic stone; Marble; Portland stone; Sohnhofen stone; Vaterite. The monocarbonate is a Food and Drug Administration (FDA) and foreign over-the-counter drug with more than 250 registered trade names.

CAS Registry Number: 1317-65-3 (dolomite; limestone); 471-34-1 (carbonic acid, calcium salt)

HSDB Number: 927

RTECS Number: EV9580000; FF9335000 (monocarbonate)

EC Number: 207-439-9; 215-279-6 (limestone)

Regulatory Authority and Advisory Information

Hazard Alert: Primary irritant (w/o allergic reaction) (monocarbonate).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Calcium carbonate is a white, odorless powder, or crystalline solid. Molecular weight = 100.09; specific gravity (H_2O:1) = 2.7 to 2.95; freezing/melting point = 825 to 1339°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Very slightly soluble in water; solubility = 0.001%. In some of the literature the monocarbonate (CAS 471-34-1) is listed: freezing/melting point = 825°C (decomposes).

Potential Exposure: Calcium carbonate is used as a source of lime; neutralizing agent; manufacturing or rubber, plastics, paint and coatings; sealants, paper, dentifrices, ceramics, putty, polishes and cleaners, insecticides, inks and cosmetics; whitewash; Portland cement; antacids; analytical chemistry, and others.

Incompatibilities: Calcium carbonate decomposes in high temperature forming carbon dioxide and corrosive materials.

Reacts with acids producing carbon dioxide gas release. Incompatible with acids, ammonium salts; fluorine. NIOSH also lists alum as incompatible, but this is questionable.

Permissible Exposure Limits in Air

OSHA PEL: 15 milligram per cubic meter (respirable fraction) TWA; 5 milligram per cubic meter (total dust) TWA

NIOSH REL: 10 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter (respirable dust) TWA

ACGIH TLV[1]: Withdrawn.

471-34-1, carbonic acid, calcium salt

PAC Ver. 29[138]

PAC-1: 45 milligram per cubic meter

PAC-2: 210 milligram per cubic meter

PAC-3: 1300 milligram per cubic meter

Australia: TWA 10 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter, 1993; Poland: MAC (TWA) dust 10 milligram per cubic meter, 1999; Russia: STEL 6 milligram per cubic meter, 1993; Switzerland: MAK-W 6 milligram per cubic meter (resp. dust), 1999; United Kingdom: TWA 10 milligram per cubic meter, total inhalable dust, 2000; United Kingdom: TWA 4 milligram per cubic meter, respirable dust, 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter, for regular and monocarbonate, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 milligram per cubic meter [(E)]

Determination in Air: NIOSH Analytical Method #7020 (Calcium), Method #7303, or OSHA Analytical Method ID-121. See also NIOSH analytical Methods #0500 for nuisance dust, total and 0600 for nuisance dust, respirable.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation can cause irritation to nose. Eye contact can cause irritation. *Ingestion:* Large amounts can cause irritability, nausea, dehydration, and constipation. Estimated lethal dose is over 2 lb.

Long-Term Exposure: Ingestion of more than 8 g (1/3 oz) a day can cause blood and kidney disorders.

Points of Attack: Eyes, respiratory system; digestive system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear safety glasses.

Respirator Selection: Wear dust mask.

Storage: Color code—Green: General storage may be used. Store to avoid contact with acids.

Shipping: The DOT Performance-Oriented Packaging Standards[19] do not cite calcium carbonate.

Spill Handling: Scoop up and place in suitable container. Discard with regular trash.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishing agents suitable for surrounding materials.
Disposal Method Suggested: Landfills. It is the responsibility of chemical waste generators to determine if a discarded chemical is classified as a hazardous waste. See 40 CFR Parts 261.3 for United States Environmental Protection Agency guidelines for the classification determination. In addition, in order to ensure complete and accurate classification, waste generators must consult state and local hazardous waste regulations.

New York State Department of Health, Chemical Fact Sheet: Calcium Carbonate, Bureau of Toxic Substance Assessment, Albany, NY (March 1986).

Calcium Chlorate C:0240

Formula: $CaCl_2O_6$; $Ca(ClO_3)_2$
Synonyms: Calcium chlorate aqueous solution; Chlorate de calcium (French); Chloric acid, calcium salt
CAS Registry Number: 10137-74-3
HSDB Number: 253
RTECS Number: FN9800000
UN/NA & ERG Number: UN1452 (solid)/140; UN2429 (solution)/140
EC Number: 233-378-2
Regulatory Authority and Advisory Information
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: Calcium chlorate forms white to yellow deliquescent crystals. Molecular weight = 243; specific gravity (H_2O:1) = 2.71; freezing/melting point = 340° (decompositional loses H_2O of crystallization @ $>100°$). Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0, O oxidizer. Highly soluble in water.
Potential Exposure: Calcium chlorate is used in making fireworks, herbicides (weed killers) and in photography.
Incompatibilities: A strong oxidizer. Reacts, possibly with risk of fire and explosion, with acids (especially organic acids), reducing agents; aluminum, arsenic, chemically active metals; combustible materials; ammonium compounds; charcoal, copper, cyanides; manganese dioxide, metal sulfides; phosphorus, sulfur.
Permissible Exposure Limits in Air
No standards or PAC available.
Permissible Concentration in Water: *Chlorates:* State Drinking Water Guidelines: California 800 μg/L; Maine 7 μg/L.
Routes of Entry: Inhalation of dust, ingestion.
Harmful Effects and Symptoms
Short-Term Exposure: Calcium chlorate can affect you when breathed in. Contact can irritate the skin and eyes. Inhalation can cause irritation of the respiratory tract. Calcium chlorate may damage the kidneys. Very high exposures can interfere with the ability of the blood to carry oxygen, causing headaches, dizziness, weakness, a bluish skin color, and even death. High exposures can cause death. LD_{50} (oral-rat) = 4500 mg/kg[41].
Long-Term Exposure: Can affect the kidneys, liver, heart, and blood.
Points of Attack: Eyes, skin, respiratory system; blood.
Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: methemoglobin level. EKG. Kidney and liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.
Personal Protective Methods: Avoid skin contact with Calcium Chlorate. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn.
Respirator Selection: Where there is potential exists for exposure to Calcium Chlorate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.
Storage: Oxidizer. Potentially explosive. Color code—Yellow: Reactive Hazard; Store in a location separate from

other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as Hydrochloric, Sulfuric, and nitric); chemically active metals (such as potassium, sodium, magnesium, and zinc). Calcium chlorate must be stored to avoid contact with organic matter; ammonium compounds, aluminum, copper, cyanides, flammable vapors, and other oxidizable materials, since violent reactions occur. Avoid storage on wood floors. Friction, heat, or physical shocks may cause calcium chlorate to ignite and explode. Wherever calcium chlorate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1452 Calcium chlorate, Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN2429 Calcium chlorate, aqueous solution, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: *For dry material:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

For solution: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid that increases the combustion of other substances. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For barium chlorate, the UN[22] recommends using a vast volume of a reducing agent (bisulfites, ferrous salts or hypo) followed by neutralization and flushing to the sewer with abundant water. This should be applicable here as well.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Calcium Chlorate, Trenton, NJ (October 2001).

Calcium Chloride C:0250

Formula: $CaCl_2$

Synonyms: Calcium chloride, anhydrous; Calplus; Caltac

CAS Registry Number: 10043-52-4; 7774-34-7 (hexahydrate); 22691-02-7 (hydrate); 10035-04-8, dihydrate

HSDB Number: 923

RTECS Number: EV9800000

EC Number: 233-140-8 [*Annex I Index No.:* 017-013-00-2] (*10043-52-4*)

Regulatory Authority and Advisory Information

Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects.

European/International Regulations (*22691-02-7*): Hazard symbol: Xi; risk phrases: R11; R36; R62; safety phrases: S2; S22; S24 S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Calcium chloride is a colorless to off-white crystalline solid which is deliquescent (absorb water). When heated, crystals lose water @ 100°C. Molecular weight = 110.98; specific gravity (H_2O:1) = 2.15; boiling point = 1935°C (decomposes); freezing/melting point = 775°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Soluble in water; solubility = 75% @ 20°C.

Potential Exposure: Calcium chloride is used as road salt for melting snow, a drying agent in desiccators, for dehydrating organic liquids and gases, in refrigeration brines and antifreeze, as a dust-proofing agent, food additives, concrete hardening accelerator, and others. May react with strong oxidizers.

Incompatibilities: The solution in water is a weak base. Reacts with zinc in presence of moisture, forming highly flammable hydrogen gas. Dissolves violently in water with generation of much heat. Incompatible with water, bromine trifluoride; 2-furan, percarboxylic acid. May attack some building materials and metals in the presence of moisture.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

10043-52-4

PAC-1: 12 milligram per cubic meter
PAC-2: 130 milligram per cubic meter
PAC-3: 790 milligram per cubic meter

22691-02-7, hydrate

PAC-1: 13 milligram per cubic meter
PAC-2: 140 milligram per cubic meter
PAC-3: 850 milligram per cubic meter

10035-04-8, dihydrate

PAC-1: 16 milligram per cubic meter
PAC-2: 170 milligram per cubic meter
PAC-3: 1100 milligram per cubic meter

7774-34-7, hexahydrate

PAC-1: 24 milligram per cubic meter
PAC-2: 260 milligram per cubic meter
PAC-3: 1600 milligram per cubic meter

Routes of Entry: Inhalation of dust; ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation of dust may cause burning, irritation of the nose, mouth, and throat, nose bleeds, and breakdown of nasal tissue. Skin contact with dry skin solid may cause severe irritation. Contact with wet skin or concentrated solutions can cause more severe irritation and burns. Ingestion may cause irritation of the mouth, throat, and stomach, nausea, and vomiting. Eye contact may cause irritation, burning, and some damage to the surface of the eye. LD_{50} (oral-rat) = 1000 mg/kg (slightly toxic).

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Prolonged or repeated inhalation may cause ulcerations of the nasal mucous membrane.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear goggles or face shield if eye hazard exists, coveralls and rubber gloves. Natural rubber, Neoprene, and polyvinyl chloride are among the recommended protective materials.

Respirator Selection: Dust mask or dust respirator may be helpful in preventing inhalation exposures.

Storage: Keep tightly sealed in a cool, dry place away from incompatible materials.

Shipping: There are no label or maximum shipping quantity requirements set by DOT[19].

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material, and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extinguishing agent suitable for surrounding fire. Thermal decomposition products may include chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add large volumes of water. Add excess soda ash, then neutralize with HCl. Route to sewage plant or use as landfill sludge.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, O, N; risk phrases:R45; R8, R22; R50/53; R60; R61; safety phrases: S17; S29/35; S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Calcium chromate is a yellow crystalline solid, often used in solution. Odorless. It normally occurs as the dehydrate and loses water @ 200°C. Molecular weight = 156.07; specific gravity (H_2O:1) = 2.89; freezing/melting point = 999°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: Calcium chromate is used as a pigment, corrosion inhibitor; in the manufacture of chromium; in oxidizing reactions; in battery depolarization.

Incompatibilities: A strong oxidizer. Incompatible with boron (violent reaction), ethanol, combustibles, organic, or other easily oxidized materials.

Permissible Exposure Limits in Air

As chromium(VI), inorganic insoluble compounds

NIOSH IDLH = 15 mg[Cr(VI)]/m^3

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendices A and C.

ACGIH TLV[1]: 0.01 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen

PAC Ver. 29[138]

PAC-1: 0.003 milligram per cubic meter

PAC-2: 7.8 milligram per cubic meter

PAC-3: 47 milligram per cubic meter

DFG MAK: Danger of skin sensitization; Carcinogen Category 2; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are less than the limits listed above. Some states have set guidelines or standards for calcium chromate in ambient air[60]: North Carolina, zero; Massachusetts, 0.0008 μ/m^3.

Determination in Air: Use NIOSH Analytical Method (IV) #7024, Chromium.

Permissible Concentration in Water: State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr(VI)]/L.

Determination in Water: Be AA using either direct aspiration into a flame or a furnace technique[49].

Routes of Entry: Skin contact, inhalation of dust, ingestion. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Exposure to 0.18−1.4 milligram per cubic meter can cause irritation of nose and throat within 2 weeks; disintegration of nasal tissue; coughing, wheezing, headache, painful breathing, and fever within 8 weeks. Skin contact can cause severe irritation. Contact with damaged skin can cause deep sores known as "chrome holes." Eye contact can cause severe chemical burns and possible loss of vision. Ingestion can cause severe sore throat and irritation of the throat, stomach and intestine, which can develop into tissue damage.

Long-Term Exposure: Calcium chromate is a carcinogen in humans, and has been shown to cause lung, liver, bladder, etc. cancer. Inhalation can cause breakdown of nasal tissue and a hole in the septum dividing the inner nose. Exposed persons may develop skin allergy, bronchitis, lung allergy; and kidney damage.

Points of Attack: Lungs, kidneys, skin, respiratory system; eyes, gastrointestinal system.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, CBC; chest X-ray, electrocardiogram, liver function tests; pulmonary Function tests, sputum cytology, urine (chemical/metabolite), UA (routine), white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Urine test for chromates. This test is most accurate shortly after exposure. Exam of the skin and nose. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing; may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. (as chromic acid and chromates) **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex-coated suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; Viton gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-(if using solution) or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129, Chromium(VI).

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Blue (carcinogen): Health Hazard: Store in a secure poison location. Calcium chromate must be stored to avoid contact with combustible, organic or other easily oxidized materials (such as paper, wood, sulfur, aluminum, hydrazine, and plastics), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Codes for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Solution: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not readily ignite. Thermal decomposition products may include metal oxides of chromium. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Container may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Reduce to trivalent chromium and precipitate as chromium(III) hydroxide. Compact the sludge and dispose in single purpose special waste dumps[22].

Calcium Cyanamide C:0270

Formula: $CCaN_2$; $CaCN_2$

Synonyms: Aero-cyanamid; Aero-cyanamid, Special grade; Alzodef; Calcium carbimide; Calcium cyanamid; CCC; Cianamida calcica (Spanish); Cyanamid; Cyanamide; Cyanamide calcique (French); Cyanamide, calcium salt (1:1); Cyanamid granular; Cyanamid special grade; Cy-L 500; Lime nitrogen; NCI-C02937; Nitrogen lime; Nitrolime; USAFCY-2

CAS Registry Number: 156-62-7

HSDB Number: 1328

RTECS Number: GS6000000

UN/NA & ERG Number: UN1403 (Calcium cyanamide, with more than 0.1% Calcium carbide)/138

EC Number: 205-861-8 [*Annex I Index No.:* 615-017-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Corrosive, Water reactive (emits flammable gas), Agricultural Chemical Possible risk of forming tumors, Suspected of causing genetic defects, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Superfund/EPCRA 40 CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; NPRI.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, C; risk phrases: R15; R22; R37; R41; R51; R62; safety phrases: S2; S22; S26; S36/37/S39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Calcium cyanamide is a blackish-gray, shiny crystalline material or powder. Molecular weight = 80.11; specific gravity (H_2O:1) = 2.29; freezing/melting point = 1340°C (sublimes > 1500°C). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 1₩. Insoluble in water; reaction, releasing explosive acetylene gas and ammonia.

Potential Exposure: Calcium cyanamide is used in agriculture as a fertilizer, herbicide; defoliant for cotton plants; and pesticide. It is also used in the manufacture of dicyandiamide and calcium cyanide as a desulfurizer in the iron and steel industry; and in steel hardening.

Incompatibilities: Commercial grades of calcium cyanamide may contain calcium carbide; contact with any form of moisture solutions may cause decomposition, liberating explosive acetylene gas and ammonia. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May polymerize in water or alkaline solutions to dicyanamide. Contact with all solvents tested also causes decomposition.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.5 milligram per cubic meter TWA

ACGIH TLV[1]: 0.5 milligram per cubic meter TWA, not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 5.6 milligram per cubic meter

PAC-3: 50 milligram per cubic meter

DFG MAK 1 milligram per cubic meter, measured as the, inhalable fraction [skin]; Peak Limitation Category II(2).

Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: MAK 0.5 milligram per cubic meter [skin] 1999; Denmark: TWA 0.5 milligram per cubic meter, 1999; Finland: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, 1999; France: VME

0.5 milligram per cubic meter, 1999; Norway: TWA 0.5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; Switzerland: MAK-W 0.5 milligram per cubic meter [skin] 1999; United Kingdom: LTEL 0.5 milligram per cubic meter; STEL 1 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for calcium cyanamide in ambient air[60] ranging from 5.0 μ/m^3 (North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; IV NIOSH Analytical Method #0500, Particulates NOR, total dust. Use NIOSH Analytical Method #7904; #6010, cyanides.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Toxic to aquatic organisms.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Calcium cyanamide can cause nausea, headache, dizziness, and flushing of the skin. It is a Primary irritant (w/o allergic reaction) of the mucous membranes of the respiratory tract, eyes, and skin. Drinking alcohol shortly before or within 1−2 days after exposure can cause a severe reaction. Inhalation may result in rhinitis, pharyngitis, laryngitis, and bronchitis. Conjunctivitis, keratitis, and corneal ulceration may occur. An itchy erythematous dermatitis has been reported and continued skin contact leads to the formation of slowly healing ulcerations on the palms and between the fingers. Sensitization occasionally develops. Chronic rhinitis and perforation on the nasal septum have been reported after long exposures. All local effects appear to be due to the caustic nature of cyanamide.

Long-Term Exposure: Calcium cyanamide may damage the developing fetus. This chemical may damage the nervous system; causing numbness, and weakness in the hands and feet. Prolonged contact can cause skin ulcers. It causes a characteristic vasomotor reaction. There is erythema of the upper portions of the body, face and arms accompanied by nausea, fatigue, headache, dyspnea, vomiting, oppression in the chest, and shivering. Circulatory collapse may follow in the more serious cases. The vasomotor response may be triggered or intensified by alcohol ingestion. Pneumonia or lung edema may develop. Cyanide ion is not released in the body, and the mechanism of toxic action is unknown.

Points of Attack: Eyes, skin, respiratory system; vasomotor system.

Medical Surveillance: Examination of the nervous system. Evaluation by a qualified allergist. Evaluate skin, respiratory tract, and history of alcohol intake in placement or periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eye wash. In addition to personal protective equipment, waterproof barrier creams may be used to provide additional face and skin protection.

Respirator Selection: *Up to 25 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front -or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Store under inert gas. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1403 Calcium cyanamide with >1% calcium carbide, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill until clean-up is complete. Remove all ignition sources. Ventilate area of spill. Collect spilled material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Absorb liquid containing calcium cyanamide in vermiculite, dry sand; earth, or similar material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Do not use foam extinguishers or water. Use dry chemical, soda ash; or lime. Thermal decomposition products may include oxides of nitrogen, calcium, and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as cyanide compounds, inorganic, n.o.s.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R28; R32; R50/53; safety phrases: S1/2; S7/8; S23; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Calcium cyanide is a white crystalline solid or powder. Odor of hydrogen cyanide. Molecular weight = 92.12; specific gravity (H_2O:1) = 1.853 @ 20°C; freezing/melting point ≥ 350°C (dangerous decomposition below MP). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Soluble in water; violent reaction.

Potential Exposure: Calcium cyanide is used as a fumigant; as a rodenticide; in leaching precious metal ores; in the manufacture of stainless steel; and as a stabilizer for cement. Used as raw material for production of nitrogenous compounds and in treatment of alcoholism.

Incompatibilities: Contact with water, acids, acidic salts; moist air, or carbon dioxide, forms highly toxic and flammable hydrogen cyanide. Incompatible with fluorine, magnesium. Reacts violently when heated with nitrites, nitrates, chlorates, and perchlorates. Calcium cyanide decomposes in high heat forming hydrogen cyanide and nitrous oxides fumes.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[CN]/m^3

OSHA PEL: 5 ppm[CN] TWA

NIOSH REL: 4.7 ppm/5 mg[CN]/m^3 [10 minutes] Ceiling Concentration

ACGIH TLV[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration

PAC* Ver. 29[138]

PAC-1: $\mathbf{3.8_A}$ milligram per cubic meter

PAC-2: $\mathbf{13_A}$ milligram per cubic meter

PAC-3: $\mathbf{28_A}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 2 mg[CN]/m^3 inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C

Determination in Air: Use NIOSH Analytical Method #7904; #6010, cyanides.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Routes of Entry: Can be absorbed through the skin, inhalation, ingestion.

Harmful Effects and Symptoms

Calcium cyanide is highly toxic. The lethal human dose is 18 mg/kg. The hazard is that of hydrogen cyanide. The dust is irritating to the eyes, nose, and throat[41]. Inhalation or ingestion causes headache, nausea, vomiting, and weakness; high concentrations are rapidly fatal.

Short-Term Exposure: The substance is corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the central nervous system; blood, heart, and respiratory tract.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May be a reproductive toxin in humans.

Points of Attack: Skin, lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Do not allow water to enter nose or mouth. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR, must be quickly available.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should Wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 25 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Calcium cyanide all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area away from moisture, water, acids, and oxidizers. Protect against physical damage to containers.

Shipping: UN1575 Calcium cyanide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep material out of drains, sewers, streams. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical or dry sand. Do not use foam, water, carbon dioxide. Thermal decomposition products may include phosgene and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add cyanide waste to strong alkaline sodium hypochlorite. Let stand 24 hours then flush to sewage plant[22].

Calcium Fluoride C:0290

Formula: CaF_2

Synonyms: Calcium difluoride; Fluorite; Fluorspar; Fluospar; Met-Spar

CAS Registry Number: 7789-75-5

HSDB Number: 995

RTECS Number: EW1760000

EC Number: 232-188-7

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Suspected reprotoxic hazard, Suspected of causing genetic defects.

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg[F]/L, as Fluoride.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Calcium fluoride is colorless crystalline or white, powdery substance. Molecular weight = 78.08; specific gravity (H_2O:1) = 3.18 @ 20°C; boiling point = 2495°C; freezing/melting point = 1418°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Practically insoluble in water.

Potential Exposure: Calcium fluoride is used for production of hydrofluoric acid; as a flux in steel manufacture; in smelting; electric arc welding, making glass and ceramics; and to fluoridate drinking water.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 minutes Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; BEI: 3 mg[F]/g creatinine in urine prior to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

PAC Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 milligram per cubic meter), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m3), 1999;

Thailand: TWA 2.5 mg[F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guide lines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May cause difficult breathing; burning of mouth, throat, and nose which may result in bleeding. These may be felt @ 7.5 milligram per cubic meter. Nausea, vomiting, profuse sweating, and excess thirst may occur at higher levels. *Skin:* May cause rash, itching, and burning of skin. Solutions of 1% strength may cause sores if not removed promptly. *Eyes:* May cause severe irritation. *Ingestion:* Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. 5−40 mg may cause nausea, diarrhea, and vomiting. More severe symptoms of burning and painful abdomen; sores in mouth; throat and digestive tract; tremors, convulsions, and shock will occur from about 1 g. Death may result by ingestion of 2−5 g (1/6 oz).

Long-Term Exposure: Repeated exposure may cause poor appetite; nausea, constipation, or diarrhea. Repeated exposure to fluoride chemicals may cause stiffness in muscles or ligaments and even crippling; this could take years to develop. Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 milligram per cubic meter or higher. Mottling of the teeth may occur at this level.

Points of Attack: Eyes, skin, respiratory system; bones.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Urine fluoride level (normal is less than 4 mg/L).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. A doctor or authorized paramedic may consider administering aluminum hydroxide gel, if conscious.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should Wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)*$^+$ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered APR with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Color code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area away from acids, and chemically active metals (such as potassium, sodium, magnesium, and zinc) because corrosive hydrogen fluoride (HF) will be produced.

Shipping: Calcium fluoride is not specifically covered by DOT[19] in its Performance-Oriented Packaging Standards.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fire. Thermal decomposition products may include HF and oxices of calcium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Calcium Hydride C:0293

Formula: CaH_2

Synonyms: Calcium dihydride; Hydrolith

CAS Registry Number: 7789-78-8; 57308-10-8 [calcium hydrogen (−1) ion]

HSDB Number: 8095

RTECS Number: EW 2440000

UN/NA & ERG Number: UN1404/138

EC Number: 232-189-2 [*Annex I Index No.:* 001-004-00-5]

Regulatory Authority and Advisory Bodies

Hazard Alert: Highly flammable, Dangerous when wet: reacts with water (emits flammable gas; self-ignition possible), Strong reducing agent, Air reactive.

Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R11; R14; R15/29; safety phrases: S7/8; S21; S24/25; S43 (no water); S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Calcium hydride is a grayish-white crystalline solid. Molecular weight = 42.24; specific gravity (H_2O:1) = 1.7; freezing/melting point = 816°C (It begins to decompose at about 600°C). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 3₩. Reacts with water, releasing flammable hydrogen gas and may form a corrosive solution[101].

Potential Exposure: Calcium Hydride is used as a drying and reducing agent and a cleaner for blocked up oil wells.

Incompatibilities: Dust may form explosive mixture with air. Reacts with water, moist air, and steam, releasing flammable hydrogen gas; and may self-ignite in air. A strong reducing agent; incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with metal halogenates, silver fluoride, and tetrahydrofuran.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

7789-78-8

PAC-1: 12 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 790 milligram per cubic meter

Permissible Concentration in Water: No criteria set (calcium hydride reacts with water in any event).

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Calcium hydride can affect you when breathed in. Contact with skin or eyes can cause severe burns. Exposure can irritate the eyes, nose, and throat. Breathing Calcium hydride can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema). This can cause death.

Long-Term Exposure: Although it is unknown whether calcium hydride causes lung damage, similar very irritating substances are capable of causing lung damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium Hydride. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential exists for exposure to Calcium Hydride use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Calcium hydride must be stored to avoid contact with water or steam, since violent reactions occur and flammable hydrogen gas is produced. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN1404 Calcium hydride, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Do not use any hydrous (water, foam, etc.) extinguishing agents*. Fire may restart after it has been extinguished. Use dry chemical, soda ash; or lime extinguishers. Thermal decomposition products may include calcium hydroxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Calcium Hydroxide C:0295

Formula: CaH_2O_2: $Ca(OH)_2$

Synonyms: Bell mine; Calcium hydrate; Carboxide; Hydrated kemikal; Hydrated lime; Lime water; Slaked lime

CAS Registry Number: 1305-62-0

UN/NA & ERG Number: UN3262/154

HSDB Number: 919

RTECS Number: EW2800000
EC Number: 215-137-3
Regulatory Authority and Advisory Information
Hazard Alert: Suspected of causing genetic defects, Corrosive, Primary irritant (w/o allergic reaction).
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, C; risk phrases: R23/25; R33; R36/37/38; R62; safety phrases: S24/25; S26; S27; S36/37/39; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Calcium hydroxide is a soft white crystalline, odorless powder with an alkaline, bitter taste. Molecular weight = 74.11; specific gravity (H_2O:1) = 2.24 @ 25°C; boiling point = decomposes; freezing/melting point = 580°C (decomposes; dehydrates to calcium oxide). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 2. Insoluble in water. *Note*: Readily absorbs CO_2 from the air to form calcium carbonate.
Potential Exposure: Calcium hydroxide is used in agriculture and in fertilizer manufacture; it is used in the formulation of mortar, plasters, and cements; it is used as a scrubbing and neutralizing agent in the chemical industry. For making insecticides, acaricides, and products to control arthropods[97].
Incompatibilities: May react violently with acids, maleic anhydride, nitromethane, nitroethane, nitropropane, nitroparaffins, and phosphorus.
Permissible Exposure Limits in Air
OSHA PEL: 15 milligram per cubic meter (total dust) TWA; 5 milligram per cubic meter (respirable fraction) TWA
NIOSH REL: 5 milligram per cubic meter TWA
ACGIH TLV[1]: 5 milligram per cubic meter TWA
PAC Ver. 29[138]
PAC-1: 1 milligram per cubic meter
PAC-2: 240 milligram per cubic meter
PAC-3: 1500 milligram per cubic meter
Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 5 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; Poland: AC (TWA) 2 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 milligram per cubic meter. Several states have set guidelines or standards for calcium hydroxide in ambient air[60] ranging from 50 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).
Determination in Air: Filter collection followed by AA analysis. Use NIOSH Analytical Method #7020 for Calcium. See also OSHA Analytical Method ID-121.
Routes of Entry: Inhalation of dust, ingestion.
Harmful Effects and Symptoms
Short-Term Exposure: A corrosive. *Inhalation:* May cause severe irritation to mouth, throat, and lungs if dust is inhaled. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* May cause painful irritation and chemical burns on contact with open cuts or sores or on prolonged contact with intact skin. *Eyes:* Powders and slurries may cause severe chemical burns. Blindness can result. *Ingestion:* Powders, crystals, or slurries may give rise to irritation, soreness, and chemical burns. The estimated lethal dose is about 1 lb.
Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Lungs may be affected by repeated or prolonged exposure to dust particles.
Points of Attack: Eyes, skin, respiratory system.
Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray following acute overexposure.
First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.
Personal Protective Methods: Prevent skin contact. Wear chemical protective clothing which is specifically recommended by the manufacturer. Structural firefighter's protective clothing provides only limited protection. Gloves, eye protection, and coveralls should be worn if contact with Calcium hydroxide is likely. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): natural rubber gloves, Neoprene rubber gloves, suits, boots; nitrile rubber gloves, suits, boots.

Respirator Selection: A dust mask or respirator with dust cartridges. Where there is potential exists for exposure to maneb, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with calcium hydroxide all handlers should be trained on its proper handling and storage. The area should be cool and adequately ventilated. Store in containers protected from physical damage separated from acids and other incompatible materials listed above.

Shipping: UN3262 Corrosive solid, basic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name required.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Keep unauthorized personnel away. Stay upwind. Keep out of low areas. Ventilate enclosed areas. Eliminate all ignition sources (no smoking, flares, sparks, or flames in immediate area). Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other noncombustible material and transfer to containers. *Do not get water inside containers.*

Fire Extinguishing: If tank, rail car, or tank truck is involved in a fire, *isolate* for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. This chemical is a noncombustible solid, however decomposition releases corrosive and toxic fumes. *Small Fire*: Dry chemical, CO_2, or water spray. *Large Fire*: Dry chemical, CO_2, alcohol-resistant foam or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Fire involving Tanks or Car/Trailer Loads Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. *Do not get water inside containers*. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. Keep exposures cool to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfill or admixture with acid industrial wastes prior to lagooning.

Regulatory Authority and Advisory Information

Hazard Alert: Powerful oxidizer, Corrosive, Dangerously water reactive, Environmental hazard.

United States National Primary Drinking Water Regulations: MCLG = 0.08 mg[ClO_2]/L; M CL = 1.0 mg [ClO_2]/L as chlorite.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: O, C, N; risk phrases: R8; R22; R31; R34; R50; safety phrases: S1/2; S26; S29/35; S36/37/39; S43; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Calcium hypochlorite is a white powder, granule, or pellets with a strong chlorine-like odor. Molecular weight = 142.98; specific gravity (H_2O:1) = 2.35; freezing/melting point = about 100°C [decomposes (possibly explosively)]. Hazard identification (based on NFPA-704 M Rating System) (active chlorine > 39%): Health 3, flammability 0, reactivity 1₩. Soluble in water; reacts slowly releasing chlorine gas; solubility = 21% @ 25°C.

Potential Exposure: Calcium hypochlorite is used to kill algae and bacteria, in bleach and in pool chemical products.

Incompatibilities: A powerful oxidizer. Decomposes in heat or sunlight; becomes explosive above 100°C/212°F. Incompatible with strong acids; water and other forms of moisture, reducing agents; combustible materials; all other chemicals, especially acetylene, aniline and all other amines, anthracene, carbon tetrachloride, iron oxide, manganese oxide, mercaptans, diethylene glycol monomethyl ether, nitromethane, organic matter; organic sulfides, phenol, 1-propanethiol, propyl mercaptan, sulfur, turpentine, organic sulfur compounds. Attacks various metals, releasing flammable hydrogen gas.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.6 milligram per cubic meter

PAC-2: 28 milligram per cubic meter

PAC-3: 170 milligram per cubic meter

Permissible Exposure Limits in Water: United States National Primary Drinking Water Regulations: MCLG = 0.08 mg[ClO_2]/L; MCL = 1.0 mg[ClO_2]/L as chlorite.

Determination in Water: The substance is very toxic to aquatic organisms[CDC/NIOSH].

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Calcium hypochlorite can affect you when breathed in. Calcium hypochlorite may cause mutations. Handle with extreme caution. Exposure can severely irritate the eyes, nose, and throat. Contact can severely irritate the skin. Exposure can severely irritate the "voice box" (larynx), bronchial tubes, and lungs. Higher levels can cause a build-up of fluid in the lungs (pulmonary edema). This can cause death.

Long-Term Exposure: Chlorite may cause anemia; infants, young children, and fetuses of pregnant women: nervous system effects. Repeated or prolonged contact can irritate the lungs; may cause bronchitis.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Avoid skin contact with Calcium hypochlorite. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Natural rubber, Neoprene, and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear dust-proof goggles and face shield when working with powders or dust unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential exists for exposure to Calcium hypochlorite, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high-efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet, in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with Calcium hypochlorite all handlers should be trained on its proper handling and storage. Calcium hypochlorite must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); ammonium compounds (such as ammonia and ammonium hydroxide) and amines (such as aniline), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture and combustibles (such as wood, paper or oil). When heated above 100°C, Calcium hypochlorite becomes explosive. Protect containers against physical damage. Avoid storage for long periods, particularly at summer temperatures. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: UN1748 Calcium hypochlorite, dry or Calcium hypochlorite mixtures dry with >39% available chlorine (8.8% available oxygen), Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN2208 Calcium hypochlorite mixtures, dry, with >10% but not >39% available chlorine, Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN2880 Calcium hypochlorite, hydrated or Calcium hypochlorite, hydrated mixtures, with not <5.5% but not >16% water, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling:

UN1748 (calcium hypochlorite, dry) is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water:* Dangerous from 0.5 to 10 km (0.3−6.0 mi) downwind.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable

Fire Extinguishing: This chemical is a strong oxidizer and will increase the intensity of any fire. Use water only. *Do not use chemical or carbon dioxide extinguishers*. Thermal decomposition products may include hydrogen chloride and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve the material in water and add to a large volume of concentrated reducing agent solution, then acidify the mixture with H_2SO_4. When reduction is complete, soda ash is added to make the solution alkaline. The alkaline liquid is decanted from any sludge produced, neutralized, and diluted before discharge to a sewer or stream. The sludge is landfilled.

Calcium Methanearsonate C:0305

Formula: $C_2H_8As_2O_6 \cdot Ca$

Synonyms: Arsonic acid, methyl-, calcium salt (2:1); Calar; **Calcium methanearsonate**; Calcium acid methanearsonate; Calcium hydrogen methanearsonate; Cama; Methanearsonic acid, calcium salt (2:1); Methylarsonic acid, calcium salt (2:1); Super dal-e-rad; Super dal-e-rad-calar; Super crab-e-rad-calar; Weed-B-Gon

CAS Registry Number: 5902-95-4

RTECS Number: PA1800000

UN/NA & ERG Number: UN3280 (organoarsenic compound, liquid, n.o.s.)/151

EC Number: 227-598-8

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Environmental hazard.

WHO Acute Hazard: Class III, Slightly hazardous as cacodylic acid, the parent chemical

CLEAN AIR ACT: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds

Clean Water Act: Toxic pollutant designated pursuant to Section 307(a)(1) of the Federal Water Pollution Control Act and is subject to effluent limitations: 40 CFR 401.15 (7/1/2001).

PAN (Pesticide Action Network) Bad Actor; possible groundwater contaminant

RCRA Section 261 Hazardous Constituents, waste number D004

EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg)

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: (inorganics) 0.1%; organics 1.0%

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as arsenic compounds

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as arsenic compounds

The "Director's List" (CAL/OSHA) as arsenic compounds

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R36/37/38; safety phrases: S26; S29/35; S36; S61 (see Appendix 4)

Description: Colorless liquid. Odorless. Molecular weight = 315.98; boiling point = 393°C; freezing/melting point = 160.5°C; flash point = 204−206°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Highly soluble in water.

Potential Exposure: Organoarsenic herbicide, and defoliant used to control a wide variety of broadleaf weeds and annual grasses, primarily in industrial and residential environments.

Incompatibilities: Keep this material away from bases, heavy metal salts, strong oxidizers; alkaline materials. Contact with reducing agents may release toxic arsine gas.

Permissible Exposure Limits in Air:

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; Biological Exposure Index (BEI): Determinant: Inorganic arsenic plus methylated metabolites in urine; Sampling Time: end of workweek; BEI = 35 μg [As]/L. The determinant may be present in biological specimens collected from subjects who have not been occupationally exposed, at a concentration which could affect interpretation of the result. Such background concentrations are incorporated in the BEI value.

NIOSH IDLH = 5 mg[As]/m^3

PAC

As arsenic, organic compounds Ver. 26, no value in Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 2.5 milligram per cubic meter

PAC-3: 350 milligram per cubic meter

Determination in Air: Filter; Reagent: Ion chromatography/hydride AA: NIOSH IV [#5022, Arsenic, organo-][18].

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guide lines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L [40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 mg[As]/L.

Determination in Water: *For arsenic:* The AA graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is AA; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58].

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. May be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritating to skin and eyes (tearing, redness, blurred vision). If swallowed, will cause nausea, vomiting, diarrhea. High exposure may cause loss of consciousness. Poisonous. Grade 2; LD_{50} (oral, rat) = 0.5−5 g/kg; >5 g/kg.

Long-Term Exposure: Repeated contact may cause skin sensitivity. Chronic exposure to arsenic compounds can cause dermatitis and digestive disorders. Renal damage may develop. In animals: kidney damage; muscle tremor, seizure; possible gastrointestinal tract, reproductive effects; possible liver damage.

Points of Attack: Skin, kidneys, liver. Possible neurotoxicant.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests if necessary[30]. Kidney function tests. Examination by a qualified allergist. Liver and kidney function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray following acute overexposure. Test for urine arsenic. Levels should not be greater than 100 μg/g of creatinine in the urine. Examine the skin for abnormal growths.

First Aid: If artificial respiration is administered, *avoid mouth-to-mouth resuscitation; use bag/mask apparatus*. Remove contaminated clothing and shoes. Flush affected areas with plenty of water. If in eyes, hold eyelids open and flush with plenty of water. If swallowed and victim is conscious and able to swallow, have victim drink 4 to 8 oz of water and have victim induce vomiting. If swallowed and victim is unconscious or having convulsions, do nothing except keep victim warm.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or

European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location.

Shipping: UN3280 Organoarsenic compound, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required, Potential Inhalation Hazard (Special Provision 5).

Spill Handling:

Organoarsenic compound, solid, or liquid

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/60
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include arsine and oxides of arsenic. This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Noncombustible containers should be crushed and buried under more than 40 cm of soil[30]. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Chemical Treatability of Arsenic—(1) Concentration Process: Chemical Precipitation; Chemical Classification: Metal; Scale of Study: Pilot Scale; Type of Wastewater Used: Domestic Wastewater + Pure Compound; Results of Study: 5 ppm @ 4 gpm @ pH = 7.0. Iron system—90% reduction; low lime system—80% reduction; high lime system—76% reduction; (3 coagulant systems were used; Iron system used 45 ppm as Fe of $Fe_2(SO_4)_3$ @ pH = 6.0. Low lime system used 20 ppm Fe of $Fe_2(SO_4)_3$ and 260 ppm of CaO @ pH = 10.0. High lime system used 600 ppm of CaO @ pH = 11.5. Chemical coagulation was followed by multimedia filtration). (2) Concentration Process: Chemical Precipitation; Chemical Classification: Metal; Scale of Study: Full Scale Continuous Flow; Type of Wastewater Used: Domestic Wastewater; Results of Study: Effluent character (ppb): 2.5, 56% reduction with lime; 3.3, 24% reduction with lime; (lime dose of 350−400 ppm as calcium oxide @ pH = 11.3)[72].

United States Department of Agriculture, United States Residue Limits for Veterinary Drugs and Unavoidable Contaminants in Meat, Poultry, and Egg Products.21 CFR 556.60. http://www.fsis.usda.gov/OPHS/red2000/appendix3.pdf.

Calcium Oxide C:0320

Formula: CaO
Synonyms: Burnt lime; Calcia; Calx; Fluxing lime; Lime; Lime, burned; Lime, unslaked; Oxydede calcium (French); Pebble lime; Quicklime
CAS Registry Number: 1305-78-8
HSDB Number: 1615
RTECS Number: EW3100000
UN/NA & ERG Number: UN1910/157
EC Number: 215-138-9
Regulatory Authority and Advisory Information
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Calcium oxide, CaO, occurs as white or grayish-white lumps or granular powder. The presence of iron gives it a yellowish or brownish tint. Molecular weight = 56.1; specific gravity (H_2O:1) = 3.34; boiling point = 2850°C; freezing/melting point = 2572°C; hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 2. Soluble in water (reactive).

Potential Exposure: Calcium oxide is used as a refractory material; a binding agent in bricks; plaster, mortar, stucco, and other building materials. A dehydrating agent, a flux in steel manufacturing, and a laboratory agent to absorb CO_2. Used in the manufacture of aluminum, magnesium, glass, pulp and paper, sodium carbonate, calcium hydroxide, chlorinated lime, calcium salts; and other chemicals. Used in the flotation of nonferrous ores; water and sewage treatment; oil treatment in agriculture; dehairing hides; in the clarification of cane and beet sugar juice; and in fungicides, insecticides, drilling fluids, and lubricants.

Incompatibilities: The water solution is a medium strong base. Reacts with water, forming calcium hydroxide and sufficient heat to ignite nearby combustible materials. Reacts violently with acids, halogens, metals.

Permissible Exposure Limits in Air
NIOSH IDLH = 25 milligram per cubic meter
OSHA PEL: 5 milligram per cubic meter TWA
NIOSH REL: 2 milligram per cubic meter TWA
ACGIH TLV[1]: 2 milligram per cubic meter TWA
PAC Ver. 29[138]
PAC-1: 6 milligram per cubic meter
PAC-2: 110 milligram per cubic meter
PAC-3: 660 milligram per cubic meter
DFG MAK: No numerical value established. Data may be available.

Australia: TWA 2 milligram per cubic meter, 1993; Austria: MAK 2 milligram per cubic meter, 1999; Belgium: TWA 2 milligram per cubic meter, 1993; Denmark: TWA 2 milligram per cubic meter, 1999; Finland: TWA 2 milligram per cubic meter, 1999; France: VME 2 milligram per cubic meter, 1999; India: TWA 2 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 2 milligram per cubic meter, 2003; Norway: TWA 2 milligram per cubic meter, 1999; the Philippines: TWA 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 2 milligram per cubic meter, MAC (STEL) 6 milligram per cubic meter, 1999; Sweden: NGV 2 milligram per cubic meter, KTV 5 milligram per cubic meter, 1999; Switzerland: MAK-W 3 milligram per cubic meter, KZG-W 4 milligram per cubic meter, 1999; Turkey: TWA 5 milligram per cubic meter, 1993; United Kingdom: TWA 2 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 milligram per cubic meter; the Czech Republic: 4 milligram per cubic meter. Several states have set guidelines or standards for calcium oxide in ambient air[60] ranging from 20 μ/m^3 (North Dakota) to 35 μ/m^3 (Virginia) to 40 μ/m^3 (Connecticut) to 48 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #7020, Method #7303, or OSHA Analytical Method ID-121.

Routes of Entry: Inhalation of dust.

Harmful Effects and Symptoms
Short-Term Exposure: The corrosive action of calcium oxide is due primarily to its alkalinity and exothermic reaction with water. It is irritating and may be caustic to the skin, conjunctiva, cornea, and mucous membranes of upper respiratory tract; may produce burns or dermatitis with desquamation and vesicular rash, lacrimation, spasmodic blinking, ulceration; and ocular perforation, ulceration and inflammation of the respiratory passages; ulceration of nasal and buccal mucosa, and perforation of nasal septum. Bronchitis and pneumonia have been reported from inhalation of dust. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. The lower respiratory tract may not be affected because irritation of upper respiratory passages is so severe that workers may be forced to leave the area.

Long-Term Exposure: Repeated or prolonged contact with skin may cause brittle nails and thickening and cracking of the skin. Repeated or prolonged exposure to dust particles may cause lung problems. Calcium oxide may cause ulceration and perforation of the cartilage separating the nose (septum).

Points of Attack: Respiratory system, skin, and eyes.

Medical Surveillance: Preemployment physical examinations should be directed to significant problems of the eyes, skin, and the upper respiratory tract. Periodic examinations should evaluate the skin; changes in the eyes, especially the cornea and conjunctiva; mucosal ulcerations of the nose, mouth and nasal septum; and any pulmonary symptoms. Smoking history should be known.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear appropriate clothing to prevent any reasonable probability of skin or eye contact. Wear eye protection to prevent any possibility of eye contact. Employees should wash promptly when skin is contaminated and daily at the end of each work shift. Work clothing should be changed daily if it is possible that clothing is contaminated. Remove nonimpervious clothing if contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *10 milligram per cubic meter*: Q_m (APF = 25) (any quarter-mask respirator); *20 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, APR with a high-efficiency particulate filter); or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with calcium oxide all handlers should be trained on its proper handling and storage. Should be stored on dry flooring in a fire resistant room, well protected from the weather. The area should be cool and adequately ventilated. Store in containers protected from physical damage; acids and oxidizing materials, such as permanganate, dichromate, or chlorine.

Shipping: UN1910 Calcium oxide, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Contact with water or moisture may generate enough heat to ignite nearby combustible materials. Avoid the use of water. Do not use carbon dioxide, foam, or halogenated fire extinguishers. Thermal decomposition products may include harmful and irritating gases. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves neutralization with hydrochloric acid to yield calcium chloride. The calcium chloride formed is treated with soda ash to yield the insoluble calcium carbonate. The remaining brine solution may be discharged into sewers and waterways[22].

EC Number: 215-139-4

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Strong oxidizer, Explosive, Polymerization hazard, Corrosive (skin, eyes), Dangerously water reactive.

Hazard symbols, risk, & safety statements: Hazard symbol: O, E; risk phrases: R2; R8; R14; R19, R23/24/25; R34; R36/37/38; safety phrases: S7/8; S17; S36/37/39; S41; 45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Calcium peroxide is a grayish-white or yellowish odorless crystalline solid. Molecular weight = 72.1; freezing/melting point = 275°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 2. Insoluble in water; slow reaction releasing calcium hydroxide.

Potential Exposure: Calcium peroxide is used as a seed disinfectant, an antiseptic, and a rubber stabilizer.

Incompatibilities: Slow reaction with water or other forms of moisture, releasing calcium hydroxide Calcium peroxide is a strong alkali and a strong oxidizer. Incompatible with reducing agents, including hydrides; acids, combustible materials; polysulfide polymers. Rapid decomposition $>200°C$.

Permissible Exposure Limits in Air

No standards or PAC available.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Calcium peroxide can affect you when breathed in. Contact can severely irritate and may burn the skin and eyes. Exposure can irritate the eyes, nose, and throat. Higher levels can irritate the lungs, causing coughing, and/or shortness of breath. Still higher exposures may cause a build-up of fluid in the lungs (pulmonary edema). This can cause death.

Long-Term Exposure: Prolonged exposure can damage the skin. Very irritating substances may cause problems.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium Peroxide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. *Eye Protection:* Wear dust-proof goggles with face shield when working with powders or dust, unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential exists for exposures to calcium peroxide, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Greater protection is provided by a PAPR. Particulate filters must be checked every day before work for physical damage, such as rips or tears and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with calcium peroxide all handlers should be trained on its proper handling and storage. Calcium Peroxide must be stored to avoid contact with combustible materials (such as wood, paper, oil, fuels, etc.), since violent reactions occur. Store in tightly closed containers. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with

OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1457 Calcium peroxide, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Calcium Peroxide is an oxidizer and will greatly increase the intensity of a fire. Extinguish fire using an agent suitable for type of surrounding fire. Thermal decomposition products may include calcium hydroxide and harmful and irritating gases. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

HSDB Number: 963

RTECS Number: EW3860000

UN/NA & ERG Number: UN1360/139

EC Number: 215-142-0 [*Annex I Index No.:* 015-003-00-2]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Exposure can be lethal, Dangerously water reactive (emits toxic gas), Air reactive, Strong reducing agent, Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F, N; risk phrases: R15/29; R28; R50; safety phrases: S1/2; S22; S29/35; S36/37; S41; S43; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Calcium phosphide is a gray granular solid or reddish-brown crystalline solid. It has a musty odor, somewhat like acetylene. Molecular weight = 182.18; specific gravity (H_2O:1) = 2.51 @ 20°C; freezing/melting point = ~1600°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 2 ₩. Water reactive, releases flammable and highly toxic phosphine gas.

Potential Exposure: Calcium phosphide is used to kill rodents; used in explosives and fireworks.

Incompatibilities: A strong reducing agent. Forms spontaneously combustible phosphine gas in moist air. Contact with water or acids release phosphine gas, and can cause explosions. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, chlorine monoxide, halogens, halogen acids, oxygen, sulfur.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.091 ppm

PAC-2: $\mathbf{1.0}_{\mathrm{A}}$ ppm

PAC-3: $\mathbf{1.8}_{\mathrm{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

Permissible Concentration in Water: Reacts violently with water as noted above.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Calcium phosphide can severely irritate the eyes, skin, and respiratory tract. It may affect the gastrointestinal tract. Phosphine (liberated from calcium phosphide) is an acute local irritant; it may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Phosphine is toxic upon inhalation, causing restlessness, tremors, fatigue, gastric pain; diarrhea, coma, and convulsions. Also, calcium phosphide is a dangerous fire and explosion hazard. Exposure may cause respiratory failure, resulting in death.

Long-Term Exposure: Repeated exposure to calcium phosphide may cause damage to the central nervous system, liver, kidneys, central nervous system, and cardiovascular system.

Points of Attack: See above.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium phosphide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. *Eye Protection:* Wear dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential exists for exposure to Calcium phosphide, use Respiratory protection: Particle filter P2 or P3; color code white or NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: (1) Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Keep away from moisture. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric); oxygen, sulfur or moisture, since violent reactions occur. Sources of ignition, such as smoking, and open flames, are prohibited where Calcium phosphide is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of Calcium phosphide. Wherever Calcium phosphide is used, handled, manufactured, or stored, used explosion-proof electrical equipment and fittings. Do not store large amounts of this material in a room protected by water sprinkler systems. Protect containers against physical damage.

Shipping: UN1360 Calcium phosphide, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

UN1360 (calcium phosphide) is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water:* Dangerous from 0.5 to 10 km (0.3−6.0 mi) downwind.

Fire Extinguishing: Thermal decomposition products may include oxides of phosphorus and metal. Contact with water forms highly toxic and flammable phosphine gas. *Do not use water* or foam extinguishers. Use dry chemical, dry sand; soda ash, or lime extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disposal of unused product must be undertaken by qualified personnel who are knowledgeable in all applicable regulations and follow all pertinent safety precautions including the use of appropriate protective equipment. For proper handling and disposal, always comply with federal, state, and local regulations.

Calcium Sulfate C:0350

Formula: CaO_4S; $CaSO_4$

Synonyms: *anhydrous:* Anhydrite; Anhydrous calcium sulfate; Anhydrous gypsum; Anhydrous sulfate of lime; Calcium salt of sulfuric acid; *dihydrate:* Gypsum; *hemihydrate:* Plaster of Paris

CAS Registry Number: 7778-18-9 (anhydrous); *(alt.)* 23296-15-3; 10101-41-4 (dihydrate); 10034-76-1 (hemihydrate); 13397-24-5 (hemihydrate-gypsum)

HSDB Number: 902

RTECS Number: WS6920000 (anhydrous); EW 4150000 (dihydrate)

EC Number: 231-900-3 (anhydrous)

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: SMCL = 250 mg[SO_4^{-2}]/L as Sulfate

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R36/37/38; safety phrases: S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Calcium sulfate forms white to clear crystals. It is commonly encountered in the anhydrous form or as the dihydrate. Molecular weight = 136.08; specific gravity (H_2O:1) = 2.96; freezing/melting point = (decomposes) 1570°C. Hazard identification (based on NFPA-704 M Rating System): (*anhydrous; dihydrate*) Health 2, flammability 0, reactivity 1. Practically insoluble in water; solubility = 0.3% @ 20°C.

Potential Exposure: Calcium sulfate is used as a pigment; in Portland cement, in tiles and plaster; in polishing powders, a filler in paints and paper coatings; in the drying of gases and liquids; a soil conditioner; in molds and surgical casts; in wallboard, and many others.

Incompatibilities: Contact with diazomethane, aluminum, phosphorus, and water may cause explosions. *Note:* Hygroscopic material (i.e., absorbs moisture from the air). Reacts with water, forming gypsum and plaster of Paris.

Permissible Exposure Limits in Air

OSHA PEL: [Particulates not otherwise regulated] 15 milligram per cubic meter TWA total dust; TWA; 5 milligram per cubic meter TWA, respirable fraction

NIO SH REL: 10 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction

ACGIH TLV[1]: 10 milligram per cubic meter TWA inhalable fraction (2005)

7778-18-9, anhydrous

PAC Ver. 29[138], no value in Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

DFG MAK: 1.5 milligram per cubic meter respirable fraction (previously "fine *dust*"); 4 milligram per cubic meter inhalable fraction (previously "total *dust*"); Pregnancy Risk Group: C

Australia: TWA 10 milligram per cubic meter, 1993; Austria: MAK 6 milligram per cubic meter (*dust*), 1999; Belgium: TWA 10 milligram per cubic meter, 1993; United Kingdom: LTEL 10 milligram per cubic meter (total *dust*), 5 milligram per cubic meter (resp. dust), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 milligram per cubic meter[(E)].

Determination in Air: By filter collection and gravimetric means. Particulates NOR: NIOSH #0500, total dust or #0600 (respirable).

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May cause irritation of mouth, throat, nose, and lungs. Senses of smell and taste may be lessened. Nose irritation may lead rhinitis and cause nose to bleeding. *Skin:* May cause irritation in open sores. The harsh washing and abrasive action necessary to remove this material may also lead to irritation. *Eyes:* Dust may irritate eyes. *Ingestion:* May cause blockage of digestive system if material hardens.

Long-Term Exposure: May cause nose irritation accompanied by sneezing, tear formation, and excessive fluid secretion. Animal studies suggest that pneumonia and other more serious lung disorders may occur.

Points of Attack: Eyes, skin, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear loose-fitting clothing of dust-tight material and safety goggles.

Respirator Selection: A dust mask should be worn if irritation effects become apparent.

Storage: Color code—Green: General storage may be used. The hemihydrate and anhydrous forms should be stored in tightly sealed containers.

Shipping: Calcium sulfate is a "NONREGULATED MATERIAL."[19]

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Cleanup using methods that do not raise dust, such as vacuum and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguisher suitable for surrounding fire. Thermal decomposition products may include oxides of sulfur and metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfilling.

Camphene C:0360

Formula: $C_{10}H_{10}$

Synonyms: Bicyclo-(2.2.1)heptane; 3,3-Dimethylen-enorcamphene; 2,2-Dimethyl-3-methylene-; 2-2-Dimethyl-3-methylene norborane; 3,3-Dimethyl-2-methylene norcamphone

CAS Registry Number: 79-92-5; 565-00-4 (±-camphene); 5794-03-6 (IR-camphene); 5794-04-7(IS-camphene)

HSDB Number: 900

RTECS Number: EX1055000

UN/NA & ERG Number: UN1325 (flammable solids, organic, n.o.s.)/133; UN2319 [terpene hydrocarbons, n.o.s. (Camphene)]/128

EC Number: 201-234-8; 209-275-3 (±-camphene); 227-336-2 (IR-camphene); 227-337-8 (IS-camphene)

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable solid, Environmental hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, N; risk phrases: R11; R36; R51/53; safety phrases: S16; S26; S33; S60; S61; S41 (see Appendix 4).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, N; risk phrases: R11; safety phrases: S21; S29/35; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Camphene is a colorless to white crystalline solid, Camphor, or turpentine odor. It may be shipped as a liquid. Freezing/Melting point = 50°C. Molecular weight = 136.24; boiling point = 159°C; freezing/melting point = 37°C; flash point = 42°C (oc); 33°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 0. Insoluble in water.

Potential Exposure: Camphene is used to manufacture synthetic camphor; for making moth-proofing and in the cosmetics, perfume, and food flavoring industries.

Incompatibilities: Forms explosive mixture with air. Emulsions in xylene may violently decompose on contact with iron or aluminum above 70°C. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with reducing agents may cause exothermic reaction, releasing flammable hydrogen gas.

Permissible Exposure Limits in Air

No standards or PAC available.

Permissible Concentration in Water: No criteria set. Highly toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Determination in Water: Octanol−water coefficient: Log $K_{\mathrm{ow}} = > 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation of vapors, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Camphene can affect you when breathed in and by passing through your skin. Contact can irritate the eyes and skin. Exposure can irritate the eyes, nose, and throat. Higher levels can cause you to feel dizzy, excited, sweaty, and have a headache. At very high levels, confusion, nausea, drowsiness, coma, and kidney damage can occur. LD_{50} (oral-rat) ≥5000 mg/kg (slightly toxic).

Long-Term Exposure: Similar chemicals also can cause skin allergy. It is not known if camphene can cause the same problem.

Points of Attack: Eyes, skin, respiratory system; kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with camphene. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. *Eye Protection:* Eye protection is included in the recommended respiratory protection.

Respirator Selection: Where there is potential exists for exposure to camphene, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high-efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with camphene all handlers should be trained on its proper handling and storage. Camphene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Camphene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of camphene.

Shipping: UN1325 Flammable solids, organic, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN2319 Terpene hydrocarbons, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner, using nonsparking tools, and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Thermal decomposition products may include oxides of carbon. The crystals do not easily ignite, but they release flammable vapor at room temperature. Heating greatly increases the release of these flammable vapors. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Camphor C:0370

Formula: $C_{10}H_{16}O$

Synonyms: Bicyclo-(2.2.1.)-heptanone; Bicyclo 2.2.1 heptan-2-one,1,7,7-trimethyl-; Bornane, 2-*oxo*-; 2-Bornanone; 2-Camphanone; Camphor, natural; 2-Camphorone; DL-Camphor; Formosa camphor; Gum camphor; Huile de camphre (French); Japan camphor; Kampfer (German); 2-Keto-1,7,7-trimethylnorcamphane; Laurel camphor; Matricaria camphor; Norcamphor, synthetic camphor; 1,7,7-Trimethyl-; 1,7,7-Trimethylbicyclo (2.2.1)-2-heptanone; 1,7,7-Trimethylnorcamphor

CAS Registry Number: 76-22-2; 8008-51-3 (camphor oil)

HSDB Number: 37

RTECS Number: EX1225000

UN/NA & ERG Number: UN2717 (synthetic)/133; UN1130 (oil)/128

EC Number: 200-945-0

Regulatory Authority and Advisory Information

Hazard Alert: Flammable solid, Possible risk of forming tumors, Suspected of causing genetic defects.

Banned or Severely Restricted (in juvenile drugs) (UN)[13]

FDA-over the counter drug.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xi, Xn; risk phrases: R11; R20/21/22; R36/37/38; R62; safety phrases: S16; S26; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Camphor is a colorless glassy solid. Penetrating, characteristic odor. Molecular weight = 152.26; specific gravity (H_2O:1) = 0.99; boiling point = 204°C; freezing/melting point = 180°C (natural); 165°C (synthetic); flash point = 66°C (solid); 47°C (oil); autoignition temperature = 460°C. Explosive limits: LEL: 0.6%, UEL: 3.5%. Hazard identification (based on NFPA-704 M Rating System) (*solid*): Health 3, flammability 2, reactivity 0. Insoluble in water; (*oil):* Health 2, flammability 2, reactivity 0.

Potential Exposure: Camphor, a natural product, is used as a plasticizer for cellulose esters and ethers; it is used in lacquers and varnishes; and in explosives and pyrotechnics formulations. It is used as a moth repellent and as a medicinal.

Incompatibilities: May form explosive mixture with air. Violent, possibly explosive, reaction with strong oxidizers, especially chromic anhydride, potassium permanganate. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 milligram per cubic meter

Odor threshold = 0.079 milligram per cubic meter.

OSHA PEL: 2 milligram per cubic meter TWA

NIOSH REL: 2 milligram per cubic meter TWA

ACGIH TLV[1]: 2 ppm/12 milligram per cubic meter TWA; 3 ppm/19 milligram per cubic meter STEL, not classifiable as a human carcinogen

DFG MAK: 2 ppm/13 milligram per cubic meter TWA; Peak Limitation Category II(2).

Australia: TWA 2 ppm (12 milligram per cubic meter); STEL 3 ppm (18 milligram per cubic meter), 1993; Austria: MAK 2 ppm (13 milligram per cubic meter), 1999; Belgium: TWA 2 ppm (12 milligram per cubic meter); STEL 3 ppm (19 milligram per cubic meter), 1993; Denmark: TWA 2 ppm (12 milligram per cubic meter), 1999; Finland: TWA 0.3 ppm (2 milligram per cubic meter); STEL 0.9 ppm (6 milligram per cubic meter), 1993; France: VME 2 ppm (12 milligram per cubic meter), 1999; Norway: TWA 2 ppm (12 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 12 milligram per cubic meter, 2003; the Philippines: TWA 2 ppm, 1999; Russia: STEL 3 milligram per cubic meter, 1993; Switzerland: MAK-W 2 ppm (13 milligram per cubic meter), 1999; United Kingdom: TWA 2 ppm (13 milligram per cubic meter); STEL 3 ppm (19 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 3 ppm. Several states have set guidelines or standards for camphor in ambient air[60] ranging from 80 μ/m^3 (Connecticut) to 120−180 μ/m^3 (Virginia) to 286 μ/m^3 (Nevada).

Determination in Air: Charcoal absorption is followed by CS_2, workup and analysis by gas chromatography (GC). Use NIOSH Analytical Method #1301, Ketones II, Method #2553, or OSHA Analytical Method 7, Organic Vapors.

Routes of Entry: Inhalation, ingestion; skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes and skin. Inhalation can cause respiratory tract irritation and coughing. Exposure can cause nausea, vomiting, diarrhea, headaches, dizziness, excitement, irrational behavior; mental confusion; epileptiform convulsions. Higher exposures can cause unconsciousness and death.

Long-Term Exposure: Camphor may cause kidney damage.

Points of Attack: Central nervous system; eyes, skin; respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Whole blood (chemical/metabolite): blood urea nitrogen, calcium, carbon dioxide; blood sugar/glucose, uranalysis; kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Work clothing should be changed daily if it is possible that clothing is contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: OSHA: *50 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *100 milligram per cubic meter:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) (any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or PaprTOvHie (APF = 50) (any powered, APR with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *200 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red (liquid): Flammability Hazard: Store in a flammable materials storage area. Color code—Red Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with camphor all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Camphor must be stored to avoid contact with oxidizers, such as permanganates, nitrates, peroxides, chlorates, and perchlorates, and especially chromic anhydride, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or flame. Sources of ignition, such as smoking and open flames are prohibited where camphor is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2717 Camphor, synthetic, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN1130 camphor oil, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Establish forced ventilation to keep levels below explosive limit. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Combustion produces lots of soot. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration of a solution in a flammable solvent.

Cantharidin C:0380

Formula: $C_{10}H_{12}O_4$
Synonyms: Can; Cantharides camphor; 1,2-Dimethyl-3,6-epoxyperhydrophthalic anhydride; 2,3-Dimethyl-7-oxabicyclo[2.2.1] heptane-2,3-dicarboxylic anhydride; 4,7-Epoxyisobenzofuran-1,3-dione, hexahydro-3a, 7a-dimethyl-, (3a a, 4b, 7b, 7a a)-; 7-Oxabicyclo[2.2.1]heptane-2,3-dicarboxylic anhydride, 2,3-dimethyl-
CAS Registry Number: 56-25-7
HSDB Number: 2181
RTECS Number: RN8575000
EC Number: 200-263-3
Regulatory Authority and Advisory Information
Carcinogenicity: IARC: Animal Limited Evidence, Human No Data, *not classifiable as carcinogenic to humans*, Group 3, 1998
Hazard Alert: Extremely toxic (deadly poison), Combustible, Possible risk of forming tumors, Human data, Natural product
Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg).
Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R23/24/25; R27/28; R36/37/38; safety phrases: S13; S28; S36/37/39; S45; S53; S41 (see Appendix 4)
Description: Cantharidin is a brown to black powder. Molecular weight = 196.22; freezing/melting point = 218°C (begins to sublime @ 110°C); vapor pressure = 0.02 mmHg @ 25°C. Explosive limits: LEL: 6000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0.
Potential Exposure: Formerly used as a counterirritant and vesicant. Also used for the removal of benign epithelial growths, e.g., warts. Used as an experimental antitumor agent. The active ingredient in "Spanish fly," a reputed aphrodisiac.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 0.39 milligram per cubic meter
PAC-2: 4.3 milligram per cubic meter
PAC-3: 33 milligram per cubic meter
Routes of Entry: Inhalation, ingestion, skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: A deadly poison by ingestion. Symptoms from ingestion include vomiting; abdominal pain; shock; bloody diarrhea; pain in throat and stomach; swelling and blistering of tongue, difficulty in swallowing; salivation, slow and painful urination; and thirst. There may be delirium, fainting, and titanic convulsions. Eye contact results in irritation with much swelling of the lids. Initial tissue reaction upon contact with the skin is swelling, followed by blister formation within 24 hours. It is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg or a taste of less than 7 drops for a 70-kg (150 lb) person. It is very toxic by absorption through skin.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. For ingestion, induce vomiting with syrup of ipecac.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.
Shipping: Cantharidin is not specifically listed in the DOT Performance-Oriented Packaging Standards[19] with respect to labeling requirements or restrictions on shipping quantities.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain

and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Caprolactam C:0390

Formula: $C_6H_{11}NO$

Synonyms: Aminocaproic lactam; 6-Aminohexanoic acid cyclic lactam; 2-Azacycloheptanone; *epsilon*-Caprolactam; Caprolactama (Spanish); 6-Caprolactum; Caprolattame (French); Cyclohexanone isooxime; Hexahydro-2*H*-azepine-2-one; Hexahydro-2-azepinone; Hexahydro-2*H*-azepin-2-one; 6-Hexanelactum; Hexanone isoxime; Hexanonisoxim (German); 1,6-Hexolactam; 2-Ketohexamethyleneimine; 2-Ketohexamethylenimine; NCI-C50646; 2-Oxohexamethyleneimine; 2-Oxohexam ethylenimine; 2-Perhydroazepinone

CAS Registry Number: 105-60-2

HSDB Number: 187

RTECS Number: CM3675000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n. o.s.)/154

EC Number: 203-313-2 [*Annex I Index No.:* 613-069-00-2]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R20/22; R36/37/38; R62; R63; safety phrases: S2; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Caprolactum is a white crystalline combustible solid with an unpleasant odor. The Odor Threshold is 0.3 milligram per cubic meter. Molecular weight = 113.16; specific gravity (H_2O:1) = 1.02 @ 75°C (liquid); boiling point = 269°C; freezing/melting point = 69.3°C; vapor pressure =
8×10^{-8} mmHg @ 20°C; flash point = 125°C (oc); 139°C (cc); autoignition temperature = 375°C. Explosive limits: LEL: 1.84%; UEL: 8.0%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Highly soluble in water; solubility = 53%.

Potential Exposure: Caprolactam is used in the manufacture of nylon, plastics, bristles, film, coatings, synthetic leather, plasticizers, and paint vehicles; as a crossslinking agent for curing polyurethanes; and in the synthesis of lysine.

Incompatibilities: Caprolactum decomposes on heating, and on burning producing toxic fumes including nitrogen oxides, ammonia. Reacts violently with strong oxidizers, producing toxic fumes. Toxic decomposition above 400°C.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.63 milligram per cubic meter

OSHA PEL: none

NIOSH REL: (*dust*): 1 milligram per cubic meter TWA; 3 milligram per cubic meter STEL; (*vapor*): 0.22 ppm/1 milligram per cubic meter TWA; 0.66 ppm/3 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 3 milligram per cubic meter

PAC-2: 40 milligram per cubic meter

PAC-3: 240 milligram per cubic meter

DFG MAK: 5 milligram per cubic meter, measured as the, inhalable fraction. Peak Limitation Category I(2); Pregnancy Risk Group C

Australia: (*dust*): TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter; (*vapor*): TWA 5 ppm (20 milligram per cubic meter); STEL 10 ppm 1993; Austria: MAK 5 milligram per cubic meter (*dust*), 1999; Belgium: (*dust*): TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter; (*vapor*): TWA 4.3 ppm (20 milligram per cubic meter); STEL 8.6 ppm (40 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (25 milligram per cubic meter), 1999; (*dust*): Denmark: TWA 1 milligram per cubic meter, 1999; Finland: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter (*dust*), 1999; the Netherlands: Fume: MAC-TGG 20 milligram per cubic meter; (*dust*): MAC-TGG 1 milligram per cubic meter, 2003; France: VME 1 milligram per cubic meter (*dust*): 5 ppm (20 milligram per cubic meter) (*vapor*), 1999; Hungary: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter (*dust*), 1993; Norway: TWA 5 ppm (25 milligram per cubic meter), moist, 1999; Poland: MAC (TWA) 10 milligram per cubic meter (*dust*), 1999; Russia: STEL 10 milligram per cubic meter (*dust*), 1993; Sweden: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 1999; Switzerland: MAK-W5 milligram per cubic meter (*dust*), 1999; United Kingdom: (*dust*): TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter; (*vapor*): TWA 5 ppm (23 milligram per cubic meter); STEL 10 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TL V: STEL 3 milligram per cubic meter (*particulate*). Several states have set guidelines or standards for caprolactam in ambient air ranging from 10 μ/m^3 (North Dakota) to 24 μ/m^3 (Nevada) to 160 μ/m^3 (Virginia) to 400 μ/m^3 (Connecticut).

Determination in Air: Use OSHA Analytical Method PV-2012, Caprolactum. Samples are collected by drawing a known volume of air through OSHA versatile sampler (OVS-7) tubes, containing a glass fiber filter and two sections of XAD-7 adsorbent. Samples are extracted with methanol and analyzed by high performance liquid chromatography (HPLC) using an ultraviolet (UV) detector.

Permissible Concentration in Water: The former USSR-UNEP/IRPTC joint project[43] has adopted Russian value[35] of a MAC of 1 mg/L in water used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.19$.

Routes of Entry: Inhalation, ingestion; skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The vapor irritates the eyes, skin, and respiratory tract. Inhalation may affect the central nervous system. Skin contact can cause irritation and serious burns if contact is prolonged and confined. Other symptoms of exposure include epistaxis (nosebleed); dermatitis, skin sensitization; asthma, dizziness, headache, abdominal cramps; diarrhea, nausea, vomiting. High exposures may also cause irritability, confusion, and convulsions (seizures). Exposure in airborne dust @ 5 milligram per cubic meter causes skin irritation in some people but not @ 1 milligram per cubic meter. Sensitivity has not been related to race, skin pigmentation, or other common indices of sensitivity. The prevalence of dermatoses among workers in a caprolactam manufacturing plant, showed that contact dermatitis and eczema of the hands were most prevalent. Dry erythematous squamous foci on smooth skin was a typical manifestation. Light sensitivity of the eyes was produced by inhalation of caprolactam at 0.11 milligram per cubic meter and higher. The olfactory threshold was 0.30 milligram per cubic meter. An oral dose of 3−6 g was given daily for 3−5 years for the treatment of obesity in 90 subjects. No toxic effects were observed. There was no effect on appetite; and only one person developed an allergy to caprolactam.

Long-Term Exposure: Exposure may damage the developing fetus and may affect the reproductive ability of males. Caprolactam may damage the liver and/or kidneys. Repeated or prolonged contact may cause skin sensitization and dermatitis. The substance may have effects on the nervous system. Exposure to high concentrations over many years may cause irritability and confusion.

Points of Attack: Eyes, skin, respiratory system; central nervous system; cardiovascular system, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures (half the TLV or greater), the following are recommended: Liver and kidney function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure has occurred, the following may also be useful: EEG (brain wave test), skin testing with dilute Caprolactam may help diagnose allergy, if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large

quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 ppm* (*vapor*): or 1 milligram per cubic meter (*dust*), use a NIOSH/MSHA or European Standard EN 149-approved respirator equipped with organic vapor cartridges and a particulate prefilter. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Green: General storage may be used. Prior to working with caprolactum all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Restrict persons not wearing protective equipment from the danger area of spill until clean-up is complete. Collect spilled material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical will burn but does not easily ignite. Extinguish fire using any agent suitable for the type of surrounding fire. If heated to more than 100°C, caprolactam boils, giving off Thermal decomposition products may include oxides of nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices). Also, Caprolactam may be recovered from Caprolactam still bottoms or nylon waste[22].

EC Number: 206-969-8

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Possible sensitization hazard, Possible risk of forming tumors, Suspected reprotoxic hazard

Poison Category: 3

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R25; R36/37/38; R41; R42; R43; safety phrases: S2; S22; S26; S28; S36/37/39; S41; S41 (see Appendix 4)

Description: Crystalline solid, rectangular plates, or scales. Pungent odor and burning taste. Molecular weight = 305.40; boiling point = 210−218°C; freezing/melting point = 65ºC; flash point = 112.8 (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Practically insoluble in cold water.

Potential Exposure: Botanical animal and insect repellent used to repel birds, voles, deer, rabbits, squirrels, insects, and attacking dogs. Capsaicin, which is made from the Capsicum red chili pepper can be used indoors to protect carpets and upholstered furniture, and outdoors to protect fruit and vegetable crops, flowers, ornamental plants, shrubbery, trees, and lawns. It is also used in pepper sprays such as MACE, and as an analgesic in creams, lotions and solid sticks to reduce arthritic, postoperative and neuopathic pain, such as shingles. Capsaicin is obtained by grinding dried, ripe *Capsicum frutescens* L. chili peppers into a fine powder. The oleoresin is derived by distilling the powder in a solvent and evaporating the solvent. The resulting highly concentrated liquid has little odor but has an extremely pungent taste

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.4$[193]. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Eyes and skin

Harmful Effects and Symptoms

Short-Term Exposure: Irritates skin, eyes, and mucous membranes. Poisonous if ingested; with severe gastritis, stomach pain, and diarrhea. Probable oral lethal dose (human) 0.5−5 g/kg, between 1 oz and 1 pt (or 1 lb) for 70-kg person[88].

LD_{50} (oral, rat) = 98- > 2500 mg/kg[88].

Long-Term Exposure; Suspected reprotoxic hazard.

Points of Attack: Nerve endings and eyes. May cause reproductive and fetal effects.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[72]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH-approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated, and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Dampen the spilled material with water. Cleanup with dampened absorbent paper and transfer material to a suitable trash container. Seal the absorbent paper and your clothing in a vapor-tight plastic bag for eventual disposal. Wash all contaminated surfaces with a soap and water solution. Do not reenter the contaminated area until an expert verifies that the area has been properly cleaned.

Fire Extinguishing: On small fire, use dry chemical powder, carbon dioxide, or water spray. On a large fire, use water spray, fog, or regular alcohol-resistant foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. Use water spray or fog; do not scatter material using straight water jet streams. *If tank, rail car, or tank truck is involved in a fire*, *isolate* for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Noncombustible containers should be crushed and buried under more than 40 cm of soil[30]. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal, Sufficient Evidence; Human, No Available Data; Group 2 A

California Proposition 65 Chemical[102]: Cancer 10/1/1988.

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Banned or Severely Restricted (Germany, Norway) (UN)[13]

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)]

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R42; R45; R50/53; R62; R63; safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Captafol is a white crystalline solid. Molecular weight = 349.06; boiling point = 161°C (decomposes); freezing/melting point = 160.5°C; vapor pressure = 8×10^{-6} mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Practically insoluble in water; solubility = 0.0001%.

Potential Exposure: Captafol is a thiophthalimide fungicide. Those engaged in the manufacture, formulation, and application of this fungicide. Captafol is not currently registered for use on field crops or stored produce in the United States.

Incompatibilities: Reacts violently with bases, causing fire and explosion hazard. Not compatible with strong acids or acid vapor, oxidizers. Strong alkaline conditions contribute to instability. Attacks some metals.

Permissible Exposure Limits in Air

OSHA PE L: None

NIOSH REL: 0.1 milligram per cubic meter TWA [skin]; Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990].

ACGIH TLV[1]: 0.1 milligram per cubic meter TWA [skin], not classifiable as a human carcinogen

No PAC available.
Australia: TWA 0.1 milligram per cubic meter, 1993; Belgium: TWA 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.1 milligram per cubic meter [skin], 1999; France: VME 0.1 milligram per cubic meter [skin], carcinogen, 1993; Norway: TWA 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter [skin], 1999; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000. Several states have set guidelines or standards for captafol in air[60] ranging from 1.0 μ/m^3 (North Dakota) to 1.5 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method #0500

Routes of Entry: Inhalation, ingestion, skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin, and respiratory tract. Captafol can affect you when breathed in and by passing through your skin. Caprafol may cause an asthma-like allergy. Future exposures can cause asthma attacks with shortness of breath; wheezing, cough, and/or chest tightness. Exposure can irritate the skin. It can also cause a skin allergy to develop. Exposure to the sun (or other ultraviolet light) after exposure to Captafol may cause severe rash with itching, swelling, and blistering.

Long-Term Exposure: Repeated or prolonged contact cause skin sensitization, dermatitis, allergic conjunctivitis. Repeated or prolonged inhalation exposure may cause asthma. The substance may have damaging effects on the liver and kidneys. Captafol is a probable carcinogen in humans. There is some evidence that it causes liver cancer in humans, and it has caused kidney cancer in animals. Captafol may cause mutations. Handle with extreme caution.

Points of Attack: Skin, respiratory system; liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function test; lung function test. Skin testing with dilute captafol may help diagnose allergy, if done by a qualified allergist.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: *Clothing:* Avoid skin contact with captafol. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn. Use splash-proof chemical goggles and face shield when working with liquids containing Captafol.

Respirator Selection: Where there is potential exists for Exposures over *0.1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a pesticide cartridge. Increased protection is obtained from full facepiece APRs. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a MSHA/NIOAH approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with captafol all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, acids, acid fumes, or strong oxidizers (such as peroxides, chlorates, perchlorates, nitrates, and permanganates), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN 2773 Phthalimide derivative pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN 2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. If Captafol is in liquid or slurry form, absorb it with vermiculite, dry sand; earth or a similar material. Dispose of the absorbing material in an approved facility. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid, but it may be dissolved in a flammable liquid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. The substance decomposes on heating or on burning, producing toxic and corrosive fumes, including hydrogen chloride, nitrogen oxides; sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis[22].

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xi; risk phrases: R23/24/25; R40; R41; R43; R51; R62; R63; safety phrases: S1/2; S26; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Captan, when pure, is a colorless crystalline solid. The technical grade is a cream to yellow powder with a strong odor. It is commonly dissolved in a “carrier” which may be combustible. Molecular weight = 300.6; boiling point = (decomposes) 177°C; freezing/melting point = (decomposes) 178°C; vapor pressure = 1×10^{-5} mmHg @20°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Very slightly soluble in water; solubility = 0.005 g/L @ ~25°C.

Potential Exposure: Captan is a thiophthalimide compound used as an agricultural fungicide for field crops and storage of produce and also as a preservative in cosmetics; an over-the-counter-drug.

Incompatibilities: Incompatible with tetraethyl pyrophosphate, parathion. Keep away from strong alkaline materials (e.g., hydrated lime) as captan may become unstable. May react with water releasing hydrogen chloride gas. Corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: Carcinogen 5 milligram per cubic meter TWA; Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990].

ACGIH TLV[1]: 5 milligram per cubic meter TWA, inhalable fraction [sensitizer]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 26 milligram per cubic meter

PAC-3: 160 milligram per cubic meter

Australia: TWA 5 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 5 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, carcinogen, 1999; Norway: TWA 5 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for captan in ambient air[60] ranging from 11.9 μ/m^3 (Kansas) to 35 μ/m^3 (Pennsylvania) to 50 μ/m^3 (North Dakota) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; IV NIOSH Analytical Method #5601. Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601.

Permissible Concentration in Water: A no-adverse-effect level of drinking water has been calculated by NAS/NRC as 0.35 mg/L. The former USSR/UPEN joint project[43] set a MAC of 2.0 mg/L in water bodies used for domestic purposes.

Guidelines have been set in two states for Captan in drinking water ranging from 100 μg/L in Maine to 350 μg/L in California.

Determination in Water: Fish Tox = 25.36705000 ppb MATC (INTERMEDIATE). Octanol—water coefficient: Log $K_{ow} = 2.4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Skin contact, inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: The substance irritates the eyes and the skin. The acute oral LD_{50} value for rats in 9000 mg/kg (insignificantly toxic). Most of the chronic-oral-toxicity data on captan suggest that the no-adverse-effect or toxicologically safe do sage is about 1000 ppm (50 mg/kg/day). However, on the basis of fetal mortality observed in monkeys exposed to captan (12.5 mg/kg/day), the ADI of captan has been established at 0.1 mg/kg of body weight by the FAO/WHO. Based on long-term feeding studies results in rats and dogs, ADIs were calculated at 0.05 mg/kg/day for captan. A rebuttal presumption against registration for captan was issued on August 19, 1980 by EPA on the basis of possible oncogenicity, mutagenitcity, and teratogenicity. LD_{50} = 9000 mg/kg[77]

Long-Term Exposure: Repeated or prolonged contact with skin may cause skin allergy to develop. Once this occurs, even very small future exposures can cause itching and a skin rash. Exposure may cause mutations or damage the developing fetus; however, this needs further study. Animal studies have found the development of cancer in animals. Whether captan is a human cancer hazard is currently being studied. Human Tox = 145.83333 ppb CHCL (Chronic Human Carcinogen Level) (VERY LOW).

Points of Attack: Eyes, skin, respiratory system; gastrointestinal tract; liver; kidneys. Cancer site in animals: duodenal tumors.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Skin testing with dilute captan may help diagnose allergy, if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with captan all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, heat, and incompatible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2773 Phthalimide derivative pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquid containing captan in vermiculite, dry sand; earth, or similar material. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 200.

Fire Extinguishing: Captan may burn, but does not ignite readily. Use dry chemical, CO_2, or foam extinguishers. *Do not use water.* At high temperatures, captan decomposes and produces Thermal decomposition products may include oxides of sulfur and nitrogen, hydrogen chloride and phosgene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Captan decomposes fairly readily in alkaline media (pH > 8). It is hydrolytically stable at neutral or acid pH but decomposes when heated alone at its freezing/melting point. Alkaline hydrolysis is recommended[22].

Carbachol Chloride C:0420

Formula: $C_6H_{15}ClN_2O_2$

Synonyms: 2-[(Aminocarbonyl)oxy]-*N*,*N*,*N*-trimethylethanaminium chloride; Cabacolina; Carbachol; Carbacholin; Carbacholine chloride; Carbamic acid, Ester with choline chloride; Carbamiotin; Carbamoylcholine chloride; Carbamylcholine chloride; Carbochol; Carbocholin; Carbyl; Carcholin; Choline carbamate chloride; Choline chlorine carbamate; Choline, chlorine carbamate (ester); Coletyl; Doryl (pharmaceutical); (2-Hydroxyethyl)trimethylammonium chloride carbamate; Isopto carbachol; Jestryl; Lentin; Lentine (French); Miostat; Mistura C; Moryl; P.V. carbachol; TL 457; Vasoperif

CAS Registry Number: 51-83-2

HSDB Number: 6373

RTECS Number: GA0875000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151; UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 200-127-3

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Drug

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40 CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R25; R28; R36/37/38; R50/53; safety phrases: S26; S28; S45; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Carbachol chloride is a crystalline odorless powder which, on standing in an open container, develops a faint odor resembling that of an aliphatic amine. Molecular weight = 182.68; freezing/melting point = 203°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0.

Potential Exposure: Used in veterinary medicine as a cholinergic; parasympathomimetic, used chiefly in large animals, especially for colic in the horse.

Incompatibilities: Carbachol chloride is a carbamate ester. Esters are generally incompatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition. Carbamates are incompatible with strong acids and bases, and especially incompatible with strong reducing agents such as hydrideds and active metals. Contact with active metals or nitrides form flammable gaseous hydrogen. Incompatible with strongly oxidizing acids, peroxides, and hydroperoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.4 milligram per cubic meter

PAC-2: 15 milligram per cubic meter

PAC-3: 90 milligram per cubic meter

Routes of Entry: Ingestion, skin contact.

Harmful Effects and Symptoms

Highly toxic by ingestion. LD_{50} (oral-rat) = 40 mg/kg.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbachol chloride all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Carbaryl is a white or grayish, odorless, crystalline solid; or various other forms including liquid and paste. Molecular weight = 201.24; boiling point = (decomposes below BP); freezing/melting point = 142°C; vapor pressure $= < 4 \times 10^{-5}$ mmHg @ 25°C; flash point = ~200°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Practically insoluble in water; solubility = 0.02 g/L @ 30°C.

Potential Exposure: Used as a broad spectrum insecticide and as acaricide and molluscicide. Workers engaged in production, formulation, and application of carbaryl as a contact insecticide for fruits, vegetables, cotton, and other crops.

Incompatibilities: Contact with strong oxidizers can cause fire and explosions.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 milligram per cubic meter

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 600 milligram per cubic meter

DFG MAK: 5 milligram per cubic meter measured as the, inhalable fraction TWA; Peak Limitation Category II(4) [skin].

Arab Republic of Egypt: TWA 5 milligram per cubic meter, 1993; Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter [skin], 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter [skin], 1999; France: VME 5 milligram per cubic meter, 1999; Hungary: STEL 1 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Japan: 5 milligram per cubic meter [skin], 1999; Norway: TWA 5 milligram per cubic meter, 1999; the Philippines: TWA 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 1 milligram per cubic meter, MAC (STEL) 8 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter, 1993; Switzerland: MAK-W 5 milligram per cubic meter [skin], 1999; Thailand: TWA 5 milligram per cubic meter, 1993; United Kingdom: LTEL 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen.

Several states have set guidelines or standards for carbaryl in ambient air[60] ranging from $3.5\ \mu/m^3$ (Pennsylvania) to $11.9050\ \mu/m^3$ (Kansas) to $50\ \mu/m^3$ (North Dakota) to $80\ \mu/m^3$ (Virginia) to $100\ \mu/m^3$ (Connecticut) to $119\ \mu/m^3$ (Nevada).

Determination in Air: Use NIOSH Analytical Method #5601, NIOSH Analytical Method #5006, and OSHA Analytical Method 63. Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection.

Permissible Concentration in Water: A no-adverse-effect-level in drinking water has been calculated as 0.574 mg/L by NAS/NRC. The UNEP/USSR joint project[43] set a MAC of 0.1 mg/L in water used for domestic purposes and 0.0005 mg/L in water bodies used for fishery purposes. Some states have set guidelines for carbaryl in drinking water[61] ranging from 10 μg/L (Wisconsin) to 60 μg/L (California) to 164 μg/L (Maine) to 574 μg/L (Kansas). See Regulatory section for Canada drinking water level.

Determination in Water: Octanol−water coefficient: Log $K_{\mathrm{ow}} = 1.6$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin contact or eye contact, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Carbaryl irritates the eyes, skin, and respiratory tract. The hot liquid may cause severe skin burns. The substance may affect the nervous system; resulting in convulsions and respiratory failure. The effects may be delayed. LD_{50} (oral-rat) = 250 mg/kg (moderately toxic). Single doses of up to about 140 mg (0.005 oz) have been reported to cause no effect. However, a single dose of about 200 mg has caused stomach pain and excessive sweating. Individual responses may vary. Several milliliters (0.1 fluid oz) of an 80% solution of carbaryl has caused nausea, salivation, headache, tremors, and excessive tearing. 500 mL (1 pt) of an 80% solution has resulted in death. LD_{50} = 250 mg/kg[77]

Long-Term Exposure: The major health problem associated with occupational exposure to Carbaryl is related to its inhibition of the enzyme cholinesterase in the central, autonomic, and peripheral nervous systems. The inhibition of cholinesterase allows acetylcholine to accumulate at these sites and thereby leads to over stimulation of innervated organs. The signs and symptoms observed as a consequence of exposure to carbaryl in the work-place environment are manifestations of excessive cholinergic stimulation, e.g., nausea, vomiting, mild abdominal cramping, dimness of vision, dizziness, headache, difficulty in breathing; and weakness. Carbaryl may affect the kidneys and nervous system. It may cause mutations and be a teratogen in humans. There is limited evidence that it reduces fertility in both males and females.

Points of Attack: Respiratory system, skin, central nervous system; cardiovascular system.

Medical Surveillance: NIOSH recommends that workers subject to carbaryl exposure have comprehensive preplacement medical examinations, with subsequent annual medical surveillance. If symptoms develop or overexposure has occurred, the following may be useful: kidney function tests, urine (chemical/metabolite), UA. Exam of the nervous system. If done within 2−3 hours after exposure, serum and RBC cholinesterase levels may be helpful. Levels can return to normal before the exposed person feels well.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact; **4 hours**: natural rubber gloves, Neoprene rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl chloride gloves, suits, boots. Wear appropriate clothing to prevent repeated or prolonged skin contact. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is contaminated. Work clothing should be changed daily if it is possible that clothing is contaminated. Remove nonimpervious clothing promptly if contaminated. Any employee whose work involves likely exposure of the skin to carbaryl or carbaryl formulations, e.g., mixing of formulations, shall wear full-body coveralls or the equivalent, impervious gloves, i.e., highly resistant to the penetration of carbaryl, impervious footwear and when there is danger of carbaryl coming in contact with the eyes, goggles or a face shield. Any employee engaged in field application of carbaryl shall be provided with, and required to wear, the following protective clothing and equipment: goggles, full-body coveralls, impervious footwear, and a protective head covering. Employees working as flaggers in the aerial application of carbaryl shall be provided with, and required to wear, full-body coveralls or waterproof rainsuits, protective head coverings; impervious gloves and impervious footwear. Significant engineering controls are recommended for this chemical in NIOSH Criteria Document #77-107.

Respirator Selection: Engineering controls should be used, wherever feasible to maintain carbaryl concentrations below the prescribed limits, and respirators should only be used in certain nonroutine or emergency situations. During certain agricultural applications, however, respirators must be used. *Up to 50 milligram per cubic meter:* Sa* (APF = 10) (any supplied-air respirator). *Up to 100 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard: Store in a secure poison location. Prior to working with carbaryl all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Carbaryl must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where carbaryl is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN 2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. If spill involves a liquid containing carbaryl, absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Carbaryl is a noncombustible solid but may be dissolved in flammable liquids. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Submit to alkaline hydrolysis before disposal[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Cancinogenicity: EPA Group C, possible human carcinogen

Hazard Alert: Nerve Toxin, Suspected of causing genetic defects, Reproductive toxin: possible endocrine disruptor, Environmental hazard.

United States DOT Regulated United States DOT Regulated marine pollutant (49CFR172.101, Appendix B)

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R33; R46; R60; R61; safety phrases: S50/S53; S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: Colorless crystalline solid or light-gray powder. Commercially supplied as dry concentrate that is mixed with water for spraying. Molecular weight = 191.21; boiling point = decomposes; specific gravity (H_2O:1) = 1.452; freezing/melting point = (decomposes) 302−307°C; vapor pressure 4.9×10^{-10} mmHg @ 20°C. Slightly soluble in water; solubility = 0.008/pH7 @ 24°C.

Potential Exposure: Carbendazim is a benzimidazole/carbamate systemic fungicide used as a drench to control a broad range of fungi in cereals, vegetables, oilseed rape, sugar beets, grapes, tomatoes, pome fruit, and stone fruit. It is also used in postharvest storage and as treatment in seed preplanting, frequently in combination with other fungicides. In some areas, it has been used to combat Dutch Elm disease.

Incompatibilities: Carbamates are incompatible with reducing agents, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas.

Permissible Exposure Limits in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Air: Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.5$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: High—1.44530 ppb, MATC.

Routes of Entry: Skin absorption, ingestion, inhalation

Harmful Effects and Symptoms

Short-Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes. LD_{50} (oral, rat) = 6400 mg/kg[77].

Long-Term Exposure: A potent acetylcholinesterase (AChE) inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase. May be a liver toxin.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Routine biological monitoring of pesticide applicators and field workers includes testing of plasma and red blood cell acetylcholinesterase levels (for enzyme poisoned by this chemical). These tests are normally accurate only if done within about 2 hours of exposure. If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover.

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eye lids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 oz of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIO United States OR HAVING CONVULSIONS*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup* *of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 g) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10-minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. DuPont Tychem suit fabrics[88] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as Sodium Hydroxide, Sodium Bicarbonate, etc.).

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: For solids, isolate spill or leak area in all directions for at least 25 m/75 ft. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand, or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. *On small fire*, use dry chemical powder, carbon dioxide, water spray, or foam. *On large fire*, use water spray, fog, or alcohol-resistant foam. Do not scatter material using straight water jet streams. Dike fire control water for later disposal; do not scatter the material. Move containers from fire area if you can do it without risk. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Carbetamide C:0437

Formula: $C_{12}H_{16}N_2O_3$

Synonyms: 11,561 RP; δ-(−)-Carbanilic acid(1-ethylcarbamoyl)ethyl ester; Carbetamex; Carbetamid (German); **Carbetamide**; Helmsman; δ-*N*-Ethyllactamide carbanilate (ester); δ-(−)-1-(Ethylcarbamoyl)ethylphenyl carbamate; (R)-*N*-Ethyl-2-[((phenylamino) carbonyl) oxy] propanamide; Legurame; *N*-Ethyl-2-[((phenylamino)carbonyl)oxy] propanamide, (*d*) isomer; (Phenylcarbamoyloxy)-2-*N*-ethylpropionamide; 2-Phenyl-carbamoyloxy-*N*-aethyl-propionamid (German); *N*-Phenyl-1-(ethylcarbamoyl-1)-ethylcarbamate, *d*-isomer; Riot; Scrum

CAS Registry Number: 16118-49-3

RTECS Number: FD8900000

UN/NA & ERG Number: UN2757 (carbamate pesticides, solid, toxic)/151

EC Number: 240-286-6

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Agricultural chemical.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R33; R40; R50/53; R63; safety phrases: S22; S26; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Carbetamide is a colorless, crystalline powder, or solid. Molecular weight 236.27; freezing/melting point = 110°C; boiling point = 234°C (decomposes); vapor pressure = $< 1 \times 10^{-5}$ mmHg @ 20°C. Highly soluble in water; solubility = 3300 ppm @ 20°C.

Potential Exposure: Carbamate herbicide used to kill unwanted plants.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. Carbamates are incompatible with reducing agents, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas. Amides react with azo and diazo compounds to generate toxic gases. Flammable gases are formed by the reaction of organic amides with strong reducing agents such as hydrideds and active metals. Amides are very weak bases (weaker than water). Mixing amides with dehydrating agents such as phosphorus pentoxide or thionyl chloride generates the corresponding nitrile. The combustion of these compounds generates mixed oxides of nitrogen (NOx). This compound is decomposed by strong base or acid[101].

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms.

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Routes of Entry: Skin absorption, ingestion, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes. LD_{50} (oral, rat) = 1718 mg/kg.

Long-Term Exposure: A potent acetylcholinesterase (AChE) inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver or thyroid damage. Human toxicity (long term)[101]: High—7.00 ppb, Health advisory.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase; liver, thyroid.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests if necessary[30]. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes.

Ingestion: Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 oz of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIO United States OR HAVING CONVULSIONS*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water*. Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel*. Administer atropine, 2 mg (1/30 g) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10-minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. DuPont Tychem suit fabrics[NOAA] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10, 000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as Sodium Hydroxide, Sodium Bicarbonate, etc.).

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: For solids, isolate spill or leak area in all directions for at least 25 m/75 ft. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand, or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. *On small fire*, use dry chemical powder, carbon dioxide, water spray, or foam. *On large fire*, use water spray, fog, or regular alcohol-resistant foam. Do not scatter material using straight water jet streams. Dike fire control water for later disposal; do not scatter the material. Move containers from fire area if you can do it without risk. *If tank, rail car, or tank truck is involved in a fire*, isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved land fill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information
Hazard Alert: Poison, Possible neurotoxic effects (methyl carbamate), Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard, Agricultural chemical.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.006; Nonwastewater (mg/kg), 0.14
United States National Primary Drinking Water Regulations: MCLG = 0.04 mg/L; MCL = 0.04 mg/L.
Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
Canada: Drinking water quality, 0.09 mg/L MAC.
Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as dustable powder formulations containing a combination of: Benomyl @ or >7%; carbofuran @ or >10%; thiram @ or >15%).
Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R26/28; R50/53; R62; R63; safety phrases: S1/2; S36/37; S41; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Carbofuran is white, odorless crystalline solid. Molecular weight = 221.28; specific gravity (H_2O:1) = 1.18; boiling point = 149°C (decomposes); freezing/melting point = 150−153°C; vapor pressure = 2.3×10^{-7} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water; solubility = 0.07 g/L @25°C.
Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this insecticide, acaricide, and nematocide.
Incompatibilities: Alkaline substances, acid, strong oxidizers, such as perchlorates, peroxides, chlorates, nitrates, permanganates.
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: 0.1 milligram per cubic meter TWA
ACGIH TLV[1]: 0.1 milligram per cubic meter TWA, inhalable fraction and vapor; BEI issued; not classifiable as a human carcinogen (2001).
PAC Ver. 29[138]
PAC-1: 0.3 milligram per cubic meter
PAC-2: 0.43 milligram per cubic meter
PAC-3: 3.7 milligram per cubic meter
Australia: TWA 0.1 milligram per cubic meter, 1993; Belgium: TWA 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; France: VME 0.1 milligram per cubic meter, 1993; India: TWA 0.1 milligram per cubic meter, 1993; Norway: TWA 0.1 milligram per cubic meter, 1999; Poland: MAC (TWA) 0.1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; United Kingdom: TWA 0.1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for carbofuran in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).
Determination in Air: Use NIOSH Analytical Method #5006, (IV) #5601, and OSHA Analytical Method 63. Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection.
Permissible Concentration in Water: Safe Drinking Water Act (47 FR 9352): MCL, 0.04 mg/L; MCLG, 0.04 mg/L. EPA[47] has determined 1-day, 10-day, and longer term health advisories for a 10-kg child of 50 μg/L of Carbofuran. The longer term (1 year) value for a 70-kg adult is 0.18 mg/L or 180 μg/L. A lifetime Health advisory: for a 70-kg adult has been determined to be 36 μg/L of Carbofuran. Most

recently, EPA has proposed a limit of 40 μg/L in drinking water[62]. Some states have set guidelines for carbofuran in drinking water[61] ranging from 10 μg/L (Massachusetts) to 15 μg/L (New York) to 36 μg/L (Arizona and Minnesota) to 50 μg/L (Kansas and Wisconsin).

Determination in Water: Analysis of Carbofuran is by a high performance liquid chromatographic procedure used for the determination of *n*-methyl carbamoyloximes and *n*-methylcarbamates in drinking water (United States Environmental Protection Agency 1984). In this method, the water sample is filtered and a 400-μL aliquot is injected into a reverse phase HPLC column. Separation of compounds is achieved using gradient elution chromatography. After elution from the HPLC column, the compounds are hydrolyzed with sodium hydroxide. The methylamine formed during hydrolysis is reacted with *o*-phthalaldehyde (OPA) to form a fluorescent derivative which is detected using a fluorescence detector. The method detection limit has been estimated to be approximately 0.9 μg/L for carbofuran. Octanol−water coefficient: Log K_{ow} (octanol/water partition coefficient) = 2.32.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Carbofuran may affect the nervous system; resulting in convulsions and respiratory failure. Cholinesterase inhibitor. Exposure may result in death. The effects may be delayed and exposed personnel should be kept under medical observation. Symptoms include headache, giddiness; blurred vision weakness, nausea, cramps, diarrhea, chest discomfort, sweating, contraction of pupils; tearing, salivation; Blue lips; lungs and abdomen fill with fluid, convulsions, coma; loss of reflexes and sphincter control. This material is extremely poisonous. The LD_{50} rat is 5.3 mg/kg May be fatal if swallowed, inhaled, or absorbed through skin. Contact may burn skin or eyes. Probable lethal oral dose to humans 5−50 mg/kg or 7 drops to 1 teaspoon for 150 lb person. LD_{50} = 5.3 mg/kg[77]

Long-Term Exposure: The major health problem associated with occupational exposure to carbofuran is related to its inhibition of the enzyme cholinesterase in the central, autonomic, and peripheral nervous systems. The inhibition of cholinesterase allows acetylcholine to accumulate at these sites and thereby leads to over stimulation of innervated organs. The signs and symptoms observed as a consequence of exposure to Carbofuran in the work-place environment are manifestations of excessive cholinergic stimulation, e.g., nausea; vomiting; mild abdominal cramping; dimness of vision; dizziness, headache, difficulty in breathing; and weakness. Carbofuran may affect the immune system.

Points of Attack: Central nervous system; peripheral nervous system; blood cholinesterase.

Medical Surveillance: Before starting work, at regular times after that, and if any symptoms develop, or overexposure occurs, the following is recommended: serum and red blood cell cholinesterase levels (a special test for the substance in the body that Carbofuran affects). For this substance these tests are accurate only if done within about 2 hours of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for Exposures over *0.1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator with a pesticide cartridge. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbofuran all handlers should be trained on its proper handling and storage. Carbofuran must be stored to avoid contact with acids and strong oxidizers (such as perchlorates, peroxides, chlorates, nitrates, and permanganates). Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.
Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Absorb liquid containing carbofuran in vermiculite, dry sand; earth, or similar material. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Carbofuran itself does not burn. The substance decomposes on heating, producing toxic fumes including nitrogen oxides. Dike fire control water for later disposal, do not scatter the material. Stay at maximum distance from fire. Extinguish fire using an agent suitable for the type of surrounding fire; use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately.
Disposal Method Suggested: Alkaline hydrolysis is the recommended mode of disposal[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human, Inadequate Evidence, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1996[1].

California Proposition 65 Chemical[102]: (*airborne, unbound particles of respirable size*), Cancer 2/21/2003.

Hazard Alert: Combustible solid or highly flammable liquid, Possible risk of forming tumors, Suspected reprotoxic hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F (liquid), Xi, Xn; risk phrases: R11; R18; R24/25; R36/37; R40; R63; safety phrases: S22; S26; S36/37; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Carbon black (essentially elemental carbon), is a black or brown liquid or solid (powder). Odorless solid. Carbon black oil is flammable and has a petroleum odor. Molecular weight = 12; freezing/melting point = ~3550°C (sublimes). Hazard identification (based on NFPA-704 M Rating System) (*activated, type C-1*): Health 1, flammability 1 (solid) 3 (liquid), reactivity 1. Insoluble in water. Combustible solid may contain flammable hydrocarbons.
Potential Exposure: Used as reinforcing agent and filler for rubber; colorants for ink, paint, and plastics. Workers in carbon black production or in its use in rubber compounding, ink and paint manufacture, plastics compounding, dry-cell battery manufacture.
Incompatibilities: Carbon blacks containing over 8% volatiles may pose an explosion hazard. Dust can form an explosive mixture in air. A reducing agent; keep away from strong oxidizers, such as chlorates, bromates, nitrates.
Permissible Exposure Limits in Air

NIOSH IDLH = 1750 milligram per cubic meter

OSHA PEL: 3.5 milligram per cubic meter TWA

NIOSH REL: 3.5 milligram per cubic meter TWA; Potential human carcinogen, in the presence of PAHs, NIOSH recommends that exposure to carbon black be limited to the lowest feasible concentration. 0.1 mg[PAHs]/m^3 [10-hour] TWA[Carbon black, in the presence of polycyclic aromatic hydrocarbons (PACs)]. See *NIOSH Pocket Guide*, Appendices A and C.

ACGIH TLV[1]: 3.5 milligram per cubic meter TWA; not classifiable as a human carcinogen

DFG MAK: Carcinogen Category 3B, inhalable dust.

PAC Ver. 29[138]

PAC-1: 9 milligram per cubic meter

PAC-2: 99 milligram per cubic meter

PAC-3: 590 milligram per cubic meter

DFG MAK: Carcinogen Category 3B, inhalable fraction

Australia: TWA 3 milligram per cubic meter, 1993; Belgium: TWA 3.5 milligram per cubic meter, 1993; Denmark: TWA 3.5 milligram per cubic meter, 1999; Finland: TWA 3.5 milligram per cubic meter; STEL 7 milligram per cubic meter, 1999; France: VME 3.5 milligram per cubic meter, 1999; Norway: TWA 3.5 milligram per cubic meter, 1999; the Philippines: TWA 3.5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 3.5 milligram per cubic meter, 2003; Sweden: NGV 3 milligram per cubic meter [dust], 1999; United Kingdom: TWA 3.5 milligram per cubic meter; STEL 7 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. The former USSR-UNEP/IRPTC joint project[43] set a MAC in ambient air in residential areas of 0.15 milligram per cubic meter on a momentary basis and 0.005 milligram per cubic meter on an average daily basis. Several states have set guidelines or standards for carbon black in ambient air[60] ranging from 117 μ/m^3 (New York) to 35 μ/m^3 (North Dakota) to 50 μ/m^3 (Virginia) to 70 μ/m^3 (Connecticut) to 83 μ/m^3 (Nevada).

Determination in Air: Filtration from air is followed by gravimetric analysis as described in NIOSH Analytical Method #5000[18]. See also NIOSH Analytical Method 5800, Polycyclic aromatic compounds (PAC), and OSHA Analytical Method ID-196.

Permissible Concentration in Water: The former USSR-UNEP/IRPTC joint project[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation may cause irritation to respiratory tract. Skin contact may cause irritation. Eye contact may cause irritation. *Ingestion:* Animal studies show that toxic effects are unlikely, although carbon black contains several substances that are toxic and known carcinogens.

Long-Term Exposure: Exposure to levels well above 3.5 milligram per cubic meter for several months may result in damage to the skin and nails; temporary or permanent damage to the lungs and breathing passages; and adversely affect the heart. Carbon black containing PAH greater than 0.1% should be considered a suspect carcinogen. Lungs may be affected by repeated or prolonged exposure at very high concentrations: Some carbon blacks may contain compounds which are carcinogenic; and as organic extracts of these have been classified as possibly carcinogenic to humans, special care should be taken to avoid exposure to such extracts. Lung effects remain controversial and may be due to contaminants. It is probable that minor effects reported are nonspecific effects associated with exposure to nuisance dusts in general. Polycyclic aromatic hydrocarbons (PAH) are reportedly present in some carbon blacks. Depending on the process of manufacture, there are variations in their chemical compositions.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: chest X-ray (to be read by a special NIOSH "B reader" radiologist); lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin and PAH contamination is present, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *Up to 17.5 milligram per cubic meter:* Qm (APF = 5) (any quarter-mask respirator). *Up to 35 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 87.5 milligram per cubic meter:* Sa:Cf (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, APR with a high-efficiency particulate filter). *Up to 175 milligram per cubic meter:* 100 F (APF = 50) (any air purifying), full facepiece respirator with and N100, R100, or P100 filter. Any powered, APR with a tight-fitting facepiece and a high-efficiency particulate filter. Any SCBA with a full facepiece. Any supplied-air respirator with a full facepiece. *up to 1750 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

In presence of polycyclic aromatic hydrocarbons: NIOSH *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode) *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Oil: Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with carbon black all handlers should be trained on its proper handling and storage. Carbon black must be stored to avoid contact with chlorates, bromates, and nitrates, since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where carbon black is used, handled, or stored in a manner that could create a potential fire or explosion hazard. If carbon black contains more than 0.1% PAHs it should be used, handled, and stored in a regulated area as a carcinogen. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Carbon black oil: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, sand, water spray; or foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested

Dump into a landfill or incinerate as a slurry[22].

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Suspected of causing genetic defects; FDA-over the counter drug.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R5; R21; R62; safety phrases: S33; S38; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Carbon dioxide is a colorless, odorless, noncombustible gas. Molecular weight = 44.01; specific gravity (H_2O:1) = 0.72; boiling point = (sublimes); freezing/melting point = −78.3°C (sublimes); −56.66[138]; vapor pressure = 750 mmHg @ −78.6; Carbon dioxide is commonly shipped in the compressed liquid form, and the solid form (dry ice). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Slightly soluble in water; solubility = 0.2% @ 25°C.

Potential Exposure: Gaseous Carbon dioxide is used to carbonate beverages; as a weak acid in the textile, leather, and chemical industries; in water treatment; and in the manufacture of aspirin and white lead; for hardening molds in foundries; in food preservation, in purging tanks and pipe lines; as a fire extinguisher, in foams; and in welding. Because it is relatively inert, it is utilized as a pressure medium. It is also used as a propellant in aerosols; to promote plant growth in green houses; it is used medically as a respiratory stimulant; in the manufacture of carbonates; and to produce an inert atmosphere when an explosive or flammable hazard exists. The liquid is used in fire extinguishing equipment; in cylinders for inflating life rafts; in the manufacturing of dry ice, and as a refrigerant. Dry ice is used primarily as a refrigerant. Occupational exposure to carbon dioxide may also occur in any place where fermentation processes may deplete oxygen with the formation of carbon dioxide, e.g., in mines, silos, wells, vats, ships' holds, etc.

Incompatibilities: The substance decomposes on heating above 2000°C producing toxic carbon monoxide. Reacts violently with strong bases and alkali metals. Various metal dusts from chemically active metals, such as magnesium, zirconium, titanium, aluminum, chromium, and manganese are ignitable and explosive when suspended and heated in carbon dioxide.

Permissible Exposure Limits in Air

NIOSH IDLH = 40,000 ppm

OSHA PEL: 5000 ppm/9000 milligram per cubic meter TWA

NIOSH REL: 5000 ppm/9000 milligram per cubic meter TWA; 30,000 ppm/54,000 milligram per cubic meter STEL

ACGIH TLV[1]: 5000 ppm/9000 milligram per cubic meter TWA; 30,000 ppm/54,000 milligram per cubic meter STEL

DFG MAK: 5000 ppm/9100 milligram per cubic meter TWA; Peak Limitation Category II(2)

Australia: TWA 5000 ppm (9000 milligram per cubic meter); STEL 30000 ppm, 1993; Austria: MAK 5000 ppm (9000 mg. m^3), 1999; Belgium: TWA 5000 ppm (9000 milligram per cubic meter); STEL 30000 ppm, 1993; Denmark: TWA 5000 ppm (9000 milligram per cubic meter), 1999; Finland: TWA 5000 ppm (9000 milligram per cubic meter), 1999; Hungary: STEL 9000 milligram per cubic meter, 1993; Japan: 5000 ppm (9000 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 9000 milligram per cubic meter, 2003; Norway: TWA 5000 ppm (9000 milligram per cubic meter), 1999; the Philippines: TWA 5000 ppm (9000 milligram per cubic meter), 1993; Poland: MAC (TWA) 9000 milligram per cubic meter, MAC (STEL) 27000 milligram per cubic meter, 1999; Russia: TWA 5000 ppm, 1993; Sweden: NGV 5000 ppm (9000 milligram per cubic meter), KTV 10000 ppm (18000 milligram per cubic meter), 1999; Switzerland: MAK-W 5000 ppm (9000 milligram per cubic meter), 1999; Thailand: TWA 5000 ppm (9000 milligram per cubic meter), 1993; Turkey: TWA 5000 ppm (9000 milligram per cubic meter), 1993; United Kingdom: TWA 5000 ppm (9150 milligram per cubic meter); STEL 15000 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 30,000 ppm. States with guidelines or standards for CO_2 in ambient air are[60]: 150 milligram per cubic meter (Virginia) and 214 milligram per cubic meter (Nevada).

Determination in Air: Gas collection bag; none; GC/Thermal conductivity detector; IV NIOSH Analytical Method #6603. Collection in a bag followed by GC. See OSHA Analytical Method ID-172.

Routes of Entry: Inhalation of gas.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation of high concentrations of this gas may cause headache, shortness of breath; nausea, vomiting, dizziness, hyperventilation, and unconsciousness. Rapid evaporation of the liquid or skin contact with "dry ice" may cause frostbite. On loss of containment, this liquid evaporates very quickly causing supersaturation of the air with serious risk of suffocation when in confined areas. Carbon dioxide is a simple asphyxiant. Concentrations of 10% (100,000 ppm) can produce unconsciousness and death from oxygen deficiency. A concentration of 5% may produce shortness of breath and headache. Continuous exposure to 1.5% CO_2 may cause changes in some physiological processes. The concentration of carbon dioxide in the blood affects the rate of breathing.

Long-Term Exposure: Long-term exposure at levels between 5000 and 20,000 ppm of carbon dioxide can affect the acid−base balance, causing acidosis, and can affect calcium metabolism.

Points of Attack: Lungs, skin, cardiovascular system.

Medical Surveillance: Consider evaluation of body calcium and acid−base balance.

First Aid: If dry ice gets into the eyes, get medical attention. If this chemical contacts the skin, get medical attention for frostbite. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform rescue breathing and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Carbon dioxide is a heavy gas and accumulates at low levels in depressions and along the floor. Generally, adequate ventilation will provide sufficient protection for the worker. Where concentrations are of a high order, supplied-air respirators are recommended.

Respirator Selection: *40,000 ppm:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbon dioxide all handlers should be trained on its proper handling and storage. Carbon dioxide must be stored to avoid contact with chemically active metals (such as potassium, sodium, magnesium, and zinc) especially in combination with peroxides, since violent reactions occur. Protect containers from physical damage. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Carbon dioxide (UN1013, UN2187), Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas. Dry ice (UN1845), Hazard class 9 is considered a "miscellaneous hazardous material" and does not require a label. The gas and refrigerated liquid fall in Hazard Class 2.2 and there is no Packing Group; solid, dry ice falls in Hazard Class 9. Solid, dry ice carries the symbol "AW." The letter "A" restricts the application of requirements of this subchapter to materials offered or intended for transportation by aircraft, unless the material is a hazardous substance or a hazardous waste. The letter "W" restricts the application of requirements of this subchapter to materials offered or intended for transportation by vessel, unless the material is a hazardous substance or a hazardous waste. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Inhalation hazard. If carbon dioxide gas is leaked, take the following steps. Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air; repair leak or allow cylinder to empty. If carbon dioxide liquid or solid is spilled or leaked, take the following steps: restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate the area of spill or leak.

Fire Extinguishing: Containers may explode in fire. Extinguish fire using an agent suitable for type of surrounding fire. Carbon dioxide itself does not burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Vent to atmosphere[22].

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Carbon disulfide is a highly refractive, flammable liquid; which, in pure form has a sweet odor and in commercial and reagent grades has a foul smell. It can be detected by odor at about 1 ppm but the sense of smell fatigues rapidly and, therefore, odor does not serve as a good warning property. Molecular weight = 76.13; specific gravity (H_2O:1) = 1.26; boiling point = 46.3°C; freezing/melting point = −110.8°C; vapor pressure = 279 mm Hg @ 25°C; flash point = −30°C; autoignition temperature = 90°C. The explosive limits are LEL: 1.3%; UEL: 50%. Hazard identification (based on NF PA-704 M Rating System): Health 3, flammability 4, reactivity 0. Slightly soluble in water; solubility = 0.3%.

Potential Exposure: Carbon disulfide is used in the manufacture of viscose rayon; ammonium salts; carbon tetrachloride; carbanilide, xantho genates; flotation agents; soil disinfectants; dyes; electronic vacuum tubes; optical glass; paints, enamels, paint removers; varnishes; varnish removers; tallow, textiles, explosives; rocket fuel; putty; preservatives, and rubber cement; as a solvent for phosphorus, sulfur, selenium, bromine, iodine; alkali cellulose; fats, waxes, lacquers, camphor, resins, and cold vulcanized rubber. It is also used in degreasing; chemical analysis; electroplating; grain fumigation; oil extraction; and drycleaning. It is widely used as a pesticide intermediate.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Also incompatible with chemically active metals (such as sodium, potassium, zinc), azides, organic amines, halogens. May explosively decompose on shock, friction, or concussion. May explode on heating. The substance may spontaneously ignite on contact with air and on contact with hot surfaces, producing toxic fumes of sulfur dioxide. Reacts violently with oxidants to produce oxides of sulfur and carbon monoxide, and causing fire and explosion hazard. Attacks some forms of plastic, rubber, and coating.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

Conversion factor: 1 ppm = 3.11 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 20 ppm TWA; 30 ppm, Ceiling Concentration; 100 ppm [30 minutes maximum peak per 8-hour shift]

NIOSH REL: 1 ppm/3 milligram per cubic meter TWA; 10 ppm/30 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 1 ppm/3.13 milligram per cubic meter TWA [skin]; Not Classifiable as a Human carcinogen, BEI: 5 mg/g [2-Thiothiazolidine-4-carboxylic acid (TTCA)] creatinine in urine at end-of-shift

PAC* Ver. 29[138]

PAC-1: **13**$_{\mathbf{A}}$ ppm

PAC-2: **160**$_{\mathbf{A}}$ ppm

PAC-3: **480**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 5 ppm/16 milligram per cubic meter TWA; Peak Limitation II(2) [skin] Pregnancy Risk Group B; BAT: 4 mg/g [2-Thio-4-thiazolidine carboxylic acid (TTCA)] creatinine in urine at end-of-shift

Arab Republic of Egypt: TWA 10 ppm (30 milligram per cubic meter) [skin], 1993; Australia: TWA 10 ppm (30 milligram per cubic meter) [skin], 1993; Austria: MAK 10 ppm (30 milligram per cubic meter) [skin], 1999; Belgium: TWA 10 ppm (31 milligram per cubic meter) [skin], 1993; Denmark: TWA 5 ppm (15 milligram per cubic meter)

[skin], 1999; Finland: TWA 5 ppm (15 milligram per cubic meter) [skin], 1999; France: VME 10 ppm (30 milligram per cubic meter), VLE 25 ppm (75 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 30 milligram per cubic meter [skin], 2003; India: TWA 10 ppm (30 milligram per cubic meter) [skin], 1993; Japan: 10 ppm (31 milligram per cubic meter) [skin], 1999; Norway: TWA 5 ppm (15 milligram per cubic meter), 1999; the Philippines: TWA 20 ppm (60 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 18 milligram per cubic meter, MAC (STEL) 30 milligram per cubic meter, 1999; Russia: TWA 10 ppm; STEL 1 milligram per cubic meter, 1993; Sweden: NGV 5 ppm (16 milligram per cubic meter), KTV 8 ppm (25 milligram per cubic meter) [skin], 1999; Thailand: TWA 20 ppm (60 milligram per cubic meter); STEL 30 ppm (90 milligram per cubic meter), 1993; Turkey: TWA 10 ppm (65 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 10 ppm (32 milligram per cubic meter) [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 ppm [skin]. Russia[43] set a MAC of 1.0 milligram per cubic meter in work-place air, of 0.03 milligram per cubic meter in ambient residential air on a momentary basis, and 0.003 milligram per cubic meter in residential ambient air on a daily average basis. Several states have set guidelines or standards for carbon disulfide in ambient air[60] ranging from 60 μ/m^3 (Connecticut) to 100 μ/m^3 (New York) to 150 μ/m^3 (South Carolina) to 186 μ/m^3 (North Carolina) to 300 μ/m^3 (Florida and North Dakota) to 714 μ/m^3 (Nevada). The WHO[35] has recommended a TWA of 10 milligram per cubic meter for male workers, and a TWA of 3 milligram per cubic meter for women of fertile age.

Determination in Air: Adsorption on charcoal, workup with benzene, GC analysis per NIOSH Analytical Method #1600 and Method #3800[18].

Permissible Concentration in Water: State Drinking Water Guidelines: Arizona 830 μg/L; California 160 μg/L; Florida 350 μg/L; Maine 600 μg/L; Minnesota 700 μg/L. New Hampshire 70 μg/L; Wisconsin 1000 μg/L. EPA[32] has suggested a permissible ambient goal of 830 μg/L.

Determination in Water: Octanol–water coefficient: $\text{Log}\,K_{\text{ow}} = 1.8$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor which may be compounded by percutaneous absorption of liquid or vapor; ingestion, and skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Carbon disulfide irritates the eyes, skin, and respiratory tract. Swallowing the liquid may cause aspiration into the lungs with the risk of chemical pneumonitis. This chemical may affect the central nervous system. In acute poisoning, early excitation of the central nervous system occurs, followed by depression with stupor, restlessness, and unconsciousness. If recovery occurs, the patient usually passes through the after-stage of narcosis, with nausea, vomiting, headache, etc. Also possible are motor disturbances of the bowel; anemia; disturbances of cardiac rhyth; loss of weight; polyuria and menstrual disorders. Severe chronic poisoning may also result in liver degeneration and jaundice. Exposure can cause a loss of consciousness. Exposure far above the PEL may result in death. The probable oral lethal dose for a human is between 0.5 and 5 g/kg or between 1 oz and 1 pt (or 1 lb) for a 70-kg (150 lb) person. In chronic exposures, the central nervous system is damaged and results in the disturbance of vision and sensory changes at the most common early symptoms. Lowest lethal dose for humans has been reported @ 14 mg/kg or 0.98 g for a 70-kg person. Alcoholics and those suffering from neuropsychic trouble are at special risk.

Long-Term Exposure: Repeated or prolonged contact with skin may cause skin allergy, dermatitis; increased cholesterol; artherosclerosis; high blood pressure; heart disease; and damage to the eyes; and other organs from its effects on arteries. Carbon disulfide may affect the central nervous system; resulting in severe neurobehavioral effects; polyneuritis, psychoses. Animal tests show that this substance possibly causes toxic effects upon human reproduction.

Points of Attack: The material affects the central nervous system; cardiovascular system; eyes, kidneys, liver, and skin.

Medical Surveillance: Preplacement and periodic medical examinations should be concerned especially with skin, eyes, central and peripheral nervous system; cardiovascular disease; as well as liver and kidney function. Electrocardiograms should be taken. CS_2, can be determined in expired air, blood, and urine. The iodine-azide test detects carbon disulfide metabolites in the urine, and it may indicate other sulfur compounds. Examination of the nervous system. NIOSH lists the following medical tests: blood urea nitrogen, electrocardiogram, expired air, ophthalmic examination; urine (chemical/metabolite)/sediment; liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves; Viton gloves, suits; 4H and Silver Shield gloves; Barricade-coated suits; Responder suits, Trellchem HPS suits; Trychem 1000 suits;

4 hours (At least 4 but <8 hours of resistance to breakthrough >0.1 μg/cm^2/min): Teflon gloves, suits, boots. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. NIOSH recommends the use of Viton and polyvinyl alcohol as protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, APR with organic vapor cartridge(s)]. *50 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any powered, APR with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *500 ppm:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with carbon disulfide all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1131 Carbon disulfide, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. For small leaks, absorb on paper towels. Evaporate the spills in a safe place, such as a fume hood. Large quantities can be reclaimed or collected and atomized in a suitable combustion chamber equipped with an appropriate effluent gas-cleaning device. If Carbon disulfide is spilled in water, neutralize with agricultural lime, crushed limestone, or sodium bicarbonate. If dissolved, apply activated carbon at 10 times the spilled amount. Use mechanical dredges or lifts to remove immobilized masses of pollutants and precipitates. In case of a spill or leak from a drum or smaller container or a small leak from a tank, isolate 50 ft in all directions. In case of a large spill, first isolate 100 ft in all directions, then evacuate in a downwind direction an area 0.2 mi wide and 0.3 mi long. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Wear positive pressure breathing apparatus and special protective clothing. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Note that the ignition temperature is dangerously low: 100°C. Vapors may be ignited by contact with ordinary light bulb; when heated to decomposition, it emits highly toxic fumes of oxides of sulfur. If the vapor concentration exceeds 2% by volume or is unknown, self-contained breathing mask with full face should be used by all persons entering contaminated area to fight fires. Wear special protective clothing. Isolate for ½ mi in all directions if tank car or truck is involved in fire. Use dry chemical, carbon dioxide, or other inert gas extinguishers. Foam may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This compound is a very flammable liquid which evaporates rapidly. It burns with a Blue flame to carbon dioxide (harmless) and sulfur dioxide. Sulfur dioxide has a strong suffocating odor; 1000 ppm in air is lethal to rats. The pure liquid presents an acute fire and explosion hazard. The following disposal procedure is suggested[22]: All equipment or contact surfaces should be grounded to avoid ignition by static charges. Absorb on vermiculite, sand, or ashes and cover with water. Transfer underwater in buckets to an open area. Ignite from a distance with an excelsior trail. If quantity is large, Carbon disulfide may be recovered by distillation and repackaged for use.

Regulatory Authority and Advisory Information

California Proposition 65 Chemical[102]: Developmental/ Reproductive toxin 7/1/1989.

Hazard Alert: Poison inhalation hazard (gas), Extremely flammable gas, Toxic gas, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard, Damage to organs (prolonged or repeated exposure).

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, T; risk phrases: R12; R23; R48/23; R61; R62; R63; safety phrases: S53; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Carbon monoxide is a flammable, colorless, odorless, tasteless gas, partially soluble in water. Molecular weight = 28.01; specific gravity (H_2O:1) = 1.15; boiling point = ∼ −190°C; freezing/melting point = −205°C; relative vapor density (air = 1) = 0.97; vapor pressure = > 35 atm; flash point = −190°C; autoignition temperature = 605°C. The explosive limits are: LEL: 12.5%; UEL: 74.20%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 4, reactivity 0. Soluble in water; solubility = 2% @ 20°C.

Potential Exposure: Carbon monoxide is used in metallurgy as a reducing agent, particularly in the Mond process for nickel; in organic synthesis, especially in the Fischer−Tropsch process for petroleum products, and in the oxo reaction; and in the manufacture of metal carbonyls. It is usually encountered in industry as a waste product of incomplete combustion of carbonaceous material (complete combustion produces CO_2). The major source of CO emission in the atmosphere is the gasoline-powered internal combustion engine. Special industrial processes which contribute significantly to CO emission are iron foundries, particularly the cupola; fluid catalytic crackers; fluid coking; and moving-bed catalytic crackers in thermal operations in carbon black plants; beehive coke ovens; basic oxygen furnaces, sintering of blast furnace feed in steel mills; and formaldehyde manufacture. There are numerous other operations in which a flame touches a surface that is cooler than the ignition temperature of the gaseous part of the flame where exposure to CO may occur, e.g., arc welding, automobile repair; traffic control; tunnel construction; firefighting; mines, use of explosives, etc.

Incompatibilities: Forms extremely explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. In the presence of finely dispersed metal powders the substance forms toxic and flammable carbonyls. May react vigorously with oxygen, acetylene, chlorine, fluorine, nitrous oxide.

Permissible Exposure Limits in Air

NIOSH IDLH = 1200 ppm

Conversion factor = 1 ppm = 1.15 milligram per cubic meter

OSHA PEL: 50 ppm/55 milligram per cubic meter TWA

NIOSH REL: 35 ppm/40 milligram per cubic meter TWA; 200 ppm/229 milligram per cubic meter, Ceiling Concentration

ACGIH TLV[1]: 25 ppm/29 milligram per cubic meter TWA; BEI: 3.5% carboxyhemoglobin (CO-Hb) in blood at end-of-shift; 20 ppm CO in end-exhaled air at end-of-shift.

PAC* Ver. 29[138]

PAC-1: 75 ppm

PAC-2: $\mathbf{83_A}$ ppm

PAC-3: $\mathbf{330_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 30 ppm/35 milligram per cubic meter TWA; Peak Limitation Category II(1); Pregnancy Risk Group B; BAT: 5% carboxyhemoglobin (CO-Hb) in blood at end-of-shift

Arab Republic of Egypt: TWA 50 ppm (55 milligram per cubic meter), 1993; Australia: TWA 50 ppm (55 milligram per cubic meter); STEL 400 ppm (440 milligram per cubic meter), 1993; Austria: MAK 30 ppm (33 milligram per cubic meter), 1999; Belgium: TWA 50 ppm (57 milligram per cubic meter); STEL 400 ppm (458 milligram per cubic meter), 1993; Denmark: TWA 35 ppm (40 milligram per cubic meter), 1999; Finland: TWA 30 ppm (34 milligram per cubic meter); STEL 75 ppm (86 milligram per cubic meter), 1999; France: VME 50 ppm (55 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 29 milligram per cubic meter, 2003; India: TWA 50 ppm (55 milligram per cubic meter); STEL 400 ppm (440 milligram per cubic meter), 1993; Japan: 50 ppm (57 milligram per cubic meter), 1999; Norway: TWA 35 ppm (40 milligram per cubic meter), 1999; the Philippines: TWA 50 ppm (55 milligram per cubic meter), 1993; Poland: MAC (TWA) 30 milligram per cubic meter, MAC (STEL) 180 milligram per cubic meter, 1999; Russia: TWA 50 ppm; STEL 20 milligram per cubic meter, 1993; Sweden: NGV 35 ppm (40 milligram per cubic meter), KTVSTEL 100 ppm (120 milligram per cubic meter), 1999; Switzerland: MAK-W 30 ppm (35 milligram per cubic meter), KZG-W 60 ppm (70 milligram per cubic meter), 1999; Thailand: TWA 50 ppm (55 milligram per cubic meter), 1993; Turkey: TWA 50 ppm (55 milligram per cubic meter), 1993; United Kingdom: LTEL 50 ppm (55 milligram per cubic meter); STEL 300 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 25 ppm. The former USSR-UNEP/IRPTC joint project[43] set a MAC in work-place air of 20 milligram per cubic meter and MAC values for ambient air in residential areas of 3 milligram per cubic meter on a momentary basis and 1 milligram per cubic meter on an average daily basis. Several states have set guidelines or standards for CO in ambient air[60] ranging from 10−40 μ/m^3 (Arizona) to 1310 μ/m^3 (Nevada) to 10,000 μ/m^3 (10 milligram per cubic meter) (Connecticut).

Determination in Air: NIOSH Analytical Method (IV) #6604, OSHA Analytical Methods ID-209 and ID-210.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient level of 552 μg/L based on health effects.

Routes of Entry: Inhalation of gas.

Harmful Effects and Symptoms

Short-Term Exposure: Carbon monoxide may affect the blood, cardiovascular system, and central nervous system. Exposure at high levels may result in a loss of consciousness and death. Carbon monoxide combines with hemoglobin to form carboxyhemoglobin which interferes with the oxygen-carrying capacity of blood, resulting in a state of tissue hypoxia. The typical signs and symptoms of acute CO poisoning are headache, dizziness, drowsiness, vomiting, collapse, coma, and death. Initially the victim is pale; later the skin and mucous membranes may be cherry-red in color. Loss of consciousness occurs at about the 50% carboxyhemoglobin level. The amount of carboxyhemoglobin formed is dependent on concentration and duration of CO exposure; ambient temperature; health, and metabolism of the individual. The formation of carboxyhemoglobin is a reversible process. Recovery from acute poisoning usually occurs without sequelae unless tissue hypoxia was severe enough to result in brain cell degeneration. Carbon monoxide at low levels may initiate or enhance deleterious myocardial alterations in individuals with restricted coronary artery blood flow and decreased myocardial lactate production. Severe carbon monoxide poisoning has been reported to permanently damage the extrapyramidal system, including the basal ganglia.

Long-Term Exposure: Causes damage to organs through prolonged or repeated exposure. Carbon monoxide may affect the nervous system and the cardiovascular system, causing neurological and cardiac disorders. Suspected to cause reproductive effects, such as neurological problems; low birth weight; increased still births; and congenital heart problems. The DFG lists pregnancy risk to fetus probable.

Points of Attack: Central nervous system; lungs, blood, cardiovascular system.

Medical Surveillance: Preplacement and periodic medical examinations should give special attention to significant cardiovascular disease and any medical conditions which could be exacerbated by exposure to CO. Heavy smokers may be at greater risk. Methylene chloride exposure may also cause an increase of carboxyhemoglobin. Smokers usually have higher levels of carboxyhemoglobin than nonsmokers (often 5%−10% or more). Carboxyhemoglobin levels are reliable indicators of exposure and hazard. Carboxyhemoglobin should be tested within a few hours following exposure to the gas. EKG. Examination of the nervous system. Persons with heart disease should not be exposed to levels of CO above 35 ppm. Medical tests listed by NIOSH: whole blood (chemical/metabolite)/carboxyhemoglobin (end-of-shift, end of work-week), CBC; expired air (end-of-shift, end of work-week).

First Aid: *Gas:* Move victim to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation for 24 to 48 hours. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Refrigerated liquid: Move victims to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Under certain circumstances where carbon monoxide levels are not exceedingly high, gas masks with proper canisters can be used for short periods, but are not recommended. In areas with high concentrations, self-contained air apparatus is recommended.

Respirator Selection: NIOSH: *350 ppm:* Sa (APF = 10) (any supplied-air respirator). *875 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *1500 ppm:* GmFS *end of service life indicator (ESLI) required.* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10, 000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS *end of service life indicator (ESLI) required.* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with Carbon monoxide all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Carbon monoxide must be stored to avoid contact with strong oxidizers, such as chlorine or chlorine dioxide, since violent reactions occur. Keep containers in a cool, well-ventilated area away from heat, flame, and sunlight. Metal containers involving the transfer of 5 gal or more of liquid carbon monoxide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of carbon monoxide. Sources of ignition, such as smoking and open flames are prohibited where carbon monoxide is used, handled, or stored. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1016 Carbon monoxide, compressed, Hazard class: 2.3; Labels: 2.3-Poisonous gas; 2.1-Flammable gas, Inhalation Hazard Zone D. NA9202 Carbon monoxide, refrigerated liquid (cryogenic liquid), Hazard class: 2.3; Labels: 2.3-Poisonous gas; 2.1-Flammable gas, Domestic (United States), Inhalation Hazard Zone D. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package) UN1016/UN9202

Carbon monoxide & Carbon monoxide, compressed

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/180
Then: Protect persons downwind (mi/km)
Day 0.8/1.2
Night 3.0/4.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This gas is under pressure; containers may rupture and explode when heated. This chemical is a flammable gas that can cause explosion. Use dry chemical extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22]. Carbon monoxide can also be recovered from gas mixtures as an alternative to disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Carbonyl sulfide is a colorless gas or cold liquid. Molecular weight = 60.08. Specific gravity (H_2O:1) = 2.46; boiling point = −50°C. freezing/melting point = −138.8°C; vapor pressure = 750 mmHg @ −50.4°C; flammable limits: LEL: 12%; UEL: 29%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 4, reactivity 1.

Potential Exposure: Carbon oxysulfide is an excellent source of usable atomic sulfur, therefore, it can be used in various chemical syntheses, such as the production of episulfides, alkenylthiols, and vinylicthiols. It is also used to make viscose rayon. It is probable that the largest source of carbon oxysulfide is as a by-product from various organic syntheses and petrochemical processes. Carbon oxysulfide is always formed when carbon, oxygen, and sulfur, or their compounds, such as carbon monoxide; carbon disulfide, and sulfur dioxide, are brought together at high temperatures. Hence, carbon, oxysulfide is formed as an impurity in various types of manufactured gases and as a by-product in the manufacture of carbon disulfide. Carbon oxysulfide is also often present in refinery gases.

Incompatibilities: Carbon oxysulfide can form explosive mixture with air. Incompatible with strong bases. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: 15 ppm

PAC-2: $\mathbf{55_A}$ ppm

PAC-3: $\mathbf{150_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Can cause irritation of the eyes, skin, and respiratory tract. Contact with the liquefied gas can cause frostbite. Inhalation can cause irritation, coughing, and sneezing. High exposure can cause salivation, nausea, vomiting, diarrhea, sweating, weakness, and muscle cramps. It may cause tachycardia or arrhythmia. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. COS is an irritant to the lungs and trachea. It depresses the central nervous system. It can be fatal by paralysis of the respiratory system[22]. The acute toxicity of carbon oxysulfide was examined by Japanese workers. Exposure of laboratory animals to this contaminant of coal gas and petroleum gas was associated with pathological changes in the brain, medulla oblongata; liver, kidney, and lung. When rats were placed in chambers containing 0.05% and 0.2% Carbon oxysulfide, death occurred in 10 and 0.5−1.0 hours, respectively.

Long-Term Exposure: High or repeated exposure may affect the nervous system causing headache, dizziness, and confusion with memory problems. May cause brain damage; reduced memory; inability to concentrate; and/or personality changes. COS can cause bronchitis with coughing, phlegm and/or shortness of breath.

Points of Attack: Lungs, brain, central nervous system.

Medical Surveillance: Evaluate the cerebellar, autonomic, and peripheral nervous systems. Brain functions. tests include: EKG, complete nervous system evaluation, chest X-ray following acute overexposure.

First Aid: *Gas:* Move victim to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Refrigerated liquid: Move victims to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented impact resistant goggles when working with gasses. When working with liquid, wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear rubber gloves and coveralls[24].

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with carbon oxysulfide all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Carbon oxysulfide must be stored to avoid contact with bases and strong oxidizers, since violent reactions occur. Keep containers in a cool, well-ventilated area away from heat, flame, and sunlight. Metal containers involving the transfer of 5 gal or more of liquid carbon oxysulfide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of COS. Sources of ignition, such as smoking and open flames are prohibited where carbon oxysulfide is used, handled, or stored. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. The storage area for flammable toxic gases should have electrical equipment conforming to Article 500 of the National Electrical Code.

Shipping: UN2204 Carbonyl sulfide, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Inhalation Hazard Zone C. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 0.8/1.2
Night 2.2/3.5

Liquid: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and allow to vaporize. Or, cover the spill with weak hypochlorite solution (up to 15%). After 12 hours, the produce may be neutralized and flushed to a sewer with abundant water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: COS is a flammable gas or liquid. Fire may restart after it has been extinguished. Thermal decomposition products may include hydrogen sulfide and sulfur oxides. This gas is under pressure; containers may rupture and explode when heated. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve in a combustible solvent, such as alcohol, benzene, etc. Burn in a furnace with afterburner and scrubber to remove SO_2[22].

Carbon Tetrabromide C:0500

Formula: CBr_4

Synonyms: Carbon bromide; Methane, tetrabromide; Methane, tetrabromo-; Tetrabromide methane; Tetrabromomethane

CAS Registry Number: 558-13-4

HSDB Number: 2032

RTECS Number: FG4725000

UN/NA & ERG Number: UN2516/151

EC Number: 209-189-6

Regulatory Authority and Advisory Information

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xi, Xn; risk phrases: R22; R26; R23/24/25; R36/37/38; R41; R50/53; safety phrases: S24; S26; S27; S36/37; S39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Carbon tetrabromide, is a colorless powder, white crystalline solid, or yellow-brown crystals. Slight odor. Molecular weight = 331.65; boiling point = 189.8°C; freezing/melting point = 90°C; vapor pressure = 40 mmHg @ 96.1°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Very slightly soluble in water; solubility = 0.02%.

Potential Exposure: CBr_4 is used in organic synthesis.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, lithium and hexacyclohexyldiilead, since violent reactions may occur.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 13.57 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.1 ppm/1.4 milligram per cubic meter TWA; 0.3 ppm/4 milligram per cubic meter STEL

ACGIH TLV[1]: 0.1 ppm/1.4 milligram per cubic meter TWA; 0.3 ppm/4.1 milligram per cubic meter STEL

No PAC available.

Australia: TWA 0.1 ppm (1.4 milligram per cubic meter); STEL 0.3 ppm, 1993; Belgium: TWA 0.1 ppm (1.4 milligram per cubic meter); STEL 0.3 ppm, 1993; Denmark: TWA 0.1 ppm (1.4 milligram per cubic meter), 1999; Finland: TWA 0.1 ppm (1.4 milligram per cubic meter); STEL 0.4 ppm [skin], 1999; France: VME 0.1 ppm (1.4 milligram per cubic meter), 1999; Norway: TWA 0.1 ppm (1.4 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (1.4 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1.4 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 0.3 ppm. Several states have set guidelines or standards for CBr_4 in ambient air[60] ranging from 14−40 μ/m^3 (North Dakota) to 20 μ/m^3 (Virginia) to 28 μ/m^3 (Connecticut) to 33 μ/m^3 (Nevada).

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: The material is a potent lachrymator even at low concentrations. Carbon tetrabromide is corrosive to the eyes and skin and may cause permanent damage. Inhalation can cause severe irritation of the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. It can affect the nervous system; liver, and kidneys. Exposure to high concentrations may result in unconsciousness.

Long-Term Exposure: The substance may damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: Liver and kidney function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should Wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 0.1 ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbon tetrabromide all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials listed above.

Shipping: UN2516 Carbon tetrabromide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Absorb liquid containing Carbon Tetrabromide in vermiculite, dry sand; earth, or similar material. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Thermal decomposition products may include hydrogen bromide and oxides of carbon. Use any agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Purify by distillation and return to suppliers.

EC Number: 200-262-8 [*Annex I Index No.:* 602-008-00-5]

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence; Human, Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B[9]; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

California Proposition 65 Chemical[102]: Cancer 10/1/1987.

Hazard Alert: Poison, Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard. Listed for Tier 1 screening as an endocrine disruptor[88].

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential (ODP) = 1.1

United States National Primary Drinking Water Regulations: MCL = 0 mg/L; MCL 0.005 mg/L as carbon tetrachloride.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/1992); Toxic Pollutant (Section 401.15)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U211, D019

RCRA Toxicity Characteristic (Section 261.24), Maximum Concentration of Contaminants, regulatory level, 0.5 mg/L

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.057; Nonwastewater (mg/kg), 6.0

RCRA Maximum Concentration Limit for Ground Water Protection (Section 264.94): 8010 (1); 8240 (5)

Superfund/EPCRA 40 CFR302.4, Appendix A and Section IV.D.3.b, RQ: 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%. NPRI; CEPA Toxic Substance List

Mexico, Drinking water criteria, 0.004 mg/L.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23/24/25; R40; R48/23; R59; R52/53; R62; R63; safety phrases: S1/2; S23; S36/37; S41; S45; S57; S59; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Carbon tetrachloride is a colorless, nonflammable liquid with a characteristic ethereal odor. The Odor Threshold is 0.52 mg/L in water and 140−548 ppm in air. Molecular weight = 153.84; boiling point = 76.5°C; freezing/melting point = −23°C; vapor pressure =

91 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Very slightly soluble in water; solubility = 0.05%.

Potential Exposure: Carbon tetrachloride, and organochlorine, is used as a solvent for oils, fats, lacquers, varnishes, rubber, waxes, and resins. Fluorocarbons are chemically synthesized from it. It is also used as an azeotropic drying agent for spark plugs; a dry-cleaning agent; a fire extinguishing agent; a fumigant, and an anthelmintic agent. The use of this solvent is widespread, and substitution of less toxic solvents when technically possible is recommended.

Incompatibilities: Oxidative decomposition on contact with hot surfaces, flames, or welding arcs. Carbon tetrachloride decomposes forming toxic phosgene fumes and hydrogen chloride. Decomposes violently (producing heat) on contact with chemically active metals, such as aluminum, barium, magnesium, potassium, sodium, fluorine gas, allyl alcohol, and other substances, causing fire and explosion hazard. Attacks copper, lead, and zinc. Attacks some coatings, plastics, and rubber. Becomes corrosive when in contact with water; corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm

Conversion factor: 1 ppm = 6.29 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm TWA; 25 ppm STEL; 200 ppm [5-minute maximum peak in any 3 hours] STEL

NIOSH REL: 2 ppm/12.6 milligram per cubic meter STEL [60-minute] STEL; Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. *See NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 5 ppm/31 milligram per cubic meter TWA; 10 ppm/63 milligram per cubic meter STEL [skin]; Suspected Human Carcinogen

PAC* Ver. 29[138]

PAC-1: 1.2 ppm

PAC-2: $\mathbf{13}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{340}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 0.5 ppm/3.2 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Carcinogen Category 4; Pregnancy Risk Group C; BAT: 3.5 μg/L in blood end-of-shift

Arab Republic of Egypt: TWA 5 ppm (30 milligram per cubic meter) [skin], 1993; Australia: TWA 5 ppm (30 milligram per cubic meter) [skin], carcinogen, 1993; Austria: MAK 10 ppm (65 milligram per cubic meter) [skin], Suspected: carcinogen, 1999; Belgium: TWA 5 ppm (31 milligram per cubic meter) [skin], carcinogen, 1993; Denmark: TWA 2 ppm (13 milligram per cubic meter) [skin], 1999; Finland: TWA 5 ppm (31 milligram per cubic meter); STEL 10 ppm (63 milligram per cubic meter) [skin], carcinogen, 1999; France: VME 2 ppm (12 milligram per cubic meter), VLE 10 ppm (60 milligram per cubic meter), carcinogen, 1999; the Netherlands: MAC-TGG 3.2 milligram per cubic meter [skin], 2003; India: TWA 5 ppm (30 milligram per cubic meter) [skin], carcinogen, 1993; Japan: 5 ppm (31 milligram per cubic meter) [skin], 2B carcinogen, 1999; Norway: TWA 2 ppm (13 milligram per cubic meter), 1999; the Philippines: TWA 10 ppm (65 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 20 milligram per cubic meter, MAC (STEL) 100 milligram per cubic meter, 1999; Russia: TWA 10 ppm; STEL 20 milligram per cubic meter, 1993; Sweden: NGV 2 ppm (13 milligram per cubic meter), KTV 3 ppm (19 milligram per cubic meter) [skin], carcinogen, 1999; Switzerland: MAK-W 5 ppm (30 milligram per cubic meter); STEL 10 ppm (60 milligram per cubic meter) [skin], 1999; Thailand: TWA 10 ppm; STEL 25 ppm, 1993; United Kingdom: TWA 2 ppm (13 milligram per cubic meter) [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 10 ppm [skin]. Several states have set guidelines or standards for CCl_4 in ambient air[60] ranging from 0 (North Dakota) to 0.03 μ/m^3 (Rhode Island) to 0.0667 μ/m^3 (Indiana) to 0.67 μ/m^3 (Massachusetts and North Carolina) to 72 μ/m^3 (Pennsylvania) to 100 μ/m^3 (New York) to 150 μ/m^3 (South Carolina) to 300 μ/m^3 (Connecticut and Virginia) to 714 μ/m^3 (Nevada).

Determination in Air: Charcoal adsorption followed by workup with CS_2 and analysis by GC; Use NIOSH Analytical Method # 1003 for Hydrocarbons, Chlorinated or OSHA Analytical Method 7, Organic Vapors.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.005 mg/L; MCLG, zero. Federal Drinking Water Standards: EPA 5 μg/L; State Drinking Water Standards: California 0.5 μg/L; Florida 3 μg/L; New Jersey 2 μg/L; State Drinking Water Guidelines: Arizona 0.27 μg/L; Connecticut 5 μg/L; Maine 3 μg/L; Minnesota 3 μg/L.

Determination in Water: GC (EPA Method 601) or GC plus mass spectrometry (EPA Method 624). Octanol–water coefficient: Log K_{ow} (octanol/water partition coefficient) = 2.6.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, skin, and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Carbon tetrachloride irritates the eyes, causing redness.

Inhalation: Levels of 20 ppm may cause dizziness, headache, vomiting; visual disturbances; extreme fatigue; nose and throat irritation. Other symptoms may include restlessness, loss of balance, twitching, and tremors. Severe exposure can lead to liver, kidney, eye, and nerve damage that may be delayed after exposure; can cause breathing stoppage, coma, and death. 1000 ppm for an unspecified time has caused death. *Skin:* May cause irritation and redness; carbon tetrachloride is readily absorbed through the skin. Symptoms as listed above may occur through skin absorption even when vapor concentrations are below OSHA Standards. *Ingestion:* May cause severe abdominal pain with diarrhea, followed by symptoms described under inhalation. Death may occur by ingestion of as little as 1/2 teaspoon. Between 45 and 100 ppm, carbon tetrachloride may cause headache, drowsiness, fatigue, nausea, and vomiting. 100−300 ppm may cause additional effects of mental confusion; weight loss and sluggishness. Liver, kidney, eye, and nerve damage can result from more severe exposures. Coma and death may occur.

Long-Term Exposure: Repeated or prolonged skin contact may cause dermatitis. Carbon tetrachloride is a possible human carcinogen. Cancer site in animals: liver cancer.

Points of Attack: Central nervous system; eyes, lungs, liver, kidneys, skin.

Medical Surveillance: Preplacement and periodic examinations should include an evaluation of alcohol intake and appropriate tests for liver and kidney functions. Special attention should be given to the central and peripheral nervous system; the skin, and blood. Expired air and blood levels may be useful as indicators of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. **8 hours** (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves; Viton gloves, suits; 4H and Silver Shield gloves; Barricade-coated suits; Responder suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Teflon gloves, suits, boots. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 500) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbon tetrachloride all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Carbon tetrachloride must be stored to avoid contact with chemically active metals, such as sodium, potassium, and magnesium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1846 Carbon tetrachloride, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Use any extinguishing agent suitable for surrounding fire. Thermal decomposition products may include phosgene and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel; care must be exercised to assure complete combustion to prevent the formation of phosgene; an acid scrubber is necessary to remove the halo acids produced[22]. Recover and purify by distillation where possible.

Description: Carbonyl fluoride is colorless or light yellow, hygroscopic, compressed liquefied gas. Pungent, highly irritating and suffocating odor. Molecular weight = 66.01; specific gravity (H_2O:1) = 1.39 @ −114°C; boiling point = −83°C; freezing/melting point = −114°C; relative vapor density (air = 1) = 2.29; vapor pressure = 55.4 atm. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity ₩. Reacts with water.

Potential Exposure: Carbonyl fluoride is a carboxy halide. The major source of exposure to COF_2 results from the thermal decomposition of fluoro carbon plastics, such as PTFE in air. Carbonyl fluoride is used for synthesizing fluoroalkanes, difluoroisocyanates, and fluorinated alkyl isocyanates. It may have been used as a military poison gas.

Incompatibilities: Reacts with water to form toxic and corrosive HF gas. HF gas is highly reactive and forms explosive hydrogen gas on contact with metals. Do not use cast iron or malleable fittings with carbonyl fluoride. Carbonyl fluoride decomposes on heating above 450°C producing toxic gases, including HF. Not compatible with hexafluoroisopropylidene-amino lithium; reaction may be dangerous.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 2 ppm/5 milligram per cubic meter TWA; 5 ppm/15 milligram per cubic meter STEL

ACGIH TLV[1]: 2 ppm/5.4 milligram per cubic meter TWA; 5 ppm/13 milligram per cubic meter STEL

PAC-1: 0.025 ppm

PAC-2: $\mathbf{0.28_A}$ ppm

PAC-3: $\mathbf{0.83_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

Australia: TWA 2 ppm (5 milligram per cubic meter); STEL 5 ppm, 1993; Austria: MAK 2.5 mg[F]/m^3, 1999;

Denmark: TWA 2.99 m (6 milligram per cubic meter), 1999; Finland: STEL 2 ppm (5 milligram per cubic meter), 1999; France: VME 2 ppm (5 milligram per cubic meter), 1999; Norway: TWA 2 ppm (5 milligram per cubic meter), 1999; Poland: MAC (TWA) 1 mg(HF)/m^3, MAC (STEL) 3 mg(HF)/m^3, 1999; Switzerland: MAK-W 2 ppm (5 milligram per cubic meter), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 5 ppm. Several states have set guidelines or standards for COF_2 in ambient air[60] ranging from 50−150 μ/m^3 (North Dakota) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: None available.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, skin and/or eye contact. May be absorbed through the skin.

Harmful Effects and Symptoms

The compound decomposes in the body to HF[190].

Short-Term Exposure: The substance irritates the eyes, skin, and is corrosive to the respiratory tract. Exposure can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Rapid evaporation of the liquid may cause frostbite. On an acute basis, COF_2 is about as toxic as HF as a respiratory irritant gas. Carbonyl fluoride is rapidly hydrolyzed to hydro fluoric acid and carbon dioxide HF burns on skin or in eyes cause immediate redness, severe pain, possible swelling, and may lead to early necrosis. See entry for hydrogen fluoride: H:0450 Prompt medical attention is essential, if not mandatory.

Long-Term Exposure: The long-term effects are due to the fluoride ion generated by hydrolysis; this inhibits succinic dehydrogenase activity, since this is a fluoride-sensitive enzyme. May cause liver and kidney damage. Repeated exposure may cause bronchitis. Chronic exposure: gastrointestinal pain, muscle fibrosis, skeletal fluorosis (NIOSH).

Points of Attack: Eyes, skin, respiratory system; bone, liver, kidneys.

Medical Surveillance: Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact resistant goggles when working with gas. Wear indirect-vent and splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. NIOSH: *(fluorides) 12.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA (APF = 10)* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa: Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or*$^+$ *if not present as a fume* PaprHie (APF = 25) (any powered, APR with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp

(APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF^{+} (any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Corrosive. Color code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Storage area must be absolutely dry. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN2417 Carbonyl fluoride, Hazard class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone B. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Carbonyl fluoride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

carbonyl fluoride and carbonyl fluoride, compressed

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.4/2.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 2000/600
Then: Protect persons downwind (mi/km)
Day 2.3/3.7
Night 5.0/8.0

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Stop the flow of gas if it can be done safely. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. *Do not use water or wet method.* Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include HF. This chemical may burn but does not readily ignite. This gas is under pressure; containers may rupture and explode when heated. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Suspected reprotoxic hazard, Environmental hazard.

Banned or Severely Restricted (in agriculture) (India) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

United States DOT Regulated Marine Pollutant (49CFR 172.101, Appendix B), severe pollutant

United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R24/25; R33; R50/53; safety phrases: S1/2; S28; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Carbophenothion is a colorless to light amber liquid with a characteristic odor. Molecular weight = 342.87. Specific gravity (H_2O:1) = 1.3; boiling point = 82°C @ 0.01 mmHg; relative vapor density (air = 1) = 11.78. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0.

Potential Exposure: Those engaged in the manufacture or application of this material, which is an insecticide and acaricide; primarily for citrus crops and deciduous fruits and nuts.

Incompatibilities: The substance decomposes on heating or on burning, producing toxic fumes including phosphorus oxides, sulfur oxides, hydrogen chloride. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides; may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.62 milligram per cubic meter

PAC-2: 6.8 milligram per cubic meter

PAC-3: 24 milligram per cubic meter

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} (octanol/water partition coefficient) = 5.1

Routes of Entry: Inhalation, ingestion, and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: The substance may affect the nervous system; resulting in convulsions and respiratory failure. Cholinesterase inhibitor. Exposure may result in death. Produces headaches, nausea, weakness, and dizziness. Symptoms may include nausea, vomiting; abdominal cramps; diarrhea; excessive salivation; headache, giddiness, weakness; muscle twitching; difficult breathing; blurring or dimness of vision; and loss of muscle coordination. Death may occur from failure of the respiratory center; paralysis of the respiratory muscles; intense broncho constriction, or all three. This material is highly toxic; the estimated fatal oral dose is 0.6 g for a 150-lb (70 kg) person. Oral LD_{50} for rats is 6.8 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible: see acute hazards/symptoms. The state of Massachusetts lists this chemical as a neurotoxin.

Points of Attack: Respiratory system, lungs; central nervous system; cardiovascular system; skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN 2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of phosphorus, sulfur, nitrogen, and carbon. This material may burn, but does not ignite readily. *For small fires*: use dry chemicals, carbon dioxide; water spray; or foam. *For large fires*: use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Container may explode in heat of fire. Fire and runoff from fire control water may produce irritating or poisonous gases. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis by hypochlorites may be used, as may incineration, In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

RTECS Number: EZ3815000

UN/NA & ERG Number: UN2992 (carbamate pesticides, liquid, toxic)/151*;* UN2810 (toxic liquid, organic, n.o.s.)/153

EC Number: 259-565-9

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Possible neurotoxic effects (methyl carbamate), Suspected of causing genetic defects, Sensitization hazard, Primary irritant (w/o allergic reaction), Environmental hazard, Agricultural chemical.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xi, N; risk phrases: R23/25; R26; R33; R36/37/38; R43; R50/53; R62; safety phrases: S1/2; S28, S29/35; S36/37, S38, S45, S60; S61, S63 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Orange-yellow thick liquid. Molecular weight = 380.59; boiling point = 219°C; flash point = 137°C. vapor pressure = low or no volatility. Low solubility in water.

Incompatibilities: Carbamates are incompatible with strong oxidizing acids, peroxides, and hydro-peroxides; strong reducing agents such as hydrides; strong acids and bases. Contact with nitrides or chemically active metals (aluminum, copper, magnesium, neptunium, sodium, tin, titanium, zinc, etc.) causes the release of potentially explosive hydrogen gas and a metal salt.

Potential Exposure: Carbosulfan is a carbamate insecticide and a low toxic derivative from cabofuran. It is a broad spectrum insecticide, nematicide, miticide, effective against pests and mites. It is used to protect alfalfa, apple, citrus, corn, deciduous fruit, potato, rice, sorghum, soybean, sugar beets, sugarcane, and other vegetable, field, tree and orchard crops. It is used for seed treatments

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = > 7$. Values at or above 3.0 are likely to bioaccumulate in marine organisms.

Routes of Entry: Skin absorption, ingestion, inhalation

Harmful Effects and Symptoms

Short-Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes. LD_{50} (oral, rat) = 51 mg/kg.

Long-Term Exposure: A potent acetylcholinesterase (AChE) inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 oz of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIO United States OR HAVING CONVULSIONS*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 g) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10-minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. DuPont Tychem suit fabrics[101]. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as Sodium Hydroxide, Sodium Bicarbonate, etc.).

Shipping: UN2992 Carbamate pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials; UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2810: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. For solids, isolate spill or leak area in all directions for at least 25 m/75 ft. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand, or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. *On small fire*, use dry chemical powder, carbon dioxide, water spray, or foam. *On large fire*, use water spray, fog or regular alcohol-resistant foam. Do not scatter material using straight water jet streams. Dike fire control water for later disposal; do not scatter the material. Move containers from fire area if you can do it without risk. *If tank, rail car, or tank truck is involved in a fire*, isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Noncombustible containers should be crushed and buried under more than 40 cm of soil[30]. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

UN/NA & ERG Number: UN2588 (pesticides, solid, toxic, n.o.s.)/155

EC Number: 226-031-1

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Agricultural chemical.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn; risk phrases: R20/21/22; R36/37/38; safety phrases: S26; S36; S41 (see Appendix 4).

Description: Carboxin is a white crystalline solid. Molecular weight = 235.32; freezing/melting point = 91.5−95°C (depending on crystal structure); vapor pressure = 1.78×10^{-7} mmHg. Practically insoluble in water; solubility = 25 mg/L; 0.15 g/L @20°C.

Potential Exposure: A potential danger to those involved in the production, Formulation and application of this systemic fungicide, seed protectant and wood preservative.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Avoid heat and humidity. Thermal decomposition products may include cyanide gas and cyanide salts.

Permissible Exposure Limits in Air

No standards or PAC available.

Permissible Concentration in Water: The no-observed-adverse-effect level has been determined by EPA to be 10 mg/kg body weight/day. This results in a long-term Health advisory: of 3.5 mg/L and a lifetime Health advisory: of 0.7 mg/L.

Determination in Water: Analysis of carboxin is by a GC method applicable to the determination of certain nitrogen-phosphorus containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen phosphorus detector. The method detection limit has not been determined for carboxin, but it is estimated that detection limits for analyses included in this method are in the range of 0.1−2 μg/L. Fish toxicity (threshold)[77]: High—1.06008 ppb, MATC.

Harmful Effects and Symptoms

LD_{50} (oral-mouse) = 3550 mg/kg (slightly toxic). A value for LD_{50} rat of 430 mg/kg puts carboxin in the moderately toxic category.

Short-Term Exposure: Harmful if swallowed, inhaled, or absorbed by the skin or eyes.

Long-Term Exposure: Based on animal studies, carboxin may cause kidney damage. Human toxicity (long term)[77]: Extra high—0.91 ppb, Health advisory.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carboxin all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include cyanide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

Carmustine C:0550

Formula: $C_5H_9Cl_2N_3O_2$

Synonyms: BCNU; BiCNU; Bis(chloroethyl) nitrosourea; 1,3-Bis(2-chloroethyl)-nitrosourea; Bischloroethyl nitrosourea; *N,N′*-Bis(2-chloroethyl)-*N*-nitrosourea; Carmubris; Carmustin; FDA 0345

CAS Registry Number: 154-93-8

HSDB Number: 7761 as 1,3-bis(2-chloroethyl)-nitrosourea

RTECS Number: YS2625000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3249 (medicine, solid, toxic, n.o.s.)/151

EC Number: 205-838-2

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen: Nitrosourea Chemotherapeutic Agents, bis(chloroethyl) nitrosourea; IARC: (BCNU) Animal Sufficient Evidence; Human, Limited Evidence, *probably carcinogenic to humans*, *probably carcinogenic to humans*, Group 2A, 1998

California Proposition 65 Chemical[102]: Cancer 7/1/1987; Developmental/Reproductive toxin 7/1/1990.

Hazard Alert: Poison, Possible risk of forming tumors, Reproductive toxin: Suspected of causing genetic defects, Drug, Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R45; R28; R60; R61; R62; safety phrases: S22; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Carmustine is an orange-yellow crystalline solid or powder. Molecular weight = 114.1; freezing/melting point = 30−32°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0.

Potential Exposure: BCNU has been used since 1971 as an antineoplastic agent in the treatment of Hodgkin’s lymphoma; multiple meyloma; and primary or metastatic brain tumors. It also has been reported to have antiviral, antibacterial, and antifungal activity, but no evidence was found that it is used in these ways. BCNU is not known to be naturally occurring. Health professionals who handle this drug (for example, pharmacists, nurses, and physicians) may possibly be exposed to BCNU during drug preparation, administration, or cleanup; however, the risks can be avoided through use of containment equipment and proper work practices.

Incompatibilities: Acids and acid solutions above pH 7 cause rapid decomposition. Most stable at pH 4 in aqueous solution or petroleum ether[101].

Permissible Exposure Limits in Air

No standards or PAC available.

As a confirmed carcinogen, exposure must be kept to the lowest feasible level.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms include nausea, vomiting, diarrhea, dyspnea; flushing of the skin; esophagitis; cytotoxic effects on the liver, kidneys and central nervous system; delayed bone-marrow suppression (e.g., leukopenia and thrombocytopenia). LD_{50} (oral-rat) = 120 mg/kg (highly toxic).

Long-Term Exposure: Potential human carcinogen. May cause liver, kidney and nervous system damage.

Points of Attack: Liver, kidney, central nervous system; bone marrow.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver and kidney function tests. Examination of the nervous system.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: When thresholds for carcinogens that would protect 100% of the population had not been identified, NIOSH usually recommended that occupational exposures to carcinogens be limited to the lowest feasible concentration. To ensure maximum protection from carcinogens through the use of respiratory protection, NIOSH also recommended that only the most reliable and protective respirators be used. *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter ck-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids[52]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with 60%−70% ethanol to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is

complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Carvone C:0560

Formula: $C_{10}H_{14}O$

Synonyms: D-Carvone; δ-Carvone; dextro-Carvone; 1-6, 8(9)-*p*-Menthadien-2-one; δ-1-Methyl-4-isopropenyl-6-cyclohexen-2-one

CAS Registry Number: 2244-16-8

HSDB Number: 707

RTECS Number: OS8670000

UN/NA & ERG Number: UN2810 (toxic liquid, organic, n.o.s.)/153

EC Number: 218-827-2

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R23/24/25; R61; R62; safety phrases: S24/25; S45.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Carvone is a pale yellow to white clear liquid. Molecular weight = 150.22; boiling point = 230°C; flash point = 93°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0.

Potential Exposure: Carvone is found in various natural oils, including caraway and dillseed; mandarin peel and spearmint oils. A food additive, it is used in flavoring liqueurs; in perfumes and soaps.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available.

Routes of Entry: Ingestion and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. This material is highly toxic by ingestion skin absorption. LD_{50} (oral-rat) = 3.71 mg/kg.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to nay rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Storage: (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store in a cool, dry place, or in a refrigerator.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak

until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well first with alcohol, then with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Catechol is a white crystalline solid. Turns brown on contact with light and air. Molecular weight = 110.11; specific gravity (H_2O:1) = 1.344 @ 20°C; boiling point = 245.5°C; freezing/melting point = 104.6°C. It sublimes readily; vapor pressure = 10 mmHg@ 117°C; flash point = 127°C; autoignition temperature = 512°C. Explosive Limits in air: LEL: 1.4%; UEL-Unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 2. Solubility in water = 44%.

Potential Exposure: Used as a chemical intermediate; pharmaceutical and veterinary drug; as an antiseptic; in photography; in dyestuff manufacture and application. It is also used in electroplating, in the formulation of specialty inks; in antioxidants; and light stabilizers.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 ppm/20 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 5 ppm/23 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 15 ppm
PAC-2: 96 ppm
PAC-3: 570 ppm
Australia: TWA 5 ppm (20 milligram per cubic meter), 1993; Austria: MAK 5 ppm (20 milligram per cubic meter), 1999; Belgium: TWA 5 ppm (23 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (20 milligram per cubic meter), 1999; Finland: TWA 5 ppm (22 milligram per cubic meter); STEL 10 ppm (45 milligram per cubic meter), 1999; France: VME 5 ppm (20 milligram per cubic meter), 1999; Norway: TWA 5 ppm (20 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 20 milligram per cubic meter, 2003; Switzerland: MAK-W 5 ppm (23 milligram per cubic meter), 1999; United Kingdom: TWA 5 ppm (23 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for catechol in ambient air[60] ranging from 200 μ/m^3 (North Dakota) to 350 μ/m^3 (Virginia) to 400 μ/m^3 (Connecticut) to 476 μ/m^3 (Nevada).

Determination in Air: None available.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 280 μg/L on a health basis. Russia set a MAC in surface water of 0.1 mg/L.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = < 1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Skin absorption, skin and eye contact, inhalation of vapors, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Catechol can affect you when breathed in. It can also rapidly enter the body through the skin. Death can occur from extensive skin contact. Lower exposures can cause skin burns, headaches, nausea, muscle twitching and convulsions. Skin allergy with rash can also occur. Catechol is a lacrimator. It irritates the respiratory and digestive tracts. It is corrosive to the eyes and can cause severe burns. The substance may affect the central nervous system; causing depression, convulsions, and respiratory failure. Because this is a potential mutagen, handle it as a possible cancer-causing substance, with extreme caution. Exposure lowers the ability of the blood to carry oxygen, causing a bluish color of the skin. Absorption through the skin results in illness akin to that which phenol produces except convulsions are more pronounced. Catechol increases blood pressure, apparently from peripheral vasoconstriction. Catechol can cause death, apparently initiated by respiratory failure. LD_{50}(rat-oral) = 260 mg/kg (moderately toxic).

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. A mutagen that may have a cancer or reproductive risk. High or repeated damage may cause kidney and liver damage. Repeated lower exposures can cause methemoglobinemia, with blue color to the skin, rapid breathing, and dizziness.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: tests for liver and kidney function. Blood methemoglobin level. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high-efficiency particulate filter. Greater protection is provided by a PAPR. If while wearing a filter, cartridge or canister respirator, you can smell, taste, or otherwise detect 1,2-Dihydroxybenznene, or in the case of a full facepiece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator.

Where there is potential for high exposures exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with catechol all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and acids. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN 2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with water to avoid dust or use a vacuum. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, alcohol foam, or carbon dioxide. Water and conventional foam may be ineffective[41]. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Cesium Hydroxide C:0580

Formula: CsHO; CsOH

Synonyms: Cesium hydroxide; Cesium hydrate; Cesium hydroxide dimer

CAS Registry Number: 21351-79-1

HSDB Number: 7906

RTECS Number: FK9800000

UN/NA & ERG Number: UN2682 (solid)/157; UN2681 (solution)/154

EC Number: 244-344-1

Regulatory Authority and Advisory Information

Hazard Alert: Primary irritant (w/o allergic reaction).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Cesium hydroxide is a colorless-to-yellow crystalline compound. It is often used in a water solution. Molecular weight = 142.91; specific gravity (H_2O:1) = 3.68; freezing/melting point = 315°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Highly soluble in water; solubility 395% @ 15°C.

Potential Exposure: Cesium hydroxide may be used as a raw material for other cesium salts; such as the chloride which in turn may be used to produce cesium metal. Cesium metal is used in electronic devices.

Incompatibilities: Cesium hydroxide is the strongest base known. Keep away from all acids. It must be stored in silver or platinum and out of contact with air because of its reactivity with glass. CsOH causes the generation of considerable heat in contact with water or moisture. Contact with many organic compounds, many metals (i.e., aluminum, lead, tin, zinc), glass, oxygen, or carbon dioxide causes a violent reaction.

PAC-3: 110 milligram per cubic meter

Australia: TWA 2 milligram per cubic meter, 1993; Belgium: TWA 2 milligram per cubic meter, 1993;

Denmark: TWA 2 milligram per cubic meter, 1999; Finland: TWA 2 milligram per cubic meter, 1999; France: VME 2 milligram per cubic meter, 1999; Russia: STEL 0.3 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 2 milligram per cubic meter, 2003; United Kingdom: TWA 2 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 milligram per cubic meter. Several states have set guidelines or standards for CsOH in ambient air[60] ranging from 20 μ/m^3 (North Dakota) to 35 μ/m^3 (Virginia) to 40 μ/m^3 (Connecticut) to 48 μ/m^3 (Nevada).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to eyes, skin, and respiratory tract. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. This chemical can cause permanent damage. LD_{50} (oral-rat) = 570 mg/kg (slightly toxic).

Long-Term Exposure: May cause lung irritation with the development of bronchitis, shortness of breath; coughing, phlegm.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: *Clothing:* Avoid skin contact with cesium hydroxide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. ACGIH recommended protective gloves be made of butyl rubber; natural rubber, nitrile rubber, Neoprene or polyvinyl chloride. *Eye Protection:* Wear dust-proof goggles and face shield when working with powders or dusts unless full facepiece respiratory protection is worn. Wear gas-proof goggles and face shield where cesium hydroxide is in solution, unless full facepiece respiratory protection is worn.

Respirator Selection: Where there is potential exists for exposures over 2 milligram per cubic meter, use a MSHA/NKIOSH approved full facepiece respirator equipped with a particulate (dust/fume/mist) filter. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH website.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with cesium hydroxide all handlers should be trained on its proper handling and storage. Cesium hydroxide should be stored in silver or platinum away from air because it reacts violently with oxygen. Store in tightly closed containers in a cool, well-ventilated area away from moisture and incompatible materials listed above.

Shipping: UN2682 Cesium hydroxide, Hazard class: 8; Labels: 8-Corrosive material. UN2681 Cesium hydroxide, solution, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. *Do not use water* in clean-up. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. *Do not use water*. Use dry chemical appropriate for extinguishing metal fires. Thermal decomposition products may include oxides metal of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSH 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Chloral C:0590

Formula: C_2HCl_3O; CCl_3CHO

Synonyms: Acetaldehyde, trichloro-; Anhydrous chloral; Chloral, anhydrous, inhibited; Cloralio; Ethanal, trichloro-; Grasex; 2,2,2-Trichloroacetaldehyde; Trichloroacetaldehyde; Trichloroethanal; Tricloroacetaldehido (Spanish)

CAS Registry Number: 75-87-6 (chloral); 302-17-0 (chloral hydrate)

HSDB Number: 2557

RTECS Number: FM7870000 (chloral); FM8750000 (chloral hydrate)

UN/NA & ERG Number: UN2075 (chloral, anhydrous, inhibited); UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 200-911-5; 206-117-5 [*Annex I Index No.:* 605-014-00-6 (chloral hydrate)]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC (*chloral and chloral hydrate*): Animal, limited evidence; Human, inadequate evidence, *not classifiable as carcinogenic to humans*, Group 3, 1995; NCI: Carcinogenesis Studies (gavage); equivocal evidence: mouse, rat; EPA (*chloral hydrate*): Possible Human Carcinogen; (*oral*): Cannot be Determined.

Hazard Alert: Poison (chloral hydrate): Flammable, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U034, as chloral.

RCRA, 40CFR 261, Appendix 8 Hazardous Constituents, as chloral

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg), as chloral.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As chloral.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; (*chloral hydrate*) risk phrases: R10; R25; R36/38; R51; R61; R62; R63; safety phrases: S1/2; S25; S41; S45 (see Appendix 4).

WGK[100] (Germ an Aquatic Hazard Class): 2-Hazard to waters (*chloral hydrate*)

Description: Chloral is a combustible, oily liquid with a pungent irritating odor. Molecular weight = 147.39; specific gravity (H_2O:1) = 1.51 @ °20 C; boiling point = 97.8°C; freezing/melting point = −57.5°C; vapor pressure = 75 mmHg @ 33.8°C; flash point = 75°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 1. Soluble in water. Chloral hydrate is colorless crystals, with characteristic odor. Molecular weight = 165.40; boiling point = 97°C (decomposes); freezing/melting point = 57−60°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 1. Very soluble in water.

Potential Exposure: Chloral is used as an intermediate in the manufacture of such pesticides as DDT, methoxychlor, DDVP, naled, trichlorfon, and TCA. Chloral is also used in the production of chloral hydrate; used as a therapeutic agent with hypnotic, sedative, and narcotic effects; used in a time prior to the introduction of barbiturates.

Incompatibilities: Chloral hydrate reacts with strong bases forming chloroform. Contact with acids, or exposure to light may cause polymerization. Reacts with water, forming chloral hydrate. Reacts with oxidizers, with a risk of fire or explosions.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

75-87-6, chloral

PAC-1: 3.9 milligram per cubic meter

PAC-2: 43 milligram per cubic meter

PAC-3: 260 milligram per cubic meter

302-17-0, chloral hydrate

PAC-1: 2.5 milligram per cubic meter

PAC-2: 27 milligram per cubic meter

PAC-3: 95 milligram per cubic meter

Russia has recommended a maximum concentration in work-room air of 220 milligram per cubic meter.

Permissible Concentration in Water: There are no United States criteria but Russia has set 0.2 mg/L as the MAC for water bodies used for domestic purposes[43].

Determination in Water: Octanol−water coefficient: Log K_{ow} = < 1. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, respiratory tract. Skin and eye contact may cause burns. Chloral may affect the central nervous system; kidneys, liver, and the cardiovascular system, causing impaired functions or damage. Exposure to high levels may cause tiredness, dizziness, lightheadedness, and loss of consciousness. Specific information on the pharmacokinetic behavior, carcinogenicity, mutagenitcity, teratogenicity, and other reproductive effects of chloral was not found in the available literature. However, the pharmacokinetic behavior of chloral may be similar to chloral hydrate, where metabolism to ritchloroethanol and trichloroacetic acid and excretion via the urine (and possibly bile) have been observed. Chloral hydrate produced skin tumors in 4 of 20 mice dermally exposed. Alcohol synergistically increases the depressant effect of the compound, creating a potent depressant commonly referred to as "Mickey Finn" or "knock-out drops." Addiction to chloral hydrate through intentional abuse of the compound has been reported.

Long-Term Exposure: Repeated skin contact may cause acne-like rash. Repeated contact may cause sedation. Chronic effects from respiratory exposure to chloral as indicated in laboratory animals include reduction of kidney function and serum transaminase activity; change in central nervous system function (unspecified); decrease in ant(toxic and enzyme-synthesizing function of the liver); and alteration of morphological characteristics of peripheral blood. Slowed growth rate, leukocytosis and changes in the arterial blood pressure were also observed.

Points of Attack: Inhalation, ingestion.

Medical Surveillance. Lung function tests. Serum trichloroethanol level.
