Fire Extinguishing: This chemical reacts violently with moisture producing hydrochloric and phosphoric acids. Thermal decomposition products may include hydrogen chlorides and oxides of phosphorus and carbon. *Do not use water* unless used in flooding quantities to control a large fire by wetting down combustibles burning in vicinity of this material. Use dry chemical, carbon dioxide; or dry sand; *Do not use water* on material itself. Use water spray to absorb vapors and cool all affected containers with flooding quantities of water. Apply water from as far a distance as possible. Avoid breathing vapors; keep upwind. Wear SCBA. Avoid bodily contact with the material. Wear boots, protective gloves; and goggles. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. If contact with the material is anticipated, wear full protective clothing. Keep unnecessary people away; isolate hazard area and deny entry. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pour onto sodium bicarbonate. Spray with aqueous ammonia and add crushed ice. Neutralize and pour into drain with running water. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Poison inhalation hazard, Powerful oxidizer, Corrosive, Violent reaction with water (releasing toxic gas); Air reactive.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 500 lb (227 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

United States National Primary Drinking Water Regulations: SMCL = 250 mg$[Cl^-]$/L as Chloride

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C; Risk phrases: R14; R22; R26; R28; R34; R37; R48/20; Safety phrases: S1/2; S7/8; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Phosphorus pentachloride is a pale yellow, fuming solid with an odor like hydrochloric acid. Molecular weight = 208.22; Specific gravity (H_2O:1) = 3.60 @ 25°C; Boiling point = (sublimes) 160°C; Freezing/Melting point = (sublimes) 162°C; Vapor pressure = 1 mmHg @ 55.6°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩. Reacts violently with water.

Potential Exposure: Phosphorus pentachloride is used as a as a chlorinating and dehydrating agent and as a catalyst. It is used in the manufacture of agricultural chemicals;

chlorinated compounds; gasoline additives, plasticizers and surfactants; and in pharmaceutical manufacture.

Incompatibilities: Phosphorus pentachloride is a powerful oxidizer. Reacts with water (violent), magnesium oxide, chemically active metals, such as sodium and potassium, alkalis, amines, carbamates, aluminum powder, combustibles, fluorine, phosphorus pentoxide, phosphorus trioxide, and many other substances. Hydrolyzes in water (even in humid air) to form hydrochloric acid and phosphoric acid. Corrosive to many metals, forming flammable and explosive hydrogen gas. Attacks plastic and rubber.

Permissible Exposure Limits in Air:

NIOSH IDLH = 70 milligram per cubic meter

OSHA PEL: 1 milligram per cubic meter TWA

NIOSH REL: 1 milligram per cubic meter TWA

ACGIH TLV[1]: 0.1 ppm/1 milligram per cubic meter TWA

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 2.6 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

DFG MAK: 1 milligram per cubic meter, measured as the, inhalable fraction TWA; Peak Limitation Category I(1); Pregnancy Risk Group C

Australia: TWA 0.1 ppm (1 milligram per cubic meter), 1993; Austria: MAK 1 milligram per cubic meter, 1999; Belgium: TWA 0.1 ppm (0.85 milligram per cubic meter), 1993; Denmark: TWA 1 milligram per cubic meter, 1999; Finland: STEL 1 milligram per cubic meter, [skin], 1999; France: VME 0.1 ppm (1 milligram per cubic meter), 1999; Japan 0.1 ppm (0.85 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Norway: TWA 0.1 milligram per cubic meter, 1999; the Phillipines: TWA 1 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.3 milligram per cubic meter; MAC (STEL) 0.9 milligram per cubic meter, 1999; Russia: TWA 0.1 ppm; STEL 0.2 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 1 milligram per cubic meter, KZG-W 2 milligram per cubic meter, 1999; Thailand: TWA 1 milligram per cubic meter, 1993; Turkey: TWA 1 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 ppm (0.87 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 ppm Several states have set guidelines or standards for PCl5 in ambient air[60] ranging from 10.0 μ/m^3 (North Dakota) to 16.0 μ/m^3 (Virginia) to 20.0 μ/m^3 (Connecticut) to 24.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH II(5), Method #S-257.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The substance is corrosive to the eyes, skin, the respiratory tract. Corrosive if swallowed. Exposure may cause pulmonary edema, a medical emergency that can be delayed for several hours; this can cause death by pulmonary edema or circulation shock. Fumes cause irritation of eyes and respiratory passages. Upon ingestion, immediate pain in the mouth and throat, abdominal pain; nausea, vomiting of mucoid and "coffee-ground" material, intense thirst; clammy skin, weak and rapid pulse; shallow respiration, and circulatory shock occur.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May cause lung irritation; bronchitis may develop. Repeated or prolonged contact may cause liver and kidney damage.

Points of Attack: Respiratory system, lungs, eyes, skin, liver, kidneys.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec). Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator).* *Up to 25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 50 milligram per cubic meter:* SCBAF (APF = 50) any SCBA with a full facepiece; or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 70 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Yellow Stripe (strong oxidizer): Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. yellow stripe. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from all other combustible and oxidizable materials, and moisture. Where possible, automatically transfer material storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1806 Phosphorus pentachloride, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: when spilled in water

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.0/1.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Keep material out of water sources and sewers. Use water spray to knock down vapors. *Do not use water* on material itself; neutralize spilled material with crushed limestone, soda ash; or lime. Avoid breathing vapors; keep upwind. Avoid bodily contact with the materials. Do not handle broken packages without protective equipment. Wash away any materials which may have contacted the body with copious amounts of water or soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: A noncombustible solid. Thermal decomposition products may include hydrogen chloride, phosphorus trichloride, chlorine and oxides of phosphorus. If material is involved in fire then use dry chemical, carbon dioxide; or dry sand. *Do not use water* on material itself. If large quantities of combustibles are involved, use water in flooding quantities (i.e., spray or fog), and use water spray to absorb vapors. Avoid breathing vapors; keep upwind. Wear SCBA. Avoid bodily contact with the material; wear boots, protective gloves; and goggles. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Decompose with water, forming phosphoric and hydrochloric acids. Neutralize acids and dilute if necessary for discharge into the sewer system.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Flammable solid, Strong reducing agent, Pyrophoric hazard, Violently water reactive, Environmental hazard. Primary irritant (w/o allergic reaction).

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U189

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, Xn, N; Risk phrases: R2; R10; R14/15; R15/29; R17; R20/22; R29; Safety phrases: S1; S2; S29, S30; S35; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Phosphorus pentasulfide is a greenish-gray to yellow, crystalline solid with an odor of rotten eggs. The Odor Threshold is 0.005 ppm. Molecular weight = 222.24 (P2S5); 444.6 (P4S10); Specific gravity (H_2O:1) = 2.1; Boiling point = 514°C @ 760 mmHg[136]; Freezing/Melting point = 275°C; Vapor pressure = 1 mmHg @ 300°C; Autoignition temperature (dry air) = 142°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 2 ₩. Reacts violently with water releasing phosphorus pentaoxide and highly toxic and flammable gases of hydrogen sulfide (may form explosive mixture with air) and sulfur dioxide.

Potential Exposure: Phosphorus pentasulfide is used as an intermediate in the manufacture of lubricant additives; insecticides, flotation agents; lubricating oil; ignition compounds; and matches. It is also used to introduce sulfur into rubber, and organic chemicals, such as pharmaceuticals.

Incompatibilities: Flammable solid; dust may form explosive mixture with air. Contact with water forms phosphorus pentoxide and an explosive mixture of hydrogen sulfide with air. Phosphorus pentasulfide is incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, ammonia, strong acids, strong bases, alcohols. Reaction with water or moisture in the air releases heat, hydrogen sulfide (H_2S), sulfur dioxide, and phosphoric acid. Pyrophoric hazard, may self-ignite in moist air.

Permissible Exposure Limits in Air:

NIOSH IDLH = 250 milligram per cubic meter

OSHA PEL: 1 milligram per cubic meter TWA

NIOSH REL: 1 milligram per cubic meter TWA; 3 milligram per cubic meter STEL

ACGIH TLV[1]: 1 milligram per cubic meter TWA; 3 milligram per cubic meter STEL

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 3 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 750 milligram per cubic meter

Australia: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1993; Austria: MAK 1 milligram per cubic meter, 1999; Belgium: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1993; Denmark: TWA 1 milligram per cubic meter, 1999; Finland: STEL 1 milligram per cubic meter, 1999; France: VME 1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; the Phillipines: TWA 1 milligram per cubic meter, 1993; Poland: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1999; Switzerland: MAK-W 1 milligram per cubic meter, KZG-W 2 milligram per cubic meter, 1999; Thailand: TWA 1 milligram per cubic meter, 1993; Turkey: TWA 1 milligram per cubic meter, 1993; United Kingdom: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South

Korea, New Zealand, Singapore, Vietman: ACGIH TLV: STEL 3 milligram per cubic meter. Several states have set guidelines or standards for P_2S_5 in ambient air[60] ranging from 10 μ/m^3 (North Dakota) to 16 μ/m^3 (Virginia) to 20 μ/m^3 (Connecticut)to 24 μ/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Severely irritates the eyes, skin, and respiratory tract. Inhalation of fumes produced by phosphorus compounds may cause irritation of pulmonary tissues with resultant acute pulmonary edema. The hazards of phosphorus pentasulfide are the same as for hydrogen sulfide to which it rapidly hydrolyzes in the presence of moisture. Symptoms include apnea, coma, convulsions, lacrimation (discharge of tears), photophobia (abnormal visual intolerance to light), kerato-conjunctivitis, corneal vesiculation; respiratory system irritation; dizziness, headaches, fatigue, irritability, insomnia, gastrointestinal disturbances.

Long-Term Exposure: Chronic exposure may lead to lung irritation, cough, bronchitis, and pneumonia.

Points of Attack: Respiratory system, lungs, CNS; eyes, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec). Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-facepiece scba operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a non-encapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical -resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 milligram per cubic meter* Sa (APF = 10) (any supplied-air respirator).* *Up to 25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 50 milligram per cubic meter:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 250 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* GmFS100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from moisture, water, alcohols, strong oxidizers; acids alkalies. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1340 Phosphorus pentasulfate, free from yellow or white phosphorus, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 4.1-flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of phosphorus, sulfur and carbon. This chemical is a flammable solid. Use dry chemical, carbon dioxide; sand. Consider the use of sodium chloride-base extinguisher suitable for metal fires. *Do not use water.* If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Decompose with water, forming phosphoric acid, sulfuric acid and hydrogen sulfide. Provisions must be made for scrubbing hydrogen sulfide emissions. The acids may then be neutralized and diluted slowly to solution of soda ash and slaked lime with stirring, then flush to sewer with large volumes of water.

Phosphorus Pentoxide P:0650

Formula: O_5P2; P_2O_5

Synonyms: Diphosphorus pentoxide; Pentoxido de fosforo (Spanish); Phosphoric anhydride; Phosphorus(V) oxide; Phosphorus(5+) oxide; Phosphorus pentaoxide; Phosphorus oxide; POX

CAS Registry Number: 1314-56-3

HSDB Number: 847

RTECS Number: TH3945000

UN/NA & ERG Number: UN1807/137

EC Number: 215-236-1 [*Annex I Index No.:* 015-010-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Violent exothermic reaction with water, Corrosive.

United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Active registration

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C; Risk phrases: R35; Safety phrases: S1/2; S22; S26; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Phosphorus pentoxide is a white crystalline solid. Molecular weight = 141.94; Freezing/Melting point = 340°C; it begins to sublime @ 360°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩ (Corrosive). Reacts with water; violent reaction releasing heat and corrosive phosphoric acid.

Potential Exposure: This material is used as an intermediate in organic synthesis, catalyst, condensing agent; dehydrating agent; in the preparation of acrylate esters, surfactants, sugar refining; medicine, fire extinguishing; and special glasses.

Incompatibilities: Reacts violently and exothermically with water, forming ignition level heat and highly corrosive phosphoric acid. Keep away from the combination of moisture and combustible materials. Phosphorus pentoxide reacts violently with the following: perchloric acid; ammonia, hydrofluoric acid; oxidizers, hydrogen fluoride; formic acid, oxygen difluoride, potassium, sodium, propargyl alcohol; calcium oxide; inorganic bases; sodium hydroxide and chlorine trifluoride. Attacks many metals in presence of water. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alcohols, ammonia. Undergoes hazardous or violent reactions with metal hydroxides and oxides, formic acid, hydrogen fluoride and hydrofluoric acid, iodides, metals (in particular potassium and sodium), ammonia, and proparygl alcohol[88,136].

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{1_E}$ milligram per cubic meter

PAC-2: $\mathbf{10_E}$ milligram per cubic meter

PAC-3: $\mathbf{50_E}$ milligram per cubic meter

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

DFG MAK: 2 milligram per cubic meter, measured as inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group C

Austria: MAK 1 milligram per cubic meter, 1999; Denmark: ceiling 1 milligram per cubic meter, 1999; France: VME 1 milligram per cubic meter, 1999; Hungary: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter, 1993; Norway: TWA 1 milligram per cubic meter, 1999; Poland: MAC (TWA) 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Turkey: TWA 1 milligram per cubic meter, 1993; United Kingdom: STEL 2 milligram per cubic meter, 2000

Permissible Concentration in Water: No criteria set (reacts with water).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly corrosive to the eyes, skin, and respiratory tract. Eye contact may lead to a total destruction of the eyes. Particles in contact with eyes react vigorously and even a small amount may cause permanent burns. Contact with the skin will cause severe burns. Corrosive if ingested; will damage the gastrointestinal tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Signs and symptoms of acute exposure to phosphorus pentoxide may include severe burns, pain, shock, intense thirst; nausea, vomiting, diarrhea, severe abdominal pain; and "smoking stools." The breath and feces may have a garlicky odor. A symptom-free period of several days may follow. Exposure to phosphorus pentoxide may also result in bloody vomitus and diarrhea, jaundice, liver enlargement with tenderness; renal damage; hematuria (bloody urine), and either oliguria (scanty urination) or anuria (suppression of urine formation). Headache, convulsions, delirium, coma, cardiac arrhythmias; and cardiovascular collapse may occur. If phosphorus pentoxide contacts the eyes, severe irritation and burns, blepharospasm (spasmodic winking), lacrimation (tearing), and photophobia (heightened sensitivity to light) may occur. Victims may experience spontaneous hemorrhaging of phosphorus pentoxide-contaminated skin and mucous membranes.

Long-Term Exposure: Highly corrosive materials can cause lung damage; bronchitis may develop.

Points of Attack: Lungs, skin, eyes

Medical Surveillance. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Rush to a health care facility.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. *Never pour water into this substance*; always add POX slowly to water when diluting or dissolving.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from incompatible materials listed above.

Shipping: UN1807 Phosphorus pentoxide, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Keep unnecessary people away. Stay upwind. Keep out of low areas. Ventilate closed spaces before entering them. Stop leak if possible without risk. Do not touch spilled material. Use water spray to reduce vapors, but do not put water on leak or spill. Keep combustibles away from spilled material. Dike spilled area and keep water away from spill. Clean up requires supervision by an expert. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Does not support combustion. Dangerously reactive with water. Thermal decomposition products may include phosphorus oxides. For small fires, use dry chemical, carbon dioxide; or sand. *Do not use water* or hydrous extinguishers. Wear positive pressure breathing apparatus and special protective clothing. Keep combustibles away from spilled material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. *For large fires*, flood fire area with water from a distance. Do not get solid stream of water on spilled material or in open containers. From a secure, explosion-proof location, use water spray to cool exposed containers long after flames have been extinguished. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Decompose with water, forming phosphoric and hydrochloric acids. The acids may then be neutralized and diluted slowly to solution of soda ash and slaked lime with stirring then flush to sewer with large volumes of water.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Phosphorus trichloride is a colorless to yellow, fuming liquid. Odor like hydrochloric acid. Molecular weight = 137.32; Specific gravity (H_2O:1) = 1.58; Boiling point = 76°C; Freezing/Melting point = −112°C; Vapor pressure = 100 mmHg @ 21°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2₩. Reacts with water, releasing white fumes and forming hydrochloric acid.

Potential Exposure: Phosphorus trichloride is used as an intermediate and as a chlorinating agent and catalyst; in the manufacture of agricultural chemicals; pharmaceuticals, chlorinated compounds; dyes, gasoline additives; acetyl cellulose; phosphorus oxychloride; plasticizers, saccharin, and surfactants.

Incompatibilities: Phosphorus trichloride is a strong reducing Violent reaction with water, producing heat and hydrochloric and phosphorous acids. Violent reaction with hydrides, alcohols, phenols and bases; water, when in contact with combustible organics; chemically active metals: sodium, potassium, aluminum; strong sulfuric or nitric acid. Attacks most metals except nickel and lead; may generate flammable hydrogen gas on contact with metals. Attacks plastics, rubber, and coatings.

Permissible Exposure Limits in Air:

NIOSH IDLH = 25 ppm

Conversion factor: 1 ppm = 5.62 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.5 ppm/3 milligram per cubic meter TWA

NIOSH REL: 0.2 ppm/1.5 milligram per cubic meter TWA; 0.5 ppm/3 milligram per cubic meter STEL

ACGIH TLV[1]: 0.2 ppm/1.1 milligram per cubic meter TWA; 0.5 ppm/2.8 milligram per cubic meter STEL

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{0.34_A}$ ppm

PAC-2: $\mathbf{2_A}$ ppm

PAC-3: $\mathbf{5.6_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.5 ppm/2.8 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group C

Arab Republic of Egypt: TWA 0.5 ppm (3 milligram per cubic meter), 1993; Australia: TWA 0.2 ppm (1.5 milligram per cubic meter); STEL 0.5 ppm (3 milligram per cubic meter), 1993; Austria: MAK 0.25 ppm (1.5 milligram per cubic meter), 1999; Belgium: TWA 0.2 ppm (1.1 milligram per cubic meter); STEL 0.5 ppm (2.8 milligram per cubic meter), 1993; Denmark: TWA 0.2 ppm (1.2 milligram per cubic meter), 1999; Finland: STEL 0.5 ppm (3 milligram per cubic meter), [skin], 1999; France: VME 0.2 ppm (1.5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1.5 milligram per cubic meter, 2003; Japan 0.2 ppm (1.1 milligram per cubic meter), 1999; Norway: TWA 0.2 ppm (1.5 milligram per cubic meter), 1999; the Phillipines: TWA 0.5 ppm (3 milligram per cubic meter), 1993; Poland: MAC (TWA) 3 milligram per cubic meter, 1999; Russia: TWA 0.2 ppm; STEL 0.2 milligram per cubic meter, [skin], 1993; Turkey: TWA 0.5 ppm (3 milligram per cubic meter), 1993; United Kingdom: TWA 0.2 ppm (1.1 milligram per cubic meter); STEL 0.5 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 0.5 ppm. Several states have set guidelines or standards for PCl_3 in ambient air[60] ranging from 15−30 μ/m^3 (North Dakota) to 30 μ/m^3 (Connecticut) to 36 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 6402.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can be lethal if inhaled or swallowed. Corrosive to the eyes, skin, and respiratory tract. Corrosive if swallowed. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. Very high levels of exposure to vapors can cause death. This material is highly toxic; it may cause death or permanent injury. Exposure may cause dizziness, headache, anorexia, respiratory difficulties; nausea, and vomiting. It can also cause liver and lung disturbances. Occupational exposure has caused coughs, bronchitis, pneumonia, and conjunctivitis.

Long-Term Exposure: Highly corrosive materials can cause lung damage; bronchitis may develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); sputum cytology; white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *25 ppm:* SaF: Pd, Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Phosphorus trichloride must be stored to avoid contact with acetic acid, aluminum, chromyl chloride; fluorine, alcohol, nitric acid; sodium, potassium, water, hydroxylamine, and lead dioxide, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water and moisture. Phosphorous trichloride corrodes most metals and will attack some forms of plastics, rubber and coatings.

Shipping: UN1809 Phosphorous trichloride, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material, Inhalation Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

when spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/90
Then: Protect persons downwind (miles/kilometers)
Day 0.6/1.0
Night 1.4/2.3

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.6/2.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not easily ignite. Thermal decomposition products may include hydrogen chloride and oxides of phosphorus. Use carbon dioxide or dry chemical on fires involving phosphorus trichloride. *Do not use water*. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Spray cooling water on containers that are exposed to flames until well after fire is out. Do not get water inside containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Decompose with water, forming phosphoric and hydrochloric acids. The acids may then be neutralized and diluted slowly to solution of soda ash and slaked lime with stirring, then flush to sewer with large volumes of water.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi; Risk phrases: R22; R36/R37/38; R41; R42/43; R62; R63; Safety phrases: S2; S23; S24/25; S26; S37/39; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Phthalic Anhydride is moderately flammable, white solid (flake) or a clear, colorless, mobile liquid (molten) Characteristic, acrid, choking odor. Molecular weight = 148.12 (flake); 1.20 (molten); Specific gravity (H_2O:1) = 1.5 @ 4°C; Boiling point = (sublimes) 295°C; Freezing/Melting point = 17.78°C; Vapor pressure = 0.0015 mmHg @ 20°C Flash point = 151.67°C (cc); Autoignition temperature = 570°C. Explosive limits: LEL = 1.7%; UEL: 10.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0₩. Reacts exothermically with water. Aqueous solution is corrosive.

Potential Exposure: Phthalic anhydride is used in plasticizers; in the manufacture of phthaleins; benzoic acid; alkyd and polyester resins; synthetic indigo; and phthalic acid;

which is used as a plasticizer for vinyl resins. To a lesser extent, it is used in the production of alizarin, dye, anthranilic acid; anthraquinone, diethyl phthalate; dimethyl phthalate; erythrosine, isophthalic acid; methylaniline, phenolphthalein, phthalamide, sulfathalidine, and terephthalic acid. It has also found uses as a pesticide intermediate.

Incompatibilities: Dust forms an explosive mixture with air. Phthalic anhydride reacts exothermically with water. The reactions are sometimes slow, but can become violent when local heating accelerates their rate. Acids accelerate the reaction with water. Incompatible with acids, strong oxidizing agents, alcohols, amines, and bases[101]. Converted to phthalic acid in hot water. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. caustics, ammonia, amines, water. Reacts violently with copper oxide or sodium nitrite + heat.

Permissible Exposure Limits in Air:

NIOSH IDLH = 60 milligram per cubic meter

Conversion factor: 1 ppm = 6.06 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 0.05 ppm.

OSHA PEL: 2 ppm/12 milligram per cubic meter TWA

NIOSH REL: 1 ppm/6 milligram per cubic meter TWA

ACGIH TLV[1]: 1 ppm/6.1 milligram per cubic meter TWA; danger of sensitization; not classifiable as a human carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 18 milligram per cubic meter

PAC-2: 56 milligram per cubic meter

PAC-3: 10,000 milligram per cubic meter

DFG MAK: Danger of skin sensitization; No numerical value established. Data may be available.

Australia: TWA 1 ppm (6 milligram per cubic meter), 1993; Austria: MAK 1 milligram per cubic meter, 1999; Belgium: TWA 1 ppm (6.1 milligram per cubic meter), 1993; Denmark: TWA 2 milligram per cubic meter, 1999; Finland: TWA 0.2 milligram per cubic meter, 1999; France: VLE 6 milligram per cubic meter, 1999; Hungary: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Norway: TWA 2 milligram per cubic meter, 1999; the Phillipines: TWA 2 ppm (12 milligram per cubic meter), 1993; Poland: MAC (TWA) 1 milligram per cubic meter; STEL 2 milligram per cubic meter (vapors and aerosols), 1999; Russia: STEL 1 milligram per cubic meter, [skin], 1993; Sweden: NGV 2 milligram per cubic meter, TGV 3 milligram per cubic meter, 1999; Switzerland: MAK-W 1 milligram per cubic meter, KZG-W 2 milligram per cubic meter, 1999; United Kingdom: TWA 4 milligram per cubic meter; STEL 12 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[43] set a MAC for ambient air in residential areas of 0.1 milligram per cubic meter (100 μ/m^3). Several states have set guidelines or standards for phthalic anhydride in ambient air[60] ranging from 0.82 μ/m^3 (Massachusetts) to 60−240 μ/m^3 (North Dakota) to 100 μ/m^3 (Virginia) to 120 μ/m^3 (Connecticut) to 143 μ/m^3 (Nevada).

Determination in Air: Use NIOSH II(3), Method #S179; OSHA Analytical Method 90.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.58$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* May cause irritation of nose, throat and mouth with coughing, sneezing, shortness of breath; and excessive discharge and bleeding from nose. Studies suggest that this will occur at about 4 ppm. *Skin:* Rapid chemical burns may occur on contact with wet skin. Molten material may cause severe burns unless removed immediately. *Eyes:* May cause severe irritation and chemical burns on contact or at dust levels above 5 ppm. *Ingestion:* May cause severe irritation to mouth and throat. Animal studies suggest that death may occur from ingestion of 4−8 ounces.

Long-Term Exposure: May cause irritation of nose, mouth, throat, and lungs. Repeated or prolonged contact may cause conjuctivitis; nasal ulcer bleeding. Allergy may develop in sensitive individuals which can lead to bronchial asthma. Repeated or prolonged skin contact may cause dermatitis, skin sensitization; and allergy. In animals: liver, kidney damage.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); urine (chemical/metabolite). Lung function tests may be normal if person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid or dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *30 milligram per cubic meter:* Qm (APF = 25) (any quarter-mask respirator). *60 milligram per cubic meter:* 95 XQ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or 95F (APF = 10) (any air-purifying full facepiece respirator equipped with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100); or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter); or SA* (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code-White stripe (*flake*): Contact Hazard; not compatible with materials in solid white category. (2) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Phthalic anhydride must be stored to avoid contact with strong oxidizers (such as chlorine and bromine), since violent reactions occur. Sources of ignition (such as smoking and open flames) are prohibited where phthalic anhydride is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2214 Phthalic anhydride with >.05 % maleic anhydride, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may includes oxides of carbon. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol -resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 201-564-2

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Environmental hazard, Drug.

Superfund/EPCRA 302, Extremely Hazardous Substances: Dropped From Listing in 1988.

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as naphthalenes

Hazardous to aquatic life or environment, with possible long lasting effects[291].(?)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi; Risk phrases: R36/37/38; R51; Safety phrases: S16; S26; S27; S29; S36/37/39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Phylloquinone is an odorless yellow viscous oil or crystals. Molecular weight = 450.77; Boiling point = 140−145°C @ 0.001 mm; Freezing/Melting point = −4°C; −20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Phylloquinone is a dietary component essential for normal biosynthesis of several factors required for clotting of blood; as a therapeutic drug used to correct bleeding tendency; and as a food supplement.

Incompatibilities: Phylloquinone is photosensitive; decomposes in sunlight and is destroyed by alkali hydroxides and reducing agents such as hydrideds and active metals. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Harmful Effects and Symptoms

Short-Term Exposure: High oral toxicity. Intravenous injection can cause toxic responses and occasionally death. Rapid intravenous administration of phylloquinone has produced flushing, irregular breathing; and chest pains. In newborns, can cause hemolytic anemia and hemoglobinuria. In patients who have severe liver disease, administration of large doses of menadione or phylloquinone may further depress function of liver. Individuals resistant to coumarin may have unusual sensitivity to the antidotal effects of vitamin K.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles

and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Store in a secure, dark poison location under inert gas such as argon. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from alkali hydroxides and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Shut off ignition sources; no flares, smoking or flames in hazard area. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch spilled material. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Highly toxic, Nerve toxin/cholinesterase inhibitor

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P204

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R1/2; R26/28; R33; Safety phrases: S25; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Physostigmine is a white crystalline solid. Odorless. Molecular weight = 275.39; Freezing/Melting point = 86−87°C (unstable form); 105−106°C (stable form); Vapor pressure = 1×10^{-5} mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Slightly soluble in water.

Potential Exposure: Physostigmine, an alkaloid, originally derived from the calabar bean (*Physostigma venenosum*) isa potent and reversible inhibitor of cholinesterase. Material is used as a cholinergic (anticholinesterase) agent and as a veterinary medication. Although listed as a carbamate pesticide, physostigmine is not registered for use as an agricultural chemical in the United States.

Incompatibilities: Light and heat.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.41 milligram per cubic meter

PAC-2: 4.5 milligram per cubic meter

PAC-3: 27 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms Super toxic. Probable oral lethal dose is less than 5 mg/kg for a 70 kg (150 lb.) person. Material is a cholinesterase inhibitor. Effects of exposure may involve the respiratory, gastrointestinal, cardiovascular, and CNS. Death occurs due to respiratory paralysis or impaired cardiac function. Time to death may vary from 5 minutes to 24 hours, in severely poisoned patients, depending on factors such as the dose and route. Persons with asthma and/or persons that require drugs containing choline esters are at risk (EPA, 1998/cameo).

Short-Term Exposure: Super toxic. Probable oral lethal dose is less than 5 mg/kg for a 70 kg (150 lb) person. Material is a cholinesterase inhibitor. Effects of exposure may involve the respiratory, gastrointestinal, cardiovascular, and CNS. Death occurs due to respiratory paralysis or impaired cardiac function. Time to death may vary from 5 minutes to 24 hours, in severely poisoned patients, depending on factors, such as the dose and route. Persons with asthma and/or persons that require drugs containing choline esters are at risk (EPA, 1998/cameo). General symptoms include increased secretions, fatigability, and generalized weakness; involuntary twitching; severe weakness of skeletal muscles. Symptoms of exposure to material by major organ system: gastrointestinal: lack of appetite; nausea and vomiting; abdominal cramps and diarrhea. CNS: confusion, lack of coordination, slurred speech; loss of reflexes; rapid irregular breathing; generalized convulsions; and coma. Cardiovascular: slowed heart beat resulting in hypotension and fall in cardiac output.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN1544 Alkaloids, solid, n.o.s. or Alkaloid salts, solid, n.o.s. poisonous, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. As for other carbamate pesticides, avoid breathing dusts and fumes from burning materials. Keep upwind. Avoid bodily contact with the material. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As for other carbamates, extinguish fire using agent suitable for type of surrounding fire (material itself burns with difficulty). Use water in flooding quantities as fog. Use alcohol foam, carbon dioxide or dry chemical. Wear SCBA when fighting fires.If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is not appropriate to dispose of expired or waste drugs or waste product such as lab chemicals by flushing them down the toilet or discarding them to the trash. Larger quantities shall carefully take into consideration applicable EPA, and FDA regulations. If possible return the lab chemicals to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste lab chemicals shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291].(?)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xi; Risk phrases: R36; R51; R62; R63; Safety phrases: S26 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters.

Description: Picloram is a colorless powder. Chlorine odor. Molecular weight = 241.46; Melting/Freezing point = (decomposes) 218−219°C. Vapor pressure = 6.15×10^{-7} mmHg @ 36.7°C. Solubility in water; solubility = 425 ppm @ 25°C.

Potential Exposure: A potential danger to those involved in the manufacture, formulation or application of this herbicide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). This material is acidic. Reacts with hot concentrated alkali (hydrolyzes), strong bases. May attack metals.

Permissible Exposure Limits in Air:

OSHA PEL: 15 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction

NIOSH REL: See Appendix D of the *NIOSH Pocket Guide*

ACGIH TLV[1]: 10 milligram per cubic meter TWA; not classifiable as a human carcinogen

Protective Action Criteria (PAC) not available

Australia: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 1993; Denmark: TWA 10 milligram per cubic meter, 1999; Finland: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; Russia: STEL 2 milligram per cubic meter, 1993; Switzerland: MAK-W 10 milligram per cubic meter, 1999; United Kingdom: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Russia set a MAC for ambient air of 0.03 milligram per cubic meter on a once-daily basis and 0.02 milligram per cubic meter on an average daily basis. Several states have set guidelines or standards for picloram in ambient air[60] ranging from 0.1−0.2 milligram per cubic meter (North Dakota) to 0.16 milligram per cubic meter (Virginia) to 0.2 milligram per cubic meter (Connecticut) to 0.238 milligram per cubic meter (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH IV, Particulates NOR: Method #0500, total dust; Method #0600 (respirable dust).

Permissible Concentration in Water: U.S.Safe Drinking Water Act (47FR 9352): MCL, 0.5 mg/L; MCLG, 0.5 mg/L. The United States Environmental Protection Agency has set a lifetime health advisory of 0.49 mg/L. States which have set guidelines for Picloram in drinking water[61] include Kansas at 0.175 mg/L and Maine at 0.3 mg/L.

Determination in Water: Fish Tox = 703.55815000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause nausea. Human Tox = 500.00000 ppb (VERY LOW).

Long-Term Exposure: Picloram should be handled as a carcinogen-with extreme caution. It may cause liver problems and damage the testes. May affect the kidneys. In animals: liver, kidney changes.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys. Cancer site in animals: liver, uterus, pituitary gland.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for Exposures over *10 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, bases, and metals. A regulated, marked area should be established where this chemical is handled, used or stored. The use of picloram has been restricted. Be sure that your operation follows regulations. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Decomposes above 200°C. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This chlorinated brush killer is usually formulated with 2,4-D and the disposal problems are similar. Incineration @ 1000°C for 2 seconds is required for thermal decomposition. Alternatively, the free acid can be precipitated from its solutions by addition of a mineral acid. The concentrated acid can then be incinerated and the dilute residual solution disposed in an area where several years' persistence in the soil can be tolerated.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

European/International Regulations (*2-picoline*): Hazard Symbol: F+, Xn; Risk phrases: R11; R20/21/22; R36/37; Safety phrases: S2; S26; S36; (*4-picoline*) Hazard Symbol:

T, F; Risk phrases: R11; R20/22; R24; R36/37/38; Safety phrases: S1/2; S21; S26; S36; S41; S45 (see Appendix 4). WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (*all isomers*)

Description: Picolines are colorless liquids. Strong, unpleasant, pyridine-like odor."Picoline" is often used as mixed isomers and physical data for the other isomers are listed. The *o*-isomer is the most heavily regulated (see above). Molecular weight = 93.14 (*m-and o*-isomers); Specific gravity (H_2O:1) = 0.95 @ 15°C (*o*-isomer); 0.96 @ 25°C (*m*-isomer) Boiling point = 129°C (*o*-isomer); 143−144°C (*m*-isomer); 145°C (*p*-isomer); Freezing/Melting point = −70°C (*o*-isomer); −18°C (*m* -isomer); 3.7°C (*p*-isomer); Vapor pressure = 11.2 mmHg @ 45°C (*o*-isomer); Flash point = 39°C (oc) (*o*-isomer); 37.8°C (cc) (*m*-isomer); 57°C (*p*-isomer); Autoignition temperature = 535°C (*o*-isomer). Explosive limits (*o*-isomer): LEL = 1.4%; UEL: 8.6%. Hazard Identification (based on NFPA-704 M Rating System): (*2-isomer*) Health 3, Flammability 3, Reactivity 0; *(3-and 4-isomer*s) Health 2, Flammability 2, Reactivity 0. Soluble in water. Floats on water; poisonous, flammable vapor is produced[136].

Potential Exposure: (*o*-isomer); Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), (*m*-isomer): Possible risk of forming tumors, Primary irritant (w/o allergic reaction). Picolines are used as intermediates in pharmaceutical manufacture, pesticide manufacture; and in the manufacture of dyes and rubber chemicals. It is also used as a solvent.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks copper and its alloys.

Permissible Exposure Limits in Air:
Odor threshold = 0.023 ppm.
Protective Action Criteria (PAC) Ver. 29[138]
109-06-8, 2-picoline
PAC-1: 5 ppm
PAC-2: 7.7 ppm
PAC-3: 46 ppm
108-99-6, 3-picoline
PAC-1: 5 ppm
PAC-2: 49 ppm
PAC-3: 300 ppm

Permissible Concentration in Water: There are no United States criteria but the maximum allowable concentration in Class I waters for the production of drinking water has been set in Russia at 0.05 mg/L[43]. The EPA has suggested[32] a permissible ambient goal of 316 μg/L based on health effects.

Determination in Water: Octanol-water coefficient: Log K_{ow} = 1.2 (all-isomers). Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Exposure can cause nausea, vomiting, diarrhea and abdominal pain. *Inhalation:* May cause irritation to mouth, nose and throat. Odor is very disagreeable above 30 ppm. However, people often become insensitive to the odor after a period of time, so odor detection cannot be relied upon as an indication of exposure. Exposure far above the OEL may cause you to pass out. Levels of 8000 ppm caused death in all exposed rats within 1.5 hours. *Skin:* Readily absorbed and may contribute to symptoms. Irritation with rash or burning sensation on contact. May cause severe irritation if not promptly removed. *Eyes:* May cause severe irritation. *Ingestion:* Irritation and upset of digestive system may occur. Muscle weakness, loss of coordination; diarrhea, and unconsciousness may result. Animal studies suggest that death may occur by ingestion of 1−2 fluid ounces for a 150 lb person.

Long-Term Exposure: Repeated exposure to picoline can cause headache, dizziness, weakness, loss of coordination; double vision and coma. Animal studies suggest that symptoms similar to those listed under ingestion would occur. Liver and kidney damage may also occur. Corrosive substances can irritate the lungs; bronchitis may develop.

Points of Attack: Skin, eyes, liver and kidneys, lungs.

Medical Surveillance: Liver and kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. A respirator providing protection against organic vapors may be of use to sensitive individuals and during entry or escape from a contaminated area.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong acids; acid chlorides; chloroformates, copper metals and alloys. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2313 Picolines, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include fumes of cyanide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Picric acid is a pale yellow, odorless solid. Usually found in solution with 10%−20% water. *Must be kept wetted; the crystalline form is highly unstable.* The dry crystal form is explosive upon rapid heating or mechanical shock. Molecular weight = 229; Specific gravity (H_2O:1) = 1.76 @ 25°C; Boiling point = (explodes above 300°C); Freezing/Melting point = 123°C; Vapor pressure = 1 mmHg @ 25°C; Flash point = 150°C; Autoignition temperature = (explodes) 300°C. Explosive limits: LEL = 12,000 ppm, UEL: unknown; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 4; (*wet*): Health 2, Flammability 2, Reactivity 2. Slightly soluble in water; solubility = 1%.

Potential Exposure: Picric acid is used in the synthesis of dye intermediates and in manufacturing picrates; in the manufacture of explosives, rocket fuels; fireworks, colored glass; matches, electric batteries; and disinfectants. It is also used in the pharmaceutical and leather industries; in copper and steel etching; forensic chemistry; histology, textile printing; and photographic emulsions.

Incompatibilities: *Explosive when dry.* Violent reaction with oxidizers and reducing materials. Air or oxygen is not required for decomposition. Shock sensitive compounds can be formed on contact with plaster, concrete. An explosive mixture results when the aqueous solution crystallizes. May explosively decompose from heat, shock, friction, or concussion. Copper, lead, zinc and other metals, or their salts can form other salts that are initiators and much more sensitive to shock than this chemical. Corrodes metals.

Permissible Exposure Limits in Air:

NIOSH IDLH = 75 milligram per cubic meter

Conversion factor: 1 ppm = 9.37 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.1 milligram per cubic meter TWA [skin]

NIOSH REL: 0.1 milligram per cubic meter TWA [skin]; 0.3 milligram per cubic meter STEL

ACGIH TLV[1]: 0.1 milligram per cubic meter TWA

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 17 milligram per cubic meter

PAC-3: 100 milligram per cubic meter

DFG MAK: 0.1 milligram per cubic meter, inhalable fraction; [skin] danger of skin sensitization; Carcinogen Category 3B.

Australia: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, [skin], 1993; Austria: MAK 0.1 milligram per cubic meter, [skin], 1999; Belgium: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter, [skin], 1999; Finland: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, [skin], 1999; Hungary: TWA 0.1 milligram per cubic meter; STEL 0.2 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; Norway: TWA 0.1 milligram per cubic meter, 1999; the Phillipines: TWA 0.1 milligram per cubic meter, [skin], 1993; Poland: MAC (TWA) 0.1 milligram per cubic meter; MAC (STEL) 0.3 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, KZG-W 0.2 milligram per cubic meter, [skin], 1999; Turkey: TWA 0.1 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 milligram per cubic meter. Several states have set guidelines or standards for picric acid in ambient air[60] ranging from 0.33 μ/m^3 (New York) to 1.0 μ/m^3 (Florida, South Carolina) to 1.0−3.0 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada). Russia set a MAC for ambient air of 10 μ/m^3 on a once-daily basis.

Determination in Air: Collection on a mixed cellulose ester membrane filter, extraction with aqueous methanol measurement by high performance liquid chromatography with UV detector. See NIOSH (II-4), Method #S-228.

Permissible Concentration in Water: To protect human health: no criteria set due to insufficient data[6]. Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604); or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log K_{ow} = 2.0. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: LD_{50} = (oral-rat) 200 mg/kg. Irritates the eyes, skin, and respiratory tract. Corneal injury may occur from exposure to picric acid dust and solutions. Dust or fume may cause eye irritation which may be aggravated by sensitization. Inhalation of high concentrations of dust by one worker caused temporary coma followed by weakness, myalgia, anuria, and later polyuria. Following ingestion of picric acid, there may be headache, vertigo, nausea, vomiting, diarrhea, yellow coloration of the skin; hematuria, and albuminuria. High doses may cause destruction of erythrocytes, hemorrhagic nephritis; and hepatitis. High doses which cause systemic intoxication will color all tissues yellow, including the conjunctive and aqueous humor; and cause yellow vision.

Long-Term Exposure: Picric acid dust or solutions are potent skin sensitizers. The cutaneous lesions which appear usually on exposed areas of the upper extremities consist of dermatitis with erythema and vesicular eruptions. Desquamation may occur following repeated or prolonged contact. Skin usually turns yellow upon contact, and areas around nose and mouth as well as the hair are most often affected. May cause liver effects; hepatitis, hematuria (blood in the urine), albuminuria, kidney effects; nephritis.

Points of Attack: Eyes, skin, kidneys, liver, blood.

Medical Surveillance: NIOSH lists the following tests: liver function tests; urinalysis (routine). Preplacement and periodic medical examinations should focus on skin disorders; such as hypersensitivity, atopic dermatitis; and liver and kidney function. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Natural rubber, Neoprene, and Nitrile are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 milligram per cubic meter:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1 milligram per cubic meter*: 95 XQ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators]. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 75 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or Sa: Pd,Pp (APF = 1000): ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: UN0154 Explosive. UN1344 Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8—10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in an explosion-proof refrigerator away from oxidizers, reducing agents; and metals. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN0154 Picric acid, dry or wetted with <30% water, by mass, Hazard Class: 1D; Labels:1D-Explosive (with a mass explosion hazard); D-Substances or articles which may mass detonate (with blast and/or fragment hazard) when exposed to fire. UN1344 Picric acid, wetted with not less than 30% water, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. More powerful than TNT, picric acid explodes above 572°F/300°C. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration in a rotary kiln incinerator equipped with particulate abatement and wet scrubber devices[22].

CAS Registry Number: 124-87-8

HSDB Number: 6385

RTECS Number: TJ9100000

UN/NA & ERG Number: UN3172/153; UN3462/153

EC Number: 204-716-6

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Highly poisonous, Environmental hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 500 lb (227 kg).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R28; R23/24/25; R36/37/38; R50; R52/53; Safety phrases: S1; S22; S28; S29/35; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Picrotoxin is an odorless crystalline solid with a very bitter taste. Molecular weight = 602.64; Freezing/Melting point = 203°C; Vapor pressure = 1×10^{-5} mmHg @ 25°C. Explosive limits: LEL = 17,000 ppm, UEL: unknown; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in cold water; soluble in boiling water.

Potential Exposure: An alkaloid poison and convulsant. Used in medicine as a CNS stimulant and antidote for barbiturate poisoning. Reportedly, this material is not currently regarded as a useful therapeutic agent since it is not a selective respiratory stimulant.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.024 milligram per cubic meter

PAC-2: 0.27 milligram per cubic meter

PAC-3: 1.6 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic and a dose of 20 mg may produce symptoms of severe poisoning. A human lethal dose of 1.5 mg/kg has been reported. It is an alkaloid convulsant poison. Picrotoxin is a powerful stimulant and affects all portions of the CNS. At doses approaching convulsant levels, signs and symptoms include salivation, elevated blood pressure; frequent vomiting; rapid breathing.

Points of Attack: CNS.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed, keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN3462 Toxins, extracted from living sources, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3172 Toxins, extracted from living sources, (solid or liquid) Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. If water pollution occurs, notify appropriate authorities. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam for small fires. Use water spray, fog, or foam for large fires. Move container from fire area if this can be done without risk. Isolate hazard area and deny entry. Wear positive pressure breathing apparatus and special protective clothing. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Agricultural Chemical, Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R25 R48/25; R50/53; Safety phrases: S1/2; S29/35; S37; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Pindone is a bright yellow crystalline solid or powder. May turn yellow-brown on contact with air. Nearly odorless. Molecular weight = 230.28; Specific gravity (H_2O:1) = 1.06 @ 25°C; Boiling point = 178°C (decomposes); Melting/Freezing point = 105−110°C; 205−210°C (Na salt). Practically insoluble in water; solubility = 0.002% @ 25°C.

Potential Exposure: Pindone is used as an anticoagulant and rodenticide. A potential danger to those involved in manufacture, formulation and application of this chemical.

Incompatibilities: Ketone substances are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrated amines; azo, diazo, azido compounds, carbamates, organic cyanates.

Permissible Exposure Limits in Air:

NIOSH IDLH = 100 milligram per cubic meter

OSHA PEL: 0.1 milligram per cubic meter TWA

NIOSH REL: 0.1 milligram per cubic meter TWA

ACGIH TLV[1]: 0.1 milligram per cubic meter TWA

Protective Action Criteria (PAC) not available

Australia: TWA 0.1 milligram per cubic meter, 1993; Belgium: TWA 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; France: VME 0.1 milligram per cubic meter, 1999; Norway: TWA 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 milligram per cubic meter. Several states have set guidelines or standards for pindone in ambient air[60] ranging from 1.0−3.0 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Nosebleeds (epostaxis), excessive bleeding of minor cuts and bruises; smoky urine; black tarry stools; abdominal and back pain. Reduced blood-clotting which leads to hemorrhaging; symptoms resembling warfarin: depressed formation of prothrombin and capillary fragility; leading to hemorrhages.

Points of Attack: Blood prothrombin.

Medical Surveillance: NIOSH lists the following tests: blood plasma, Prothrombin Time; CBC; urinalysis (routine), red blood cells/count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 milligram per cubic meter:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 100 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Remove all sources of ignition and dampen spilled material with 60%−70% ethanol to avoid airborne dust, then transfer material to a suitable container. Wash surfaces well with soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Piperazine P:0770

Formula: $C_4H_{10}N_2$; $C_4H_{12}Cl_2N_2$; $C_4H_{10}N_2 \cdot 2HCl$; $C_4H_{10}N_2$ Hcl (monochloride)

Synonyms: Antiren; *N*,*N*-Diethylene diamine; 1,4-Diethylenediamine; Dihydrochloride salt of diethylenediamine; Dispermine; Dowzene; Hexahydro-1,4-diazine; Hexahydropyrazine; Lumbrical; Piperazidine; Piperazin (German); Piperazine dihydrochloride; Piperazine hydrochloride; Pyrazine hexahydride

CAS Registry Number: 110-85-0; 142-64-3 (hydrochloride)

HSDB Number: 1093

RTECS Number: TK7800000; TL4025000 (hydrochloride)

UN/NA & ERG Number: UN2579/153

EC Number: 203-808-3 [*Annex I Index No.:* 612-057-00-4]; 205-551-2 [*Annex I Index No.:* 612-241-00-4] (hydrochloride)

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction), Sensitization hazard (skin, resp.), Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard, Agricultural chemical.

Banned or Severely Restricted (several countries) (UN)[13]

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%, piperazine and piperazine dihydrochloride.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, C, Xi; Risk phrases: R34; R36/37/38; R42/43; R62; R63; Safety phrases: S1/2; S22; S26; S36/37/39; S45; (*hydrochloride*): Hazard Symbol: Xn, C, N; Risk phrases: R10; R36/38; R42/43; R62; R63; R52/53; R62; Safety phrases: S1/2; S22; S29/35; S36/37; S45; S61; S63; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Piperazine and piperazine dihydrochloride are white to cream-colored needles or powder. Characteristic ammonia-like odor. Combustible solids that do not easily ignite. Molecular weight = 86.16 (piperazine); 159.08 (dihydrochloride); Specific gravity (H_2O:1) = 1.1 @ 20°C; Boiling point = 146°C; Freezing/Melting point = 106°C; 335°C (*dihydrochloride*); Flash point = 87.8°C. Explosive limits: LEL: 40,000 ppm, UEL: unknown. Hazard Identification (based on NFPA-704 M Rating System): (*piperazine*) Health 3, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: (Piperazine): Primary irritant (w/o allergic reaction), (dihydrochloride) Agricultural chemical, Suspected reprotoxic hazard. Piperazine is used to manufacture anthelmintics, antifilarials, antihistamines, and tranquilizers; the dihydrochloride is used in the manufacture of fibers, pharmaceuticals and insecticides. They are used as an intermediate in the manufacture of, pesticides, rubber chemicals and fibers. Also, piperazine is widely available, effective, and safe when used on an occasional basis against ascaride infections. It is also considerably cheaper than other anthelminthic drugs. In some countries where ascariasis is not endemic and where piperazine was used predominantly for the treatment of pinworn, it has been withdrawn from use on the grounds that other effective drugs are now available. Clinical dosages occasionally induce transient neurological signs and, in some circumstances, the drug may generate small amounts of *nitrosamine* in the stomach, which at considerably greater dosage in experimental animals has been demonstrated to have a carcinogenic potential.

Incompatibilities: Aqueous solution is a strong base. Violent reaction with strong oxidizers and dicyanofurazan. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrogen compounds, carbon tetrachloride. Attacks aluminum, copper, nickel, magnesium and zinc.

Permissible Exposure Limits in Air:

ACGIH TLV (*piperazine and piperazine dihydrochloride*): *2010 Notice of intended change*: 0.1 milligram per cubic meter measured as inhalable fraction and vapor TWA; Danger os sentitization; not classifiable as a human carcinogen

NIOSH REL (*dihydrochloride*): 5 milligram per cubic meter TWA

110-85-0

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.09 milligram per cubic meter

PAC-2: 8.9 milligram per cubic meter

PAC-3: 54 milligram per cubic meter

DFG MAK (*piperazine*): Danger of skin and airway sensitization.

Denmark: TWA 0.1 ppm (0.35 milligram per cubic meter), 1999; Norway: TWA 0.1 ppm (0.3 milligram per cubic meter), 1999; Sweden: NGV 0.1 ppm (0.3 milligram per cubic meter), KTV 0.3 ppm (1 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003.

dihydrochloride

OSHA PEL: None

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA

DFG MAK: Danger of skin and airway sensitization; No numerical value established. Data may be available.

Australia: TWA 5 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, 1999; United Kingdom: TWA 5 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 milligram per cubic meter, 2003.

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Piperazine can affect you when breathed in and by passing through your skin. Piperazine is a corrosive chemical and eye contact can cause severe irritation and burns. Skin contact can cause irritation or a skin allergy, with rash at even very low exposure levels. Exposure can cause a lung allergy to develop, with cough and wheezing triggered by even low exposures. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High exposures can cause weakness, tremors, visual changes and trigger seizures. It can also interfere with the ability of the blood to carry oxygen; causing headaches, dizziness and cyanosis, a bluish color to the skin and lips.

Long-Term Exposure: Repeated exposure to piperazine dihydrochloride can cause skin sensitization and asthma-like allergy.

Points of Attack: Lungs, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Blood methemoglobin level. Evaluation by a dermatologist and/or a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is

recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Piperazine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where piperazine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2579 Piperazine, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Piperazine is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. The monochloride or hydrochloride will also produce hydrogen chloride. Use dry chemical, water spray; or alcohol foam extinguishers. Piperazine dihydrochloride may burn, but does not readily ignite. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration). (≥1.00% concentration).

Hazard Alert: Corrosive, Highly flammable, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

List 1, DEA chemical code 2704 (Title 21 CFR1310.02)

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, T, C, N; Risk phrases: R11; R16; R23/24; R34; R48/21/22; R60; R61; R62; R63; Safety phrases: S1/2; S16; S21; S26; S27; S29; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Piperidine is a clear, colorless liquid. Pepper, ammonia or amine odor. Molecular weight = 85.17; Boiling point = 106°C; Specific gravity (H_2O:1) = 0.87 @ 20°C; Freezing/Melting point = −9°C; Vapor pressure = 40mm Hg @ 29°C; Flash point = 2.8°C. Explosive limits: LEL: 1.4%, UEL: 10.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water; forms a strong basic solution.

Potential Exposure: Piperidine is used in agriculture and pharmaceuticals; intermediate for rubber accelerators; as a solvent; as a curing agent for rubber and epoxy resins; catalyst for condensation reactions; as an ingredient in oils and fuels; complexing agent; manufacture of local anesthetics; in analgesics; pharmaceuticals, wetting agents; and germicides; synthetic flavoring. Not registered as a pesticide in the Unied States.

Incompatibilities: Piperidine is a highly flammable liquid. Vapor may form explosive mixture with air (at room temperature). A medium-strong base. Reacts violently with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Piperidine neutralizes acids in exothermic reactions to form salts plus water. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen may be generated in combination with strong reducing agents, such as hydrides[101].

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{6.6}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{33}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{110}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

United Kingdom: TWA 1 ppm/3.5 milligram per cubic meter [skin]

Russia[43] MAC (workplace air) 0.2 milligram per cubic meter

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.06 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Sore throat, coughing, labored breathing; and dizziness occur after inhalation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure may cause increased blood pressure. May cause permanent injury after short exposure to small amounts. Ingestion may involve both irreversible and reversible changes. 30−60 mg/kg may cause symptoms in humans. Symptoms upon oral administration include weakness, nausea, vomiting, salivation, labored respiration; muscular paralysis; and asphyxiation. Redness, pain, and burns occur upon contact with skin.

Long-Term Exposure: Irritating substances may cause lung irritation; bronchitis may develop. Prolonged or repeated exposures may affect the liver and kidneys.

Points of Attack: Lungs, blood, liver, kidneys.

Medical Surveillance: Monitor blood pressure. Lung function tests. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2401 Piperidine, Hazard Class: 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors; do not get water inside container. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. *Small fires:* dry chemical, carbon dioxide; water spray; or alcohol foam. *Large fires:* water spray, fog, or alcohol foam. Move container from fire area if you can do it without risk. Do not get water inside container. Cool containers that are exposed to flames with water from the side until well after fire is out. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low area. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Isolate for ½ mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS Number: EZ9100000

HSDB Number: 7005

UN/NA & ERG Number: UN2757 (carbamate pesticides, solid, toxic)/151; UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 245-430-1 [*Annex I Index No.:* 006-035-00-8]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Likely to be carcinogenic to humans.

California Proposition 65 Chemical[102]: Cancer, 7/1/2008

Hazard Alert: Poison, Possible neurotoxic effects (dimethyl carbamate), Suspected reprotoxic hazard, Environmental hazard, Agricultural chemical.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R45; R25; R33; R50/53; Safety phrases: S1/2; S23; S29; S37; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Colorless crystalline solid. Odorless. Commercial product may be available as a liquid. Molecular weight = 238.39; Specific gravity (H_2O:1) = 1.21 @20°C; Boiling point = 370°C; Freezing/Melting point = 90.5°C. Vapor pressure = 9×10^{-6} mmHg @ 25°C; Flash point = 180°C. Soluble in water; solubility = 3 g/L. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Primicarb is a carbamate (N-methyl) insecticide. Originally registered in the United States for non-food use on alfalfa grown for seed in selected. Elsewhere it is used on a wide range of cereals, potatoes, fruits, vegetables and other crop.

Incompatibilities: May react with strong oxidizers such as chlorates, peroxides, and nitrates. May form explosive materials with phosphorus pentachloride.

Determination in Water: FDA Method 232.4. Organophosphorous Residues General Methods for Nonfatty Foods Using Acetone Extraction and Isolation in Organic Phase. No detection limit. FDA Method 242.1. Organonitrogen Residues General Method for Nonfatty Foods Including Acetone Extraction and Isolation in Organic Phase. No detection limit. Octanol-water coefficient: Log $K_{ow} = <1.75$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Skin absorption, ingestion and inhalation

Harmful Effects and Symptoms

Short-Term Exposure: Eye pupils are small, blurred vision, eye watering, runny nose, cough, shortness of breath, salivation, nausea, stomach cramps, diarrhea, and vomiting, increased blood pressure, profuse sweating, hypermotility, hallucinations, agitation, tingling of the skin, slow heartbeat, convulsions, fluid in lungs, loss of consciousness, incontinence, breathing stops, death. Carbamates inhibit the acetylcholinesterase enzymes and alter the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes. LD_{50} (oral, rat) = 100−145 mg/kg; LD_{50} (dermal, rat) = >500[83]

Long-Term Exposure: A potent acetylcholinesterase (AChE) inhibitor; cumulative effect is possible. Neutoxic. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase

Medical Surveillance: Medical observation is recommended for 24−48 hours following breathing overexposure, as pulmonary edema may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Routine biological monitoring of pesticide applicators and field workers includes testing of plasma and red blood cell acetylcholinesterase levels (for enzyme poisoned by this chemical). These tests are normally accurate only if done within about 2 hours of exposure. If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. Do not drink any alcoholic beverages before or during use. Also consider CBC and chest X-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. DuPont Tychem suit fabrics[88] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust -proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA >0.51 milligram per cubic meter NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front -or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as sodium hydroxide and sodium bicarbonate). Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. *On small fire*, use dry chemical powder, carbon dioxide, water spray, or foam. *On large fire*, use water spray, fog or alcohol-resistant foam. Do not scatter material using straight water jet streams. Dike fire control water for later disposal; do not scatter the material. Move containers from fire area if you can do it without risk. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Combustible, Suspected of causing genetic defects, Environmental hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B), severe pollutant

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R21; R25; R33; R50/53; Safety phrases: S1/2; S23; S29, S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Pirimifos-ethyl is a straw-colored liquid. Molecular weight = 333.43; It decomposes @ 130°C; no boiling point can be determined; Vapor pressure = 0.0003 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Decomposes in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this organophosphate soil insecticide.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 2.3 milligram per cubic meter

PAC-2: 25 milligram per cubic meter

PAC-3: 28 milligram per cubic meter

Determination in Water: Log $K_{ow} = >4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms. Fish Tox = 1.70268000 ppb MATC (HIGH).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: As with other organophosphorus pesticides, symptoms are secondary to cholinesterase inhibition: headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Other signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All

protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3278 Organophosphorus compound, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required, Potential Inhalation Hazard (Special Provision 5).

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.6/2.6
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. As with other organophosphorus pesticides, stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Remove all ignition sources. Ventilate area of spill or leak. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but does not ignite readily. Thermal decomposition products may include oxides of nitrogen, phosphorus, sulfur and carbon. For small fires, use dry chemical, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Pirimiphos-Ethyl, Washington, DC, Chemical Emergency Preparedness Program (November 30, 1987)

Pirimiphos-methyl P:0791

Formula: $C_{11}H_{20}N_3O_3PS$

Synonyms: Actellic; Actellifog; AI3-27699; Blex; Caswell No. 334B; *O*-[2-(Diethylamino]-6-methyl-4-pyrimidinyl) *O*, *O*-dimethyl phosphorothioate; *O*-(2-Diethylamino-6-methylpyrimidin-4-yl) *O,O*-dimethyl phosphorothioate; *O*-[2-(Diethylamino)-6-methyl-4-pyrimidinyl]-*O,O*-dimethyl phosphorothioate; 2-Diethylamino-6-methylpyrimidin-4-yl dimethyl phosphorothionate; *O,O*-Dimethyl-*O*-[2-(diethylamino)-6-methyl-4-pyrimidinyl]; *O,O*-Dimethyl *O*-[2-(diethylamino)-6-methyl-4-pyrimidinyl]phosphorothioate; ENT 27699GC; Dominator ear tag; Double barrel ear tag; Methylpirimiphos; Methylpyrimiphos; Phosphorothioic acid, *O*-[2-(diethylamino)-6-methyl-4-pyrimidinyl] *O,O*-dimethyl ester; Plant protection PP511; PP511; 4-Pyrimidinol, 2-(diethylamino)-6-methyl-, *O*-ester with *O,O*-dimethyl phosphorothioate; Pyridimine phosphate; Silosan; Sybol; Tomahawk

CAS Number: 29232-93-7

HSDB Number: 6984

RTECS Number: TF1410000

UN/NA & ERG Number: UN2783 (organophosphorus pesticide, solid, n.o.s.)/152; UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 249-528-5 [*Annex I Index No.*:015-134-00-5]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Not yet determined

Hazard Alert: Poison, Neurotoxin (cumulative), Suspected of causing genetic defects, Reproduction Hazard, Sensitization hazard, Environmental hazard.

DOT Inhalation Hazard Chemicals as organophosphates

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N; Risk phrases: R22; R33; R50/53; Safety phrases: S2; S29; S41; S42/43; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: Light yellow, straw colored, or amber oily liquid. Odorless when pure. Molecular weight = 305.33; 274.4; Specific gravity (H_2O:1) = 1.17 @ 20°C; Freezing/Melting point = 21°C; Boiling point = (decomposes) 387°C; Specific gravity (H_2O:1) = 1.157 @ 30 mmHg; Vapor pressure = 3.8×10^{-6} mmHg @ 25°C; Flash point = 45°C. Henry's Law constant = 6.0×10^{-7} atm-m^3/mol @ 25°C (est)[83]. Slightly soluble in water; solubility = ~15 mg/L @ 25°C.

Potential Exposure: Pirimiphos-methyl is a post -harves organophosphate insecticide/acaricide used to control a variety of insects in stored grain products and seed such as corn, rice, wheat and sorghum. It is also incorporated into cattle ear tags, and used for the fogging treatment of iris bulbs and preharvest cleanup of fruits and vegetables.

Incompatibilities: May react violently with antimony(V) pentafluoride. Incompatible with strong acids and alkalies, lead diacetate, magnesium, silver nitrate. In the presence of strong reducing agents such as hydrides, organophosphates form highly toxic and flammable phosphine gas. Contact with oxidizers can cause the release of toxic oxides of phosphorus.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV, Method #5600, Organophosphorus Pesticides[18].

Determination in Water: Octanol-water coefficient: Log K_{ow} = >4.0. Values above 3.0 are likely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. LD_{50} (oral, rat) = 1200−1400 mg/kg; LD_{50} (dermal, rat) = >1900 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. May cause contact dermatitis.

Points of Attack: Respiratory system, skin, CNS, cardiovascular system, blood cholinesterase. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

Medical Surveillance: Medical observation is recommended for 24−48 hours following breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic might consider administering a drug or other inhalation therapy.

Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Routine biological monitoring of pesticide applicators and field workers includes testing of plasma and red blood cell acetylcholinesterase levels (for enzyme poisoned by this chemical). These tests are normally accurate only if done within about 2 hours of exposure. If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate pesticides is recommended until enzyme levels recover. Do not drink any alcoholic beverages before or during use as it promotes absorption of organophosphates. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum follicle-stimulating hormone (FSH), and serum lutenizing hormone (LH), may be indicated.

First Aid: Speed in removing material from eyes and skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. *If conscious, alert, and able to swallow, rinse mouth and have victim drink 4−8 ounces of water do NOT induce vomiting but immediately administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *unconscious or having convulsions,* do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended
Note to physician or authorized medical personnel. Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Notes to physician or authorized medical personnel*: *N*-methylpyridinium-2-aldoxime (2-PAMCI) when used in conjunction with atropine reacts with the phosphorylated cholinesterase, thereby restoring normal activity to by removing the phosphorylating group. The combination of these two chemicals is synergistic and must be administered within minutes to a few hours following exposure (depending on the specific agent) to be effective. Give 2-PAMCI (Pralidoxime; Protopam), 2.5 gm in 100 mL of sterile water or in 5% dextrose and water, intravenously, slowly, in 15−30 minutes; if sufficient fluid is not available, give 1 gm of 2-PAMCI in 3 mL of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur. Also Diazepam, an anticonvulsant, might be considered

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. One recommendation is the use of DuPont Tychem suit fabrics[88] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code-Blue: Health Hazard/Poison. Store at 2−8°C in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Decomposes >120°C. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. May be fatal if inhaled, ingested or absorbed through skin. Inhalation or contact with some of these materials will irritate or burn skin and eyes. Vapors may cause dizziness or suffocation. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destruction by alkali hydrolysis or incineration. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Platinum P:0800

Formula: Pt

Synonyms: Elemental platinum; Platin (German); Platinum black

CAS Registry Number: 7440-06-4 (platinum metal)

HSDB Number: 6479

RTECS Number: TP2160000 (Platinum metal)

UN/NA & ERG Number: Metal powder, in bulk, may be pyrophoric: UN3089

EC Number: 231-116-1

Regulatory Authority and Advisory Information

Hazard Alert:Flammable solid (powder/dust), Pyrophoric (powder in bulk), Known catalytic activity; Possible risk of forming tumors.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0% platinum elemental

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F (dust/powder); Risk phrases: R10; R17; R18; Safety phrases: S21 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water. (*metal* size >1mm)

Description: Platinum is a soft, ductile, malleable, silver-white metal. It is found in the metallic form and as the arsenide, sperrylite. It forms complex soluble salts, such as Na_2PtCl_6. It also forms halides. Metallic platinum is insoluble in water. Platinum(IV) chloride is red-brown crystals or powder. Molecular weight = 195.09; 336.89 [Platinum(IV) chloride] Freezing/Melting point = (decomposes) 370°C. Soluble in water.

Potential Exposure: Platinum and its alloys have high electrical conductivity and excellent catalytic properties. They are used in relays, contacts and tubes in electronic equipment, in spark plug electrodes for aircraft; and windings in high-temperature electrical furnaces. Platinum alloys are used for standards for weight, length, and temperature measurement. Platinum and platinum catalysts, for example, hexachloroplatinic acid and H_2PtCl_6, are widely used in the chemical industry in persulfuric, nitric, and sulfuric acid production, in the synthesis of organic compounds and vitamins, and for producing higher octane gasoline. They are coming into use in catalyst systems for control of exhaust pollutants from automobiles. They are used in the equipment for handling molten glass and manufacturing fibrous glass; in laboratory, medical, and dental apparatus; in electroplating; in photography; in jewelry; and in X-ray fluorescent screens. Because platinum complexes are used as antitumor agents, the potential for carcinogenic activity is present; tests to clarify this aspect should be conducted. While low levels of emissions of platinum particulate have been observed from some catalyst-equipped automobiles, the major potential source of Pt is from the disposal of spent catalysts.

Incompatibilities: Dust or powder may form explosive mixture with air. Platinum metal is incompatible with aluminum; acetone, arsenic, ethane, hydrazine, hydrogen peroxide; lithium, phosphorus, selenium, tellurium, various fluorides.

Permissible Exposure Limits in Air:

NIOSH IDLH = 4 mg [Pt]/m^3

OSHA PEL (*soluble salts, as Pt*) 0.002 mg[Pt]/m^3 TWA

NIOSH REL (*metal*): 1 milligram per cubic meter; (*soluble salts, as Pt*): 0.002 mg[Pt]/m^3 TWA

ACGIH TLV[1] (*soluble salts, as Pt*): 1 milligram per cubic meter (metal); 0.002 mg[Pt]/m^3 TWA

7440-06-4

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 3 milligram per cubic meter

PAC-2: 33 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

DFG MAK (*chloroplatinates*): 0.002 mg[Pt]/m^3 Ceiling Concentration (peak should not be exceeded); danger of skin and airway sensitization.

Australia: TWA 1 milligram per cubic meter, 1993; Austria: MAK 1 milligram per cubic meter, 1999; Belgium: TWA 1 milligram per cubic meter, 1993; Finland: TWA 1 milligram per cubic meter, 1999; France: VME 1 milligram per cubic meter, 1999; Hungary: TWA 0.001 milligram per cubic meter; STEL 0.002 milligram per cubic meter, 1993; Norway: TWA 0.002 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Switzerland: MAK-W 0.002 mg[Pt]/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietman: ACGIH TLV: TWA 1 milligram per cubic meter. Several states have set guidelines or standards for platinum in ambient air[60] ranging from 0.1 μ/m^3 (Nevada) to 0.4–20.0 μ/m^3 (Connecticut) to 10.0 μ/m^3 (North Dakota) to 330.0 μ/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method (IV) #7300, #7303, Elements by ICP; #8310, Metals in urine; #8005, Elements in blood or tissue, OSHA Analytical Method ID-121; ID-130-SG; NIOSH II(7), Method S-19, Soluble salts.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Metal dust and fume may cause irritation of the eyes, skin, and respiratory tract. Metal particles in the eye can cause scratching and possible damage. Hazards arise from the dust, droplets, spray, or mist of complex salts of platinum, but not from the metal itself. These salts are sensitizers of the skin, nasal mucosa; and bronchi, and cause allergic phenomena. One case of contact dermatitis from wearing a ring made of platinum alloy is recorded.

Long-Term Exposure: Characteristic symptoms of poisoning occur after 2–6 months' exposure and include pronounced irritation of the throat and nasal passages, which results in violent sneezing and coughing; bronchial irritation, which causes respiratory distress; and irritation of the skin, which produces cracking, bleeding and pain. Respiratory symptoms can be so severe that exposed individuals may develop status asthmaticus. After recovery, most individuals develop allergic symptoms and experience further asthma attacks when exposed to even minimal amounts of platinum dust or mists. Mild cases of dermatitis involve only erythema and urticaria of the hands and forearms. More severe cases affect the face and neck. All pathology is limited to allergic manifestations. EPA research efforts indicate that platinum is more active biologically and toxicologically than previously believed. It methylates in aqueous media, establishing a previously unrecognized biotransformation and distribution mechanism.

Points of Attack: Respiratory system, skin, eyes.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); biologic tissue/biopsy; urine (chemical/metabolite). In preemployment and periodic physical examinations, the skin, eyes, and respiratory tract are most important. Any history of skin or pulmonary allergy should be noted, as well as exposure to other irritants or allergens, and smoking history. Periodic assessment of pulmonary function may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When chloroplatinic acid has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear appropriate splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (for soluble Pt salts): *Up to 0.05 milligram per cubic meter:* Sa:Cf$^{£}$ (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.1 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 4 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). Note: Substance cause eye iritation and damage; eye protection needed.

Storage: UN3089 Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. UN2507 Color code-White (*chloroplatinic acid*): Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Platinum powder is a combustible solid. Thermal decomposition products may include metal oxides. Use dry chemicals appropriate for metal fires. *Do not use water*. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Catalyst disposal is expected to be the largest contributor of Pt to the environment. The value of the metal would help to offset the cost of reclaiming the Pt from discarded catalysts. If direct vehicular emissions of Pt are found to be significant, particulate taps, which are available at reasonable cost, may provide a technological solution. In any event, recovery and recycling is the preferred technique for both health and economic reasons. Details of platinum recovery and recycling from plating wastes, platinum metal refinery effluents; spent catalysts and precious metals scrap have been published.

Polybrominated Biphenyls (PBBs)

P:0810

Formula: $C1_2H_4Br_6$; $Br_3C_6H_2$-$C_6H_2Br_3$

Synonyms: Decabromobiphenyl; Firemaster BP-6; Firemaster FF-1; HBB; NCI-C53634; 2,4,5,2′,4′,5′-Hexabromobiphenyl; PBBs; PBB (BP-6); PBB (FF-1); Polybrominated biphenyl (BP-6); Polybrominated biphenyl (FF-1); Tetrabromo(tetrabromophenyl)benzene

CAS Registry Number: 59536-65-1; 67774-32-7; 36355-01-8 (hexabromobiphenyl); 27858-07-7 (octabromobiphenyl); 59536-65-1 (Firemaster BP-6)

Polybrominated biphenyls category include the following:

p-Bromodiphenyl ether	101-55-3
Decabromobiphenyl	13654-09-6
Decabromodiphenyl ether	1163-19-5
*p,p′*Dibromodiphenyl ether	2050-47-7
Hexabromobiphenyl	59080-40-9
Hexabromo-1,1′-biphenyl	36355-01-8
Hexabromodiphenyl ether	36483-60-0
Nonabromodiphenyl ether	63936-56-1
Octabromobiphenyl	27858-07-7
Octabromobiphenyl	61288-13-9
Octabromodiphenyl ether	32536-52-0
Pentabromodiphenyl ether	32534-81-9
Polybrominated biphenyl	59536-65-1
Polybrominated biphenyl mixture	67774-32-7
Tetrabromodiphenyl ether	40088-47-9
Tribromodiphenyl ether	49690-94-0

HSDB Number: 7064

RTECS Number: DV5330000 (hexabromobiphenyl); LK5060000 (Firemaster BP-6); LK5065000 (Firemaster FF-1)

UN/NA & ERG Number: UN3152 (Polyhalogenated biphenyls, solid)/171; UN3151 (Polyhalogenated biphenyls, liquid)/171

EC Number: 252-994-2 (hexabromobiphenyl); 248-696-7 (octabromobiphenyl or [tetrabromo(tetrabromophenyl)benzene]); 237-137-2 (decabromobiphenyl)

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Human Limited Evidence, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B.

California Proposition 65 Chemical[102]: Cancer 1/1/1988; Reproductive toxin 10/1/1994

Hazard Alert: Exposure can be lethal, Combustible, Endocrine disruptor (high/59536-65-1), Suspected of causing genetic defects, Suspected reprotoxic hazard.

Chemicals Subject to TSCA 12(b) Export Notification Requirements, Section 5: Any combination of the following substances resulting from a chemical reaction (as well as the individual chemicals): Tetrabromodiphenyl ether (CAS:40088-47-9); Pentabromodiphenyl ether (CAS: 32534-81-9); Hexabromodiphenyl ether(CAS: 36483-60-0); Heptabromodiphenyl ether(CAS: 68928-80-3); Octabromodiphenyl ether (CAS: 32536-52-0); Nonabromodiphenyl ether (CAS: 63936-56-1). Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; Risk phrases: R27/28; R50/53; R62; R63; Safety phrases: S13; S28; S41; S45 (see Appendix 4)

Description: Hexabromobiphenyl is the predominant isomer. These materials are heavy, highly brominated compounds. Typical is hexabromobiphenyl, $Br_3C_6H_2$-$C_6H_2Br_3$: White chalky substance, softens at 72°C. Molecular weight = 627.62; decomposes @ 300° to 400°C. It will be used as an illustrative example of such compounds. PBBs are produced by direct bromination of biphenyl and it could be anticipated that very complex mixtures of compounds differing from each both in number of bromine atoms per molecule and by positional isomerism are formed. The possibility also exists (analogous to the PCBs) that halogenated dibenzofurans, for example, brominated dibenzofurans, may be trace contaminants in certain PBB formulations. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Polybrominated diphenylethers (PBDEs), especially p- or o-mixtures of polybrominated diphenyl ethers, which are widely used as flame retardants in various consumer products, including children's clothes, furniture foam and upholstery, curtain materials, mattresses, consumer electronics, and wire insulation. Studies have shown that PBDEs accumulate in the environment and living organisms. These compounds have also been associated with liver toxicity, thyroid toxicity, and neurodevelopmental toxicity in humans[NCSL].

Potential Exposure: The polybrominated biphenyls (PBBs) are inert substances and have been employed, primarily as fire retardants. For example, the PBBs were incorporated into thermoplastics at a concentration of about 15% to increase the heat stability of the plastic to which it is added. In 1973, one to two tons of PBBs, a highly toxic flame retardant, were accidentally mixed into an animal feed supplement and fed to cattle in Michigan. Contamination also resulted from traces of PBBs being discharged into the environment at the manufacturing site and at other facilities involved in handling PBBs. Approximately 250 dairy and 500 cattle farms were quarantined; tens of thousands of swine and cattle and more than one million chickens were destroyed; and lawsuits involving hundreds of millions of dollars were instituted. Before the nature of the contamination was recognized, many of the contaminated animals had been slaughtered, marketed, eaten; and eggs and milk of the contaminated animals were also consumed. Thus, large numbers of people have been exposed to PBBs; they are persistent in the environment and are concentrated in body fat. While commercial manufacture and distribution of PBBs have currently ceased, the full extent of the problem has not yet been assessed.

Incompatibilities: Polybrominated biphenyls (PBBs) are very unreactive. Materials in this category may be incompatible with strong oxidizing (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.; contact may cause fires or explosions) and reducing agents such as hydrides, nitrides, alkali metals, and sulfides. Also, PBBs may be incompatible with various amines, nitrides, azo/diazo compounds, alkali metals, and epoxides. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Long-Term Exposure: Confirmed carcinogen. Experimental teratogenic and reproductive effects. Mutation data reported.

Points of Attack: Liver, kidneys, skin.

Medical Surveillance: These chemicals are suspected or confirmed human carcinogens. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3152 Polyhalogenated biphenyls, solid or Polyhalogenated terphenyls, solid, Hazard class: 9; Labels: 9-Miscellaneous hazardous material. UN3151 Polyhalogenated biphenyls, liquid or Polyhalogenated terphenyls, liquid, Hazard class: 9; Labels: 9-Miscellaneous hazardous material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Flame retardants in this category are of great concern to firefighters. Thermal decomposition products may include highly poisonous bromine compounds and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B), severe pollutant

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1% (Aroclor 1254; Aroclor 1260; Chlorodiphenyl (42% chlorine); Polychlorinated biphenyls, carcinogen) *Note:* The EPA requires the following: All PCB transformer locations must be cleared of stored combustible materials (solvents, paints, paper, etc.). All PCB transformers must be registered with the local fire department. All PCB-containing equipment must be posted with a large yellow label and the exterior door of the vault, machinery room door and any other means of exit must also be marked with PCB yellow ID labels. All PCB-containing transformers must be inspected every three[3] weeks; leaks must be repaired within two[2] days and reported to the EPA within five[5] days. In order to prevent fires, EPA recently required that high voltage network transformers be removed and that enhanced electrical protection be added on many types of PCB transformers in commercial buildings.

List of Stockholm Convention POPs: Annex A (Elimination); Annex C (Unintentional production and release) *as PCBs*

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol (*PCB*): Xn, N; Risk phrases: R45; R33; R50/53; Safety phrases: S2; S35; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Arochlor 1242 is a colorless to light-yellow colored, viscous liquid with a mild, hydrocarbon odor. Molecular weight = 258 (approx); Specific gravity (H_2O:1) = 1.39 @ 25°C; Boiling point = 325−366°C; Freezing/Melting point = −18°C; Vapor pressure = 0.001 mmHg @ 25°C. Insoluble in water. Arochlor 1254 is acolorless to pale-yellow, viscous liquid (resinous state) or solid (below 10°C) with a mild, hydrocarbon odor. Molecular weight = 326 (approx); Specific gravity (H_2O:1) = 1.39 @ 25°C; Boiling point = 365−390°C; Freezing/Melting point = −18°C; Vapor pressure = 0.00006 mmHg @ 25°C. Insoluble in water. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. $C_{12}H_{10-x}Cl_x$, diphenyl rings, in which one or more hydrogen atoms are replaced by a chlorine atom. Most widely used are chlorodiphenyl (42% chlorine), containing 3 chlorine atoms in unassigned positions, and chlorodiphenyl (54% chlorine) containing 5 chlorine atoms in unassigned positions. These compounds are light, straw-colored liquids with typical chlorinated aromatic odors; 42% chlorodiphenyl is a mobile liquid and 54% chlorodiphenyl is a viscous liquid. Insoluble in water. Polychlorinated biphenyls are prepared by the chlorination of biphenyl and hence are complex mixtures containing isomers of chlorobiphenyls with different chlorine contents. It should be noted that there are 209 possible compounds obtainable by substituting chlorine for hydrogen from one to ten different positions on the biphenyl ring system. An estimated 40−70 different chlorinated biphenyl compounds can be present in each of the higher chlorinated commercial mixtures. For example. Aroclor 1254 contains 69 different molecules, which differ in the number and position of chlorine atoms. It should also be noted that certain PCB commercial mixtures (no longer produced in the United States) but produced in France, Germany, and Japan have been shown to contain other classes of chlorinated derivatives, for example, chlorinated naphthalenes and chlorinated dibenzofurans. The possibility that naphthalene and dibenzofuran contaminate the technical biphenyl feedstock used in the preparation of the commercial PCB mixtures cannot be excluded.

Potential Exposure: (Aroclor 1242): Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, (Aroclor 1254) Agricultural chemical, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard. PCBs are mixtures of individual chemicals which are no longer produced in the United States, but are still found in the environment. Chlorinated diphenyls are used alone and in combination with chlorinated naphthalenes. They are stable, thermoplastic, and nonflammable; and are used in heat transfer and hydraulic fluids; lubricants; and insecticide formulations; they found use in insulation for electric cables and wires; in the production of electric condensers; as additives for extreme pressure lubricants; and as a coating in foundry use. Polychlorinated biphenyls (PCBs, first introduced into commercial use more than 45 years ago) are one member of a class of chlorinated aromatic organic compounds which are of increasing concern because of their apparent ubiquitous dispersal, persistence in the environment; and tendency to accumulate in food chains; with possible adverse effects on animals at the top of food webs; including man.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:
NIOSH IDLH = 5 milligram per cubic meter, chlorodiphenyl (42% chlorine) & (54% chlorine)
Protective Action Criteria (PAC) Ver. 29[138]
1336-36-3, (Aroclor PCBs); (42% Cl); 53469-21-9; (Aroclor 1242) (42% Cl)

NIOSH IDLH = 5 milligram per cubic meter, potential occupational carcinogen.
PAC-1: 33 milligram per cubic meter
PAC-2: 360 milligram per cubic meter
PAC-3: 2200 milligram per cubic meter
OSHA PEL: 1 milligram per cubic meter TWA [skin]
NIOSH REL: 0.001 milligram per cubic meter TWA (The REL also applies to other PCBs); A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV[1]: 1 milligram per cubic meter TWA [skin]
DFG MAK: 0.1 ppm/1.1 milligram per cubic meter TWA; Peak Limitation Category II(8) [skin]; Carcinogen Category 3B; Pregnancy Risk Group B
Australia: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter, [skin], carcinogen, 1993; Austria: MAK 0.1 ppm (1 milligram per cubic meter), [skin], suspected carcinogen, 1999; Belgium: TWA 1 milligram

per cubic meter; STEL 2 milligram per cubic meter, [skin], 1993; Finland: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, [skin], 1993; France: VME 1 milligram per cubic meter, [skin], 1999; Japan: 0.1 milligram per cubic meter, [skin], 2A carcinogen, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, [skin], 2003; the Phillipines: TWA 1 milligram per cubic meter, [skin], 1993; Poland: MAC (TWA) 1 milligram per cubic meter, 1999; Sweden: NGV 0.01 milligram per cubic meter, KTV 0.3 milligram per cubic meter, [skin], carcinogen, 1999; Switzerland: MAK-W 0.1 ppm (1 milligram per cubic meter), [skin], 1999; United Kingdom: TWA 0.1 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 milligram per cubic meter [skin]

54% chlorine

NIOSH IDLH = 5 milligram per cubic meter

OSHA PEL: 0.5 milligram per cubic meter TWA [skin]

NIOSH REL: 0.001 milligram per cubic meter (applies to all PCBs) TWA [skin]. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.5 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: 0.05 ppm/0.70 milligram per cubic meter TWA; Peak Limitation Category II(8) [skin]; Carcinogen Category 3B; Pregnancy Risk Group B

Australia: TWA 0.5 milligram per cubic meter; STEL 1 milligram per cubic meter, [skin], Carcinogen, 1993; Austria: MAK 0.05 ppm (0.5 milligram per cubic meter), [skin], suspected carcinogen, 1999; Belgium: TWA 0.5 milligram per cubic meter; STEL 1 milligram per cubic meter, [skin], 1993; France: VME 0.5 milligram per cubic meter, [skin], 1999; Japan: 0.1 milligram per cubic meter, [skin], 2A carcinogen, 1999; Norway: TWA 0.01 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, [skin], 2003; Poland: MAC (TWA) 1 milligram per cubic meter, 1999; Sweden: NGV 0.1 milligram per cubic meter, KTV 0.3 milligram per cubic meter, [skin], carcinogen, 1999; Switzerland: MAK-W 0.05 ppm (0.5 milligram per cubic meter), [skin], 1999; Turkey: TWA 1 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.1 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic has set a TWA of 0.5 milligram per cubic meter and a ceiling value of 1.0 milligram per cubic meter.

PCB oxide: 0.5 milligram per cubic meter, inhalable fraction [skin]

Determination in Air: Use NIOSH Analytical Method #5503, Polychlorobiphenyls; #8004, Polychlorobiphenyls in serum; #PV-2089, Chlorodiphenyl (42% Chlorine); #PV-2088, Chlorodiphenyl (54% Chlorine).

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.0005 mg/L; MCLG, zero. Federal Drinking Water Standards: Clean Water Act, the ambient criterion for PCBs in navagable waters 0.001 μg/L; Federal Drinking Water Guidelines: EPA 0.5 μg/L; State Drinking Water Standards: New Jersey 0.5 μg/L; State Drinking Water Guidelines: Arizona 0.008 μg/L; Connecticut 0.5 μg/L; Maine 0.5 μg/L; Minnesota 0.04 μg/; Wisconsin 0.03 μg/L.

Determination in Water: Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log $K_{ow} = 6.25$ (54% Chlorine) (estimated). Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Inhalation of fume or vapor and percutaneous absorption of liquid,ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May produce irritation to nose, throat and lungs. The vapors can cause coughing and/or difficulty in breathing. Levels above 10 milligram per cubic meter are reported to be unbearable. Inhalation may contribute significantly to all symptoms of long-term exposure. *Skin:* Absorption moderate. Contributes significantly to all symptoms of long-term exposure. Sensitized individuals may develop a rash after 2 days exposure by contact or inhalation. *Eyes:* May produce irritation and burns. Levels of 10 milligram per cubic meter are severely irritating. *Ingestion:* Absorption in digestive system contributes significantly to all symptoms of long-term exposure. There are no reported deaths of humans due to a single ingestion. However, experiments in animals suggest that ingestion of 6−10 fluid ounces would cause death to a healthy 150 lb adult.

Long-Term Exposure: Skin changes; thymus gland problems; immune deficiencies; reproductive or nervous system difficulties; increased risk of cancer. Repeated or prolonged contact with skin may cause acne-like skin rash (chloroacne). The substance may cause liver damage. High exposure can damage the nervous system. PCBs are readily absorbed into the body by all routes of exposure. They may persist in tissues for years after exposure stops. The symptoms below may be due to PCBs or to chemical contaminants. High levels of PCB vapor, 1−10 milligram per cubic meter, may produce burning feeling in eyes, nose and face; dry throat; lung and throat irritant; nausea, dizziness, and aggravation of acne. These may be felt immediately or be delayed weeks or months. Chemical acne, black heads; dark patches on skin; and unusual eye discharge have been reported by all routes of exposure. Although some sensitive individuals have reported these effects after two days, onset may not occur for months. These effects may last for months. Digestive disturbance have been reported in some individuals. PCBs may impair the function of the immune system. High levels of PCBs been shown to produce cancer and birth defects in laboratory animals. Whether PCBs produce these effects in humans is not known.

Points of Attack: Liver, skin, nervous system. Cancer site in animals: liver. Dermal (Skin), Developmental (effects during periods when organs are developing), Endocrine (Glands and Hormones), Hepatic (Liver), Immunological (Immune System), Neurological (Nervous System)[76].

Medical Surveillance: This class of chemicals is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Adipose Tissue; whole blood (chemical/metabolite); blood serum; blood plasma; liver function tests. Before beginning employment and at regular times after that, the following are recommended: Serum Triglycerides level. Exam of the skin. Examination of the nervous system. Nerve conduction studies should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. *Chlorodiphenyl* (42% chlorine) 53469-21-9 Prevent skin contact. **8 hr** (more than 8 hours of resistance to breakthrough >0.1 micron g/cm/min): butyl rubber gloves, suits, boots; Neoprene rubber gloves, suits, boots; Teflon gloves, suits, boots; Viton gloves, suits; Saranex coated suits, Barricade coated suits; Responder suits; **4 hr** (At least 4 but < 8 hours of resistance to breakthrough >0.1 micron g/cm^2/min): 4H and Silver Shield gloves. *Chlorodiphenyl* (54% chlorine) 11097-69-1 Prevent skin contact. **8 hr** (more than 8 hours of resistance to breakthrough >0.1 micron g/cm/min): butyl rubber gloves, suits, boots; Neoprene rubber gloves, suits, boots; Teflon gloves, suits, boots; Viton gloves, suits, Saranex coated suits, Barricade coated suits; Responder suits; **4 hr** (At least 4 but <8 hours of resistance to breakthrough >0.1 micron g/cm^2/min): 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document: #77-225, *Occupational Exposure to Polychlorinated Biphenyls.*

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) (any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with these chemicals all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2315 Polychlorinated biphenyls, liquid, Hazard class: 9; Labels: 9-Miscellaneous hazardous material. UN3432 Polychlorinated biphenyls, solid, Hazard class: 9; Labels: 9-Miscellaneous hazardous material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Spills of one[1] pound or more must be reported to the EPA.

Fire Extinguishing: PCBs may burn but do not easily ignite. Thermal decomposition products may include hydrogen chloride and dioxins, including chlorinated dibenzofurans and chlorinated dibenzodioxines. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration @1648°C with scrubbing to remove any chlorine-containing products. In addition, some chemical waste landfills have been approved for PCB disposal. More recently, treatment with metallic sodium has been advocated which yields a low molecular weight polyphenylene and sodium chloride.

Potassium Metal P:0840

Formula: K

Synonyms: Elemental potassium; Kalium

CAS Registry Number: 7440-09-7

HSDB Number: 698

RTECSNumber: TS6460000

UN/NA & ERG Number: UN2257/130; UN1420 (metal alloys)/138; metal powder, in bulk, may be pyrophoric: UN3089 (Metal powder, flammable, n.o.s.)/170

EC Number: 231-119-8 [*Annex I Index No.:* 019-001-00-2]

Regulatory Authority and Advisory Information

Hazard Alert (powder, dust): Pyrophoric hazard, Highly flammable, Dangerously water reactive.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, C; Risk phrases: R11; R14/15; R29; R17; R34; R51; Safety phrases: S1/2; S5 (If appropriate); S8; S21; S43; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Potassium is a soft silvery metal. Molecular weight = 39.1; Specific gravity (H_2O:1) = 0.89; Boiling point = 774°C; Freezing/Melting point = 64°C; Autoignition temperature = 441°C. Hazard Identification (based on NFPA-704 M Rating System) (*lump*): Health 3, Flammability 3, Reactivity 3₩. Reacts violently with water releasing corrosive potassium hydroxide and flammable hydrogen gas.

Potential Exposure: Used as a reagent and in sodium-potassium alloys which are used as high-temperature heat transfer media.

Incompatibilities: Air contact causes spontaneous ignition. Violent reaction with water, forming heat, spattering, corrosive potassium hydroxide and explosive hydrogen. The heat from the reaction can ignite the hydrogen that is generated. A powerful reducing agent. Violent reaction with oxidizers, organic materials; carbon dioxide; heavy metal compounds; carbon tetrachloride; halogenated hydrocarbons; easily oxidized materials; and many other substances. Store under nitrogen, mineral oil, or kerosene. Oxidizes and forms unstable peroxides under storage conditions. Potassium metal containing an oxide coating is an extremely dangerous explosion hazard and should be removed by an expert and destroyed.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 2.3 milligram per cubic meter

PAC-2: 25 milligram per cubic meter

PAC-3: 150 milligram per cubic meter

Permissible Concentration in Water: No criteria set. (Reacts violently with water).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium can affect you when breathed in. Inhalation of dusts or mists can irritate the eyes, nose, throat and lungs with sneezing, coughing and sore throat. Higher exposures may cause a build-up of fluid in the lungs (pulmonary edema). This can cause death. Skin and eye contact can cause severe burns leading to permanent damage.

Long-Term Exposure: Prolonged exposure to fumes can cause sores of the inner nose and nasal septum. Fumes can irritate the lungs; bronchitis may develop.

Points of Attack: Lungs, skin

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water. Continue without stopping for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately.

Skin Contact: Quickly remove contaminated clothing. Immediately wash area with large amounts of water. Seek medical attention immediately.

Breathing: Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to potassium, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive mode or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Color code-Red Stripe: Flammability Hazard (4.2): Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium must be stored to avoid contact with carbon monoxide and moisture, compounds of heavy metals (such as silver oxide and silver chloride) and carbon tetrachloride, since violent reactions occur. Store under nitrogen, mineral oil, or kerosene. Sources of ignition, such as smoking, create a potential fire or explosion hazard. Protect containers against physical damage. Wherever potassium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2257Potassium, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material. UN1420 Potassium, metal alloys and metal alloys, liquid, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material. UN3089 Metal powder, flammable, n.o.s. Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Potassium is spontaneously combustible. Use dry chemical, dry graphite; soda ash; or lime extinguishers. *Do not use water*, carbon dioxide; or foam. Potassium may ignite in presence of moisture or itself if exposed to air. Thermal decomposition products may include metal oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: inorganics 0.1%; organics 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R45; R23/25; R50/53; Safety phrases: S29; S53; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Potassium arsenate is a colorless to white crystalline solid. Molecular weight = 180.04; Specific gravity (H_2O:1) = 2.8 @ 20 · C; Boiling point = 463°C; Freezing/Melting point = 288°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability0, Reactivity 1.

Potential Exposure: Potassium arsenate is used in the textile, tanning, preserving hides; in the textile printing and paper industries; and as an insecticide in fly baits, especially for fly paper; as laboratory reagent.

Incompatibilities: A weak base. Reacts with strong oxidizers, bromine azide, acids and decomposes on contact with strong acids producing acetic acid fumes. Arsine, a very deadly gas, can be released in the presence of acid, acid mists, or hydrogen gas.

Permissible Exposure Limits in Air:

NIOSH IDLH = 5 mg[As]/m^3, potential occupational carcinogen.

OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled. See [1910.1018]

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. A potential occupational carcinogen. Limit exposure to lowest feasible concentration; See Appendix A.

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 3.6 milligram per cubic meter

PAC-2: 40 milligram per cubic meter

PAC-3: 240 milligram per cubic meter

DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/ end-of-shift; Carcinogen Category 1

Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India: TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Phillipines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air: [60] 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L [40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic:* The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Potassium arsenate can affect you when breathed, and may enter through skin. Potassium arsenate is a carcinogen; handle with extreme caution. Eye contact causes irritation, burns and red, watery eyes. Skin contact can cause burning, itching, and rash. Breathing can cause irritation with sneezing and coughing. High or repeated exposures can cause disturbed sleep; with numbness and weakness of arms and legs; and can cause poor appetite; nausea, cramps and if severe, vomiting and diarrhea.

Long-Term Exposure: Long-term exposure can cause ulcer or hole in the nasal septum; hoarseness and sore eyes also occur. Repeated exposure can cause nervous system damage. Repeated skin contact can cause thickened skin and/or patchy area of darkening and loss of pigment.

Points of Attack: Nervous system, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Test for urine arsenic. Levels should not be greater than 100 micrograms per gram of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests. Before beginning employment and at regular times after that, the following are recommended: examination of the nose, skin, eyes, nails, nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a workday). At NIOSH recommended exposure levels, urine arsenic should not be greater than 50−100 micrograms per liter of urine. After suspected overexposure, repeat these tests. Also examine your skin periodically for abnormal growths. Skin cancer from arsenic is easily cured when detected early.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: For severe poisoning BAL has been used. For milder poisoning penicillamine (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposures. It can only be done under strict medical care.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All

protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, *Inorganic Arsenic*.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). ***Requirements for Respiratory Protection for Inorganic Arsenic Particulate Except for Those With Significant Vapor Pressure:*** $<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. $<$ or $= 20{,}000\ \mu g/m^3$ Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $>20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting Any full-facepiece SCBA operated in positive-pressure mode.

*A high-efficiency filter means a filter that is at least 99.97% efficient against mono-disperesed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where potassium arsenate is handled, used, or stored as required by OSHA Standard 29 CFR 1910.1018 for inorganic arsenic. Potassium arsenate must be stored to avoid contact with acids. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN1677 Potassium arsenate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include arsenic trioxide and potassium oxide. Extinguish fire using an agent suitable for type of surrounding fire. Potassium arsenate itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: inorganics 0.1%; organics 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as arsenic, water-soluble compounds, n.o.s.

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: 45; R23/25; R50/53; R53; R62; Safety phrases: S1/2; S20/21; S28; S29; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Potassium arsenite is a white crystalline solid. Molecular weight = 146; Decomposes below Freezing/ Melting point @ 300°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Potassium metaarsenite is used in veterinary medicine; and for chronic dermatitis in man. Potassium arsenite reduces silver salt to metallic silver during mirror silvering. Currently, it is probably not being used for this purpose.

Incompatibilities: A weak base. Reacts with acids and decomposes on contact with strong acids producing acetic acid fumes. Arsine, a very deadly gas, can be released in the presence of acid or acid mist. Incompatible with alkaloidal salts, strong oxidizers; bromine azide, hypophosphites, sulfites in acid solution; iron salts; heavy metals and heavy metal compounds. Hydrogen gas can react with inorganic arsenic to form the highly toxic gas, arsine.

Permissible Exposure Limits in Air:

NIOSH IDLH = 5 mg[As]/m^3, potential occupational carcinogen.

OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled. See [1910.1018]

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. A potential occupational carcinogen. Limit exposure to lowest feasible concentration; See Appendix A.

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

13464-35-2

PAC-1: 2.9 milligram per cubic meter

PAC-2: 32 milligram per cubic meter

PAC-3: 190 milligram per cubic meter

DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/ end-of-shift; Carcinogen Category 1

Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India: TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Phillipines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air:[60] 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L [40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic:* The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact can cause irritation with a burning sensation; itching. High exposure can cause loss of appetite; garlic or metallic taste; nausea, vomiting, and muscle cramps. May affect the CNS; digestive tract; circulatory system; causing loss of fluids and electrolytes; collapse, shock and death. Very toxic: probable oral lethal dose in humans is 50−500 mg/kg, or between 1 teaspoonful and 1 ounce for a 150 lb adult. Nausea, vomiting and diarrhea result from arsenic ingestion. Patient may go into collapse and shock with weak, rapid pulse; cold sweat; coma, and death. Exposure at low level may result in death.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. May cause liver damage; cirrhosis, jaundice. A skin allergen. Repeated or prolonged contact may cause skin sensitization. Itching or skin pigmentation changes may occur. May affect the peripheral nervous system, causing weakness in the hands and feet. May cause an ulcer on the inner nose and perforation of the nasal septum, and cirrhosis. This substance is carcinogenic to humans. Chronic arsenic poisoning may manifest itself by loss of appetite; cramps, nausea, constipation, or diarrhea.

Points of Attack: Liver, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Test for urine arsenic. Arsenic should not be greater than 100 micrograms per gram of creatinine in the urine. Tests are most accurate at the end of a workday and may be inaccurate within 2 days of eating shellfish. If abnormal growths are detected on the skin, they can be easily cured when detected early. Liver function testing. Examination of the nervous system. Examination of the nose, eyes, nails, and skin.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to physician:* For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: **Requirements for Respiratory Protection for Inorganic Arsenic Particulate*Except for Those With Significant Vapor Pressure*:** $<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. $<$or $= 20{,}000\ \mu\ g/m^3$ Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $>20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting Any full-facepiece SCBA operated in positive-pressure mode.

*A high-efficiency filter means a filter that is at least 99.97% efficient against mono-disperesed particles of 0.3 μm (micrometers) in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where potassium arsenite is handled, used, or stored as required by OSHA Standard 29 CFR 1910.1018 for inorganic arsenic. Store in tightly closed containers in a cool, well ventilated area away from acids, acid fumes; alkaloidal salts; strong oxidizers; bromine azide; hypophosphites, sulfites in acid solution; iron salts; heavy metals and heavy metal compounds. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1678 Potassium arsenite (solid), Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid inhalation and skin contact. Dike far ahead of spill for later disposal. Do not touch spilled material; stop leak if you can do it without risk. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include arsenic, phosgene, and potassium oxide. Extinguish fire using agents suitable for surrounding fire. Potassium arsenite itself does not burn. Keep unnecessary people away; stay upwind; keep out of low areas. Wear full protective clothing and SCBA. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Potassium bromate is a white crystalline solid. Molecular weight = 167.01; Specific gravity (H_2O:1) = 3.3 @ 20°C; Decomposes @ 370°C; Freezing/Melting point = 350°C; also reported @ 435°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3 (Oxidizer). Soluble in water.

Potential Exposure: Potassium bromate is used as animal feed additive, food additive; flavor and packaging material; as a laboratory reagent; an oxidizing agent.

Incompatibilities: A strong oxidizer.Violent reaction with many compounds, including reducing agents; chemically active metals; combustible materials, strong acids, alkaline earth sulfides, aluminum carbides, aluminum, amines, calcium sulfide, carbides, chlorine trifluoride, glycerin, hydrides, hydrochloric acid, hydrogen peroxide, hydrogen sulfide, hydroxylamine, magnesium, metal powders, metal sulfides, molybdenum, phenylhydrazine, phosphorous red/ friction, phosphorous trichloride, silicon, sulfides, sulfur, sulfur dioxide, sulfur/friction, sulfuric acid, tungsten, hydrogen trisulfide. Incompatible with aluminum, copper.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 3.1 milligram per cubic meter

PAC-3: 89 milligram per cubic meter

Permissible Exposure Limits in Water: Safe Drinking Water Act (47FR 9352): MCLG = zero mg/L; MCL = 0.010 mg/L as bromates

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium bromate can affect you when breathed in and may enter the body through the skin. Skin and eye contact can cause irritation, and burns may occur with prolonged contact. Breathing the mist or dust can irritate the nose, throat, and bronchial tubes, causing sneezing and coughing. Overexposure can cause kidney damage. Ingestion may affect the gastrointestinal tract and CNS.

Long-Term Exposure: Bromates may cause an increase risk of cancer. This substance is possibly carcinogenic to humans. May affect the nervous system causing headache, irritability, impaired thinking and personality changes. May cause kidney damage. May cause lung irritation; bronchitis may develop.

Points of Attack: Lungs, kidneys, nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: kidney function tests. Examination of the nervous system. Interview for brain damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to potassium bromate use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate(dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/ MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium bromate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and other incompatible materials listed above, since violent reactions can occur. Protect storage containers against physical damage. Avoid storage on wood floors. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Store in a cool, well ventilated area away from incompatible materials listed above. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101

and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1479 Potassium bromate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: *Caution:* Incompatible absorbents: Cellulose-Based Absorbents, Expanded Polymeric Absorbents[101]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium bromate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen bromide, potassium oxide, and oxygen, which will increase fire hazard. Use water only. Do not use chemical or carbon dioxide extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 400 (Commercial grade).

Hazard Alert: Strong oxidizer, Environmental hazard, FDA-over the counter drug.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: O, Xn; Risk phrases: R9; R20/R22; R51/53; Safety phrases: S1; S13; S16; S26; S27; S29; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Potassium chlorate is a white crystalline solid. Molecular weight = 122.55; Boiling point = decomposes below BP @ ~400°C; Freezing/Melting point = 356°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1 (Oxidizer). Soluble in water.

Potential Exposure: Potassium chlorate is used in the manufacture of soap, glass, pottery, and many potassium salts; as an oxidizing agent; in explosives; matches, textile printing; disinfectants, and bleaching.

Incompatibilities: A strong oxidizer. Potentially explosive. Decomposes on heating above 400°C, on contact with strong acids producing toxic fumes including chlorine dioxide, chlorine fume, s and oxygen. Violent reaction with combustibles, oxidizers, strong acids; and reducing materials. Attacks many metals in presence of water.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 5.6 milligram per cubic meter

PAC-2: 6.2 milligram per cubic meter

PAC-3: 370 milligram per cubic meter

Permissible concentration in Water: *Chlorates:* State Drinking Water Guidelines: California 800 μg/L; Maine 7 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium chlorate can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Prolonged contact can cause eye and skin burns and possible permanent damage. Exposure lowers the ability of the blood to carry oxygen (methemoglobinemia). This can result in a bluish color to skin and lips, headache, dizziness, collapse and even death. Breathing the dust or mist can cause nose and throat irritation with sneezing, coughing and sore throat. High exposure may cause kidney damage.

Long-Term Exposure: May cause lung damage; bronchitis may develop. Repeated exposures may affect the kidneys and CNS.

Points of Attack: Lungs, kidneys, nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: A blood test for methemoglobin level. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to potassium chlorate use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Oxidizer. Potentially explosive. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium chlorate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. Protect storage containers from physical damage. Avoid storage on wood floors. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well ventilated area away from incompatible materials listed above. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1479 Potassium chlorate, Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN2427 Potassium chlorate, *aqueous solution*, Hazard Class: 5.1; Labels: 5.1-Oxidizer, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use water spray only. Do not use dry chemical, halon, foam, or carbon dioxide extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of chlorine, metal, and carbon and oxygen which may increase intensity of fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Potassium chromate(VI) is a yellow crystalline solid. Molecular weight = 194.20; Freezing/Melting point = 974°C. Soluble in water.

Potassium dichromate(VI) is a yellowish-red crystalline solid. Molecular weight = 294.2; Specific gravity (H_2O:1) = 2.7; Boiling point = decomposition @ 500°C; Freezing/Melting point = 398°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3 (Oxidizer). Soluble in water.

Potential Exposure: Potassium chromate is used in printing: photomechanical processing; chrome-pigment production; and wool preservative methods; to make dyes, pigments, inks and enamels; as an oxidizing agent; analytical reagent; in electroplating; explosives.

Incompatibilities: A powerful oxidizer. Violent reactions with combustibles, organics, powdered metals; or easily oxidizable substances. Contact with hydroxylamine, hydrazine causes explosion.

Permissible Exposure Limits in Air:

7789-00-6

NIOSH IDLH = 15 mg[Cr(VI)]/m^3, potential occupational carcinogen.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.56 milligram per cubic meter

PAC-2: 9.7 milligram per cubic meter

PAC-3: 58 milligram per cubic meter

OSHA PEL: 0.1 mg[CrO$_3$]/m^3 Ceiling Concentration

NIOSH REL: 0.001 mg[CrO$_3$]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid; *tert*-butyl chromate; zinc chromate; and chromyl chloride) to be potential occupational carcinogens.

ACGIH TLV[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued

DFG MAK: Danger of skin sensitization; Carcinogen Category 2; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

United Kingdom: carcinogen, 2000; the former USSR-UNEP/IRPTC joint project[43] give a MAC in workplace air of 0.01 milligram per cubic meter. Connecticut[60] has set a guideline for chromium trioxide in ambient air of 0.25 μ/m^3; Sweden [35] for potassium chromate at 0.02 milligram per cubic meter as a TWA in workplace air. North Carolina[60] has set a guideline for ambient air for both compounds of zero.

Protective Action Criteria (PAC) Ver. 29[138]

7778-50-9 (dichromate)

PAC-1: 0.42 milligram per cubic meter

PAC-2: 8.8 milligram per cubic meter

PAC-3: 44 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible concentration in Water: State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr(VI)]/L. Federal Drinking Water Guidelines: EPA 100 μg[Cr]/L.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide); or by inductively coupled plasma (CP) optical emission spectrometry. Chromium (VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods[49].

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium chromates can affect you when breathed in. It can also pass into inner layers of the skin. Eye contact can cause severe damage with possible loss of vision. Irritation of nose, throat and bronchial tubes can occur, with cough and/or wheezing. Skin contact can cause severe irritation, deep ulcers, or an allergic skin rash.

Long-Term Exposure: Chromium may cause allergic dermatitis. Potassium chromate is a human carcinogen. Potassium chromates can cause a sore or perforated nasal septum; with bleeding, discharge or crusting. May cause skin allergy. Can cause lung irritation; bronchitis may develop.

Points of Attack: Lungs, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Blood gas analysis, CBC; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: examination of the nose and skin. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Also check your skin daily for little bumps or blisters, the first sign of "chrome ulcers." If not treated early, these can last for years after exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. (as chromic acid and chromates) **8 hr** (more than 8 hours of resistance to breakthrough >0.1 micron g/cm/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex coated suits; **4 hr** (At least 4 but <8 hours of resistance to breakthrough >0.1 micron g/cm^2/min): butyl rubber gloves, suits, boots; Viton gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation For *potassium dichromate* Neoprene and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. (1) Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 meters or a 1-hour fire wall from flammable or reactive materials. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium chromates must be stored to avoid contact with combustible, organic, or other easily oxidized materials (such as paper, wood, sulfur, aluminum, hydrazine, and plastics), since violent reactions occur. A regulated, marked area should be established where potassium chromate is handled, used, or stored. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well ventilated area away from incompatible materials listed above. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1479 Oxidizing solid, n.o.s., Hazard Class: 5.1; Labels: 5.1-Oxidizer, Technical Name Required. UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium dichromate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include oxides of chromium, potassium and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium Cyanide P:0910

Formula: CNK; KCN

Synonyms: Cianuro potasico (Spanish); Cyanide of potassium; Cyanure de potassium (French); Hydrocyanic acid, Potassium salt; Kalium-cyanid (German)

CAS Registry Number: 151-50-8

HSDB Number: 1245

RTECS Number: TS8750000

UN/NA & ERG Number: UN1680/157

EC Number: 205-793-3

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Poison, Systemic agent, Water reactive, Organometallic, Strong reducing agent, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

United States National Primary Drinking Water Regulations: MCLG = 0.2 mg[CN$^-$]/L; MCL = 0.2 mg [CN$^-$]/L as cyanide.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P098

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B)

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R26/27/28; R32; R50/53; R62; R63; Safety phrases: S1; S7; S28; S29; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Canada, National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited

As cyanide compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants, as cyanide, total

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. as cyanides, soluble salts and complexes, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as cyanide compounds, inorganic, n.o.s.

Description: Potassium cyanide are white lumps, granular powder, or colorless solution. It may be shipped as capsules, tablets, or pellets. Toxic hydrogen cyanide gas released by potassium cyanide has a distinctive, weak bitter almond odor, but many people cannot detect it; the odor does not provide adequate warning of hazardous concentrations. Molecular weight = 65.12; Specific gravity (H_2O:1) = 1.55 @ 20°C; Boiling point = 1625°C; Freezing/Melting point = 633.9°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0₩. Soluble in water; solubility = 72% @ 25°C; with slow decomposition forming a strong alkaline solution.

Potential Exposure: Used in electroplating, steel hardening; extraction of precious metals form ores; as a fumigant; in insecticides; a reagent in analytical chemistry.

Incompatibilities: A strong reducing agent; keep away from oxidizers. Potassium cyanide decomposes on contact with water, humidity, carbon dioxide, strong acids (such as hydrochloric, sulfuric, and nitric acids), and acid salts, producing highly toxic and highly flammable hydrogen cyanide gas. Potassium cyanide absorbs water from air (is hygroscopic or deliquescent); the aqueous solution is a strong base. Incompatible with organic anhydrides; isocyanates, alkylene oxides; epichlorohydrin, aldehydes, alcohols, glycols, phenols, cresols, caprolactum, strong oxidizers; nitrogen trichloride; sodium chlorate. Attacks aluminum, copper, zinc in the presence of moisture.

Permissible Exposure Limits in Air:

NIOSH IDLH = 25 mg[CN]/m^3

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min., Ceiling Concentration

ACGIH TLV[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: **5.3**$_{\mathbf{A}}$ milligram per cubic meter

PAC-2: **19**$_{\mathbf{A}}$ milligram per cubic meter

PAC-3: **40**$_{\mathbf{A}}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C

Skin contact may contribute significantly in overall exposure.

Australia: TWA 5 milligram per cubic meter, [skin], 1993; Austria: MAK 5 mg[CN]/m^3, [skin], 1999; Denmark: TWA 5 milligram per cubic meter, [skin], 1999; France: VME 5 mg[CN]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 milligram per cubic meter, KZG-W 10 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 5 milligram per cubic meter [skin]. Russia [43] has set MAC values for ambient air in residential areas of 0.009 milligram per cubic meter on a momentary basis and 0.004 milligram per cubic meter on an average daily basis. Several states have set guidelines or standards for cyanides in ambient air[60] ranging from 16.7 μ/m^3 (New York) to 50.0 μ/m^3 (Florida and North Dakota) to 80.0 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut and South Dakota) to 125 μ/m^3 (South Carolina) to 119.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides. See also Method #6010, Hydrogen cyanide[18].

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium cyanide is corrosive to the eyes, skin, and the respiratory tract. Contact can cause skin and eye burns, and possible permanent eye damage. Inhalation can cause lung irritation with coughing, sneezing, and difficult breathing; slow gasping respiration. Corrosive if swallowed. These substances may affect the CNS. Symptoms include headaches, confusion, nausea, pounding heart, weakness, unconsciousness and death.

Long-Term Exposure: Repeated or prolonged contact with potassium cyanide may cause thyroid gland enlargement and interfere with thyroid function. May cause nosebleed and sores in the nose; changes in blood cell count. May cause CNS damage with headache, dizziness, confusion; nausea, vomiting, pounding heart; weakness in the arms and legs; unconsciousness and death. May affect liver and kidney function.

Points of Attack: Liver, kidneys, skin, cardiovascular system; CNS; thyroid gland.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. Blood cyanide levels. CBC. Evaluation of thyroid function. Liver function tests. Kidney function tests. CNS tests. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep under observation for 24−48 hours as symptoms may return. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available. *Note to physician:* For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care. *Note to physician:* For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (RED ZONE): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-facepiece scba operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Up to 25 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or Sa: Pd,Pp (APF = 1000): ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong acids; acid salts; oxidizers, light and moisture. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN1680 Potassium cyanide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/90
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.8/1.2

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete.

Remove all ignition sources. This chemical has a lower explosive limit; ventilate closed spaces before entering them. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen cyanide gas and oxides of nitrogen and metal. KCN is not combustible itself but it decomposes in the presence of moisture, damp air, or carbon dioxide; producing highly toxic and flammable hydrogen cyanide gas and oxides of nitrogen. NO acidic dry chemical extinguishers. NO hydrous agents. NO water. NO carbon dioxide. Use dry chemical and foam on surrounding fires. Vapors are heavier than air and may collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not allow water to enter open containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Add strong alkaline hypochlorite and react for 24 hours. Then flush to sewer with large volumes of water[22].

Regulatory Authority and Advisory Information

Hazard Alert: Strong oxidizer, Water reactive, Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: O, Xn, N; Risk phrases: R22; R24/25; R31; R36/37; R50/53; Safety phrases: S2; S8; S26; S29; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Potassium dichloroisocyanurate is a white crystalline solid. Chlorine odor. Molecular weight = 237.07; Freezing/Melting point = (decomposes) 250°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2, Oxidizer ₩. Reacts with water; Slightly soluble; solubility = 10–50 mg/mL @ 20°C [193].

Potential Exposure: Potassium dichloroisocyanurate is used in household bleaches, dishwashing compounds and detergents.

Incompatibilities: A strong oxidizer; violent reaction with reducing agents; combustibles, organics; easily chlorinated or oxidized materials; ammonia, urea, other nitrogen compounds; calcium hypochloride; other alkalies and moisture. Contact with ammonium compounds or hydrated salts can cause a very vigorous reaction. Prolonged exposure to heat/fire may result in the vigorous decomposition of the material with the rupture of its containers, it will accelerate the burning of combustible materials. Chlorine plus alcohols would yield alkyl hypochlorites. They decompose in the cold and explode on exposure to sunlight or heat. Tertiary hypochlorites are less unstable than secondary or primary hypochlorites[NFPA 491M, Cameo].

Permissible Exposure Limits in Air:
No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium dichloroisocyanurate can affect you when breathed in. Exposure can severely irritate the eyes. It can also irritate the nose, throat and air passages. Contact can cause skin and eye irritation.

Long-Term Exposure: May cause lung irritation and damage.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended. Lung function tests. consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to potassium dichloroisocyanurate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustibles (like wood, paper and oil), ammonia, urea, other nitrogen compounds; calcium hypochlorite; other alkalis and moisture. Do not store on wooden floors. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2465 Dichloroisocyanuric acid, dry or Dichloroisocyanuric acid salts, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. *Do not use water*. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Potassium dichloroisocyanurate is not flammable. Potassium dichloroisocyanurate is a strong oxidizer and a dangerous fire hazard on contact with combustible (such as wood, paper, and oil). Thermal decomposition products may include hydrogen cyanide, hydrogen chloride, chlorine gas and oxides of nitrogen and potassium. Use dry chemical, or CO_2 extinguishers. Use water to keep fire-exposed containers cool. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Suspected reprotoxic hazard, Agricultural chemical.

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T; Risk phrases: R23/24/25; R63; Safety phrases: S1/2; S26; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Potassium fluoride is a white crystalline solid. Molecular weight = 58.1; Specific gravity (H_2O:1) = 2.48 @ 20°C; Boiling point = 1502°C; Freezing/Melting point = 858°C; Vapor pressure = 0.75 mmHg @ 869°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Potassium fluoride is used in etching glass; as a preservative and insecticide.

Incompatibilities: Incompatible with strong acids; reacts releasing hydrogen fluoride. Aqueous solutions corrode glass and consequently are prepared and stored in polyethylene containers. The pure solid may be stored in glass containers. Reacts violently with (Pt + BrF_3)[101].

Permissible Exposure Limits in Air:

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 23 milligram per cubic meter

PAC-2: 250 milligram per cubic meter

PAC-3: 1500 milligram per cubic meter

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium fluoride can affect you when breathed in. Inhalation of dust or mist can cause severe irritation and burns of the eyes and skin. May cause permanent eye damage. Inhalation can cause irritation of the nose and throat causing sneezing, coughing and sore throat. High exposure can irritate the lungs, causing a build-up of fluid in the lungs. This can cause death.

Long-Term Exposure: These effects do not occur at the levels of fluorides used in water to prevent cavities. Repeated exposure can cause fluoride to build-up in the body. Can irritate the lungs; bronchitis may develop. Repeated exposure can cause fluoride to build up in the body causing stiffness, brittle bones; and crippling. Prolonged contact can cause sores in the nose and perforated septum.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre-and postshift; urinalysis (routine); CBC/differential.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Qm (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)*+ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)+ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)+ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. +May need acid gas sorbent.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Aqueous solutions corrode glass and consequently are prepared and stored in polyethylene containers. The pure solid may be stored in glass containers. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium fluoride must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1812 Potassium fluoride, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include potassium oxide and fluorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium Hydroxide P:0950

Formula: HKO; KOH
Synonyms: Caustic potash; Hidroxido potasico (Spanish); Hydroxide de potassium (French); Kaliumhydroxid (German); KOH; LYE; Potassa; Potasse caustique (French); Potassium hydrate; Potassium (hydrixyde de) (French)
CAS Registry Number: 1310-58-3; 548-08-7 (liquid)
HSDB Number: 1234
RTECS Number: TT2100000
UN/NA & ERG Number: UN1813 (solid)/154; UN1814 (solution)/154
EC Number: 215-181-3 [*Annex I Index No.:* 019-002-00-8]
Regulatory Authority and Advisory Information
Hazard Alert: Suspected of causing genetic defects, Violently water reactive Primary irritant (w/o allergic reaction).
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, C; Risk phrases: R14/15; R21/22; R35; R62; Safety phrases: S26; S37/39; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Potassium hydroxide is a white deliquescent solid. Molecular weight = 56.1; Specific gravity (H_2O:1) = 2.04; Boiling point = 1327°C; Freezing/Melting point = 380°C; also reported @ 406°C (varies with water content). Hazard Identification (based on NFPA-704 M Rating System) (*45%*): Health 3, Flammability 0, Reactivity 1₩. Soluble in water; solubility = 107% @ 15°C; violent reaction, releasing heat and forming a caustic solution.
Potential Exposure: KOH is generally used as an alkali and in the manufacture of other potassium compounds.
Incompatibilities: A strong base. Violent reaction with acids, alcohols, water, metals (when wet), halogenated hydrocarbons; maleic anhydride. Heat is generated if KOH comes in contact with water and carbon dioxide from the air. Corrosive to zinc, aluminum, tin and lead in the presence of moisture releasing combustible/explosive hydrogen gas. Can absorb water from air and give off sufficient heat to ignite surrounding combustible materials.
Permissible Exposure Limits in Air:
OSHA PEL: None
NIOSH REL: 2 milligram per cubic meter Ceiling Concentration
ACGIH TLV[1]: 2 milligram per cubic meter Ceiling Concentration
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 0.18 milligram per cubic meter
PAC-2: 2 milligram per cubic meter
PAC-3: 54 milligram per cubic meter
Australia: TWA 2 milligram per cubic meter, 1993; Austria: MAK 2 milligram per cubic meter, 1999; Belgium: STEL 2 milligram per cubic meter, 1993; Denmark: TWA 2 milligram per cubic meter, 1999; Finland: TWA 2 milligram per cubic meter, 1999; Japan: STEL 2 milligram per cubic meter, 1999; Norway: TWA 2 milligram per cubic meter, 1999; the Netherlands: MAC 2 milligram per cubic meter, 2003; Switzerland: MAK-W 2 milligram per cubic meter, 1999; United Kingdom: STEL 2 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 2 milligram per cubic meter. Several states have set guidelines or standards for KOH in ambient air[60] ranging from 16.0 μ/m^3 (Virginia) to 20 μ/m^3 (North Dakota) to 48 μ/m^3 (Nevada).
Determination in Air: Use NIOSH Analytical Method (IV) #7401, alkaline Dusts.
Routes of Entry: Inhalation, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Potassium hydroxide can affect you when breathed in. Potassium hydroxide is highly corrosive. Eye contact causes immediate severe burns and can lead to blindness. Skin contact causes severe skin burns. Exposure can irritate the nose, throat, and airways; causing sneezing, coughing, and sores in the nose. Higher levels can irritate the lungs and cause a build-up of fluid (pulmonary edema). This can cause death. Ingestion may be fatal; causes epigastrium, hermatemesis, collapse, and stricture of esophagus.
Long-Term Exposure: May cause sores in the nose and perforation of the nasal septum. May cause lung damage.
Points of Attack: Eyes, skin, respiratory system.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.
First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be

delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For solutions of 30%−70%, natural rubber; Neoprene, nitrile, nitrile + PVC, Neoprene + natural rubber, and polyethylene are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid or dust-proof goggles and face shield when working with powders or dusts, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 2 milligram per cubic meter, use an NIOSH/MSHA or European Standard EN 149-approved full facepiece respirator with a high efficiency particulate filter. More protection is provided by a powered-air purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium hydroxide must be stored to avoid contact with water or moisture and metals, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acids, explosives, combustible materials and organic peroxides. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: UN1814 (solution) & UN1813 (solid); Potassium hydroxide, solid or solution, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate the area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Potassium hydroxide may ignite surrounding material if it absorbs water. Thermal decomposition products may include oxide of potassium. Extinguish fire using an agent suitable for type of surrounding fire. Potassium hydroxide itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dilute with large volume of water, neutralize and flush to sewer[22].

Potassium Nitrate P:0960

Formula: KNO_3

Synonyms: Kaliumnitrat (German); Niter; Nitre; Nitric acid, potassium salt; Saltpeter; Vicknite

CAS Registry Number: 7757-79-1

HSDB Number: 1227

RTECS Number: TT3700000

UN/NA & ERG Number: UN1486/140

EC Number: 231-818-8

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 400 (Commercial grade).

Hazard Alert: Strong oxidizer, Suspected of causing genetic defects, Suspected reprotoxic hazard.

United States National Primary Drinking Water Regulations: MCLG = 10 mg[N]/L; MCL = 10 mg[N]/L nitrate measured as Nitrogen.

FDA-over the counter drug

Hazard Symbols, Risk & Safety statements: Hazard Symbol: O, Xi, Xn; Risk phrases: R8; R22; R25; R36/37/

38; R62; R63; Safety phrases: S1; S7; S21; S24/25; S26; S36; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Potassium nitrate is an odorless, white or colorless crystalline powder with a salty, taste. Molecular weight = 101; Specific gravity (H_2O:1) = 2.1; Boiling point = (decomposes) 400°C; Freezing/Melting point = 334°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3, Oxidizer. Highly soluble in water; solubility = 36% @ 25°C.

Potential Exposure: Used to make explosives, gunpowder, fireworks, rocket fuel; matches, fertilizer, fluxes, glass manufacture; and as a diuretic

Incompatibilities: A powerful oxidizer. Dangerously reactive and friction-and shock-sensitive when mixed with organic materials and many materials. Violent reactions with reducing agents; chemically active metals; charcoal, trichloroethylene.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 9 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 600 milligram per cubic meter

Permissible Exposure Limits in Water: Safe Drinking Water Act (47FR 9352): MCLG = 10 mg[N]/L; MCL = 10 mg[N]/L nitrate measured as Nitrogen.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause eye and skin irritation. Inhalation can cause respiratory tract irritation, coughing, and wheezing. High levels of exposure can interfere with the blood's ability to carry oxygen, causing headache, dizziness, cyanosis, methemoglobinemia, with Blue color to the skin and lips. Higher levels can cause breathing difficulty, collapse and death.

Long-Term Exposure: There is limited evidence that this chemical can damage the developing fetus. Infants below the age of 6 months who drink water containing nitrate in excess of of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.

Points of Attack: Blood.

Medical Surveillance: Blood test for methemoglobin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8—10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all other materials. Do not store on wooden floors. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1486 Potassium nitrate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until

cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and potassium. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Strong oxidizer, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

United States National Primary Drinking Water Regulations: MCLG = 1 mg[N]/L; MCL = 1 mg[N]/L nitrite measured as Nitrogen

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: O, T, N; Risk phrases: R8; R25; R22; R35; R51; R62; R63; Safety phrases: S1/2; S26; S29; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Potassium nitrite is a white to yellowish crystalline solid. Molecular weight = 85.1; Specific gravity (H_2O:1) = 1.92; Boiling point = decomposition starts @ 350°C; explosion @ 535°C; Freezing/Melting point = 440°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 2 (Oxidizer). Soluble in water; solubility = 280 gm/100 mL.

Potential Exposure: Potassium nitrite is used in chemical analysis, as a food additive; in fertilizers; in medications as a vasodilator and as antidote for cyanide poisoning.

Incompatibilities: A strong oxidizer. Reacts violently with combustible and reducing materials. Heat above 530°C may cause explosion. Incompatible with cyanide salts; boron, ammonium sulfate; potassium amide; and acids. Decomposes on contact with even weak acids producing toxic nitrogen oxide fumes.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 4.1 milligram per cubic meter

PAC-2: 45 milligram per cubic meter

PAC-3: 3000 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium nitrite can affect you when breathed in. Contact can cause eye and skin burns. Breathing the dust or mist can irritate the nose, throat and lungs, and may cause cough with phlegm. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High levels can affect the vascular system and interfere with the ability of the blood to carry oxygen (methemoglobinemia), causing headaches, weakness, dizziness and cyanosis, a bluish color to the skin and lips. Higher levels can cause troubled breathing; collapse and even death.

Long-Term Exposure: Repeated skin contact causes dermatitis; drying and cracking. May cause lung irritation; bronchitis may develop. There is limited evidence that potassium nitrite may damage the developing fetus. Infants below the age of 6 months who drink water containing nitrite in excess of of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.

Points of Attack: Eyes, skin, blood, lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for methemoglobin. Lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to potassium nitrite, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, cyanide salts; boron, ammonium sulfate and potassium amide. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1488 Potassium nitrite, Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN1479 Oxidizing solid, n.o.s., Hazard Class: 5.1; Labels: 5.1-Oxidizer, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium nitrite out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Fire Extinguishing: Does not burn but may ignite other combustible materials. Thermal decomposition products may include oxides of nitrogen and potassium. Use dry chemical, CO_2, water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg).

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: O, Xn, N; Risk phrases: R8; R22; R36/37/38; R50/53; R62; R63; Safety phrases: S1; S2; S17; S22; S24; S26; S29/35; S37, R61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Potassium permanganate is a dark purple crystalline solid. Molecular weight = 158.03; Specific gravity (H_2O:1) = 2.7@ 20°C; Freezing/Melting point = (decomposition, with evolution of oxygen) $<240°C$. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3 (Oxidizer). Highly soluble in water.

Potential Exposure: Potassium permanganate is used in solutions as a disinfectant, topical antibacterial agent; deodorizer, bleaching agent; and in air and water purification.

Incompatibilities: Potassium permanganate is a powerful oxidizing agent, that is, it will initiate a fire or explosion if brought into contact with reducing materials; combustibles, organic materials; strong acids; or oxidizable solid, liquid or gas; glycerin, ethylene glycol; polypropylene, hydroxylamine, hydrogen trisulfide; antimony, arsenic, sulfuric acid; hydrogen peroxide; phosphorus, and any finely divided combustible material. It will decompose, and release oxygen, if brought into contact with heat, alcohol, acids, ferrous salts; iodides and oxalates.

Permissible Exposure Limits in Air:

Manganese:

NIOSH IDLH = 500 mg[Mn]/m^3

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume)

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL

ACGIH TLV[1] 0.02 mg[Mn]/m^3, respirable fraction; 0.1 mg[Mn]/m^3, inhalable fraction; not classifiable as a human carcinogen.

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 8.6 milligram per cubic meter

PAC-2: 14 milligram per cubic meter

PAC-3: 150 milligram per cubic meter

DFG MAK: 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

Australia: TWA 5 mg[Mn]/m^3, 1993; Belgium: TWA 5 mg [Mn]/m^3, 1993; Denmark: TWA 2.5 mg[Mn]/m^3, 1999; Finland: TWA 0.5 mg[Mn]/m^3, 1999; Hungary: TWA 0.3 mg[Mn]/m^3, short-term exposure limit 0.6 mg[Mn]/m^3, 1993; Japan: 0.3 mg[Mn]/m^3, respirable dust, 1999; Poland: MAC (TWA) 0.3 mg[Mn]/m^3; MAC 5 mg[Mn]/m^3, 1999; Sweden: NGV 1 mg[Mn]/m^3, KTV 2.5 mg[Mn]/m^3 (resp. dust), 1999; Sweden: NGV 2.5 mg[Mn]/m^3, KTV 5 mg [Mn]/m^3 (total dust), 1999; United Kingdom: LTEL 5 mg [Mn]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.2 mg[Mn]/m^3.

Determination in Air: *Manganese:* Use NIOSH Analytical Method, Elements by ICP, #7300; #7301; #7303; #9102; Elements in blood or tissue, #8005; Metals in urine, #8310; OSHA Analytical Method, ID-125G or ID121.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50 μg[Mn]/L; State Drinking Water Standards: New York: 300 μg[Mn]/L; State Drinking Water Guidelines: California 500 μg[Mn]/L; Connecticut: 500 μg

[Mn]/L; Maine: 500 μg[Mn]/L; Minnesota: 300 μg[Mn]/L; New Hampshire: 100 μg[Mn]/L. World Health Organization (WHO) limit: 400 μg(Mn)/L

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Irritates the respiratory tract, causing coughing and chest tightness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* Concentrated solutions may cause severe irritation and burns. Dilute solutions can cause brown staining of the skin and hardening of outer skin layer. Penetration is poor. *Eyes:* Concentrated solution or crystalline material can cause severe irritation and damage that may be permanent. *Ingestion:* Dilute solutions (1%) may cause burning of the throat, nausea, vomiting and stomach pain. Concentrations of 2%−3% may cause anemia and swelling of the throat with a possibility of suffocation. More concentrated solutions may result in above symptoms plus the onset of kidney damage and circulatory collapse. The probable lethal dose is 1½ teaspoons (10 grams) for a 150 lb (70 kilogram) adult.

Long-Term Exposure: May cause mutations and might pose a cancer risk or reproduction hazard. May cause lung effects.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests (for manganese and fume): whole blood (chemical/metabolite); biologic tissue/biopsy; CBC; chest X-ray; pulmonary function tests; urine (chemical/metabolite); urinalysis (routine). For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give egg whites and milk. A tracheotomy may be required if swelling in throat blocks air. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 50 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium permanganate must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); any organic material; or any other combustible or oxidizable solid, liquid or gas, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect containers from physical damage. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1490 Potassium permanganate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. *Liquid:* Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. *Dry material:* Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. *Large spills:* Clean up should be performed by trained personnel. Cover the weak reducing agents, such as sodium thiosulfate, bisulfites, or ferrous salts. Bisulfites or ferrous salts need an additional promoter of three molar sulfuric acids to accelerate reaction. Transfer slurry or sludge to large container of water and neutralize with soda ash. Keep potassium permanganate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Potassium permanganate does not burn. However, it is a powerful oxidizer. Potassium permanganate decomposes @ 240°C/464°F and releases oxygen which will greatly intensify an ongoing fire. Thermal decomposition products may include oxides of potassiuma nd metal. Use dry chemical or carbon dioxide extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: React with reducing agent, neutralize and flush to sewer[22].

Regulatory Authority and Advisory Information

Hazard Alert: Strong oxidizer, Sensitization hazard (skin, resp.).

United States National Primary Drinking Water Regulations: SMCL = 250 mg[SO_4^{-2}]/L as sulfate

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%, as persulfate compounds.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: O, Xi, Xn; Risk phrases: R8; R9; R22; R36/37/38; R42/43; Safety phrases: S2; S17; S22; S24; S26; S37 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Potassium persulfate is a colorless or white, odorless crystalline material. Molecular weight = 272.34; Specific gravity (H_2O:1) = 2.5 @ 20°C; Boiling point = 109.5°C; Freezing/Melting point = (decomposes) <100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3, Oxidizer. Soluble in water.

Potential Exposure: Potassium persulfate is used as a bleaching and oxidizing agent; it is used in redox polymerization catalysts; in the defiberizing of wet strength paper and in the desizing of textiles. Soluble in water.

Incompatibilities: A strong oxidizer. Incompatible with combustible, organic or other readily oxidizable materials; sulfur, metallic dusts, such as aluminum dust; chlorates and perchlorates. Attacks chemically active metals. Keep away from moisture.

Permissible Exposure Limits in Air:

ACGIH: 0.1 mg $[S_2O_8]/m^3$ TWA *as persulfates*

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 26 milligram per cubic meter

PAC-3: 160 milligram per cubic meter

Permissible Concentration in Water: No criteria set. (Aqueous solution decomposes even at room temperature).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium persulfate can affect you when breathed in. Breathing the dust or mist can cause eye, nose and throat irritation with sneezing, coughing and sore throat. Contact with skin and eyes can cause burns and permanent damage. Prolonged or repeated exposures may lead to sores of the inner nose. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause sores of the inner nose. Skin contact may cause skin rash, with dryness and cracking. May cause lung irritation.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA or European Standard EN 149-approved dust mask when dust is encountered. Where there is potential exists for exposures *over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium persulfate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); strong oxidizers (such as chlorine, bromine, and fluorine); and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Protect storage against physical damage. Store in tightly closed containers in a cool, well-ventilated area away from moisture. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1492 Potassium persulfate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium persulfate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of potassium and sulfur. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use large volumes of reducing agents (bisulfites, e.g.). Neutralize with soda ash and drain into sewer with abundant water.

United States National Primary Drinking Water Regulations: MCLG = 0.2 mg[CN^-]/L; MCL = 0.2 mg [CN^-]/L as cyanide

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants, as cyanide, total

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): X + CN-where X = H+ or any other group where a formal dissociation may occur. For example, KCN or Ca(CN)2. Form R *de minimis* concentration reporting level: 1.0%. Section 313 Category Code N106 (cyanide compounds)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%., Cyanide compounds, inorganic, n.o.s.

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Silver compounds:

Clean Water Act: Section 307 Toxic Pollutants as silver and compounds.

RCRA Section 261 Hazardous Constituents, as silver compounds, n.o.s., waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains silver as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%. Section 313 Category Code N740 (silver compounds).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Potassium silver cyanide is a white crystalline solid. Molecular weight = 199.01; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0₩. Soluble in water; dangerously reaction releasing cyanide vapors.

Potential Exposure: Potassium silver cyanide is used in silver plating; as a bactericide; and in the manufacture of antiseptics. Not registered for use as a pesticide in the United States

Incompatibilities: Contact with acid, acid fumes release hydrogen cyanide. Incompatible with water, steam, or when heated to decomposition, emits toxic and flammable cyanide vapors. Potassium silver cyanide reacts with carbon dioxide releasing hydrogen cyanide. Light sensitive. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Acids precipitate silver cyanide from its aqueous solution. Fusion with metal chlorates, perchlorates, nitrates or nitrites can cause violent explosions[136].

Permissible Exposure Limits in Air:
NIOSH IDLH = 25 mg[CN]/m^3
OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA
NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min., Ceiling Concentration
ACGIH TLV[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 2.9 milligram per cubic meter
PAC-2: 32 milligram per cubic meter
PAC-3: 190 milligram per cubic meter
DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides. See also Method #6010, Hydrogen cyanide[18].

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: The primary health hazard is as a cyanide. It is poisonous and may be fatal if inhaled, swallowed or absorbed through the skin. Fire may produce irritating or poisonous gases. As a cyanide, massive doses may produce, without warning, sudden loss of consciousness and prompt death from respiratory arrest. Smaller but still lethal doses result in illness that may be prolonged for 1 or more hours. Other symptoms may include numbness in throat, salivation, nausea, anxiety, dizziness, irregular breathing; odor of bitter almonds may be noted on breath, blood pressure may rise, slowing of the heart beat; sensation of constriction in the chest; unconsciousness followed by violent convulsions and paralysis. LD_{50} = (oral-rat) 21 mg/kg.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 25 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN1588 Cyanides, inorganic, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen cyanide, cyanide and oxides of nitrogen, potassium, metal and carbon. Use dry chemical, carbon dioxide; water spray; or foam for *small fire*s; and water spray, fog, or foam for *large fires*. Move containers of this material away from fire area if this can be done without risk. Isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Fight fire from maximum distance. Dike fire control water for later disposal. Do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Potassium Silver Cyanide, Washington, DC, Chemical Emergency Preparedness Program (November 30, 1987)

Potassium Sulfide P:1010

Formula: K_2S

Synonyms: Dipotassium monosulfide; Dipotassium sulfide; Hepar sulfurous; Potassium monosulfide

CAS Registry Number: 1312-73-8

HSDB Number: 1204

RTECS Number: TT6000000 (anhydrous); TT6008000 (hydrated)

UN/NA & ERG Number: UN1382 (anhydrous)/135; UN1847 (hydrated)/153

EC Number: 215-197-0 [*Annex I Index No.:* 016-006-00-1]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable solid, Pyrophoric hazard (dry), Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291].

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C, N; Risk phrases: R10; R31; R34; R50; Safety phrases: S1/2; S26; S29; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Potassium sulfide is a brownish-red crystalline solid. Molecular weight = 110.26; Freezing/Melting point = 840°C. Soluble in water.

Potential Exposure: Potassium sulfide is used as a reagent in analytical chemistry; and in pharmaceutical preparations.

Incompatibilities: May explosively decompose from shock, friction, or concussion. Dust or granules may spontaneously ignite on contact with air. The aqueous solution is a strong base; reacts violently with strong acids and acid fumes. The solid material decomposes on contact with acids producing hydrogen sulfide, and oxidizers producing sulfur dioxide.

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Potassium sulfide can affect you when breathed in. Breathing the dust or mist can irritate the eyes, nose and throat with sneezing, coughing and sore throat. Potassium sulfide is a corrosive chemical and contact with skin and eyes can cause burns. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Corrosive materials can cause lung problems; bronchitis may develop. Prolonged exposure can lead to sores or ulcers of the inner lining of the nose.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to potassium sulfide use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposures and liquid potassium sulfide exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Red Stripe: Flammability Hazard (4.2): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. (2) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Potassium sulfide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where potassium sulfide is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Protect storage against physical damage.

Shipping: UN1382 Potassium sulfide, anhydrous or Potassium sulfide with <30% water of crystallization, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen sulfide and oxides of sulfur. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include hydrogen sulfide and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to

fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 211-582-2; 206-678-6 (hydrochloride)

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen (Procarbazine & Procarbazine hydrochloride); IARC: (hydrochloride) Animal Sufficient Evidence; Human Limited Evidence, *probably carcinogenic to humans*, Group 2A, 1998; NTP: Report on Carcinogens, 2014; NCI: Carcinogenesis Studies (ipr); clear evidence: mouse, rat 1979.

California Proposition 65 Chemical[102]: Cancer (methylhydrazine and its salts) 7/1/1992; (procarbazine) 1/1/1988; (procarbazine hydrochloride) cancer 1/1/1988; Developmental/Reproductive toxin 7/1/1990.

Hazard Alert: Poison, Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertilty; Suspected reprotoxic hazard, Drug.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T; Risk phrases: R45; R20/21/22; R27/28; R46; R50/53; R61; R62; R63; R68; Safety phrases: S13; S22; S36/37/39; S45; S53; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Procarbazine is a white to pale yellow crystalline powder with a slight odor. Molecular weight = 221.34. The hydrochloride has a similar description. Molecular weight = 257.80; Freezing/Melting point = 223−236°C (hydrochloride). Soluble in water.

Potential Exposure: Procarbazine is available in capsule form. The primary use of this drug is as an antineoplastic agent in the treatment of advanced Hodgkin's disease, and oat-cell carcinoma of the lung. The hydrochloride compound is used in treatment. The FDA approved use of procarbazine hydrochloride in 1969 and indicated that the drug should be used as an adjunct to standard therapy. Possible exposure occurs during manufacture of the drug and direct exposure during its subsequent administration to patients. Some of the metabolites of procarbazine hydrochloride are both carcinostatic and carcinogenic.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air: No standard set.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can cause nausea, vomiting, diarrhea, stomach pain; loss of appetite and weight loss. Symptoms of exposure include [52] nausea, vomiting, anorexia, dry mouth; dysphagia, diarrhea, constipation, chills and fever; sweating, weakness, edema, cough, dermatitis, jaundice, headache, insomnia, coma.

Long-Term Exposure: A probable human carcinogen. There is some evidence that it causes cancer of the nervous system; blood forming organs; breast, lung, uterus, and leukemia in humans. It has been shown to cause cancer in the same sites in animals. May damage the testes. The hydrochloride is a teratogen in animals and may decrease the body's ability to produce blood cells, causing reduced white blood cells with increased infection and general weakness, reduced platelets; causing bleeding when cut or bruised; and/or reduced blood cells (anemia).

Points of Attack: Blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. CBC.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water to avoid dust, than transfer material to a suitable container. Use absorbent dampened with water to pick up remaining material. Wash surfaces well with soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fireighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)
United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B).
Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R25; R33; R50/53; Safety phrases: S1/2; S24; S29/35; S37; S41; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Promecarb is a colorless, odorless, crystalline solid. Molecular weight = 207.3; Boiling point = 345°C; Freezing/Melting point = 87−88°C; Vapor pressure = 3×10^{-5} mmHg @ 25°C;. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Slightly soluble in water.
Potential Exposure: A potential danger to those involved in the manufacture, formulation or application of this non-systemic contact insecticide.
Incompatibilities: Alkalis.
Permissible Exposure Limits in Air:
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 1.5 milligram per cubic meter
PAC-2: 16 milligram per cubic meter
PAC-3: 96 milligram per cubic meter
Determination in Water: Fish Tox = 33.48370000 ppb (INTERMEDIATE)
Routes of Entry: Inhalation, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Promecarb is highly toxic by ingestion and is absorbed through the intact skin. It is a reversible cholinesterase inhibitor and its effects are related to action on the nervous system. Symptoms of exposure include diarrhea, nausea, vomiting, excessive salivation; headache, pinpoint pupils; and uncoordinated muscle movements are all common symptoms of exposure to carbamate insecticides.
Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.
Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.
Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal."

Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from alkaline materials.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Keep unnecessary people away; isolate hazard areas and deny entry. Stay upwind and keep out of low areas. Do not touch spilled material or breathe the dusts, vapors, or fumes from burning materials. Use water spray to reduce vapors. Do not handle broken packages without protective equipment. Wash away any material that may have contacted the body with soap and water. Take up *small spills* with sand or other noncombustible absorbent material and place in containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. Dike far ahead of *large spills* for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Soil Adsorption Index (K_{oc}) = 200, (estimate).

Fire Extinguishing: Extinguish fire using agent suitable for the surrounding fire, as the material itself burns with difficulty. Use water in flooding quantities as a fog. Use alcohol foam, carbon dioxide; or dry chemical. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: *Small quantities:* treat with alkali and then bury. *Large quantities:* incineration[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Prometon P:1034

Formula: $C_{10}H_{19}N_5O$

Synonyms: 2,4-Bis(isopropylamino)-6-methoxy-*s*-triazine; 2,6-Diisopropylamino-4-methoxytriazine; *N,N′*-Diisopropyl-6-methoxy-1,3,5-triazine-2,4-diamine; *N,N′*-Diisopropyl-6-methoxy-1,3,5-triazine-2,4-diyldiamine; G-31435; Gesafram; Gesafram 50; Gesagram; Ground zero;

Kleenwalk; 2-Methoxy-4,6-bis(isopropylamino)-1,3,5-triazine; 2-Methoxy-4,6-bis(isopropylamino)-*s*-triazine; 6-Methoxy-*N,N'*-bis(1-methylethyl)-1,3,5-triazine-2,4-diamine; Methoxypropazine; Nix; Noxall; Ontrack; Primatol; Prometone; *s*-Triazine, 2,4-bis(isopropylamino)-6-methoxy-; Weed-Go

CAS Number: 1610-18-0

HSDB Number: 1519

UN/NA & ERG Number: UN2763 (triazine pesticide, solid, toxic)/151

EC Number: 216-548-0

RTECS Number: XY4200000

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group D, Not classifiable as a human carcinogen.

Hazard Alert: Poison, Combustible, Suspected reprotoxic hazard, Sensitization hazard, Environmental hazard.

Potential Ground water Pollutant [California FAC (Section 13149)]

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N, Xn; Risk phrases: R22; R36/37/38; R34; R40; R42; R51/53; Safety phrases: S16; S22; S26; S29/35; S36/37/39; S45; S53, S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Colorless crystalline solid or white powder. Odorless. Molecular weight 225.28; Specific gravity (H_2O:1) = 1.09 @ 20°C; Boiling point = 324°C; Freezing/Melting point = 91.5°C; Vapor pressure = 7.7×10^{-6} mmHg @ 20°C. Soluble in water; solubility = 750 mg/L @ 20°C.

Potential Exposure: A nonselective pre-emergence and postemergence triazine herbicide. Use around buildings, storage areas, industrial sites, fences, recreational areas, rights-of-way, railroads, pipelines, lumberyards, tank farms, and similar areas. Controls broadleaf weeds and grasses over an extended period of time

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. UV causes decomposition.

Permissible Concentration in Water: Federal Drinking Water Guidelines: 10 ppb[93]; EPA Alert: 400 μg/L; State Drinking Water Guidelines: Florida 105 μg/L; Maine 100 μg/L; Minnesota 100 μg/L; Wisconsin 90 μg/L Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = \sim 3$. Values above 3.0 May bioaccumulate in marine organisms.

Routes of Entry: Inhalation, passing through the skin, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: May cause skin and severe eye irritation. Moderately poisonous if ingested or inhaled. LD_{50} (oral, rat) = 1450 mg/kg $- >$ 2 g/kg; (dermal, rat) = >2 g/kg.

Long-Term Exposure: May cause lung irritation and damage. May cause skin allergy. Contact with some triazine compounds (such as atrazine) may increase risks for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects on the hypothalamic pituitary gonadal axis. Repeated exposure may cause weight loss and reduced red blood cell count. May cause reproductive and fetal effects.

Points of Attack: Liver, lungs, skin. Reproductive cells.

Medical Surveillance: Preliminary medical examination to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical examinations of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung function tests. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist. Examination of the nervous system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH, may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Engineering control must be effective to ensure that exposure to cyanazine does not occur. Where there is potential exists for exposures to cyanazine use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a pesticide cartridge. Increased protection is obtained from full facepiece air purifying respirators.

Where there is potential for high exposures exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air-respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with cyanazine all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. If appropriate, moisten to prevent dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. *On a small fire:* use dry chemical, CO_2 or water spray. *On a large fire:* use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving tanks or car/trailer loads*: Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for human.

Hazard Alert: Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard, Sensitization hazard (skin), Agricultural Chemical, Primary irritant (w/o allergic reaction), Environmental hazard.

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: N, Xn; Risk phrases: R11; R20/21/22; R37; R51/53; R62; R63; Safety phrases: S16; S26; S29; S36/37; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Colorless crystalline solid. Molecular weight = 241.385; Specific gravity (H_2O:1) = 1.16 @20°C; Boiling point = 295°C; Freezing/Melting point = 119°C; Vapor pressure = 1.24×10^{-6} mmHg @ 20°C. Slightly soluble in water; solubility = 48 ppm @ 20°C.

Potential Exposure: Prometryn, a triazine herbicide, is used to control several annual grasses and broadleaf weeds in terrestrial food and feed crops. Among its major applications are on cotton and celery and is often used on dill and pigeon peas.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Permissible Concentration in Water: Federal Drinking Water Guidelines: 30 ppb[93]. State Drinking Water Guidelines: Florida 28 μg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3.0$. Values >3.0 may bioaccumulate in marine organisms.

Routes of Entry: Inhalation, passing through the skin, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: May cause skin and severe eye irritation. Moderately poisonous if ingested or inhaled. LD_{50} (oral, rat) = <2 g/kg[83]; LD_{50} (dermal, rat) = > 3 g/kg[83].

Long-Term Exposure: May cause lung irritation and damage. May cause skin allergy. Contact with some triazine compounds (such as atrazine) may increase risks for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects on the hypothalamic pituitary gonadal axis. Repeated exposure may cause weight loss and reduced red blood cell count. May be mutagenic. May be a liver, kidney and blood toxin.

Points of Attack: Kidney, liver, blood, lungs, skin

Medical Surveillance: Preliminary medical examination to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical examinations of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung function tests. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist. Examination of the nervous system. Live and kidney function tests. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Engineering control must be effective to ensure that exposure to cyanazine does not occur. Where there is potential exists for exposures to cyanazine use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a pesticide cartridge. Increased protection is obtained from full facepiece air purifying respirators.

Where there is potential for high exposures exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air-respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with cyanazine all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: Triazine pesticides, solid, toxic, n.o.s. require a shipping label of "poisonous materials." This material fall in DOT/UN Hazard Class 6.1.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. If appropriate, moisten to prevent dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of sulfur, nitrogen and carbon. *On a small fire:* use dry chemical, CO_2 or water spray. On a large fire, use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xn, N; Risk phrases: R45; R20/21/22; R36/

R37; R50/53; Safety phrases: S26; S29; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Pronamide is a colorless crystalline solid or powder. Molecular weight = 256.14; Freezing/Melting point = 155−156°C; Vapor pressure = 1.3×10^{-4} mbar @ 25°C. Practically insoluble in water; solubility = 15 ppm @ 25°C.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this selective herbicide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air:
No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: The EPA has derived a lifetime health advisory of 0.052 mg/L (52 μg/L).

Determination in Water: Extraction with methylene chloride, separation by capillary-column gas chromatography; then measurement using a nitrogen-phosphorus detector. Fish Tox = 13901.63079000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact can cause irritation. Inhalation can cause irritation of the respiratory tract with cough, phlegm, and/or chest tightness. The acute oral LD_{50} for male rats is 8350 mg/kg and for female rats is 5620 mg/kg (insignificantly toxic in both cases).

Long-Term Exposure: Applying the criteria described in EPA's final guidelines for assessment of carcinogenic risk, pronamide has tentatively been classified in Group C: possible human carcinogen. This category is for substances with limited evidence of carcinogenicity in animals in the absence of human data. There is limited animal evidence of liver cancer. Human Tox = 22.72727ppb (INTERMEDIATE)

Points of Attack: Cancer site in animals: liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 200.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; or water spray extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, Likely to be carcinogenic to humans (2006)

California Proposition 65 Chemical[102]: Cancer 2/27/2001.

Hazard Alert: Poison, Possible risk of forming tumors, Environmental hazard, Sensitization hazard, Agricultural chemical.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N, Xn, Xi; Risk phrases: R45; R5; R20/21/22; R36; R43; R44; R49; R50/53; Safety phrases: S24; S29; S36/37/39; S41; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Propachlor is a light tan solid. Molecular weight = 211.71; Specific gravity (H_2O:1) = 2.24 @ 25°C; Boiling point = 110°C @ 0.03 mm; Freezing/Melting point = 67−77°C; Vapor Pressure = 2.5×10^{-4} mbar @ 25°C. Flash point = about 316°C. Henry's Law constant = 3.6×10^{-7} atm-m^3/mol @ 25°C (est)[72] Slightly soluble in water.

Potential Exposure: Those engaged in the manufacture, formulation and application of this preemergence herbicide which is used to combat annual grasses and broad-leaved weeds in corn, soybeans, cotton, sugar cane and vegetable crops.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks carbon steel. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air: Russia[35,43] set a MAC in work-place air of 0.5 milligram per cubic meter.

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.01 mg/L and in water for fishery purposes of zero. The EPA has set a lifetime health advisory of 0.092 mg/L (92 μg/L). States which have set guidelines for propachlor in drinking water include Kansas @ 700 μg/L and Maine @ 200 μg/L.

Determination in Water: Fish Tox = 17.92643000 ppb MATC (INTERMEDIATE). Octanol-water coefficient: Log K_{ow} = <2.3. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The maximal tolerated dosage of propachlor without adverse effect is reported as 133.3 mg/kg/day in both rats and dogs. Other workers reported slight organ pathology in rats, mice, and rabbits @ 100 mg/kg/day or higher; this agrees approximately with the former data.

Long-Term Exposure: May be a mutagen. Human Tox = 10.93750 ppb; Chronic Human Carcinogen Level (INTERMEDIATE).

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH, may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling:

UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 80.

Fire Extinguishing: Decomposes @ ~170°C. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. This chemical usually is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkaline hydrolysis would yield *N*-isopropylaniline. However, incineration @ 850°C together with flue gas scrubbing is the preferred disposal method[22].

Propadiene P:1050

Formula: C_3H_4; $H_2C{=}C{=}CH_2$

Synonyms: Allene; Allylenel; Dimethylenemethane; 1,2-Propadiene; Propadieno (Spanish)

CAS Registry Number: 463-49-0

HSDB Number: 5135

RTECS Number: BA040000

UN/NA & ERG Number: UN2200/116

EC Number: 207-335-3 (as Allene)

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Extremely flammable gas; Unstable, may explode (high heat), Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+; Risk phrases: R5; R2; R12; R21; Safety phrases: S1; S9; S15; S16; S33; S38; S41; S45(see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Propadiene is a colorless, flammable gas or liquid with a sweet odor. Molecular weight = 40.1; Specific gravity (H_2O:1) = 1.79 @ 20°C; Boiling point = −32°C; Freezing/Melting point = −146°C. Explosive limits: LEL = 2.1%; 21,000 ppm[138]; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 3. Insoluble in water.

Potential Exposure: Used in chemical synthesis and as a component in mixtures with methyl acetylene, which make up specialty welding gases.

Incompatibilities: Extremely flammable gas or liquid. Vapor or liquid forms explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrogen oxides.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 230 ppm

PAC-2: 2500 ppm

PAC-3: 15,000 ppm

Determination in Air: Use NIOSH Analytical Method (IV) #1500, Hydrocarbons.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Propadiene can affect you when breathed in. Exposure can cause irritation of the eyes, nose and throat. Very high levels can cause you to feel dizzy, lightheaded and to pass out. Extremely high levels could cause death. Contact with the liquid may cause frostbite.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles, unless full facepiece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to propadiene exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Propadiene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric) and nitrogen oxides; since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where propadiene is handled, used, or stored. Wherever propadiene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store cylinders in well-ventilated areas away from potential heat sources. Protect cylinders from physical damage. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2200 Propadiene, stabilized, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extremely flammable gas. Thermal decomposition products may include oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

Propane P:1060

Formula: $C_3H_2O_8$; $CH_3CH_2CH_3$
Synonyms: A-108; Dimethylmethane; Hydrocarbon propellent A-108; *n*-Propane; Propano (Spanish); Propyl hydride
CAS Registry Number: 74-98-6
HSDB Number: 1672
RTECS Number: TX2275000
UN/NA & ERG Number: UN1978/115; UN1075 (liquefied)/115
EC Number: 200-827-9 [*Annex I Index No.:* 601-003-00-5]
Regulatory Authority and Advisory Information
Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 60,000. *Note*: Facilities are not required to count propane in tanks of 10,000 lbs or less. The higher threshold of 60,000 pounds is set to focus on the screening of high-volume propane users; not on nonindustrial propane users.
Hazard Alert: Extremely flammable gas, Agricultural Chemical, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.
Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).
Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, Xn; Risk phrases: R2; R5; R12; R21; Safety phrases: S1; S2; S9; S16; S33; S38; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): Non hazard to water.
Description: Propane is a colorless gas that is odorless when pure (a foul-smelling odorant is often added). Molecular weight = 44.11; Specific gravity (H_2O:1) = 0.49 @ 20°C; Boiling point = −42.2°C; Freezing/Melting point = −187.8°C; Relative vapor density (air = 1) = 1.55; Vapor pressure = 8.4 atm @ 21°C; 750 mmHg @ −42°C; Flash point = flammable gas (−104°C); Autoignition temperature = 450°C. Explosive limits: LEL = 2.1%°C; UEL: 9.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water; solubility = 0.01%.
Potential Exposure: Propane is used as a household, industrial and vehicle fuel; it is used as a refrigerant and aerosol propellant; it is used as an intermediate in petrochemical manufacture.
Incompatibilities: Flammable gas. May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Liquid attacks some plastics, rubber and coatings.
Permissible Exposure Limits in Air:
NIOSH IDLH = 2100 ppm [LEL]
Conversion factor: 1 ppm = 1.80 milligram per cubic meter @ 25°C & 1 atm
Odor Threshold = 2700 ppm.
OSHA PEL: 1000 ppm/1800 milligram per cubic meter TWA
NIOSH REL: 1000 ppm/1800 milligram per cubic meter TWA
ACGIH TLV[1]: 1000 ppm TWA *as aliphatic hydrocarbon gas* (C_1–C_4)
Protective Action Criteria (PAC)* Ver. 29[138]
PAC-1: $\mathbf{5500_A}$ ppm
PAC-2: $\mathbf{17{,}000_A}$ ppm
PAC-3: $\mathbf{33{,}000_A}$ ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
DFG MAK: 1000 ppm/1800 milligram per cubic meter TWA; Peak Limitation Category II(4); Pregnancy Risk Group D
Australia: asphyxiant, 1993; Austria: MAK 1000 ppm (1800 milligram per cubic meter), 1999; Belgium: asphyxiant, 1993; Denmark: TWA 1000 ppm (1800 milligram per cubic meter), 1999; Finland: TWA 800 ppm (1100 milligram per cubic meter), 1999; Hungary: asphyxiant, 1993; the Phillipines: TWA 1000 ppm (1800 milligram per cubic meter), 1993; Switzerland: MAK-W 1000 ppm (1800 milligram per cubic meter), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2500 ppm
Determination in Air: By combustible gas meter NIOSH (II-2) Method #S-87; OSHA Analytical Methods PV-2077. Use NIOSH Analytical Method (IV) #1500, Hydrocarbons.
Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 120,000 μg/L based on health effects.
Routes of Entry: Inhalation, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Very high levels may produce the following symptoms, due primarily to lack of oxygen: dizziness, lightheadedness, disorientation, headache, numbness, vomiting, unconsciousness and death from suffocation. Narcotic at high levels. Contact with the liquid can cause frostbite.
Long-Term Exposure: No effects reported.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene, nitrile + PVC, Polyurethane, and polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2,100 ppm:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propane must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where propane is handled, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of propane. Wherever propane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1978 Propane, Hazard Class: 2.1; Labels: 2.1-Flammable gas. UN1075 Petroleum gases, liquefied or Liquefied petroleum gas, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 1,3-Propane sultone is a white crystalline solid or a colorless liquid above 30°C. It releases a foul odor as it melts. Molecular weight = 122.14; Specific gravity (H_2O:1) = 1.39 @ 25°C; Boiling point = 180°C @ 30 mm; 155−157°C @ 14 mm; Freezing/Melting point = 31°C; Flash point >113°C[30]. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water; solubility = 10%.

Potential Exposure: A potential danger to those involved in use of this chemical intermediate to introduce the sulfopropyl group ($-CH_2CH_2CH_2SO_3-$) into molecules of other products.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

NIOSH IDLH = Not determined. Potential occupational carcinogen

OSHA PEL: None

NIOSH REL: A potential occupational carcinogen.* [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: Exposures by all routes should be carefully controlled to levels as low as possible. confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.6 milligram per cubic meter

PAC-2: 18 milligram per cubic meter

PAC-3: 110 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2

Austria [skin], carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for propane sultone in ambient air[60] ranging from zero (North Dakota) to 0.03 μ/m^3 (New York) to 3.0 μ/m^3 (Virginia).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory system. More irritating if heated.

Long-Term Exposure: Potential occupational carcinogen. Other long-term effects are unknown at this time.

Points of Attack: Eyes, skin, respiratory system. Cancer site in animals: skin tumors, leukemia, gliomas.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70].

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)

Day 1.1/1.8
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of sulfur and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Safe Drinking Water Act (47FR 9352): Priority List (55FR 1470) as DCPA (and its acid metabolites)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N; Risk phrases: R22; R50; R62; Safety phrases: S2; S22; S29/35; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Propanil is a colorless solid. The technical product is a brown crystalline solid. Molecular weight = 218.09; Specific gravity (H_2O:1) = 1.22 @ 25°C; Freezing/Melting point = 91−93°C (pure); 88−91°C (technical grade); Freezing/Melting point (pure) = 89−92°C (pure); 85−89°C (technical grade); Vapor pressure = 2.6×10^{-7} mmHg @ 30°C. Flash point = ≥ 110°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 125 ppm @ 22°C. Commercial formulations use carrier solvents that may change the physical properties shown.

Potential Exposure: Propanil is used as a postemergent herbicide for rice and spring wheat. A potential danger to those involved in the manufacture, formulation, and application of this contact herbicide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.Russia[43] set a MAC in work-place air of 0.1 milligram per cubic meter and has set MAC values for ambient air in residential areas of 0.005 milligram per cubic meter on a once-daily basis and 0.001 milligram per cubic meter on a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.1 mg/L.

Determination in Water: Fish Tox = 0.48990000 ppb (EXTRA HIGH). Octanol-water coefficient: Log $K_{ow} = > 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Propanil is well tolerated by experimental animal on a chronic basis, and there is little or no indication of mutagenic or oncogenic properties of the compound. The highest no-adverse-effect concentration of propanil based on reproduction in the rat and acute, subchronic, and chronic studies in rats and dogs is 400 pm in the diet. Based on this data, an ADI was calculated at 0.02 mg/kg/day. LD_{50} (oral-rat) 2756 mg/kg (male); 2343 mg/kg (female).

Long-Term Exposure: Human Tox = 35.00000 ppb (INTERMEDIATE)

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 149

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis in acidic or basic media yields the more toxic substance, 3,4-dichloraniline, and is not recommended.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N, Xi; Risk phrases: R11; R19; R26/27/28; R34; R43; R51/53; Safety phrases: S1/2; S21; S26; S28; S29/35; S33; S36/37/39; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Propargyl alcohol is a colorless liquid with a geranium-like odor. Molecular weight = 56.06; Specific gravity (H_2O:1) = 0.95 @ 25°C; Boiling point = 114°C; Freezing/Melting point = −52°C; Vapor pressure = 15.6 mmHg @ 25°C;. Flash point = 36°C; Explosive limits: LEL = 3.4%; UEL: 70%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3. Soluble in water.

Potential Exposure: Propargyl alcohol is used as a corrosion inhibitor, soil fumigant; solvent, stabilizer, and chemical intermediate.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, phosphorus pentoxide. May polymerize under the influence of heat, oxidizers, peroxides, light. Attacks many plastics.

Permissible Exposure Limits in Air:

Conversion factor: 1 ppm = 2.29 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 1 ppm/2 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 1 ppm/2.3 milligram per cubic meter TWA [skin]

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{2.5}_\mathbf{A}$ ppm

PAC-2: $\mathbf{16}_\mathbf{A}$ ppm

PAC-3: $\mathbf{72}_\mathbf{A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 2 ppm; 4.7 milligram per cubic meter TWA; Peak Limitation Category I(2); [skin]; Pregnancy Risk Group D

Australia: TWA 1 ppm (2 milligram per cubic meter), [skin], 1993; Austria: MAK 2 ppm (9 milligram per cubic meter), [skin], 1999; Belgium: TWA 1 ppm (2.3 milligram per cubic meter), [skin], 1993; Denmark: TWA 1 ppm (2.5 milligram per cubic meter), [skin], 1999; Finland: TWA 1 ppm (2 milligram per cubic meter); STEL 3 ppm (6 milligram per cubic meter), [skin], 1999; France: VME 1 ppm (2 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG

2 milligram per cubic meter, [skin], 2003; the Phillipines: TWA 1 ppm

(1 milligram per cubic meter), [skin], 1993; Russia: STEL 1 milligram per cubic meter, 1993; Switzerland: MAK-W 1 ppm (2 milligram per cubic meter), [skin], 1999; United Kingdom: TWA 1 ppm (2.3 milligram per cubic meter); STEL 3 ppm, [skin], 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 ppm [skin]

Determination in Air: Use OSHA Analytical Method 97.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Severe health hazard. CNS depressant. May be fatal is absorbed through skin or inhaled. Causes severe irritation. High concentrations are extremely destructive to mucous membranes, upper respiratory tract, eyes, and skin. Symptoms of exposure may include burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea, and vomiting[136].

Short-Term Exposure: Propargyl alcohol can affect you when breathed and by passing through skin. Irritates the eyes, skin, and respiratory tract. Contact can severely burn the eyes, causing permanent damage. Skin contact can irritate the skin and allow dangerous amounts to enter the body. Affects the CNS. Exposure can cause you to feel dizzy, lightheaded and to have trouble concentrating. High exposures can cause liver and kidney damage; coma and death.

Long-Term Exposure: Propargyl alcohol may damage the liver and kidneys.

Points of Attack: Skin, respiratory system; CNS; liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propargyl alcohol must be stored to avoid contact with alkalis, mercury(II) sulfate; oxidizing materials and phosphonic anhydride, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where propargyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of propargyl alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Propargyl alcohol. Wherever propargyl alcohol is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1986 Alcohols, flammable, toxic, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials, Technical Name Required. UN2929 Toxic liquids, flammable, organic, n.o.s., Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Technical Name Required.

Spill Handling:

Toxic liquids, flammable, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/180
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.9/4.6

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcingenicity: EPA, Cancer Classification: Not Likely to be Carcinogenic to Humans. *Note:* Originally classified in 1989 as a Group C carcinogen, or possible human carcinogen.

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Environmental hazard, Possible sensitization hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N; Risk phrases: R40; R50/53; Safety phrases: S2; S29; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Propazine is a colorless crystalline solid or powder. Molecular weight = 229.75; 230.09; Freezing/Melting point = 214°C; Vapor pressure = 1.3×10^{-7} mmHg @ 20°C. Slightly soluble in water; solubility = 9.0 ppm @ 20°C; 4.5×10^{-4} g/100 mL @ 20°C.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this triazine pre-emergence selective herbicide used to control annual broadleaf weeds and grasses.

Permissible Exposure Limits in Air:

No United States standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices. Russia[43] set a MAC in work-place air of 5.0 milligram per cubic meter and a MAC in ambient air in residential areas of 0.04 milligram per cubic meter both on a momentary and an average daily basis.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L. The United States Environmental Protection Agency has determined a lifetime health advisory of 0.014 mg/L (14 μg/L) (see "References" below). States which (31); have set guidelines for propazine in drinking water[61] include Kansas @ 325 μg/L and Maine @ 93 μg/L; (100).

Determination in Water: Analysis of propazine is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen-phosphorus containing pesticides in water samples. In this method, approximately 1 liter of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen-phosphorus detector. The method detection limit has not been determined for propazine, but it is estimated that the detection limits for analytes included in this method are in the range of 0.1−2 μg/L. Fish Tox = 938.12580000 ppb (VERY LOW). Octanol-water coefficient: Log $K_{ow} = \sim 3$ Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. May be absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: May cause eye irritation. Contact dermatitis was reported in workers involved in propazine manufacturing. Poisonous if ingested. No other information on the health effects of propazine in humans was found in the available literature.

Long-Term Exposure: May cause skin allergy. Human Tox = 10.00000 ppb (INTERMEDIATE).

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, moisture, oxidizers, alkaline environments. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 154.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen oxides and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg).

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F, Xn; Risk phrases: R11; R22; R23/24/25; R33; R36/37/38; R39/23/24/25; SR40; R46; R50; Safety phrases: S7; S16; S26; S29/35; S36/37; S45; S53; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Propham is a colorless crystalline solid. Molecular weight = 179.24; Boiling point = Thermal decomposition above 150°C; Freezing/Melting point = 87−88°C; 84°C (technical grade); Vapor pressure = 1.35×10^{-4} mmHg. Practically insoluble in water; solubility = 0.25 g/L @25°C.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this carbamate/organonitrogen grass-control herbicide.

Incompatibilities: Carbamates are incompatible with reducing agents, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas. May react violently with bromine, ketones. Incompatible with azo dyes, caustics, ammonia, amines, boranes, hydrazines, strong

Permissible Exposure Limits in Air:

No United States standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices. Russia[43] set a MAC in work-place air of 2.0 milligram per cubic meter and a MAC in ambient air of residential areas of 0.02 milligram per cubic meter, both on a momentary and an average daily basis.

Determination in Air: Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/UV detection; NIOSH Analytical Method (IV) #5601.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.2 mg/L. The EPA has set a lifetime health advisory of 0.12 mg/L.

Determination in Water: Analysis of propham is by a high-performance liquid chromatographic (HPLC) method applicable to the determination of certain carbamate and urea pesticides in water samples. This method requires a solvent extraction of approximately 1 liter of sample with methylene chloride using a separatory funnel. The methylene chloride extract dried and concentrated to a volume of 10 mL or less. Compounds are separated by HPLC, and measurement is conducted with a UV detector. The method detection limit has not been determined for propham, but it is estimated that the detection limits for analytes included in this method are in the range of 1−5 μg/L. Fish Tox = 5112.55273000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Doses to rats of 2000 mg/kg produced loss of righting reflex, ptosis, piloerection, decreased locomotor activity; chronic pulmonary disease; rugation and irregular thickening of the stomach. The acute oral LD_{50} values in male and female rats were reported to be 3,000 232 mg/kg and 2,360 118 mg/kg, respectively. Carbamates are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. LD_{50} = 3274 mg/kg[NIOSH].

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 100.00000 ppb (VERY LOW).

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 200 (estimate).

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Propiconazole P:1125

Formula: $C_{15}H_{17}Cl_2N_3O_2$

Synonyms: Alamo; Banner; Benit; Break; Bumper; Caswell No. 323EE; CGA-64250; CGA-92710F; Desmel; (±)-1-[2-(2,4-Dichlorophenyl)-4-propyl-1,3-dioxolan-2-ylmethyl]-1*H*-1,2,4-triazole; 1-[(2-(2,4-Dichlorophenyl)-4-propyl-1,3-dioxolan-2-yl)methyl]-1*H*-1,2,4-triazole; 1-[2-(2,4-Dichlorophenyl)-4-propyl-1,3-dioxolan-2-yl]-methyl-1*H*-1,2,4,-triazole; Fidis; Juno; Manti S; Maxx; Novel; Orbit; Practis; Proconazole; Propimax; Radar; Restore; Spire; Stratego (trifloxystrobin + propiconazole); Taspa; Tilt; 1*H*-1,2,4-Triazole, 1-[(2-(2,4-dichlorophenyl)-4-propyl-1,3-dioxolan-2-yl)methyl]-; Wocosin

CAS Number: 60207-90-1; 75881-82-2

HSDB Number: 6731
RTECS Number: XZ4620000
UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171
EC Number: 262-104-4 [*Annex I Index No.:* 613-205-00-0]
Regulatory Authority and Advisory Information
Carcinogenicity[83]: EPA Group C, possible human carcinogen
Hazard Alert: Poison (category 3), Suspected reprotoxic hazard, Possible endocrine disruptor; Sensitization hazard (skin), Environmental hazard.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Regulations: Hazard Symbol: T, Xn, Xi, N; Risk phrases: R40; R21; R22; R43; R50/53; R63; Safety phrases: S1/2; S29; S36/37; S41; S46; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.
Description: Colorless solid or a yellow thick liquid. Odorless. Commercial product is available as an emulsifiable concentrate. Physical and toxicological properties may be affected by carrier solvents in commercial formulations. Molecular weight = 342.22; Specific gravity (H_2O:1) = 1.33 @ 20°C; Boiling point = (decomposes); Freezing/Melting point = -25°C; Vapor pressure = 4.2×10^{-7} mmHg @ 20°C; Flash point = 244°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water; solubility = 112 ppm.
Potential Exposure: Propiconazole is a triazole fungicide used to control fungi on a broad range of crops and turf. Used on ornamentals, range land and rights-of-way to prevent and control powdery mildew and fungi on hardwoods and conifers.
Incompatibilities: The triazoles are sensitive to heat, friction, and impact. Sensitivity varies with the type substitution to the triazole ring. Metal chelated and halogen substitution of the triazol ring make for a particularly heat sensitive material. Azido and nitro derivatives have been employed as high explosives. No matter the derivative these materials should be treated as explosives[88].
Permissible Concentration in Water: Federal Drinking Water Guidelines: 9 ppb[93] State Drinking Water Guidelines: Maine 9 μg/L. Runoff from spills or fire control may cause water pollution.
Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.
Routes of Entry: Inhalation, passing through the skin and ingestion

Harmful Effects and Symptoms
Short-Term Exposure: Irritates the skin, eyes, and respiratory tract. Eye contact may cause irritation, burning sensation, and damage. Harmful if ingested, inhaled or absorbed through the skin. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved air purifying respirators for pesticides. May be harmful if swallowed. LD_{50} (oral, rat) = >1000 mg/kg; LD_{50} (dermal, rat) = >4 g/kg.
Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. Consult a physician if poisoning is suspected or if redness, itching, or burning of the eyes or skin develop. Skin sensitizer.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.
Personal Protective Methods: Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. DuPont Tychem Suit Fabrics is recommended by one government source[88]. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.
Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).
Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Refrigerate. Prior to working with this chemical all handlers should be trained on its proper

handling and storage. Store in tightly closed containers in a cool, well ventilated area. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: For solids, isolate spill or leak area in all directions for at least 25 meters/75 feet. Increase, in the downwind direction, as necessary. First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. If you spill this chemical, you should dampen the solid spill material with water, then transfer the dampened material to a suitable container. Use absorbent paper dampened with water to pick up any remaining material. Seal your contaminated clothing and the absorbent paper in a vapor-tight plastic bag for eventual disposal. Wash all contaminated surfaces with a soap and water solution. Do not reenter the contaminated area until the Safety Officer (or other responsible person) has verified that the area has been properly cleaned. Do not allow water to get inside containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Treat as an explosive. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. See "Incompatibilities" section. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Contact a licensed disposal facility about surplus and nonrecyclable solutions. Burn in a chemical incinerator equipped with an afterburner and scrubber. Extra care must be exercised as the material in an organic solvent is highly flammable. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Incineration or permanganate oxidation.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: β-Propiolactone is a colorless liquid which slowly hydrolyzes to hydracrylic acid and must be cooled to remain stable. Molecular weight = 72.06; Specific gravity (H_2O:1) = 1.15 @ 20°C; Boiling point = (decomposes) 162°C; Freezing/Melting point = −33.4°C; Vapor pressure = 3 mmHg @ 25°C; Flash point = 75°C. Explosive limits: LEL = 2.9%; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 2, Reactivity 0₩. Soluble in water; solubility = 37%. Reacts with water, releasing irritating 3-hydroxypropionic acid.

Potential Exposure: β-Propiolactone is used as a chemical intermediate in synthesis of acrylic acid and esters, acrylate plastics; as a vapor sterilizing agent; phase disinfectant; and a viricidal agent.

Incompatibilities: Reacts with water, causing decomposition and forming 3-hydroxypropionic acid (CAS: 503-66-3), an irritant. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with acetates, halogens, thiocyanates, thiosulfates, strong oxidizers; strong bases. Forms explosive mixture with air above 75°C. May polymerize upon storage or due to warming. Stable if kept under refrigeration @ 5 to 10°C/40 to 50°F.

Permissible Exposure Limits in Air:

NIOSH IDLH = Not determined. Potential occupational carcinogen

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and personal protective equipment, including respirators. See 29CFR 1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 0.5 ppm/1.5 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.5 ppm

PAC-2: 5 ppm

PAC-3: 30 ppm

DFG MAK: [skin] Carcinogen Category 2

Australia: TWA 0.5 ppm (1.5 milligram per cubic meter), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.5 ppm (1.5 milligram per cubic meter), carcinogen, 1993; Denmark: TWA 0.1 ppm (1.5 milligram per cubic meter), 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Poland: MAC (TWA) 1 milligram per cubic meter, 1999; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.5 ppm (1.5 milligram per cubic meter), carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for propiolactone in ambient air[60] ranging from zero (North Dakota) to 5.0 μ/m^3 (New York) to 7.5 μ/m^3 (South Carolina) to 15 μ/m^3 (Florida and Virginia) to 22.5 μ/m^3 (Connecticut) to 36.0 μ/m^3 (Nevada).

Routes of Entry: Inhalation, ingestion, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes. May cause corneal opacity and blindness. Irritates the respiratory tract.

Contact with skin causes irritation, burns, and blistering; fluid from blisters may cause additional blistering of adjacent skin. Ingestion causes burns of mouth and stomach. The toxicity potential of this material via inhalation or ingestion is high; may cause death or permanent injury after very short exposures to small quantities.

Long-Term Exposure: A potential occupational carcinogen. May cause frequent urination, dysuria, hematuria (blood in the urine). May affect the liver and kidneys. May cause tumors and cancer.

Points of Attack: Kidneys, skin, lungs, eyes, liver. Cancer site in animals: tumors of the liver, skin and stomach.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Based on its high toxicity and carcinogenic effects in animals, preplacement and periodic examinations should include a history of exposure to other carcinogens; alcohol and smoking habits; medication and family history. The skin, eye, lung, liver, and kidney should be evaluated. Sputum cytology may be helpful in evaluating the presence or absence of carcinogenic effects. Kidney and liver function tests. Periodic lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required for this chemical. Refer to OSHA Standard: *beta-Propiolactone, 29 CFR 1910.1013.*

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code-Blue: Health Hazard/Poison: Store in a cool secure poison location. Avoid storing in areas of exposure to the direct rays of the sun or heat and in areas of high fire hazard. Tends to polymerize on storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in a refrigerator or a freezer in glass containers and protect from air and light. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3382 Toxic by inhalation liquid, n.o.s. with an $LC_{50} \leq 1000$ mL/m^3 and saturated vapor concentration ≥ 10 LC_{50}, Hazard class: 6.1; Labels: 6.1 Technical Name Required, Inhalation Hazard Zone B. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN3382 Toxic by inhalation liquid, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fireighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information
Carcinogenicity: EPA: Inadequate Information to assess carcinogenic potential.
Hazard Alert: Highly flammable, Polymerization hazard; Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, Xi; Risk phrases: R11; R19; R36/37/38; R41; R62; Safety phrases: S2; S9; S16; S21; S25; S29 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Propionaldehyde is a colorless liquid. Very strong, intensive fruit odor. Molecular weight = 58.08; Specific gravity (H_2O:1) = 0.9 @ 20°C; Boiling point = 48°C; Freezing/Melting point = −80°C; Flash point = −30°C(oc); Vapor pressure = 750 mmHg @ 48°C Autoignition temperature = 207°C. Explosive limits: LEL = 2.6%; UEL: 17%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Slightly soluble in water.

Potential Exposure: Used as a synthetic flavoring; as a disinfectant and preservative; to make propionic acid; in plastic and rubber manufacturing; to make alkyl resins and plasticizers.

Incompatibilities: Incompatible with strong acids; amines. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong caustics; reducing agents can cause explosive polymerization. Can self-ignite if finely dispersed on porous or combustible material, such as fabric. Heat or UV light can cause decomposition. Aldehydes are frequently involved in self-condensation or polymerization reactions. These reactions are exothermic; they are often catalyzed by acid. Aldehydes are readily oxidized to give carboxylic acids. Flammable and/or toxic gases are generated by the combination of aldehydes with azo, diazo compounds, dithiocarbamates, nitrides, and strong reducing agents. Aldehydes can react with air to give first peroxo acids, and ultimately carboxylic acids. These autoxidation reactions are activated by light, catalyzed by salts of transition metals, and are autocatalytic (catalyzed by the products of the reaction). The addition of stabilizers (antioxidants) to shipments of aldehydes retards autoxidation[101].

Permissible Exposure Limits in Air:

ACGIH TLV[1]: 20 ppm/48 milligram per cubic meter TWA

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{45_A}$ ppm

PAC-2: $\mathbf{260_A}$ ppm

PAC-3: $\mathbf{840_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Air: NIOSH Analytical Method #2539, aldehydes, screening.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin causing a burning sensation and rash on contact. Inhalation can irritate the respiratory tract and may cause nosebleeds, sore throat; cough and phlegm. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Can irritate the lungs; bronchitis may develop. Testing has not been completed to determine the carcinogenicity of propionaldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Lungs, skin.

Medical Surveillance: Lung function test. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1275 Propionaldehyde, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. *Do not use water.* Use dry chemical, carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid, Corrosive (skin, eyes), Suspected of causing genetic defects, Primary irritant (w/o allergic reaction). Listed for Tier 1 screening as an endocrine disruptor[88].

United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Pesticide subject to registration or re-registration

FDA-over the counter drug

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C, T, F; Risk phrases: R10; R34; R36/38; R62; Safety phrases: S1/2; S23; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Propionic acid is a colorless liquid. Sharp, rancid odor. The Odor Threshold is 0.16 ppm. Molecular weight = 74.09; Specific gravity (H_2O:1) = 0.998 @ 25°C; Boiling point = 141°C; Freezing/Melting point = −22°C; Vapor pressure = 3 mmHg @ 25°C; Flash point = 52.2°C (cc); 57°C (oc); Autoignition temperature = 465°C. Explosive limits: LEL = 2.9%; 11.000 ppm[138]; UEL: 12.1%[17]. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water, releases heat.

Potential Exposure: Propionic acid is used in the manufacture of inorganic propionates and propionate esters which are used as mold inhibitors, electroplating additives; emulsifying agents; flavors and perfumes. It is an intermediate in pesticide manufacture, pharmaceutic manufacture; and in the production of cellulose propionate plastics. Also used as grain preservative.

Incompatibilities: The substance is a medium strong acid. Incompatible with sulfuric acid, strong bases; ammonia, isocyanates, alkylene oxides; epichlorohydrin. Reacts with bases; strong oxidizers; and amines, causing fire and explosion hazard. Attacks many metals forming flammable/explosive hydrogen gas.

Permissible Exposure Limits in Air:

Conversion factor: 1 ppm = 3.03 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 10 ppm/30 milligram per cubic meter TWA; 15 ppm/45 milligram per cubic meter STEL
ACGIH TLV[1]: 10 ppm/30 milligram per cubic meter TWA
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 15 ppm
PAC-2: 28 ppm
PAC-3: 170 ppm
DFG MAK: 10 ppm/31 milligram per cubic meter TWA; Peak Limitation Category I(2); [skin]; Pregnancy Risk Group C.
Australia: TWA 10 ppm (30 milligram per cubic meter); STEL 15 ppm, 1993; Austria: MAK 10 ppm (30 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (30 milligram per cubic meter); STEL 15 ppm, 1993; Denmark: TWA 10 ppm (30 milligram per cubic meter), 1999; Finland: TWA 10 ppm, [skin], 1999; France: VME 10 ppm (30 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 31 milligram per cubic meter, 2003; Russia: STEL 20 milligram per cubic meter, 1993; Sweden: NGV 10 ppm (30 milligram per cubic meter), KTV 15 ppm (45 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (30 milligram per cubic meter), KZG-W 20 ppm (60 milligram per cubic meter), 1999; United Kingdom: TWA 10 ppm (31 milligram per cubic meter); STEL 15 ppm (46 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietman: ACGIH TLV: TWA 10 ppm. Russia[43] set a MAC for ambient air in residential areas of 0.015 milligram per cubic meter (15 μ/m^3) on a momentary basis. Several states have set guidelines or standards for propionic acid in ambient air[60] ranging from 300−450 μ/m^3 (North Dakota) to 500 μ/m^3 (Virginia) to 600 μ/m^3 (Connecticut) to 714 μ/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 0.31$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause severe eye burns, leading to permanent damage. Skin contact causes skin burns. Inhalation can cause irritation of the respiratory tract with mild cough; asthmatic response were found in medical reports of acute exposure of workers.

Long-Term Exposure: May cause an asthma-like allergy. May irritate the lungs; may lead to lung damage.

Points of Attack: Skin, eyes, and respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. These may be normal if person is not having an attack at the time of the test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends Neoprene, nitrile rubber and polyvinyl chloride as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 10 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece powered-air purifying respirators. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air purifying respirators. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in containers made of aluminum or stainless steel. Propionic acid will corrode steel. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), ignition sources or heat. Outside or detached storage is preferred. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1848 Propionic acid, Hazard class: 8; Labels: 8-Corrosive material. UN3463 Propionic acid, with not <90% acid by mass, Hazard Class 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover spilled material with soda ash or sodium bicarbonate. Mix and add water. Neutralize and drain to sewer with plenty of water. Use water spray to dilute spill and disperse vapor. Or, absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with flammable solvent.

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Corrosive, Violently water reactive.

List 1, DEA chemical code 8328 (Title 21 CFR1310.02)

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C, F; Risk phrases: R10; R14; R34; Safety phrases: S1/2; S26; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Propionic anhydride is a colorless liquid. Strong, pungent, unpleasant odor. Molecular weight = 130.16; Specific gravity (H_2O:1) = 1.01 @ 20°C; Boiling point = 167°C; Freezing/Melting point = −45°C; Vapor pressure = 1 mmHg @ 21°C; Flash point = 62.8°C; Autoignition temperature = 285°C. Explosive limits: LEL = 1.3%; 20,000 ppm[138]; UEL: 9.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1₩. Decomposes exothermically in water forming heat and propionic acid which is flammable (NFPA 2).

Potential Exposure: Used in the manufacture of perfumes, flavorings, alkyd resins; dyestuffs, pharmaceuticals; as an esterifying agent for fats, oils, and cellulose; dehydrating medium for nitrations and sulfonations.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, reducing agents; alcohols and metals. Contact with water forms heat + flammable propionic acid. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 7.1 milligram per cubic meter

PAC-2: 78 milligram per cubic meter

PAC-3: 470 milligram per cubic meter

Permissible Concentration in Water: High concentrations are dangerous to aquatic life. May be dangerous if it enters water intakes.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact can cause burns and permanent damage. Contact with liquid causes burns of skin. Ingestion causes burns of the mouth and stomach. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause skin allergy. Can irritate the lungs; bronchitis may develop.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2496 Propionic anhydride, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; Risk phrases: R11; R27/28; R41; R62; R63; Safety phrases: S1; S13; S21; S24/25; S28; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Propionitrile is a colorless liquid with a pleasant, sweetish, ethereal odor. Molecular weight = 55.09; Specific gravity (H_2O:1) = 0.78 @ 20°C; Boiling point = 97°C; Freezing/Melting point = −104°C; Vapor pressure = 35 mmHg @ 30°C; Flash point = 2.2°C (cc). Explosive limits: LEL = 3.1%; 30.000 ppm[138]; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 1. Soluble in water; solubility = 12%.

Potential Exposure: Used as a solvent in petroleum refining, as a chemical intermediate; a raw material for drug manufacture; and a setting agent.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides., reducing agents. Hydrogen cyanide is produced when propionitrile is heated to decomposition. Reacts with acids, steam, warm water; producing toxic and flammable hydrogen cyanide fumes. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

Permissible Exposure Limits in Air:
Conversion factor: 1 ppm = 2.25 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: TWA 6 ppm/14 milligram per cubic meter; *Nitriles:* 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.
ACGIH TLV[1]: None
Protective Action Criteria (PAC)* Ver. 29[138]
PAC-1: 0.27 ppm
PAC-2: $\mathbf{3.0}_{\mathbf{A}}$ ppm
PAC-3: $\mathbf{9.1}_{\mathbf{A}}$ ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may cause burns to skin and eyes. May affect the iron metabolism, causing asphyxia. It is highly toxic. Forms cyanide in the body. This super toxic compound has a probable oral lethal dose in humans of less than 5 mg/kg or a taste (less than 7 drops) for a 70 kg (150 lb) person[101]. Exposure results in headache, dizziness, rapid pulse; deep-rapid breathing; nausea, vomiting, unconsciousness, convulsions and possible death. May cause cyanosis (blue coloration of skin and lips caused by lack of oxygen).

Long-Term Exposure: Chronic exposure over long periods may cause fatigue and weakness. Can cause same general symptoms as hydrogen cyanide but onset of symptoms is likely to be slower. May cause liver and kidney damage. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: In animals: liver, kidney damage

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1–2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. For engineering controls, see NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: *60 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *150 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *300 ppm:* CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight -fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1000 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in an explosion-proof refrigerator. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2404 Propionitrile, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous material.

UN1992 Flammable liquids, toxic, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Nitriles spill

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen cyanide vapors and oxides of nitrogen and carbon and other toxic chemicals. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alcoholic NaOH followed by calcium hypochlorite may be used, as may incineration[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Propoxur is a white to tan crystalline solid or powder. Faint characteristic odor. Molecular weight = 209.27. Boiling point = (decomposes). Freezing/Melting point = 91.5°C. Vapor pressure = 9.75 mmHg @ 20°C. Flash point = > 149°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 2 g/L @ 20°C.

Potential Exposure: Personnel engaged in the manufacture, formulation and application of this organonitrogen agricultural chemical and pesticide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alkalis, heat, and moisture. Emits highly toxic methyl isocyanate fumes when heated to decomposition.

Permissible Exposure Limits in Air:

OSHA PEL: None

NIOSH REL: 0.5 milligram per cubic meter TWA

ACGIH TLV[1]: 0.5 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans. BEIA issued for Acetylcholinesterase inhibiting pesticides

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 6.7 milligram per cubic meter

PAC-3: 40 milligram per cubic meter

DFG MAK: 2 milligram per cubic meter measured as the, inhalable fraction TWA; Peak Limitation Category II(8)

Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: MAK 0.5 milligram per cubic meter, 1999; Belgium: TWA 0.5 milligram per cubic meter, 1993; Denmark: TWA 0.5 milligram per cubic meter, 1999; Finland: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, 1993; France: VME 0.5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; Poland: MAC (TWA) 0.5 milligram per cubic meter; MAC (STEL) 2 milligram per cubic meter, 1999; Switzerland: MAK-W 0.5 milligram per cubic meter, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for Baygon in ambient air[60] ranging from $5-20\ \mu/m^3$ (North Dakota) to $8\ \mu/m^3$ (Virginia) to $10\ \mu/m^3$ (Connecticut) to $12\ \mu/m^3$ (Nevada).

Determination in Air: Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/UV detection; NIOSH Analytical Method (IV) #5601.

Determination in Water: Fish Tox = 168.01099000 MATC (LOW). Octanol-water coefficient: Log $K_{ow} = 1.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Propoxur can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is a moderately toxic carbamate chemical. Exposure can cause severe carbamate poisoning, with symptoms of headaches, sweating, nausea and vomiting; diarrhea, muscle twitching; loss of coordination and even death. May affect the nervous system; liver, kidneys. A cholinesterase inhibitor. $LD_{50} = 83$ mg/kg[77].

Long-Term Exposure: Propoxur may cause mutations. Handle with extreme caution. It may damage the developing fetus. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 94.85095 ppb CHCL (Chronic Human Carcinogen Level) (LOW).

Points of Attack: CNS; liver, kidneys, gastrointestinal tract; blood cholinesterase.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: serum and red blood cell cholinesterase levels (a test for the enzyme in the body affected by propoxur). These tests are only useful if done 1−2 after exposure and can return to normal before the person feels well. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 0.5 milligram per cubic meter, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, moisture, oxidizers, alkaline environments. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 30.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Highly toxic gases are produced in fire, including methyl isocyanate. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Hazard Alert: Highly Flammable; Polymerization hazard (nonstabilized), Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F; Risk phrases: R11; R19; R36; R66; R67; Safety phrases: S2; S16; S21; S23; S26; S29; S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: *n*-Propyl acetate is a colorless liquid with a mild, fruity odor. The Odor Threshold is 70 milligram per cubic meter and 2.8 milligram per cubic meter (New Jersey Fact Sheet). Molecular weight = 102.15 (both isomers); Specific gravity (H_2O:1) = 0.84 @ 20°C; Boiling point = 101.5°C; Freezing/Melting point = −92.2°C; Vapor pressure = 36 mmHg @ 25°C; Flash point = 13°C; Autoignition temperature = 450°C. Explosive limits: LEL = 1.7% @ 38°C; UEL: 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 2%.

Potential Exposure: Propyl acetate is a used as a solvent for plastics and cellulose ester resins; perfume ingredient; component of food flavoring. It is also used as a chemical intermediate.

Incompatibilities: Contact with nitrates, strong oxidizers; strong alkalis; strong acids; may pose risk of fire and explosions. Attacks plastic.

Permissible Exposure Limits in Air:

NIOSH IDLH = 1700 ppm

Conversion factor: 1 ppm = 4.18 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 200 ppm/840 milligram per cubic meter TWA

NIOSH REL: 200 ppm/840 milligram per cubic meter TWA; 250 ppm/1050 milligram per cubic meter STEL

ACGIH TLV[1]: 200 ppm/835 milligram per cubic meter TWA; 250 ppm/1040 milligram per cubic meter STEL

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 250 ppm

PAC-2: 1300 ppm

PAC-3: 8000 ppm

Several states have set guidelines or standards for propyl acetate in ambient air[60] ranging from 8.4−10.5 milligram per cubic meter (North Dakota) to 14 milligram per cubic meter (Virginia) to 16.8 milligram per cubic meter (Connecticut) to 20 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1401, alcohols II; #1405, alcohols, Combined; OSHA Analytical Method 7, Organic Vapors.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.23$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *n*-Propyl acetate can affect you when breathed in. Exposure can irritate the eyes, nose, and throat. Very high levels are narcotic and may affect the nervous system and cause you to feel dizzy, lightheaded, and to pass out.

Long-Term Exposure: Prolonged or repeated contact can cause drying and cracking of the skin.

Points of Attack: Eyes, skin, respiratory system; CNS.

Medical Surveillance: There is no special test for this substance. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber; polyvinyl alcohol, and Silvershield are recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1700 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. *n*-Propyl acetate must be stored to avoid contact with nitrates, strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. *n*-Propyl acetate will dissolve some plastics and resins. Sources of ignition, such as smoking and open flames, are prohibited where *n*-propyl acetate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of *n*-propyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of *n*-propyl acetate.

Shipping: UN1276 *n*-Propyl acetate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Negative: *In vitro* SCE-nonhuman

Hazard Alert: Highly Flammable liquid, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, Xi; Risk phrases: R2; R11; R36/37/38; R41; R47; R61; R63; R67; Safety phrases: S2; S7; S16; S21; S26; S39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: The two isomers of propyl alcohol are *n*-propyl alcohol and isopropyl alcohol. The Odor Threshold is 5.3 *ppm*[41] and 2.6 ppm (NJ). Both are colorless, volatile liquids. Alcohol odor. Isopropyl alcohol is discussed in a separate entry in this volume. *n*-Propanol: Molecular weight = 60.11; Specific gravity (H_2O:1) = 0.81 @ 20°C; Boiling point = 97°C; Freezing/Melting point = −127°C; Vapor pressure = 15 mmHg @ 25°C; Flash point = 22.2°C; Autoignition temperature = 412°C. Explosive limits: LEL = 2.2%; UEL: 13.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water.

Isopropanol; Molecular weight = 102.2; Specific gravity (H_2O:1) = 0.80 @ 20°C; Boiling point = 130°C. Soluble in water.

Potential Exposure: *n*-Propyl alcohol is used as as solvent in lacquers, dopes; to make cosmetics; dental lotions; cleaners, polishes, and pharmaceuticals; as a surgical antiseptic. It is a solvent for vegetable oils, natural gums and resins; rosin, shellac, certain synthetic resins; ethylcellulose, and butyral; as a degreasing agent; as a chemical intermediate.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. *n*-Propanol reacts with alkali metal, nitrides and strong reducing agents to give flammable and/or toxic gases. Reacts with oxoacids and carboxylic acids to form esters plus water. Converted by oxidizing agents to propanal or propionic acid. May initiate the polymerization of isocyanates and epoxides[101].

Permissible Exposure Limits in Air:

NIOSH IDLH = 800 ppm

Odor Threshold = 5.3 ppm[41]; 2.6 ppm[70] (*iso*-)

PAC-3: 67 ppm
DFG MAK: 200 ppm/500 milligram per cubic meter [skin]; BAT: 50 mg[Acetone]/L in blood or urine/end-of-shift as isopropyl alcohol
Australia: TWA 200 ppm (500 milligram per cubic meter); 200 ppm (492 milligram per cubic meter) STEL [skin], 1993; Austria: MAK 200 ppm (500 milligram per cubic meter), 1999; Belgium: TWA 200 ppm (492 milligram per cubic meter); STEL 250 ppm, [skin], 1993; Denmark: TWA 200 ppm (500 $mg.m^3$), [skin], 1999; Finland: TWA 200 ppm (500 milligram per cubic meter); STEL 250 ppm, [skin], 1999; France: VME 200 ppm (500 milligram per cubic meter), 1999; Hungary: TWA 100 milligram per cubic meter; STEL 200 milligram per cubic meter, 1993; Norway: TWA 100 ppm (245 milligram per cubic meter), 1999; Poland: MAC (TWA) 200 milligram per cubic meter; MAC (STEL) 600 milligram per cubic meter, 1999; Russia: STEL 10 milligram per cubic meter, 1993; Sweden: NGV 150 ppm (350 milligram per cubic meter), KTV 250 ppm (600 milligram per cubic meter), 1999; Switzerland: MAK-W 200 ppm (500 milligram per cubic meter), [skin], 1999; Turkey: TWA 200 ppm (500 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (500 milligram per cubic meter); STEL 250 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 250 ppm [skin]. Russia[35][43] set a MAC values for ambient air in residential areas[60] of 0.3 milligram per cubic meter both on a momentary and a daily average basis. Several states have set guidelines or standards for propanol in ambient air[60] ranging from 0.67 milligram per cubic meter (Massachusetts) to 5.0−6.25 milligram per cubic meter (North Dakota) to 8.0 milligram per cubic meter (Virginia) to 10.0 milligram per cubic meter (Connecticut) to 11.905 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #1401, alcohols[18].

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 6,900 μg/L based on health effects. Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.25 mg/L.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Propyl alcohol can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. May cause serious eye damage. Prolonged skin contact can cause a burning sensation and rash. Exposure to high concentrations can affect the CNS and cause headaches, drowsiness, dizziness, and confusion; ataxia, gastrointestinal pain; abdominal cramps; nausea, vomiting, diarrhea. High levels can cause unconsciousness.

Long-Term Exposure: Repeated skin exposure may cause drying and cracking of the skin. Propyl alcohol may cause mutations. Handle with extreme caution. This chemical is listed by the state of New Jersey as a Special Health Hazard and a data sheet (listed below) states that this chemical may be a carcinogen in humans: It has been shown to cause liver carcinomas and sarcoma, spleen sarcoma, and leukemia in animals. It should be treated with caution.

Points of Attack: Eyes, skin, respiratory system; gastrointestinal tract; CNS. May cause liver damage. It may cause brain or nerve damage.

Medical Surveillance: Liver function tests. Evaluate for brain and nerve effects including cerebellar, autonomic and peripheral nervous systems; changes in memory; concentration, sleeping pattern, and mood; headaches and fatigue. Positive and borderline individuals should be referred for neuropsychological testing. Eye evaluation by an opthomologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene, Teflon, nitrile, and polyvinyl acetate are recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 800 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or

GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propyl alcohol must be stored to avoid contact with strong oxidizers, (such as chlorine and bromine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where propyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of propyl alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1274, *n*-Propanol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Corrosive, Primary irritant (w/o allergic reaction).

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U194

RCRA, 40CFR261, Appendix 8 Hazardous Constituents
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg)
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, C; Risk phrases: R11; R20/21/22; R34; Safety phrases: S7; S9; S16; S21; S26; S36/37/39; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: *n*-Propylamine is a water-white liquid with a strong irritating odor similar to that of ammonia. Molecular weight = 59.3; Specific gravity (H_2O:1) = 0.72 @ 20°C; Boiling point = −83°C; Freezing/Melting point = −83°C; Vapor pressure = 248 mmHg @ 20°C; Flash point = < −37°C; Autoignition temperature = 318°C. Explosive limits: LEL = 2.0%, 2000 ppm[138]; UEL: 10.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water forming a highly alkaline soluation.

Potential Exposure: Propylamine is used to make textile resins, drugs, pesticides, and other chemicals.

Incompatibilities: Vapors may form explosive mixture with air. Violent reaction on contact with oxidizers and mercury, strong acids; organic anhydrides; isocyanates, aldehydes, nitroparrafins, halogenated hydrocarbons; alcohols and many other compounds. Attacks many metals and alloys, especially those of copper. Aqueous solution is acidic and may attack glass.

Permissible Exposure Limits in Air:
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 5.4 ppm
PAC-2: 59 ppm
PAC-3: 100 ppm
Finland: STEL 5 ppm (12 milligram per cubic meter), [skin], 1999; Russia[43] set a MAC in work-place air of 5 milligram per cubic meter. It should be recognized that propylamine can be absorbed through your skin, thereby increasing your exposure.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 0.2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Propylamine can affect you when breathed in and by passing through your skin. Corrosive to the eyes, skin, and respiratory tract. Propylamine can cause severe eye burns leading to permanent damage and blindness. Contact can cause severe skin burns. Breathing Propylamine can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema). This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Overexposure or repeated lower exposure may damage the lungs, liver, kidneys and/or heart muscle. Some amines cause skin or lung sensitization and allergy; however, it is not known if this chemical causes these allergies.

Points of Attack: Lungs, liver, kidneys, heart.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following also may be useful: tests for kidney and liver function. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon and polyvinyl acetate are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to propylamine exists, use a NIOSH/MSHA (US) or EN149

(Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a MSHA/NOSH approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.
Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propylamine is incompatible with strong acids (such as hydrochloric, sulfuric, and nitric); acid anhydrides; acid chlorides; strong oxidizers (such as chlorine, bromine, and fluorine), carbon dioxide; and triethynyl aluminum. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where Propylamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of propylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of propylamine. Wherever propylamine is used, handled, manufactured, or stored use explosion-proof electrical equipment and fittings.
Shipping: UN1277 Propylamine, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Water may be ineffective for fighting fires. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg)
Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 500 lb (227 kg)
United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, T; Risk phrases: R12; R23; R29; R34; Safety phrases: S1/2; S16; S26; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Propyl chloroformate is a colorless liquid. Molecular weight = 122.56; Boiling point = 114−116°C; Flash point = 10°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 2₩. Insoluble in water; slowly decomposes releasing heat and hydrochloric acid.

Potential Exposure: Propyl chloroformate is used in organic synthesis; as an intermediate for polymerization initiators; may have been used as a military poison gas.

Incompatibilities: Propyl chloroformate forms explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, water and alcohols. Reaction with water forms heat and hydrochloric acid. Attacks some metals and coating in the presence of moisture.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 0.34 ppm

PAC-2: $\mathbf{3.7_A}$ ppm

PAC-3: $\mathbf{11_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: A lacrimator; vapors cause tearing. Corrosive to eyes, skin, and mucous membranes. May cause burns and permanent eye damage. Poisonous: may be fatal if inhaled, swallowed or absorbed through skin. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause lung damage.

Points of Attack: Lungs.

Medical Surveillance. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on non-wooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2740 *n*-Propyl chloroformate, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, 8-Corrosive material. Inhalation Hazard Zone B.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 0.8/1.3

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride, chlorine fumes and oxides of carbon. *Small fires:* Dry chemical, carbon dioxide extinguishers. Move container from fire area if you can do so without risk. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Isolate for ½ mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Spray cooling water on containers that are exposed to flames until after fire is out. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Propylene is a colorless gas. Slight odor. The Odor Threshold is 23 ppm. Molecular weight = 42.1; Specific gravity (H_2O:1) = 0.59 @ 20°C; Boiling point = −48°C; Freezing/melting point = −185°C; Vapor pressure = 7.6×10^3 mmHg @ 25°C; Flash point = Flammable gas (−72°C); Autoignition temperature = 455°C. Explosive limits: LEL = 2.0%; UEL: 11.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 1. Insoluble in water.

Potential Exposure: Propylene is used in production of fabricated polymers, fibers, polypropylene resins; solvents, isopropyl alcohol, propylene dimer, and trimer as gasoline components and detergent raw materials; propylene oxide; cumene, synthetic glycerol; isoprene, and oxo-alcohols.

Incompatibilities: Propylene forms explosive mixture with air. Violent reaction with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and many other compounds. Able to form unstable peroxides; can polymerize, especially in heat, direct sunlight, oxidizers and other chemicals.

Permissible Exposure Limits in Air:

ACGIH TLV[1]: 500 ppm/860 milligram per cubic meter TWA, not classifiable as a human carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1500 ppm

PAC-2: 2800 ppm

PAC-3: 17,000 ppm

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Russia: STEL 100 milligram per cubic meter, 1993; Switzerland: MAK-W 10000 ppm (17500 milligram per cubic meter), 1999; United Kingdom: asphyxiant, 2000; the Netherlands: MAC-TGG 900 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[43] set a MAC in ambient air in residential areas of 3.0 milligram per cubic meter both on a momentary and a daily average basis.

The oxygen content should be tested regularly to ensure that it is at least 19% by volume.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.8$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Propylene can affect you when breathed in. Exposure to high levels can cause you to feel dizzy and lightheaded. Very high levels can cause you to pass out from lack of oxygen. Death can result. Contact with liquefied propylene can cause frostbite.

Long-Term Exposure: Exposure may cause an irregular heartbeat. It may also damage the liver.

Points of Attack: Liver, heart, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Holter monitor (a special 24 hour EKG to look for irregular heart beat).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to propylene is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved

SCBA with a full facepiece operated in positive pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propylene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or direct sunlight. Sources of ignition, such as smoking and open flames, are prohibited where propylene is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of propylene. Wherever propylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded. Procedures for the handling, use and storage of propylene cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1077 Propylene, Hazard Class: 2.1; Labels: 2.1-Flammable gas. UN1075 Petroleum gases, liquefied or Liquefied petroleum gas, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Put on protective clothing and equipment. Remove tank or cylinder to an open area. Allow to bleed off slowly into atmosphere. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas or liquid. Thermal decomposition products may include oxides of carbon (carbon dioxide and/or carbon monoxide). Stop flow of gas. Use carbon dioxide or dry chemical. Use water spray, fog, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers and protect firefighters. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Use a licensed professional waste disposal service to dispose of this material, perhaps using controlled incineration. All federal, state, and local environmental regulations must be observed.

EC Number: 201-154-3 (2-chloropropan-1-ol); 204-819-6 (1-chloropropan-2-ol).

Regulatory Authority and Advisory Information

Carcinogenicity: *(78-89-7 & 204-819-6)* ACGIH: Not classifiable as a human carcinogen

Hazard Alert: Poison, Combustible, Poison (ingestion).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn; Risk phrases: R10; R22; R36/37/38; R41; R50/53; Safety phrases: S16; S26; S36/37; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Propylene chlorohydrin is a colorless liquid. Molecular weight = 94.54; Boiling point = (78-89-7) 126; 133−134°C; Flash point = (CAS:78-89-7) >40°C; 52°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: This material is used in organic synthesis; to make other chemicals.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Alcohols are sensitive to light and oxidation. It is unstable in solution. It undergoes hydrolysis in aqueous buffers. Contact with alkali metals, nitrides, and strong reducing agents may form flammable and/or toxic gases. May react with anhydrides forming acids and esters, generating noticeable heat, and also with oxoacids and carboxylic acids to form esters plus water, but the heat of reaction in the latter case typically is low. May initiate the polymerization of isocyanates and epoxides.

Permissible Exposure Limits in Air:

78-89-7 & 204-819-6

ACGIH TLV[1]: 1 ppm/4 milligram per cubic meter [skin], not classifiable as a human carcinogen

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous by ingestion. Propylene chlorohydrin can affect you when breathed in and by passing through your skin. It is moderately toxic by inhalation and skin contact. Contact can severely irritate and may burn the eyes. Breathing propylene chlorohydrin can irritate the nose and throat. Contact can irritate the skin. Overexposure may cause you to be lightheaded, unsteady and drowsy.

Long-Term Exposure: It may cause destruction of red blood cells (hemolysis).

Points of Attack: Skin, eyes, blood.

Medical Surveillance: Blood tests. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to propylene chlorohydrin, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials.

Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bomine, and fluorine). Sources of ignition, such as smoking and open flames, are prohibited where propylene chlorohydrin is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2611Propylene chlorohydrin, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak

until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Propylene glycol is a colorless, odorless, syrupy liquid. Molecular weight = 76.1; Boiling point = 187°C; Specific gravity (H_2O:1) = 1.04 @ 20°C; Freezing/Melting point = −60°C; Flash point = 99°C (cc); Autoignition temperature = 371°C. Explosive limits: LEL = 2.6%; 8,000 ppm[138]; UEL: 12.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1 (must be preheated), Reactivity 0; NJDHSS: Health 1, Flammability 1, Reactivity 0 Soluble in water.

Potential Exposure: Propylene glycol is used as a solvent; emulsifying agent; food and feed additive; flavor, in manufacture of plastics; as a plasticizer, surface-active agent; antifreeze, solvent, disinfectant, hydroscopic agent; coolant in refrigeration systems; pharmaceutical, brake fluid; and many others.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids (especially nitric acid), strong bases, permanganates, dichromates; may cause a violent reaction.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 1300 milligram per cubic meter

PAC-3: 7900 milligram per cubic meter

United Kingdom: TWA 150 ppm, total vapor and particulates; STEL 10 milligram per cubic meter, particulates, 2000.

Determination in Air: NIOSH Analytical Method #5523, Glycols.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -0.9$.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Two fluid ounces (60 mL) has caused stupor which lasted for a few hours which was followed by complete recovery.

Long-Term Exposure: A mild allergen. Repeated or prolonged contact may cause skin sensitization and allergy. Therapeutic doses given for over a year have been associated with seizures; no further seizures occurred upon withdrawal of medication.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation., Polyethylene, Nitrile+PVC, butyl rubber; polyvinyl chloride, Tychem (from E.I. du Pont de Nemours & Company), Trellchem, and Responder are among the recommended protective materials. Butyl rubber, Nitrile, and Neoprene, and Neoprene + natural rubber are among the glove materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in a well-ventilated area away from ignition sources. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Not subject to regulation.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

All federal, state, and local environmental regulations must be observed.

Propylene Glycol Dinitrate P:1260

Formula: $C_3H_6N_2O_6$; $CH_3CHONO_2CH_2ONO_2$

Synonyms: PGDN; Propylene glycol-1,2-dinitrate; 1,2-Propanediol, dinitrate; 1,2-Propylene glycol dinitrate Note: Otto fuel is primarily propylene glycol dinitrate.

CAS Registry Number: 6423-43-4; 106602-80-6 (otto fuel)

HSDB Number: 6823 (6423-43-4)

RTECS Number: TY6300000

UN/NA & ERG Number: UN/NA0473 (EXPLOSIVE)/112

EC Number: 229-180-0

Regulatory Authority and Advisory Information

Hazard Alert: Explosive, Strong Oxidizer, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: O, Xn; Risk phrases: R2; R3; R5; R8; R9; R23/24/25; R34; R36/37/38; R44; Safety phrases: S7/8; S16; S17; S36/37/39; S41; S45(see Appendix 4)

Description: Propylene glycol dinitrate is an explosive. It is a colorless, high-boiling liquid (solid below −8°C) with a disagreeable odor. Molecular weight = 166.11; Specific gravity (H_2O:1) = 1.37 @ 20°C; Boiling point = (decomposes) 92°C @ 7.5 mmHg @ 0°C; Freezing/Melting point = −30°C; Flash point = 99°C. Vapor pressure = 0.07 mmHg @ 22°C; Explosive limits: LEL = 17,000 ppm, UEL: unknown. Strong oxidizer. Slightly soluble in water; solubility = 0.1%.

Otto fuel: Molecular weight = 170.

Potential Exposure: Propylene glycol dinitrate has been used as a torpedo propellant. The explosion potential is similar to ethylene glycol dinitrate.

Incompatibilities: Explosive. A strong oxidizer. Contact with ammonia compounds, amines, strong acids; reducing agents; combustible materials may result in fire and explosion. It is similar to ethylene glycol dinitrate in explosion potential. Propylene glycol dinitrate may explode if strongly shocked or heated. Propylene glycol dinitrate is explosive. Acts as a strong oxidizing agent. Heating may cause a violent combustion or explosion producing toxic fumes (nitrogen oxides). May also decompose explosively from shock, friction or from a build-up of electrostatic charge that sparks suddenly to ground. Can begin a vigorous reaction that culminates in an explosion if mixed with reducing agents including hydrides, sulfides, and nitrides and numerous ordinary combustible materials. Reacts violently with al, bp, cyanides, esters, pn2h, p, nacn, sncl2, sodium hypophosphite, and thiocyanates. Reacts with acids and with alkalis, including ammonia and amines[101].

Permissible Exposure Limits in Air:

Conversion factor: 6.79 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.05 ppm/0.3 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.05 ppm/0.34 milligram per cubic meter TWA [skin]; BEIM issued for methemoglobin inducers

Protective Action Criteria (PAC)* Ver. 29[138]

6423-43-4 (propylene glycol dinitrate) & 106602-80-6 (otto fuel which is primarily propylene glycol dinitrate)

PAC-1: **0.17**$_\mathbf{A}$ ppm

PAC-2: **1.0**$_\mathbf{A}$ ppm

PAC-3: **13**$_\mathbf{A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.05 ppm/0.34 milligram per cubic meter TWA; Peak Limitation Category I(1) [skin]

Australia: TWA 0.05 ppm (0.3 milligram per cubic meter), [skin], 1993; Austria: MAK 0.05 ppm (0.3 milligram per cubic meter), [skin], 1999; Belgium: TWA 0.5 ppm (0.35 milligram per cubic meter), [skin], 1993; Denmark: TWA 0.02 ppm (0.2 milligram per cubic meter), [skin], 1999; Finland: TWA 0.02 ppm (0.2 milligram per cubic meter); STEL 0.06 ppm, [skin], 1999; France: VME 0.05 ppm (0.3 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 0.3 milligram per cubic meter, [skin], 2003; Sweden: NGV 0.1 ppm (0.7 milligram per cubic meter), KTV 0.3 ppm (2 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 0.05 ppm (0.35 milligram per cubic meter), [skin], 1999; United Kingdom: TWA 0.2 ppm (1.4 milligram per cubic meter); STEL 0.2 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietman: ACGIH TLV: TWA 0.05 ppm [skin]. Several states have set guidelines or standards for propylene glycol dinitrate in ambient air[60] ranging from 3 μ/m^3 (North Dakota) to 5 μ/m^3 (Virginia) to 6 μ/m^3 (Connecticut) to 7 μ/m^3 (Nevada).

Determination in Air: See OSHA Analytical Method 43.

Routes of Entry: Inhalation, ingestion, dermal and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Propylene glycol dinitrate can affect you when breathed in and by passing through your skin. Exposure can cause headaches, stuffy nose; eye irritation; a "drunken" feeling with impaired balance, visual disturbance. Higher exposures can interfere with the ability of the blood to carry oxygen (methemoglobinemia). This causes cyanosis, a bluish color to the skin and can lead to death. Propylene glycol dinitrate can cause the blood pressure to drop rapidly. Human volunteers at 0.2 ppm exposure exhibited headaches and disruption in visually evoked response. At 0.5 ppm, marked impairment in balance was noted. At 1.5 ppm eye irritation occurred, in addition[53].

Long-Term Exposure: May cause liver and kidney damage.

Points of Attack: Eyes, CNS; blood, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood tests for methemoglobin level. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 0.05 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Explosive. Must be stored in a cool, ventilated place, away from acute fire hazards and easily oxidized materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Propylene glycol dinitrate must be stored to avoid contact with ammonia compounds, amines, oxidizers, reducers or combustible material, since violent reactions occur. Store it tightly closed containers in a cool, well-ventilated area away from heat and avoid shocking or jolting containers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN0473 Substances, explosive, n.o.s., Hazard Class: 1.1A; Labels:1.1A-Explosive (with a mass explosion hazard); A-Substances which are expected to mass detonate very soon after fire reaches them, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Possible polymerization hazard (glycol ethers), Reproductive toxin: Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: None assigned; Risk phrases: R11; R19; R20/21/22; R62; Safety phrases: S2; S21; S24/25; S26; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

as glycol ethers:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono-and di-ethers of ethylene glycol, diethyl glycol; and triethylene glycol R-$(OCH_2CH_2)_n$-OR′ where n = 12, or 3; R = alkyl or aryl groups; R′ = R, H, or groups which, when removed, yield glycol ethers with the structure: R-$(OCH_2CH)_n$-OH. Polymers are excluded from the glycol category

EPCRA Section 313: Certain glycol ethers are covered. R-$(OCH_2CH_2)_n$-OR'; Where n = 1 2 or 3; R = alkyl C7 or less; or R = phenyl or alkyl substituted phenyl; R′ + H, or alkyl C7 or less; or OR' consisting of carboxylic ester, sulfate, phosphate, nitrate or sulfonate. Form R *de minimis* concentration reporting level: 1.0%.

Description: Propylene glycol monomethyl ether is a colorless liquid. Ethereal odor. The Odor Threshold is 10 ppm. Molecular weight = 90.12; Specific gravity (H_2O:1) = 0.96 @ 20°C; Boiling point = 119°C; Freezing/Melting point = (sets to glass) −95°C; Vapor pressure = 13 mmHg @ 25°C; Flash point = 31.8°C[101]; Autoignition temperature = 272°C. Explosive limits: LEL = 1.6%; 20,000 ppm[138]; UEL: 18.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Propylene glycol monomethyl ether is used as a solvent for coatings; cellulose esters and acrylics; acrylics dyes; inks, and stains. It may also be used as a heat-transfer fluid.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid chlorides, acid anhydrides, isocyanates, aluminum, and copper. Hygroscopic (i.e., absorbs moisture from the air). May slowly form reactive peroxides during prolonged storage or on exposure to air and light.

Permissible Exposure Limits in Air:

Conversion factor: 1 ppm = 3.69 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 100 ppm/360 milligram per cubic meter TWA: 150 ppm/540 milligram per cubic meter STEL

ACGIH TLV[1]: 100 ppm TWA; 150 ppm STEL

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 100 ppm

PAC-2: 160 ppm

PAC-3: 660 ppm

DFG MAK: 100 ppm/370 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

Austria: MAK 100 ppm (375 milligram per cubic meter), 1999; Belgium: TWA 100 ppm (369 milligram per cubic meter); STEL 150 ppm (553 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (185 milligram per cubic meter), 1999; Finland: TWA 100 ppm (360 milligram per cubic meter); STEL 150 ppm, [skin], 1999; France: VME 100 ppm (360 milligram per cubic meter), 1999; Norway: TWA 50 ppm (180 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 375 milligram per cubic meter, 2003; Switzerland: MAK-W 100 ppm (360 milligram per cubic meter), KZG-W 200 ppm (720 milligram per cubic meter), 1999; United Kingdom: TWA 100 ppm (375 milligram per cubic meter); STEL 300 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 150 ppm. Several states have set guidelines or standards for PGME in ambient air[60] ranging from 3.6−5.4 milligram per cubic meter (North Dakota) to 6.0 milligram per cubic meter (Virginia) to 7.2 milligram per cubic meter (Connecticut).

Determination in Air: Use NIOSH Analytical Method #2554; OSHA Analytical Method 99.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Propylene glycol monomethyl ether can affect you when breathed in and by passing through your skin. Contact can irritate the eyes and skin. Exposure can irritate the nose and throat. Very high levels may cause lung, liver, and kidney damage. Very high levels of propylene glycol monomethyl ether may cause CNS depression; dizziness and lightheadedness; and unconsciousness.

Long-Term Exposure: Causes skin dryness; dermatitis. May cause liver an kidney damage. Can irritate the lungs; bronchitis may develop.

Points of Attack: Eyes, skin, respiratory system; CNS.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 100 ppm; Use an NIOSH/MSHA or European Standard EN 149-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3092 1-Methoxy-2-propanol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific _recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: NTP 13 th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen (as 2-Methylaziridine); IARC: Human No Adequate Data, animal Sufficient Evidence*, possibly carcinogenic to humans*, Group 2B, 1999; NIOSH: Potential occupational carcinogen. United States Environmental Protection Agency Gene-Tox Program, Positive: Carcinogenicity-mouse/rat; SHE-clonal assay; Positive: Cell transformation-RLV F344 rat embryo; Host-mediated assay; Positive: *E coli polA* without S9; Histidine reversion-Ames test; Positive: *In vitro* UDS-human fibroblast; S *cerevisiae-homozygosis*; Positive: *S pombe*-reversion; Positive/dose response: Cell transformation-BALB/c-3T3.

California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: Poison, Highly flammable, Polymerization hazard (nonstabilized), Possible risk of forming tumors, Suspected reprotoxic hazard, Environmental hazard.

Banned or Severely Restricted (Belgium, Sweden) (UN)[13]

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P067

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10,000 lb (4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, T+, N; Risk phrases: R45; R11; R19; R26/27/28; R41; R50/53; Safety phrases: S1; S29; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Propyleneimine is a fuming, colorless, oily liquid with a strong ammonia-like odor. Molecular weight = 57.1; Specific gravity (H_2O:1) = 0.81 @ 16°C; Boiling point = 66.7°C; Freezing/Melting point = −65°C; Vapor pressure = 140 mmHg @ 25°C; Flash point = −3.89°C (cc). Explosive limits: LEL = 2.3%; 13,000 ppm[138]; UEL: 15.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water.

Potential Exposure: Propyleneimine is used in the modification of latex surface coating resins; in the production of polymers for use in the paper and textile industries as coatings and adhesives.

Incompatibilities: Vapors or liquid form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, water, carbonyl compounds; quinones, sulfonyl halides. May explode in heat. Subject to violent polymerization in contact with acids. Hydrolyzes in water to form methylethanolamine.

Permissible Exposure Limits in Air:
NIOSH IDLH = 100 ppm, potential occupational carcinogen.
OSHA PEL: 2 ppm/5 milligram per cubic meter TWA [skin]
NIOSH REL: 2 ppm/5 milligram per cubic meter TWA [skin]; A potential occupational carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV[1]: 2 ppm/5 milligram per cubic meter TWA; 0.4 ppm/1 milligram per cubic meter STEL [skin]; confirmed animal carcinogen with unknown relevance to humans.
Protective Action Criteria (PAC)* Ver. 29[138]
PAC-1: 0.4 ppm
PAC-2: $\mathbf{12_A}$ ppm
PAC-3: $\mathbf{23_A}$ ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutation Category 3B
Australia: TWA 2 ppm (5 milligram per cubic meter), [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Denmark: TWA 2 ppm (5 milligram per cubic meter), [skin], 1999; Finland: STEL 2 ppm (5 milligram per cubic meter), [skin], carcinogen, 1999; France: carcinogen, 1993; Japan: 2 ppm (4.7 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 0.6 $\mu g/m^3$, 2003; the Phillipines: TWA 2 ppm (5 milligram per cubic meter), [skin], 1993; Russia: TWA 2 ppm, 1993; Switzerland: MAK-W 2 ppm (5 milligram per cubic meter), [skin], carcinogen, 1999; Turkey: TWA 2 ppm (5 milligram per cubic meter), [skin], 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for propyleneimine. in ambient air[60] ranging from zero (North Dakota) to 12 μ/m^3 (Pennsylvania) to 50 μ/m^3 (Connecticut and Virginia) to 119 μ/m^3 (Nevada).
Determination in Air: No method available.
Routes of Entry: Inhalation, skin absorption; ingestion, eye and/or skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: Severely irritates the eyes, skin, and respiratory tract. Contact may cause skin burns and permanent eye damage. Symptoms of exposure include inflammation and blistering of the skin, eye, and upper respiratory tract; irritation, nausea, itching, and periodic vomiting. Headache, dizziness, and pain in the temple. Shortness of breath; and increased nasal and laryngeal secretion are seen. It is toxic after acute exposure. LD_{50} = (oral-rat) 19 mg/kg (highly toxic).
Long-Term Exposure: Caused skin drying and dermatitis. A potential occupational carcinogen. May affect the kidneys.
Points of Attack: Eyes, skin. Cancer site in animals: nasal tumors, breast, brain, leukemia.
Medical Surveillance: NIOSH lists the following tests: CBC; granulocytic leukemia. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).
Storage: (1) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Propyleneimine must be stored to avoid contact with acids and strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where propyleneimine. is used, handled, or

stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of Propyleneimine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of propyleneimine. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1921 Propyleneimine, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid breathing vapors; avoid bodily contact with the material. Toxic gases, including oxides of nitrogen and carbon monoxide are released in a fire. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap with water. Use water spray to disperse vapors and dilute standing pools of liquid. Keep sparks and flames away. Attempt to stop leak if it can be done without hazard. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Propylene oxide is a colorless liquid. Ethereal odor. Molecular weight = 58.1; Boiling point = 34°C; Specific gravity (H_2O:1) = 0.83 @ 20°C; Freezing/Melting point = −112°C; Vapor pressure = 538 mmHg @ 25°C; Flash point = −37.2°C; Autoignition temperature = 450°C. Explosive limits: LEL = 2.3%; UEL: 36 to 38.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 2. Soluble in water; solubility = 41%.

Potential Exposure: Propylene oxide is used as an intermediate in the production of polyether polyols and propylene glycol; as a fumigant; in the production of adducts as urethane foam ingredients; in detergent manufacture; as a component in brake fluids.

Incompatibilities: Vapors may form explosive mixture with air. Reacts with strong oxidizers, anhydrous metal chlorides; chlorine, iron, strong acids; caustics and peroxides. Polymerization may occur due to high temperatures or contamination with alkalis, aqueous acids; amines, metal chlorides; and acidic alcohols. Attacks some plastics, coatings and rubber.

Permissible Exposure Limits in Air:

NIOSH IDLH = 400 ppm, potential occupational carcinogen

Conversion factor: 1 ppm = 2.38 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 100 ppm/240 milligram per cubic meter TWA

NIOSH REL: A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 2 ppm/4.8 milligram per cubic meter TWA, sensitizer; confirmed animal carcinogen with unknown relevance to humans. (2000)

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{73_A}$ ppm

PAC-2: $\mathbf{290_A}$ ppm

PAC-3: $\mathbf{870_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin] Carcinogen Category 2

Australia: TWA 20 ppm (50 milligram per cubic meter), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 20 ppm (48 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (12 milligram per cubic meter), [skin], 1999; Finland: TWA 5 ppm (12 milligram per cubic meter), carcinogen, 1999; France: VME 20 ppm (50 milligram per cubic meter), carcinogen, 1999; the Netherlands: MAC -TGG 6 milligram per cubic meter, 2003; the Phillipines: TWA 100 ppm (240 milligram per cubic meter), 1993; Russia: STEL 1 milligram per cubic meter, [skin], 1993; Sweden: NGV 5 ppm (12 milligram per cubic meter), KTV 10 ppm (25 milligram per cubic meter), 1999; Switzerland: MAK-W 2.5 ppm (6 milligram per cubic meter), carcinogen, 1999; Turkey: TWA 100 ppm (240 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (12 milligram per cubic meter), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia set a MAC for ambient air in residential areas of 0.08 milligram per cubic meter. Several states have set guidelines or standards for propylene oxide in ambient air[60] ranging from 0.0833 μ/m^3 (Kansas) to 1.0 μ/m^3 (Connecticut) to 15.0 μ/m^3 (Massachusetts) to 167.0 μ/m^3 (New York) to 250.0 μ/m^3 (South Carolina) to 500.0 μ/m^3 (North Dakota) to 625.0 μ/m^3 (Pennsylvania) to 850.0 μ/m^3 (Virginia) to 1190.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1612. Propylene oxide; OSHA Analytical Method 88.

Permissible Concentration in Water: Russia has set[35] a MAC value of 0.01 mg/L in water bodies used for domestic purposes and 0.005 mg/L in water bodies used for fishery purposes.

Determination in Water: Octanol-water coefficient: Log K_{ow} = < 0.02.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Propylene oxide may irritate or burn the skin, eyes, and respiratory tract. Contact with the liquid can cause blindness and death. This material is moderately toxic by inhalation and ingestion. It may cause irreversible and reversible changes. Skin contact with the material or solutions of the material cause irritation; diluted solutions are more irritating than undiluted materials. Dermatitis (red, inflamed skin) is common. Exposure may cause mild depression of the CNS and eye, nasal, and lung irritation. Other signs and symptoms of acute exposure may include headache, nausea, vomiting, and unconsciousness. Victims may appear as if they are in a drunken stupor. Pulmonary edema may occur.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. This substance is possibly carcinogenic to humans. May decrease fertility in males and females. May cause lung damage; pneumonia may develop.

Points of Attack: Eyes, skin, respiratory system. Cancer site in animals: nasal tumors, stomach.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Examination of the eyes and vision.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon and butyl rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propylene oxide must be stored to avoid contact with anhydrous metal chlorides, iron, strong acids (such as hydrochloric, sulfuric, and nitric); strong bases and peroxides; copper or copper alloys, since violent reactions occur. Propylene oxide will attack some forms of plastics, rubber and coatings. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where propylene oxide is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of propylene oxide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of propylene oxide. Wherever propylene oxide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1280 Propylene oxide, Hazard Class: 3; Labels: 3-Flammable liquid

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Extinguish with dry chemical, carbon dioxide; water spray, fog or foam. Firefighting should be done from a safe distance or from a protected location. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Isolate for ½ mile in all directions if tank car or truck is involved in fire. Move container from area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides-discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides-perforation of a container of the waste from a safe distance followed by open burning[22].

Regulatory Authority and Advisory Information

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Alert: Explosive (shock sensitive), Highly flammable liquid, Strong Oxidizer (H271).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, O: Risk phrases: R2; R3; R5; R8; R9; R11; R44; Safety phrases: S16; S21; S17; S41 (see Appendix 4)

Description: *n*-Propyl nitrate is a colorless to pale yellow liquid. Ethereal odor. Molecular weight = 105.11; Specific gravity (H_2O:1) = 1.1 @ 20°C; Boiling point = 111°C; Freezing/Melting point = −100°C; Vapor pressure = 18 mmHg @ 25°C; Flash point = 20°C. Autoignition temperature = 175°C; Explosive limits: LEL = 2%/ 20,000 ppm[138]; UEL: 100%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Instability 3 Capable of detonation or explosive decomposition or explosive reaction but requires a strong initiating source or must be heated under confinement before initiation. (Oxidizer). Slightly soluble in water.

Potential Exposure: Propyl nitrate has been used as an intermediate as a rocket propellant and as an ignition improver in diesel fuels.

Incompatibilities: Vapor may form explosive mixture with air. Reacts with reducing agents, combustible materials; may be violent. A shock-sensitive explosive. The shock sensitivity is removed by addition of 1%−2% of propane, butane, chloroform, ethyl ether, or methyl ether[101]. May explode on heating. Forms explosive mixtures with combustible materials. This material is an organonitrate. They can range from slight to strong oxidizing agents. If mixed with reducing agents, including hydrides, sulfides, and nitrides, they may begin a vigorous reaction that culminates in a detonation. Nitroalkanes are milder oxidizing agents, but still react violently with reducing agents at higher temperature and pressures. Nitroalkanes react with inorganic bases to form explosive salts. The presence of metal oxides increases the thermal sensitivity of nitroalkanes. Nitroalkanes with more than one nitro group are generally explosive. Contact with either strong oxidizers or with combustibles may cause fires and explosions[101].

Permissible Exposure Limits in Air:
NIOSH IDLH = 500 ppm
Conversion factor: 1 ppm = 4.30 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: 25 ppm/110 milligram per cubic meter TWA
NIOSH REL: 25 ppm/105 milligram per cubic meter TWA; 40 ppm/170 milligram per cubic meter STEL
ACGIH TLV[1]: 25 ppm/107 milligram per cubic meter TWA; 40 ppm/172 milligram per cubic meter STEL; BEIM issued for methemoglobininducers.
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 40 ppm
PAC-2: 330 ppm
PAC-3: 2000 ppm (Warning: 10% of LEL)
DFG MAK: 25 ppm/110 milligram per cubic meter TWA; Peak Limitation Category II(2)
Australia: TWA 25 ppm (110 milligram per cubic meter); STEL 40 ppm, 1993; Austria: MAK 25 ppm (110 milligram per cubic meter), 1999; Belgium: TWA 25 ppm (107 milligram per cubic meter); STEL 40 ppm (172 milligram per cubic meter), 1993; Denmark: TWA 25 ppm (110 milligram per cubic meter), 1999; Finland: TWA 25 ppm (105 milligram per cubic meter), 1999; Norway: TWA 20 ppm (90 milligram per cubic meter), 1999; the Phillipines: TWA 25 ppm (110 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 1 10 milligram per cubic meter, 2003; Switzerland: MAK-W 25 ppm (110 milligram per cubic meter), 1999; Turkey: TWA 25 ppm (110 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 40 ppm. Several states have set guidelines or standards for propyl nitrate in ambient air[60] ranging from 1.05−1.70 milligram per cubic meter (North Dakota) to 1.75 milligram per cubic meter (Virginia) to 2.1 milligram per cubic meter (Connecticut) to 2.5 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH II(3), Method #S-227; OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: None listed for humans according to NIOSH[2] but other sources[24] state that vapor inhalation causes low blood pressure; hypotony and hemoglobin defect; anoxia and cyanosis. In animals: irritation of the eyes, skin; methemoglobinemia, anoxia, cyanosis, dyspnea (breathing difficulty), weakness, dizziness, headache.

Points of Attack: May attack the blood.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), methemoglobin; CBC; urinalysis.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Consider treatment for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 250 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).
*End-of-service life indicator (ESLI) required.

Storage: Check oxygen content prior to entering storage area. (1) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Protect containers against physical damage. Outdoor or detached storage is preferred. Indoor storage should be in a flammable liquid storage room. Propyl nitrate should be isolated from combustible materials and oxidizing agents. Wear Neoprene gloves, plastic coverall and SCBA. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1865 *n*-Propyl nitrate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. After covering the spills with soda ash, mix and spray with water. Scoop into a bucket of water and let it stand for 2 hours. Neutralize with 6M-HCl and pass into the drain with sufficient water. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. On fires in which containers are not exposed, use dry chemical foam or carbon dioxide. Water spray may be ineffective as an extinguishing agent. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Use water from unmanned monitors or house-holders to keep fire-exposed containers cool If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration: large quantities of material may require nitrogen oxide removal by catalytic or scrubbing processes[22]. An alternative route suggested involves pouring over soda ash, neutralizing with HCl and flushing to the drain with water.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: n*-Propyl Nitrate, Trenton, NJ (July 2001).

Propylthiouracil P:1315

Formula: $C_7H_{10}N_2OS$

Synonyms: 2,3-Dihydro-6-propyl-2-thioxo-4(1H)-pyrimidinone; 2-Mercapto-4-hydroxy-6-*N*-propylpyrimidine; 2-Mercapto-6-propyl-4-pyrimidone; 2-Mercapto-6-propyl-pyrimid-4-one; Procasil; Propacil; Propilthiouracil; 6-Propil-tiouracile; Propycil; 6-Propyl-2-thio-2,4(1H,3H)pyrimidine-dione; Propyl-thiorist; Propyl-thiorit; Propylthiouracil; 4-Propyl-2-thiouracil; 6-Propylthiouracil; 6-Propyl-2-thiouracil; 6-*N*-Propylthiouracil; 6-*N*-Propyl-2-thiouracil; Prothycil; Propyl-thyracil; Prothiucil; Prothiurone; Prothyran; Protiural; PTU (thyreostatic); 4(1H)-Pyrimidinone, 2,3-dihydro-6-propyl-2-thioxo-; 2-Thio-4-*oxo*-6-propyl-1,3-pyrimidine; 2-Thio-6-propyl-1,3-pyrimidin-4-one; 6-Thio-4-propyluracil; Thiuragyl; Thyreostat II; Uracil, 6-propyl-2-thio-

CAS Registry Number: 51-52-5

HSDB Number: 3390

RTECS Number: YR1400000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 200-103-2

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen.

California Proposition 65 Chemical[102]: Cancer, 1/1/1988

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, Xi; Risk phrases: R45; R22; R40; R51; R62; R63; Safety phrases: S1/2; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: White crystalline solid or powder. Odorless. Bitter taste. Molecular weight = 170.23; Freezing/Melting point = 219−221°C; Vapor pressure = 6.9×10^{-8} mmHg @ 25°C (est.)[72]; Flash point = ~300°C. Henry's Law constant = 1.1×10^{-9} atm-m^3/mol @ 25°C (est)[72] Practically insoluble in water; solubility = < 1 mg/mL @ 20°C.

Potential Exposure: Medication (antihyperthyroid; thyroid inhibitor) with human and veterinary applications.

Incompatibilities: This chemical is probably combustible; it's dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Forms complexes with divalent metals. Reacts with sulfhydryl-oxidizing agents[193]. Sensitive to light and may be sensitive to air.

Permissible Exposure Limits in Air: No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol-water coefficient: Log K_{ow} = < 1. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingested, inhaled, possibly absorbed through the skin.

Harmful Effects and Symptoms

Symptoms of exposure to this compound include recurrent painful skin lesions, fatigue, migratory polyanthralgias of hands and knees, palpable spleen, splenomegaly, amenorrhea, low-grade fever, gingivostomatitis, weakness, weight loss, dark red-brown colored urine, necrotizing vasculitis, leukopenia, cutaneous vasculitis, nasal congestion, enlarged thyroid, necrotic ulcerations on the lower extremities, bloody nasal discharge and cough. Other symptoms include fever, sore throat, rash and malaise. The most serious reaction to this chemical may be agranulocytosis. It may also cause pain and stiffness in the joints, paresthesias, headache, nausea and loss or depigmentation of hair. On rare occasions, exposure to this material may cause drug fever, hepatitis and nephritis. Other symptoms include urticaria, anorexia, hypoprothrombinemia with purpura and hepatic injury. Exposure may also cause a tendency to hemorrhage, lupus-like syndrome, hypothyroidism, galactorrhea, migratory polyarthritis, reversible tinnitus, hearing loss, hypocalcemia, jaundice, hepatic necrosis and liver disease similar to chronic active hepatitis. It may also cause goiter in infants born to women following exposure to this compound.

Short-Term Exposure: Harmful if ingested or inhaled. LD_{50} = (oral-rat) ~1300 mg/kg.

Long-Term Exposure: May cause cancer, brain damage. Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Points of Attack: Kidney, ureter, bladder, reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH, may be indicated.

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear chemical goggles and face shield unless full-facepiece respiratory protection is worn.

Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location away from exposure to light, in a tightly closed container, under an inert atmosphere, at cold, refrigerated temperatures.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. *Small spills and leakage*: Dampen spilled solid material with 5% ammonium hydroxide, then transfer the dampened material to a suitable container. Use absorbent paper dampened with 5% ammonium hydroxide to pick up any remaining material. Your contaminated clothing and the absorbent paper should be sealed in a vapor-tight plastic bag for eventual disposal. Wash all contaminated surfaces with 5% ammonium hydroxide followed by washing with a soap and water solution. Do not reenter the contaminated area until the Safety Officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: Thermal decomposition products may include toxic fumes of oxides of nitrogen, sulfur and carbon. This chemical is probably combustible. Fires involving 6-*N*-propyl-2-thiouracil may be controlled with a dry chemical, carbon dioxide or halon extinguisher.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding to trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Prothoate P:1320

Formula: $C_9H_{20}NO_3PS_2$

Synonyms: AC18682; American Cyanamid 18682; *O*,*O*-Diethyldithiophosphorylacetic acid *N*-monoisopropylamide; *O*,*O*-Diethyl *S*-(*N* -isopropylcarbamoylmethyl) dithiophosphate; *O*,*O*-Diethyl *S*-(*N*-isopropylcarbamoylmethyl) phosphorodithioate; *O*,*O*-Diethyl *S*-isopropylcarbamoylmethyl phosphorodithioate; ENT 24,652; FAC; FAC20; Fostion; Isopropyl diethyldithiophosphorylacetamide; *N*-Isopropyl-2-mercaptoacetamide *S*-ester with *O*,*O*-diethyl phosphorodithioate; L 343; *N*-Monoisopropylamide of *O*,*O*-diethyldithiophosphorylacetic acid; Oleofac; Phosphorodithioic acid *O*,*O*-diethyl esters, ester with *n*-isopropyl-2-mercaptoacetamide; Phosphorodithioic acid, *O*,*O*-diethyl *S*-(2-[(1-methylethyl)amino]-2-oxoethyl) ester; Telefos; Trimethoate

CAS Registry Number: 2275-18-5

HSDB Number: 2844

RTECS Number: TD8225000

UN/NA & ERG Number: (PIH) UN2783 (organophosphorus pesticides, solid, toxic)/152

EC Number: 218-893-2 [*Annex I Index No.:* 015-032-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Neurotoxin (cumulative), Combustible, Agricultural chemical, Environmental hazard.

Banned or Severely Restricted (Malaysia) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R27/28; R33; R50/53; Safety phrases: S1/2; S28; S29; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Prothoate is an amber to yellow crystalline solid with a camphor-like odor. Molecular weight = 285.39;

Boiling point = 135°C @ 0.1 mm; Freezing/Melting point = 29°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of the systemic acaricide and insecticide.

Incompatibilities: Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101] Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.15 milligram per cubic meter

PAC-2: 1.7 milligram per cubic meter

PAC-3: 10 milligram per cubic meter

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus pesticides.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This is a highly toxic material capable of causing death or permanent injury due to exposures during normal use. Small doses at frequent intervals are additive. Similar to parathion[88,1998]. Symptoms may include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; headache, giddiness, dizziness, weakness, muscle twitching; difficult breathing; blurring or dimness of vision; and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles; intense bronchoconstriction; or all three. Can be fatal from ingestion and skin contact.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. If material has been ingested, induce vomiting with ipecac.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. This material may burn, but does not ignite readily. For small fires, use dry chemical, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. In fighting fires, stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, F, N, Xn, Xi; Risk phrases: R40; R10, R22; R23/24/25; R26; R36/37/38; R39; R40; R43; R48/20; R50/53; R62; R65; R67; Safety phrases: S7; S22; S23; S24/25; S28; S29; S36/37/39; S45; S53; S60; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Pyrene is a colorless crystalline solid when pure or pale yellow plates (impure). Polycyclic aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Solids and solutions have a Blue fluorescence (Merck Index). Molecular weight = 202.25; Boiling point 404°C @ 760 mmHg;[2] Freezing/Melting point = 151°C[2].; Vapor pressure = 1.3 mmHg @ 23°C; Flash point = 199°C. Explosive limits: LEL = 0.6%; UEL: 3.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Practically insoluble in water.

Potential Exposure: Pyrene is used as an industrial chemical and in biochemical research.

Incompatibilities: Pyrene Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Pyrene reacts with nitrogen oxides to form nitro derivatives. It also reacts with 70% nitric acid[NTP, 1992, cameo].

Permissible Exposure Limits in Air:

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.15 milligram per cubic meter

PAC-2: 1.7 milligram per cubic meter

PAC-3: 110 milligram per cubic meter

DFG MAK: [skin]

Determination in Air: Use NIOSH Analytical Method #5506 polycyclic aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polycyclic aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms, therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0 ng/L, 2.8 ng/L, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0 ng/L, 31.1 ng/L, and 3.11 ng/L, respectively. The World Health Organization (WHO) recommends a maximum of 2 μg/L for specific PAHs, but this list does not include pyrene.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = \sim 5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Can be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Pyrene is a skin irritant, a suspected mutagen; and an equivocal tumor-causing agent. Workers exposed to 3–5 milligram per cubic meter of pyrene exhibited some teratogenic effects. Pyrene is a polycyclic aromatic hydrocarbon (PAH). The acute toxicity of pure PAHs appears low when administered orally or dermally to rats or mice. Human exposure to PACs or PAHs is almost exclusively via the gastrointestinal and respiratory tracts, and approximately 99% is ingested in the diet. Despite the high concentrations of pyrene to which humans may be exposed through food, there is currently little information available to implicate diet-derived PAHs as the cause of serious health effects.

Long-Term Exposure: The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies.

Points of Attack: Skin, respiratory system; bladder, liver, kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Preplacement and regular physical examinations are indicated for workers having contact with acenaphthene in the work-place. NIOSH lists: CBC; chest X-ray; pulmonary function tests: Forced Vital Capacity; Forced Expiratory Volume (1 sec); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria[2].

First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that this airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Remove all sources of ignition and dampen spilled material with toluene to avoid airborne dust, then transfer material to a suitable container. Ventilate the spill area and use absorbent dampened with toluene to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, Suggestive Evidence of Carcinogenicity, but Not Sufficient to Assess Human Carcinogenic.

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Environmental hazard.

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*I & II*): Hazard Symbol: Xn, N; Risk phrases: R0/21/22; R50/53; R62; Safety phrases: S2; S13; S29; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Type I and II:

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P008

Description: Pyrethrum is a variable mixture of compounds which are found in cinerin, jasmolin, and pyrethrin. Pyrethrum is a brown, viscous oil or solid. Molecular weight = 328.49 (I); Specific gravity (H_2O:1) = 1.52 (approx.) @ 20°C; Boiling point = 170°C @ 0.1 mm (decomposition); Vapor pressure = 3.8×10^{-5} mmHg @ 25°C; Class IIIA Combustible Liquid: Flash point ≥ 60°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water. *Note*: Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: Pyrethrins are used as an ingredient of various contact insecticides. Those engaged in the isolation, formulation, or application of these materials.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air:

NIOSH IDLH = 5000 milligram per cubic meter

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA; not classifiable as a human carcinogen

121-21-1, Pyrethrin (1)

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 25 milligram per cubic meter

PAC-3: 150 milligram per cubic meter

DFG MAK: 5 milligram per cubic meter, inhalable fraction, danger of skin sensitization; Peak Limitation Category II(2)

Arab Republic of Egypt: TWA 5 milligram per cubic meter, 1993; Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG

5 milligram per cubic meter, 2003; Norway: TWA 5 milligram per cubic meter, 1999; Thailand: TWA 5 milligram per cubic meter, 1993; Turkey: TWA 5 milligram per cubic meter, 1993; United Kingdom: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for pyrethrum in ambient air[60] ranging from 16.7 μ/m^3 (New York) to 50.0 μ/m^3 (Florida and South Carolina) to 50.0−100.0 μ/m^3 (North Dakota) to 80.0 μ/m^3 (Virginia) to 100.0 μ/m^3 (Connecticut) to 119.0 μ/m^3 (Nevada).

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/UV. See NIOSH IV, Method #5008[18], pyrethrum.

Determination in Water: Fish Tox: 2.38748000 ppb (HIGH).

Routes of Entry: Inhalation, ingestion; skin and/or eye absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Pyrethrum can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness and rhinorrhea (discharge of thin nasal mucous).

Long-Term Exposure: High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic "pneumonia" can also occur with cough, chest pain; breathing difficulty and abnormal chest X-ray. Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Skin contact can cause rash with redness, blisters and intense itching. A severe generalized allergy can occur with weakness and collapse. Human Tox = 68.09339 ppb Chronic Human Carcinogen Level (CHCL) (LOW).

Points of Attack: Respiratory system, skin, CNS.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest X-ray if lung symptoms are present. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear appropriate clothing to prevent rep Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/ clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 milligram per cubic meter:* CcrOv95 (APF = 10) [Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *250 milligram per cubic meter:* CcrFOv100 (APF = 50) [Any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *5000 milligram per cubic meter:* SaF: Pd, Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Pyrethroids must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and alkalines, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2902 Pesticides, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}): 100000 (estimate).

Fire Extinguishing: Class IIIA Combustible Liquid: Flash point $\geq 60°C$ and $<93.3°C$. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire-fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for human.

Hazard Alert: Poison, Suspected reprotoxic hazard, Environmental hazard.

EPA Oral reference dose (RfD) = 0.50 mg/kg/day. (NOAEL = 50 mg/kg/day, UF = 100) was selected for use in assessing acute dietary risk for the general population. EPA acute RfD of 0.13 mg/kg/day NOAEL = 13 mg/kg/day, uncertainty factor (UF) = 100 for use in assessing acute dietary risk for females 13 years and older[83].

Hazard Alert: Suspected reprotoxic hazard, Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R23/25; R50/53; R63; Safety phrases: S1/2; S29; S36/37; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: White to tan crystalline solid or powder. Faint vanilla odor. Commercial product is available as an emulsifiable concentrate or wettable powder. Molecular weight = 364.92; Specific gravity (H_2O:1) = 1.19 @ 20°C; Boiling point = (decomposes); Freezing/Melting point = 109−112°C; Vapor pressure = 2×10^{-7} mmHg @ 25°C; Flash point = $>200°C$; Autoignition temperature = 395°C. Practically insoluble in water; solubility = <0.5 mg/L. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Pyridaben is a pyridazinone insecticide/acaricide/miticide used to control mites, whiteflies, leafhoppers and psyllids on fruit trees, vegetables, ornamentals and other field crops. It is also used to control pests in apple, grapes, pear, pistachio, stone fruits, and the tree nuts group[83].

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 6.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, eyes, dermal absorption.

Harmful Effects and Symptoms

Short-Term Exposure: May be fatal if inhaled. Do not breathe dust or spray mist. Avoid contact with skin. Causes moderate injury. Do not get in eyes or on clothing[83]. Absorbed through the unbroken skin. Harmful if swallowed. LD_{50} (oral, rat) = 600−1100 mg/kg; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: May be a developmental/reproduction hazard.

Points of Attack: Reproductive system; DNA, testes, ovaries.

Medical Surveillance: In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH, may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. Give artificial respiration if victim is not breathing. *Do not* use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: For handling activities, use a dust/mist filtering respirator. or a NIOSH approved respirator with a N, P, R, or HE prefilter[83]. *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Possible Human Carcinogen: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2902 Pesticides, liquid, toxic. UN2902 Pesticides, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: For solids, *small spill*, isolate spill or leak area in all directions for at least 25 meters/75 feet. Increase, in the downwind direction, as necessary. For a *large spill* evacuate downwind at least 100 meters/330 feet. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Do not allow water to get inside containers. *Small dry spill*: With clean shovel place material into clean, dry container and cover loosely; move containers from spill area. *Large spill*: Dike far ahead of liquid spill for later disposal. Following product recovery, flush area with water. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen, sulfur, and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods. Follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Pyridine is a colorless liquid. Nauseating, sickening fish-like odor. The Odor Threshold is 0.17 ppm. Molecular weight = 79.1; Specific gravity (H_2O:1) = 0.98 @ 20°C; Boiling point = 115°C. Melting/Freezing point = −42°C; Vapor pressure = 21 mmHg @ 25°C; Flash point = 20°C; Autoignition temperature = 482°C. Explosive limits: LEL = 1.8%; 20,000 ppm[138]; UEL: 12.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Pyridine is used as a solvent in the chemical industry and as a denaturant for ethyl alcohol; as an intermediate in the production of pesticides; in pharmaceuticals; in the manufacture of paints, explosives, dyestuffs, rubber, vitamins, sulfa drugs; and disinfectants.

Incompatibilities: Violent reaction with strong oxidizers; strong acids; chlorosulfonic acid; maleic anhydride; oleum iodine.

Permissible Exposure Limits in Air:

NIOSH IDLH = 1000 ppm[LEL]

Conversion factor: 1 ppm = 3.24 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/15 milligram per cubic meter TWA

NIOSH REL: 5 ppm/15 milligram per cubic meter TWA

ACGIH TLV[1]: 1 ppm/3.1 milligram per cubic meter TWA

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 3 ppm

PAC-2: 19 ppm

PAC-3: 3600 ppm *ppm (> = 10% LEL, lower explosive limit but <50% LEL)

DFG MAK: [skin] 5 ppm/16 milligram per cubic meter TWA; Peak Limitation Category II(2)

Arab Republic of Egypt: TWA 5 ppm (15 milligram per cubic meter), 1993; Australia: TWA 5 ppm (15 milligram per cubic meter), 1993; Austria: MAK 5 ppm (15 milligram per cubic meter), 1999; Belgium: TWA 5 ppm (16 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (15 milligram per cubic meter), 1999; Finland: TWA 5 ppm (15 milligram per cubic meter); STEL 10 ppm (30 milligram per cubic meter), [skin], 1999; France: VME 5 ppm (15 milligram per cubic meter), VLE 10 ppm, 1999; the Netherlands: MAC-TGG 0.9 milligram per cubic meter, 2003; Norway: TWA 5 ppm (15 milligram per cubic meter), 1999; the Phillipines: TWA 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 30 mg/me, 1999; Russia: STEL 5 milligram per cubic meter, 1993; Sweden: NGV 5 ppm (16 milligram per cubic meter), KTV 10 ppm (35 milligram per cubic meter), 1999; Switzerland: MAK-W 5 ppm (15 milligram per cubic meter), KZG-W 10 ppm (30 milligram per cubic meter), 1999; Turkey: TWA 5 ppm (15 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (16 milligram per cubic meter); STEL 10 ppm (33 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 ppm. The Czech Republic: MAC 5.0 milligram per cubic meter[35]. Russia[35,43] has also set a MAC for the ambient air in residential areas of 0.08 milligram per cubic meter both on a momentary and a daily average basis. Several states have set guidelines or standards for pyridine in ambient air[60] ranging from 2.0 μ/m^3 (New York) to 35.714 μ/m^3 (Kansas) to 150 μ/m^3 (Indiana) to 150.0−300.0 μ/m^3 (North Dakota) to 250.0 μ/m^3 (Virginia) to 300.0 μ/m^3 (Connecticut, Florida) to 357.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1613;[18] OSHA Analytical Method 7.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 207 μg/L. Russia[43] set a MAC in water bodies used for domestic purposes of 200 μg/L and in water bodies used for fishery purposes of 10 μg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 0.65$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquids,ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the CNS; can cause stomach upset, headache, increased urinary frequency, dizziness, lightheadedness, confusion, coma, and death. *Inhalation:* May cause nose and throat irritation at low levels. Above 5 ppm the odor may no longer be detected but a characteristic taste may remain. Exposures of 6−12 ppm have caused headache, dizziness, nervousness, trouble sleeping, nausea and vomiting. *Skin:* Contact with liquid may cause painful irritation, and first-degree burns. Longer contact may cause second-degree burns. *Eyes:* Vapors may cause irritation. Contact with liquid can cause irritation, burns, and permanent eye damage. *Ingestion:* 2−3 mL (1/15-1/10 fl oz) may cause loss of appetite; nausea, fatigue and depression. Swallowing ½ cup has resulted in vomiting, diarrhea, fever, abdominal pain; bluish tint to the skin; confusion, hallucinations, severe lung congestion and death.

Long-Term Exposure: Affects the CNS; brain, liver and kidneys. Can cause skin allergy. Ingestion of about 2 mL (1/10 fl oz) three times/day for a prolonged period resulted in lever and kidney damage and death. Long-term inhalation of levels of 125 ppm in addition to the symptoms listed above, may result in damage to the nervous system.

Points of Attack: Eyes, skin; CNS; liver, kidneys, gastrointestinal tract.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Expired Air; liver function tests; urinalysis. If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system; interview for brain effects, kidney function tests. Evaluation by a qualified allergist, including careful exposure history an special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

NIOSH: *125 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *250 ppm:* CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1000 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Pyridine must be stored to avoid contact with strong oxidizers (such as chloride, bromine, and fluorine); strong acids (such as hydrochloride, sulfuric, and nitric), chlorosulfonic acid; maleic anhydride; and oleum iodine; because violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where pyridine is used, handles, or stored in a manner that could create a potential fire or explosion hazard. Metal containers used in the transfer of 5 gallons or more of pyridine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of pyridine. Wherever pyridine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1992 Flammable liquids, toxic, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby nitrogen oxides are removed from the effluent gas by scrubber, catalytic or thermal devices[22].

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen.

Hazard Alert: Possible endocrine disruptor, Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: N; Risk phrases: R51/53; Safety phrases: S2; S29; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Pyrimethanil is a white to light yellow crystalline powder. Commercial product is available as a brown emulsifiable concentrate. Molecular weight = 199.26; Specific gravity (H_2O:1) = 1.16 @ 20°C; Freezing/Melting point = 93.3°C; Vapor pressure = 2×10^{-5} mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Practically insoluble in water. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: A pyrimidine fungicide used on grapes, strawberries, tomatoes, onions, beans, cucumbers, eggplant, and ornamental plants.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Determination in Water: Octanol -water coefficient: Log $K_{ow} = 2.5-2.8$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Harmful if inhaled. May cause skin, eye, and respiratory tract irritation. May be harmful if swallowed or if absorbed through skin. LD_{50} (oral, rat) = >4 g/kg; LD_{50} (dermal, rat) = >5 g/kg.

Long-Term Exposure: Possible human carcinogen.

Points of Attack: May affect major organs.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240 (d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Where the neat (undiluted) test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with a combination filter cartridge, i.e., organic vapor/acid gas/HEPA (specific for organic vapors, HCl, acid gas, SO_2 and a high efficiency particulate filter)[88].

Storage: Color code-Blue: Health Hazard/Poison. Store in a tightly closed container in a dry, well -ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. If this material cannot be disposed of according to label instructions, it may be dissolved or mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

State of Washington, Department of Ecology, *Fact sheet for the fresh fruit packing general permit*, Lacey WA (July 2, 2009)

Pyriminil P:1350

Formula: $C_{13}H_{12}N_4O_3$

Synonyms: DLP787; DPL-87; *N*-(4-Nitrophenyl)-*N*′-(3-pyridinylmethyl)urea; 1-(4-Nitrophenyl)-3-(3-pyridinylmethyl) urea; nitrophenylurea; Pyrinuron; RH-787; Urea, *N*-(4-nitrophenyl)-*N'*-(3-pyridinylmethyl)-; Vacor

CAS Registry Number: 53558-25-1

HSDB Number: 6460

RTECS Number: YI9690000

UN/NA & ERG Number: UN2767/151; UN2588 (Pesticide, solid, poisonous, n.o.s.)/151

EC Number: 258-626-7

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Poison, Diabetes hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; Risk phrases: R10; R27/28; R50/53; Safety phrases: S13; S28; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Pyriminil is a yellow crystalline solid, resembling corn meal. Molecular weight = 272.29; Freezing/Melting point = 223°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: A potential danger to those involved in the application of this single-dose, acute rodenticide. No longer registered, produced or used in the United States There are more than 20 global suppliers[146].

Incompatibilities: A nitrated amine. Amines are combustible. Azo, diazo, azido compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.56 milligram per cubic meter

PAC-2: 6.2 milligram per cubic meter

PAC-3: 380 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Pyriminil may cause death by cardiovascular collapse and respiratory failure. Symptoms include nausea, vomiting, abdominal pain; chills, mental confusion; anorexia, aching, dilated pupils, dehydration, chest pain; urinary retention; irregular heartbeat; and muscular weakness. Exposure may also result in visual disturbances, CNS depression and tremors.

Long-Term Exposure: Pyriminil may damage the pancreas, causing diabetes. Human survivors of exposure regularly develop an insulin-deficient, ketosis-prone form of diabetes mellitus[72]. Also may affect the CNS.

Points of Attack: CNS.

Medical Surveillance: Blood sugar. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN2767 Phenyl urea pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Pyriminil, Washington, DC, Chemical Emergency Preparedness Program (November 30, 1987)

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Pyriminil, Trenton, NJ (May 2002)

Pyriproxyfen P:1360

Formula: $C_{20}H_{19}NO_3$

Synonyms: Archer; Dalar; Distance; Esteem; Nylar; 2-[1-Methyl-2-(4-phenoxyphenoxy)ethoxy] pyridine; 4-Phenoxyphenyl (*RS*)-2-(2-pyridyloxy)propyl ether; Pyridine, 2-[1-methyl-2-(4-phenoxyphenoxy)ethoxy]-; S-9318; S 31183; Sumilarv pyriproxyfen

CAS Number: 95737-68-1

HSDB Number: 7053

RTECS Number: UT5804000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 429-800-1

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for humans.

Hazard Alert: Environmental hazard.

EPA/OPP Oral reference dose (RfD) = 0.35 mg/kg/day. This RfD is based on a NOAEL of 35.1 mg/kg/day and an uncertainty factor (UF) of 100. The NOAEL was established from the combined chronic feeding/oncogenicity study in rats where the the LOAEL was 3,000 ppm, based on a 16.9% decrease in body weight gain in females when compared to controls[83].

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: N; Risk phrases: R50/53; Safety phrases: S2; S29; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Gray to white crystalline solid or powder. Also described as a pale yellow, waxy solid or liquid. Commercial product is available as an emulsifiable concentrate or wettable powders. Molecular weight = 321.37; Specific gravity (H_2O:1) = 1.23 @ 20°C; Boiling point = (decomposes); Freezing/Melting point = 49.7°C; Vapor pressure = 1×10^{-5} mmHg @ 25°C; Flash point = >90°C. Low solubility in water. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Pyriproxyfen is an unclassified insect growth regulator, insecticide, veterinary medicine found in a number of household products as sprays, powders, baits, mists and shampoos for the control of fleas, ticks, mites, and flying insects on pets, in the air, and in carpets and rugs. It's a l larvicidal agent that mimics juvenile insect hormone.

Incompatibilities: This material is combustible. Dust may form an explosive mixture in air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Dermal contact, ingestion, eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May cause irritation of the eyes, skin, and respiratory tract. Inhalation may cause mucous membrane and respiratory irritation. Ingestion may cause stomach irritation, nausea, cramps and vomiting. LD_{50} (oral, rat) = >5 g/kg.; LD_{50} (dermal, rat) = >2 g/kg.

Long-Term Exposure: Possible blood and liver toxin.

Points of Attack: Liver, blood.

Medical Surveillance:.CBC. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Possible Human Carcinogen: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: For solids, *small spill*, isolate spill or leak area in all directions for at least 25 meters/75 feet. Increase, in the downwind direction, as necessary. For a *large spill* evacuate downwind at least 100 meters/330 feet. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Do not allow water to get inside containers. *Small dry spill*: With clean shovel place material into clean, dry container and cover loosely; move containers from spill area. *Large spill*: Dike far ahead of liquid spill for later disposal. Following product recovery, flush area with water. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods. Follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Q

Quinoline Q:0050

Formula: C_9H_7N
Synonyms: 1-Azanaphthalene; B-500; 1-Benzazine; 1-Benzine; Benzo(*b*)pyridine; Benzopyridine; Chinoleine; Leucol; Leucoline; Leukol; Quinoleina (Spanish); Quinolin
CAS Registry Number: 91-22-5
HSDB Number: 121
RTECS Number: VA9275000
UN/NA & ERG Number: UN2656/154
EC Number: 202-051-6 [*Annex I Index No.*: 613-281-00-5]

Regulatory Authority and Advisory Information

Carcinogenicity: EPA: Likely to produce cancer in humans; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies; has not been identified as a carcinogen. Handle with caution as several related polynuclear aromatic hydrocarbons are known carcinogens. NIOSH has recommended that coal tar pitch volatiles, including polycyclic aromatic hydrocarbons (PAHs) be treated as potential human carcinogen.

California Proposition 65 Chemical[102]: (*Quinoline and its strong acid salts*) Cancer 10/24/1997

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard, Preparative hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 307(a)(1) Toxic pollutant designated, pursuant to of the and is subject to effluent limitations as polycyclic aromatic hydrocarbons (PAHs)

United States National Primary Drinking Water Regulations: MCLG = 0 mg/L; MCL = 0.0002 mg/L as polycyclic aromatic hydrocarbons (PAHs).

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg)

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%.

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as naphthalenes

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R21/22; R36/37/38; R68; R51/53; R62; safety phrases: S1/2; S29; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Quinoline is a colorless liquid with a penetrating amine odor. Turns brown on exposure to light. Molecular weight = 129.16; specific gravity (H_2O:1) = 1.1 @ 15°C; boiling point = 237°C; freezing/melting point = −15°C; flash point = 101−107°C; autoignition temperature = 480°C. Explosive limits: LEL = 1.2%; 29,000 ppm[138]; UEL: 7%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Insoluble in cold water; highly soluble in hot.

Potential Exposure: In manufacture of quinoline derivatives (dyes and pesticides); in synthetic fuel manufacture. Occurs in cigarette smoke.

Incompatibilities: Reacts, possibly violently, with strong oxidants, strong acids; perchromates, nitrogen tetroxide; and maleic anhydride. Keep away from moisture, steam, and light. Contact with hydrogen peroxide may cause explosion. Unpredictably violent, this substance has been the source of various plant accidents.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 0.003 ppm
PAC-2: 2.9 ppm
PAC-3: 17 ppm

The state of New York has set a guideline for quinoline in ambient air[60] of 0.03 μ/m^3.

Harmful Effects and Symptoms

Short-Term Exposure: Skin or eye contact can cause burns. Vapors can irritate the eyes and respiratory tract and may cause sore throat, nosebleeds, hoarseness, cough, phlegm, and/or tightness in the chest. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High exposure can cause nausea, vomiting, gastrointestinal cramping; fever, dizziness, fatigue, rapid and irregular pulse, troubled breathing; collapse, and even death from paralysis of muscles needed for breathing. Liver damage may also occur.

Long-Term Exposure: May affect the liver and retina of the eyes. May cause liver damage. May lead to development of skin allergy with rash and itching. Very irritating substances may cause lung damage. This substance caused mutations and is possibly carcinogenic to humans.

Points of Attack: Nervous system, liver and kidneys, eyes.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00016-8

the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Eye examination. Liver and kidney function tests. Examination of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective butyl rubber gloves and protective clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved self-contained breathing apparatus (SCBA) that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in a refrigerator under an inert atmosphere and protect from exposure to light, moisture, strong oxidants, strong acids; perchromates, nitrogen tetroxide; maleic anhydride. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2656 Quinoline, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use absorbent substance to pick up spilled material. Follow by washing surface well first with alcohol, then with soap and water. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R11; R20/21/22; R23/25; R36/37/38; R50; R63; safety phrases: S1/2; S16; S23; S26; S28; S29/35; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Quinone is a yellow, crystalline material or large yellow, monoclinic prisms. Pungent, irritating odor. Molecular weight = 108.10; specific gravity (H_2O:1) = 1.32 @ 25°C; boiling point = (sublimes) about 180°C; freezing/melting point = 115.6°C; 224°C (decomposes); vapor pressure = 0.1 mmHg @ 25°C; flash point (depending on humidity) = 38–93°C; 77°C[136]; autoignition temperature = 560°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Slightly soluble in water.

Potential Exposure: Due to this compound's ability to react with certain nitrogen compounds to form colored substances, quinone is widely used in the dye, textile, chemical, tanning, and cosmetic industries. It is used as an industrial chemical; laboratory reagent; and as an intermediate in chemical synthesis for hydroquinone and other chemicals.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, some combustible substances; reducing agents. Decomposes exothermically on warming above 60°C, when moist, producing carbon monoxide.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 milligram per cubic meter

Conversion factor: 1 ppm = 4.42 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.1 ppm/0.4 milligram per cubic meter TWA

NIOSH REL: 0.1 ppm/0.4 milligram per cubic meter TWA

ACGIH TLV[1]: 0.1 ppm/0.44 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 0.3 ppm

PAC-2: 11 ppm

PAC-3: 68 ppm

DFG MAK: Danger of skin sensitization; Carcinogen Category 3B; Germ Cell, Mutagen, Group 3B

Arab Republic of Egypt: TWA 0.1 ppm (0.4 milligram per cubic meter), 1993; Australia: TWA 0.1 ppm (0.4 milligram per cubic meter), 1993; Austria: MAK 0.1 ppm (0.4 milligram per cubic meter), 1999; Belgium: TWA 0.1 ppm (0.44 milligram per cubic meter), 1993; Denmark: TWA 0.1 ppm (0.4 milligram per cubic meter), 1999; Finland: TWA 0.1 ppm (0.4 milligram per cubic meter); STEL 0.3 ppm, [skin], 1999; France: VME 0.1 ppm (0.4 milligram per cubic meter), VLE 0.3 ppm (1.5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG

0.4 milligram per cubic meter, 2003; the Philippines: TWA 5 ppm (15 milligram per cubic meter), 1993; Poland: TWA 0.1 milligram per cubic meter; STEL 0.4 milligram per cubic meter, 1999; Russia: STEL 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.1 ppm (0.4 milligram per cubic meter), KTV 0.3 ppm (1.3 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (0.4 milligram per cubic meter), KZG-W 0.2 ppm (0.8 milligram per cubic meter), 1999; Turkey: TWA 0.1 ppm (0.4 milligram per cubic meter), 1993; United Kingdom: TWA 0.1 ppm (0.45 milligram per cubic meter); STEL 0.3 ppm (1.3 milligram per cubic meter), 2000; New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 ppm

Determination in Air: Use NIOSH II(4), Method #S-181, Quinone.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.21$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The vapor irritates the eyes, skin, and respiratory tract; can cause nosebleeds, hoarseness, cough, phlegm, and/or tightness in the chest. Skin contact can cause severe irritation. Solid quinone in contact with skin or the lining of the nose and throat may produce discoloration, severe irritation; swelling; and the formation of ulcers, papules and vesicles. Prolonged contact with the skin may cause ulceration. quinone vapor is highly irritating to the eyes. Following prolonged exposure to vapor, brownish conjunctival stains may appear. These may be followed by corneal opacities and structural changes in the cornea and loss of visual acuity. The early pigmentary stains are reversible, while the corneal dystrophy tends to be progressive. Further effects reported[52] include vomiting, collapse, and coma.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. The substance may have effects on the skin and eyes, resulting in discoloration, inflammation and injury of the corneal epithelium; keratitis (inflammation of the cornea); reduced vision. Can cause lung irritation; bronchitis may develop. May cause kidney damage.

Points of Attack: Eyes, skin, lungs, kidneys.

Medical Surveillance: Ophthalmic examination. Careful examination of the eyes, including visual acuity and slit lamp examinations, should be done during placement and periodic examinations. Lung function tests. Kidney function tests. Also evaluate skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 milligram per cubic meter*: Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode). *Up to 20 milligram per cubic meter*: SCBAF (APF = 50) (any SCBA with a full facepiece); or, SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 100 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

*Substance causes eye irritation or damage; eye protection needed

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2587 Benzoquinone, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (982°C, 2.0 seconds minimum).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; Xi; risk phrases: R43; R50/53; R62; R63; safety phrases: S2; S13; S24; S29; S37; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Quintozene is a colorless to cream-colored crystalline material. Musty, mothball odor. Technical-grade PCNB contains an average of 97.8% PCNB, 1.8% hexachlorobenzene (HCB), 0.4% 2,3,4,5-tetrachloronitrobenzene (TCNB), and less than 0.1% pentachlorobenzene. Musty odor. Molecular weight = 295.32; boiling point = 328°C;

freezing/melting point = 142−146°C; vapor pressure = 1×10^{-4} mbar @ 25°C. Insoluble in water.

Potential Exposure: Quintozene is used as a chemical intermediate, soil and seed fungicide; slime control in industrial waters; herbicide. A rebuttal presumption against registration was issued on October 13, 1977 by EPA on the basis of oncogenicity.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Thermal decomposition products may include nitrogen oxides and hydrogen chloride. Corrosive to unlined metal containers[101].

Permissible Exposure Limits in Air

ACGIH TLV[1]: 0.5 milligram per cubic meter TWA; not classifiable as a human carcinogen.

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 28 milligram per cubic meter

PAC-3: 62 milligram per cubic meter

Denmark: TWA 0.5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003

Determination in Water: Fish Tox = 64.49856000 ppb (INTERMEDIATE)

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Eye contact can cause corneal damage and permanent injury. High levels can interfere with the blood's ability to carry oxygen causing methemoglobinemia; cyanosis, with Blue color to the skin and lips. Higher levels can cause trouble breathing; collapse and even death. A chloromononitrobenzene, this chemical may have similar toxic effects as nitrobenzene.

Long-Term Exposure: May cause sensitization and skin allergy. May cause damage of the liver and kidneys. Human Tox = 2.10000 ppb (HIGH).

Points of Attack: Blood, skin, liver, kidneys.

Medical Surveillance: Blood methemoglobin levels. Evaluation by a qualified allergist. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical above 0.5 milligram per cubic meter, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 5000 (estimate).

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dispose of contents/container to an approved waste disposal plant or consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group D, Not classifiable as a human carcinogen.

California Proposition 65 Chemical[102]: Male reproductive toxin, 12/24/1999.

Hazard Alert: Combustible, Suspected reprotoxic hazard (male, TRI); Possible endocrine disruptor, Environmental hazard, Agricultural chemical.

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (severe)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R21/22; R50/53; R63; safety phrases: S22; 24/25; S29/35; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: White crystalline solid or powder. Commercial product is available as an emulsifiable concentrate. Practically insoluble in water; solubility $\leq 2 \times 10^{-8}$ ppm. Molecular weight = 372.78; 372.80 (*p*-isomer); vapor pressure = 3×10^{-7} mmHg @ 20°C. Specific gravity (H_2O:1) = 1.35 @ 20°C; boiling point = 92°C; freezing/melting point = 92°C; 75°C *p*-isomer); vapor pressure = 3×10^{-7} mmHg @ 25°C; flash point = ~100°C. Practically insoluble in water; solubility = 0.5 mg/L @ 25°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: A chlorophenoxy/aryloxyphenoxypropionate herbicide

Determination in Water: Octanol–water coefficient: Log K_{ow} = > 4.0 (both isomers). Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, absorption through the skin

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness, and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years. LD_{50} (oral, rat) = 1500 mg/kg; 1200 mg/kg (*p*-isomer)]; LD_{50} (dermal, rat) = > 5 g/kg.

Long-Term Exposure: Workers exposed to chlorophenoxy compounds over a 5 to 10 year period at levels above

10 milligram per cubic meter complained of weakness, rapid fatigue, headache, and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, may affects human reproduction

Points of Attack: Eyes, skin, respiratory system, central nervous system (CNS), cardiovascular system, liver, kidney. A possible liver toxin.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Comprehensive physical examination with emphasis on the genito-urinary tract including testicle size and consistency in males. Semen analysis to include sperm count, motility, and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone, and serum lutenizing hormone, may be carried out if, in the opinion of a physician, they are indicated. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested*. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. In addition, waste generators must consult and follow all regional, national, state, and local hazardous waste laws to ensure complete and accurate classification and disposal methods.

Quinuclidinyl Benzilate (QNB-Agent BZ) Q:0120

Formula: $C_{21}H_{23}NO_3$

Synonyms: Agent 15; Agent-Buzz; 1-Azabicyclo(2,2,2) octan-3-ol, benzilate (ester); Benzeneacetic acid, α-hydroxy-α-phenyl-, 1-azabicyclo(2.2.2)oct-3-yl ester; Benzilic acid, 3-quinuclidinyl ester; BUZZ; BZ; 3-Chinuclidylbenzilate; 3-(2,2-Diphenyl-2-hydroxyethanoyloxy)-quinuclidine; Oksilidin; QNB; 3-Quinuclidinol benzilate; 3-Quinuclidinyl benzilate; Quinuclidinyl benzilate

Hydrochloride: 1-Azabicyclo(2.2.2)octan-3-ol, benzylate (ester), hydrochloride; Benzeneacetic acid, alpha-hydroxy-alpha -phenyl-, 1-azabicyclo(2.2.2)oct-3-yl ester, HCL; Benzilic acid, 3-quinuclidinyl ester, hydrochloride; CHEKB; HNB 3; 3-Quinuclidinyl benzilate hydrochloride; Quinuclidyl benzylate hydrochloride; Ro 2-3308

CAS Registry Number: 6581-06-2; 62869-69-6; 13004-56-3 (hydrochloride)

HSDB Number: 7533

RTECS Number: DD4639000; VD6300000 (hydrochloride)

UN/NA & ERG Number: UN2810 (Toxic liquids, organic, n.o.s.)/153

EC Number: Not established

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Report any release of WMD to National Response Center 1-800-424-8802

While not a mandated "Federally listed" waste, BZ is more toxic than most RCRA listed chemicals. However, BZ is a "listed" hazardous waste in some states where it may have been stockpiled by the military.

Hazard Alert: Poison, Incapacitating agent, Combustible, Environmental hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn; risk phrases: R22; R26; R36/37/38; R34; R40; R45; R50/53; safety phrases: S1; S22; S26; S28; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Quinuclidinol benzilate (QNB) aka BZ, is a white crystalline solid. Odorless to fruitlike. Molecular weight = 337.43; freezing/melting point = 167.5°C; also 164−165°C; boiling point = 320°C; solid density = 0.51 g/cm^3 (bulk); 1.33 g/cm^3 (crystal); vapor density = 11.6; vapor pressure = negligible, 2.38×10^{-10} @ 25°C; flash point = 246°C; hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Slightly soluble in water.

History of the agent: QNB is an incapacitating agent and has been considered historically for use as a chemical warfare agent[92]. As a chemical weapon, QNB was mixed with a pyrotechnic mixture in small bombs designed for aerial delivery. Once exploded, the mixture produced a potentially dangerous aerosol of QNB. In the early 1960s at Pine Bluff Arsenal, Arkansas, the United States produced munitions containing QNB. Production ceased in the late 1960s and all stockpiles at every military installation were eventually destroyed by 1990. Iraq's "Agent 15" is believed to be identical to, or closely related to QNB. In general, the effectiveness of QNB as a WMD has proven both highly undependable and unpredictable.

Potential Exposure; Suspected reprotoxic hazard, drug; incapacitating agent. QNB is a glycolate anticholinergic compound that affects the CNS and peripheral nervous system (PNS) and is related to the drugs atropine, scopolamine, and hyoscyamine. QNB is nonirritating; symptoms are delayed for several hours. QNB can be used to contaminate water, food, and agricultural products. A highly potent drug and CNS depressant, QNB is a delayed-action incapacitating agent, usually dispersed as an aerosol, but it can also be used to penetrate skin when mixed with a solvent (such as DMSO), and to contaminate food and water. QNB appears to be widely used in pharmacologic research. The key to protection from QNB is prevention from entering the body with good quality aerosol filter and impermeable gloves and clothing. QMB is stable in most solvents, with a half-life of 3 to 4 weeks in moist air; it can be dispersed even with heat-producing munitions.

Incompatibilities: May form explosive mixture with air. Decomposes at about 170°C in air under prolonged heating. After 1 or 2 hours at 200°C, it is completely decomposed. Rate of decomposition is both temperature- and purity dependent. No effect on steel or stainless steel after 3 months @ 71°C. Aluminum and anodized aluminum are mildly attacked after 3 months @ 71°C. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with metals may evolve flammable hydrogen gas

Persistence of Chemical Agent: QNB is very persistent in soil and water and on surfaces.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

6581-06-2

PAC-1: 1.00E − 03 milligram per cubic meter

PAC-2: $\mathbf{0.011}_{\mathbf{A}}$ milligram per cubic meter

PAC-3: $\mathbf{0.21}_{\mathbf{A}}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Air: No method is available for detecting QNB in environmental samples[92].

Determination in Water: No method is available for detecting QNB in environmental samples[92].

Routes of Entry: Respiratory system; ingestion, skin, or eye contact. Skin and eye absorption is possible, depending on liquid solvents that might be used to enhance absorption. Inhalation and ingestion of QNB are important routes of exposure for the solid[92].

Harmful Effects and Symptoms

QNB is nonirritating stunning agent. The onset of incapacitation is dose-dependent. Symptoms may occur as early as 1 hour following exposure and continue for 48 hours. The onset of incapacitation is dose-dependent. It might occur as early as 1 hour after exposure and continue from 48 hours to 4 days depending on level of exposure. An untreated casualty may require from three to four days to achieve full recovery from the effects of QNB intoxication. QNB affects a victim's ability to remember, solve problems, make sound decisions and judgments, pay attention to assigned tasks, and understand instructions. High levels of exposure can completely destroy a victim's ability to perform any tasks, military, and/or otherwise.

Short-Term Exposure: A very potent drug, QNB can cause confusion, dream-like state, hallucinations, and severe delirium; it also affects circulation, digestion, salivation, sweating, and vision. QNB causes dilation of the pupils, which is extremely uncomfortable to most people. QNB produces profound mental disturbances at a dose of 0.1 to 0.2 mg. Signs and symptoms of exposure include agitation, restlessness, dizziness, giddiness; failure to obey orders, confusion, erratic behavior; stumbling or staggering; vomiting. hallucinations; blurred vision; dry, flushed skin; urinary retention; ileus; tachycardia; hypertension; and elevated temperature (>101°F/38°C). QNB may cause short-term memory loss, and variable levels of side effects are experienced in different people. Impairments caused by QNB are generally temporary and unlikely to be fatal; however, they can be severe with high exposures[77]. QNB is an anticholinergic. LCt_{50} = High; estimated to be 200,000 mg min/m^3; ICt_{50} = 112 mg min/m^3. LD50 = (iv-mouse) 18 mg/kg[United States Army]; 25 mg/kg; TDLo (lowest published toxic dose) = (subcutaneous-human) 3 μg/kg[NIOSH].

Delayed effects of exposure: Widespread formation of clots in the blood vessels (disseminated intravascular coagulation) is a potential complication in a victim with marked agitation and/or exceptionally high body temperature (hyperthermia)[77].

Long-Term Exposure: Information is unavailable about the carcinogenicity, developmental toxicity, or reproductive toxicity from chronic or repeated exposure to QNB.

Points of Attack: CNS; PNS.

Medical Surveillance: In a victim with marked agitation and/or exceptionally high body temperature (hyperthermia) clotting studies e.g., prothrombin time, activated partial thromboplastin time, and international normalized ratio) are recommended. Urine tests.

Decontamination: Establish the decontamination corridor upwind and uphill of the hot zone. The warm zone should include two decontamination corridors. One decontamination corridor is used to enter the warm zone and the other for exiting the warm zone into the cold zone. The decontamination zone for exiting should be upwind and uphill from the zone used to enter. Decontamination area workers should wear appropriate PPE. A solution of detergent and water (which should have a pH value of at least 8 but should not exceed a pH value of 10.5) should be available for use in decontamination procedures. Soft brushes should be available to remove contamination from the PPE. Labeled, durable 6-mil polyethylene bags should be available for disposal of contaminated PPE.

INDIVIDUAL DECONTAMINATION: *Decontamination of First Responder:* Begin washing PPE of the first responder using soap and water solution and a soft brush. Always move in a downward motion (from head to toe). Make sure to get into all areas, especially folds in the clothing. Wash and rinse (using cold or warm water) until the contaminant is thoroughly removed. Remove PPE by rolling downward (from head to toe) and avoid pulling PPE off over the head. Remove the SCBA after other PPE has been removed. Place all PPE in labeled durable 6-mil polyethylene bags.

Decontamination of Patient/Victim: Remove the patient/victim from the contaminated area and into the decontamination corridor. Remove all clothing (at least down to their undergarments) and place the clothing in a labeled durable 6-mil polyethylene bag. Thoroughly wash and rinse (using cold or warm water) the contaminated skin of the patient/victim using a soap and water solution. Be careful not to break the patient/victim's skin during the decontamination process, and cover all open wounds. Cover the patient/victim to prevent shock and loss of body heat. Move the patient/victim to an area where emergency medical treatment can be provided.

First Aid: ***Eyes***: After removing patient/victim from the source of exposure, immediately wash eyes with large amounts of tepid water for at least 15 minutes. Do not allow the patient/victim to rub eyes. Monitor the patient/victim for signs of whole-body (systemic) effects; if signs appear, see the *Inhalation* section for treatment recommendations. Seek medical attention immediately. *Ingestion*: After removing patient/victim from the source of exposure, immediately ensure that the patient/victim has an unobstructed airway. *Do not induce vomiting.* See the *Inhalation* section for first aid recommendations. Seek medical attention immediately. *Inhalation*: After removing patient/victim from the source of exposure, immediately, evaluate respiratory function and pulse. Ensure that the patient/victim has an unobstructed airway. If shortness of breath occurs or breathing is difficult, administer oxygen. Assist ventilation as required. Always use a barrier or bag-valve-mask device. If breathing has ceased, provide artificial respiration. Monitor for exceptionally high body temperature. If body temperature is elevated above 102°F/39°C, initiate immediate and vigorous cooling (as for heatstroke), using 72° to 75°F/22° to 24°C water and air circulation (fanning), wet cloths and air circulation, or maximum exposure to air in a shaded area with maximum air circulation. Do not use ice for skin cooling. Give fluids sparingly. Manage dryness and coating of the mouth and lips using moist swabs and small amounts of petroleum jelly. Monitor for skin abrasions caused by repetitive movements. Remove potentially harmful items, including cigarettes, matches, medications, and small items that could be accidentally ingested, from the patient/victim's possession. Consider loose restraint of disoriented or agitated patient/victims. Consider separation of affected individuals into small groups to minimize potential crowd control problems. Seek medical attention immediately. *Skin*: After removing patient/victim from the source of exposure, immediately, see the *Decontamination* section (above). See the *Inhalation* section for first aid recommendations. Seek medical attention immediately.

Note to health professionals: Treatment of QNB intoxication largely consists of supportive care: use of intravenous fluids and appropriate cooling measures to address elevated core body temperature and judicious use of sedation using benzodiazepines. Severe toxicity may require the use of physostigmine in a hospital setting*[92].

Antidote: *Some military references suggest the use of physostigmine to temporarily increase synaptic acetylcholine concentrations. Physostigmine poses its own risks of side effects and interactions with other drugs and should be used. Only by physician or other medical personnel familiar with its safe use. Suggested dosages for physostigmine in the treatment of QNB (BZ) poisoning follow: *Test dose:* If the diagnosis is in doubt, a dose of 1 mg might be given. If a slight improvement occurs, routine dosing should be given. *Routine dosing:* Doses of about 45 μg/kg for adults have been recommended. This might be modified by the response. A mental status examination should be done every hour and the dose and time interval of dosing should be modified according to whether the mental status is improved or not. As the patient improves, the dosage requirement will decrease. *Routes of administration*: IM: 45 μg/kg in adults (20 mg/kg in children); IV: 30 μg/kg slowly (1 mg/min); PO: 60 μg/kg if patient is cooperative (because of bitter taste, consider diluting in juice). For each route, titrate about every 60 minutes to mental status[163].

Personal Protective Methods: F

General information: First responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): Select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered APR (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to QNB, use a NIOSH-or European Standard EN 149-certified CBRN full facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. QNB is stable in most solvents, with a half-life of 3 to 4 weeks in moist air. Store at 2 to 8°C.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 1.1/1.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

QNB (BZ, Buzz), when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 1.1/1.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1250/381
Then: Protect persons downwind (mi/km) Day 1.4/2.3
Night 5.0/8.0

QNB aerosol is heavier than air. It will spread along the ground and collect and stay in poorly ventilated, low-lying, or confined areas e.g., sewers, basements, and tanks). Hazardous concentrations may develop quickly in enclosed, poorly ventilated, or low-lying areas. Keep out of these areas. Stay upwind. *Environment/spillage disposal*: Do not touch or walk through the spilled agent if at all possible. However, if you must, personnel should wear the appropriate PPE during environmental decontamination. See the PPE section of this record for detailed information. Keep combustibles (e.g., wood, paper, and oil) away from the spilled agent. Use water spray to reduce aerosols or divert aerosol cloud drift. Avoid allowing water runoff to contact the spilled agent. Do not direct water at the spill or the source of the leak. Stop the leak if it is possible to do so without risk to personnel. Prevent entry into waterways, sewers, basements, or confined areas. Isolate the area until aerosol has dispersed. Ventilate the area[77]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Spills must be contained by covering with vermiculite, diatomaceous earth; clay, fine sand; sponges, and paper or cloth towels. This containment is followed by treatment with copious amounts of aqueous sodium hydroxide solution (a minimum 10 wt.%). Scoop up all material and place in a fully removable head drum with a high density polyethylene liner. The decontamination solution must be treated with excess bleach to destroy the CN formed during hydrolysis. Cover the contents with additional bleach before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW, EPA, and DOT regulations.

Fire Extinguishing: QNB (BZ) is combustible; it may burn but does not ignite readily. Thermal decomposition products may include oxides of nitrogen and carbon. QNB (BZ) might be transported in a molten form. QNB (BZ) may decompose upon heating producing corrosive and/or toxic gases. Containers may explode when heated. In case of fire, evacuate the area, including yourself. If there is some reason that you have to put out the fire—for example, there are things nearby that cannot be allowed to burn—use unattended equipment, then evacuate everyone immediately, including yourself. When heated, aerosols may form explosive mixture with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. QNB (BZ) aerosol is heavier than air. It will spread along the ground and collect and stay in poorly ventilated, low-lying, or confined areas (e.g., sewers, basements, and tanks). Hazardous concentrations may develop quickly in enclosed, poorly ventilated, or low-lying areas. Keep out of these areas. Stay upwind. Fire may produce irritating, corrosive, and/or toxic gases.

If you must extinguish a QNB (BZ) fire—Small fires: Use dry chemical, carbon dioxide, or water spray. *Large fires*: Use dry chemical, carbon dioxide, alcohol-resistant foam, or water spray. Move containers from the fire area if it is possible to do so without risk to personnel. Dike fire control water for later disposal; do not scatter the material. For fire involving tanks or car/trailer loads, fight the fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tanks. Always stay away from tanks engulfed in fire. Run-off from fire control or dilution water may be corrosive and/or toxic, and it may cause pollution. If the situation allows, control and properly dispose of run-off (effluent).

Disposal Method Suggested: Dispose of the material per IAW waste disposal methods provided below. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If 10 wt.% sodium hydroxide is not available then the following decontaminants may be used instead and are listed in order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate and Supertropical Bleach Slurry (STB). Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Regulatory Authority and Advisory Information
Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen (Ionizing radiation: Radon and its isotopic forms, radon-220 and radon-222); IARC: Known carcinogen; EPA and the National Academy of Sciences, Committee on Biological Effects of Ionizing Radiation: Radium is a known human carcinogen. Radium-224; Radium-226; Radium-228; Radon-222 and their decay products Category 1.
California Proposition 65 Chemical[102]: Cancer, 1/1/1989 as radionuclides. Hazard Alert: Dangerous radioactive hazard.
Radionuclides and Reportable Quantities (RQ) listed under CERCLA (see 40CFR Part 302, Table 302.4, Appendix B, for more information): Radium-223 RQ = 1 curies; Radium-224 RQ = 10 curies; Radium-225 RQ = 1 curies; Radium-226 RQ = 0.1 curies; Radium-227 RQ = 1000 curies; Radium-228 RQ = 0.1 curies; Radon-220 RQ = 1 curies; Radon-222 RQ = 1 curies.
United States National Primary Drinking Water Regulations: MCL = zero mg/L; MCL = 5pCi/L, Radium 226 & Radium 228 (combined); MCL = 15 pCi/L, (Ra-$_{226}$), as *alpha*-proton emitter.
The Clean Air Act authorizes EPA to establish annual limits, known as National Emission Standards for Hazardous Air Pollutants (NESHAP) for the maximum amount of radium and other radionuclides that may be released to the air. Radium = 10 m Rem.
Description: Radium (Ra) is a radioactive element, found naturally occurring in the environment. Ra is a silvery-white-metallic solid @ 25°C; it tarnishes black when exposed to air. It is an alkaline earth metal; there are 33 isotopes, all of them are unstable. Radium is commonly available as radium bromide ($RaBr_2$) or radium chloride (RaC_{12}). Atomic Weight = 226.025; Density = 5.5 g/cm^3 @ 28°C; Freezing/Melting Point = 700°C; Boiling Point = 1140°C; 1536°C; 1737°C[206]; Density = 5.3 g/cm^3 @ 26.85°C; Vapor Pressure = 327 Pa @ 700°C. *Radium bromide* is a white to brownish crystalline solid. Radioactive. Molecular weight = 395.83; Density = 5.79 @ 20°C; Specific gravity (H_2O:1) = (H_2O:1) 3.34; Freezing/Melting point = 728°C (decomposes); Boiling point = 900°C (sublimes). Soluble in cold water. *Radium chloride* is a yellowish-white or brownish crystalline solid. Radioactive. Molecular weight = 296.9 g/mol; Density = 4.91; Freezing/Melting point = 1000°C.
Potential Exposure: Radium is not available as a pure metal but is found in very small quantities in uranium and thorium ores. Uranium and thorium are found in small amounts in most rocks and soil; radium is formed when these elements break down in the environment. One ton of uranium ore yields only slightly more than 0.1 gm of radium. Radium is formed from the radioactive decay; and, as a by-product of refining these ores. Radium exists in several isotope forms. Two of the principal radium isotopes found in the environment are ^{226}Ra (radium-226) and ^{228}Ra (radium-228). Radium compounds, due to their geologically short half-life and intense radioactivity, are quite rare. A single gram of ^{226}Ra produces 10^{-4} mm of radon (Rn) a day. Radium's- 226, radium's most stable isotope has a half-life of about 1603 to 1620 years, and remains in the body for life. Radium, when used to produce radon gas, is used for treating various types of cancer; in radiography of metals; and combined with other metals, such as beryllium, as a neutron emitting source used in research and for calibrating radiation instruments. Until the 1960s, radium was a component in self-luminous paints used for watch, compass, and aircraft instrument dials and other aircraft and military instrumentation. A less dangerous radioactive source, ^{60}Co (cobalt-60), replaced radium in luminous paint. The greatest health risk from radium comes from exposure to its radioactive decay product, radon (Rn). Radon is common in many soils and can collect in buildings, including homes.
Incompatibilities: Metallic radium is highly chemically reactive. It forms compounds that are very similar to barium compounds, making separation of the two elements difficult[72]. On contact with water, radium forms flammable hydrogen gas. Radium bromate is a strong oxidizer; avoid contact with a combustible material (clothing, wood, paper, oil, etc.).

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00017-X

Permissible Exposure Limits:

Recommended Occupational Annual Dose Limits (NCRP and NRC):

Whole body: 5 Rem (0.05 Sv)/1 year

Lens of eye: 15 Rem (0.15 Sv)

Skin: 50 Rem (0.5 Sv)

Hands or feet: 50 Rem (0.5 Sv)

Cumulative occupational limit: 1 Rem (0.01 Sv) x age

The limit for radiation exposure for a declared pregnant radiation worker is 500 mRem (0.005 Sv) for the entire gestation period. The separate limit for the fetus of 500 mRem (0.005 Sv) for the entire gestation; exposures to the fetus must be uniform, and must be maintained at or below 50 mRem (0.0005 Sv)/mo.

Radiological Dispersal Device (RDD) Incidents

Particulate sampling can be performed to measure the radioactivity of dust in the air and to further characterize exposures. Based on the sampling data, the respirator protection factor needed to meet the relevant exposure limits can be determined (see table below), and the specific type of respirator needed can be identified. According to the data, it may be possible to downgrade or remove requirements for respiratory protection. However, until exposures have been characterized, responders and support personnel should continue to utilize full-face air-purifying P100 respirators, or higher respiratory protection (e.g., SCBAs, PAPRs).

Guidance Matrix for Radiological Dispersal Device (RDD) Incidents

OSHA Occupational Exposure Rem (Sv)/calendar qtr.

Limits for Ionizing Radiation

29 CFR 1910.1096

Lens of Eye, or Gonads 1.25 (0.0125 Sv)

Feet and Ankles 18.75 (0.1875 Sv)

Skin of Whole Body 7.5 (0.075 Sv)

Minors (under age 18 workers) 10% of above limits

Over age 18 workers 3 Rem (0.3 Sv) may be permitted under conditions specified in 29CFR1910.1096 (b)

(2) *Note*: The Department of Homeland Security is currently chairing an interagency workgroup which is in the process of assessing the protective action guidance for response to an RDD event.

EPA Limits and advisory levels: United States, annual radiation exposure limits are found in Title 10, part 20 of the Code of Federal Regulations, and in equivalent state regulations.

Public dose limits due to licensed activities (NRC) 100 mRem (0.01 Sv)/year

Air: Radium NESHAP = 10 mRem (0.1 Sv)*

Water: ^{226}Ra & ^{228}Ra (combined radium) MCL = 5pCi/L; ^{224}Ra = 5pCi/L*

Indoor Air (advisory "action level"): 4pCi/L for Radon (Rn)

*Both the air and water standards limit the increased lifetime cancer risk to about two in 10,000.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL = zero mg/L; MCL = 5pCi/L, Radium 226 & Radium 228 (combined); MCL = 15 pCi/L, (Ra-$_{226}$), as *alpha*-proton emitter.

Permissible Concentration in Soil: The United States Environmental Protection Agency has set a soil concentration limit for Radium-226 in uranium and thorium mill tailings of 5 pCi/g in the first 15 centimeters of soil and 15 pCi/g in deeper soil.

Routes of Entry: Inhalation, ingestion, external exposure to *alpha*-, *beta*-, and *gamma*-rays.

Harmful Effects and Symptoms

Radium is highly radioactive and its decay product, radon (Rn) gas, is also radioactive. Radium is over one million times more radioactive than the same mass of uranium. Since radium is chemically similar to calcium, it has the potential to cause great harm by replacing it in bones and teeth. The latter affects include an increase in cavities and broken teeth.

Short-Term Exposure: Inhalation, injection, ingestion, or body exposure to radium can cause cancer and other disorders. Exposure to high levels can increase the risk of bone, liver, and breast cancer. Radium emits several different kinds of radiation, in particular, *alpha* particles and *gamma* rays. *Alpha* particles are generally only harmful if emitted inside the body. However, both internal and external exposure to *gamma* radiation is harmful. *Gamma* rays can penetrate the body, so *gamma* emitters like radium can result in exposures even when the source is a distance away. *Radium bromate*: Very hazardous in case of skin contact (irritant), of eye contact (irritant), of ingestion, and of inhalation. Slightly hazardous in case of skin contact; prolonged contact may result in skin burns, inflammation (including reddening, itching, and scaling,), blistering, and ulcerations. Inhalation overexposure may cause respiratory irritation. Inflammation of the eye is characterized by redness, watering, and itching. Exposure from *gamma* rays is measured in units of roentgens (Rads); 100 Rads = 1 Gray (Gy) = 1joule/kilogram. For example: Radiation sickness = total body exposure of 100 rads (or 1 Gy). Radiation sickness and death in half the population = total body exposure of 400 Rads (or 4 Gy). Without medical treatment, nearly everyone who receives more than 400 Rads will die within 30 days. 100,000 rads causes almost immediate unconsciousness and death within an hour.[NYT]

Long-Term Exposure: Increased risk of cancer. Long-term exposure to radium increases the risk of developing several diseases. Inhaled or ingested radium increases the risk of developing lymphoma, bone cancer, and diseases that affect the formation of blood, such as leukemia and aplastic anemia. These effects usually take years to develop. External exposure to radium's *gamma* radiation increases the risk of cancer to varying degrees in all tissues and organs. Historically, Marie Curie's death due to aplastic anemia has been blamed on exposure and handling of radium. Patients who were injected with radium in Germany, from 1946 to 1950, for the treatment of certain diseases including tuberculosis were significantly shorter as adults than people who were not treated[92].

Points of Attack: Liver, blood (anemia), eyes (cataracts) and other organs, bones and teeth.

Medical Surveillance: There are tests that are used to determine exposure to radium or other radioactive substances. For example, a whole body count can measure the total amount of radioactivity in the body, and urine and feces can be tested for the presence of radionuclides. There is no test that can detect external exposure to radium's *gamma* radiation, unless the doses were very high, and cellular damage is detectable. Another test measures radon (Rn) in exhaled air [radon (Rn) is a breakdown product of radium]. None of these tests are routinely performed in a doctor's office; they require specialized laboratory equipment. These tests are unable to quantify exposure, nor can they be used to predict whether a patient will develop long-term or harmful health effects.

First Aid: Unless you are dressed in appropriate protective gear to prevent self-contaminating, do not provide medical attention. Evacuate the victim from area of exposure to a safe area as soon as possible. To stop ongoing contamination, have the victim remove clothing, if possible, and place clothing in a sealed garbage bag or container. Check the victim's breathing and pulse; start CPR, if necessary. *Skin*: If skin contamination has occurred, measure levels of contamination with a survey meter, record results, and begin decontamination by gentle washing with plenty of water (warm if possible) and nonabrasive and disinfecting soap, washing downwards towards extremities, not upwards. Dry body and cover the irritated skin with an emollient. If burns are obvious, do not use ointments. Wrap victim in a clean, soft blanket. Seek immediate medical attention; evacuate the victim to nearest emergency medical facility. *Eyes*: Check for and remove any contact lenses. Immediately flush eyes with cold water, Avoid the use of an eye ointment. Seek immediate medical attention; evacuate the victim to nearest emergency medical facility. *Inhalation*: Allow the victim to rest in a well-ventilated area. If breathing is difficult, administer oxygen. Seek immediate medical attention; evacuate the victim to nearest emergency medical facility. *Ingestion*: Do not induce vomiting. Loosen tight clothing such as a collar, tie, belt Seek immediate medical attention; evacuate the victim to nearest emergency medical facility.

Personal Protective Methods: *Radium bromate*: Engineering Controls: Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit. Emergency responders to an explosion or the resulting fires will generally not know they are being exposed to radiation unless they utilize a radiation detecting device. There is no practical personal protective equipment (PPE) to protect First Responders against externally penetrating *gamma* radiation. Monitoring devices are the only means to ensure that responders do not enter an area where exposure to external *gamma* radiation is excessive. Personal protective equipment (PPE) to prevent skin contamination of particulates is very effective against particulate-borne radiation hazards (i.e., *alpha* and *beta* particles). Typical fire fighter "turn-out" gear, including an SCBA and radiation detection device or dosimeter, may be adequate for this purpose (depending on radiation level). The use of turn-out gear or any disposable protective clothing suitable for particulate exposure, should be followed by appropriate decontamination of personnel and equipment. *Personal Protection in Case of a Large Spill*: Splash goggles. Full suit. Dust respirator. Boots. Gloves. A self-contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling radioactive material.

Respirator Selection: Protection of internal organs from inhalation of radioactive particulates can be provided by wearing an appropriate particulate respirator. The SCBAs will provide the highest level of protection. Responders should utilize at least a full-face air-purifying respirator with a P100 or HEPA filter, as appropriate. Respiratory protection specifically approved by NIOSH for CBRN exposures is desirable. However, where specific CBRN-approved respirators are not available, the incident commander may allow alternative NIOSH-approved respirators, such as SCBAs, or full-face powered or nonpowered air-purifying respirators with P100 or HEPA filters, as appropriate. It should be noted that these recommendations for respiratory protection are designed ONLY for protection against inhalation of radioactive particulates, and do not consider protection that may be necessary for other contaminants, such as chemical or biological agents.

At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Store in a ventilated area to prevent accumulation of radon (Rn).

Shipping: UN3323(does not appear in the 49CFR hazard materials tables[101]) Radioactive material, Type C package, nonfissile or fissile excepted. UN2915 Radioactive material, Type A package nonspecial form, nonfissile or fissile-excepted, Hazard class: 7-Radioactive material; Labels: None. *A1 and A2 values for Radium- 226 taken from §173.435 (see also Table A-1 in 10CFR71(Appendix A): A1 (SpecialForm*) 0.3 TBq (8.11Ci); A2 (NormalForm) 0.02TBq (0.541Ci))*

*Special form materials are limited to those materials which, if released from a package, would present a hazard due to direct *external radiation only*. Usually, due to the high physical integrity of a special form material, radioactive material contamination is not expected even under severe accident conditions. This high physical integrity is occasionally the result of *inherent natural* properties of the material, such as its being in nondispersible solid form. Most often, however, it is an *acquired characteristic*, resulting from being welded (encapsulated) into an extremely durable metal capsule.

The A1 and A2 quantities for each radionuclide are basically the maximum activity that can be transported in a type A package. For many radionuclides, the regulations allow substantially larger quantities of special form material to be placed in a Type A packaging than when the material is in "normal form," i.e., "nonspecial form". Special form radioactive material is defined in 49 CFR 173.403. Special form sources must have at least one external physical dimension which exceeds 5 mm (0.197″). The minimum dimension requirement makes the capsule easier to see and recover in the event of its release from the package during an accident. *Special form encapsulations are required to be constructed in a manner that they can only be opened by destroying the capsule*. This requirement prevents the inadvertent loosening or opening of the capsule, either during transport or following an accident. The testing requirements for determination of whether radioactive materials qualify as "special form" are found in 49CFR173.469, which describes tests for high temperature, impact, percussion, bending, and leakage.

Spill Handling: Notify authorities that spill has occurred. Do not touch spilled material. Cover with absorbent paper or dike with absorbent. Isolate the area to prevent unnecessary spread of the material and personnel exposures. Prevent entry into sewers, basements or confined areas; dike if needed. Using appropriate monitoring equipment, survey the spill site; evaluate the presence of contamination on an individual's skin and clothing and on lab equipment. If skin or clothing contamination is present, assume a MAJOR spill has occurred. Do not attempt to clean it up. Confine all potentially contaminated individuals in order to prevent the further spread of contamination. If possible, shield the source, but only if it can be done without significantly increasing radiation exposure to yourself or other personnel. Leave the affected room and lock the doors in order to prevent entry. Do what you can to prevent further spreading of contamination to unrestricted areas. Contact local and state authorities and the Department of Energy (DOE) Radiological Response Team. Call for assistance on disposal.

Fire Extinguishing: If "Radioactive material, Type A package nonspecial form" material is involved in a fire situation: First: Contact the Department of Energy (DOE) Radiological Response Team, as well as state and local authorities. Do not use water; use suitable dry powder, graphite, soda ash, powdered sodium chloride, or sand.

Disposal Method Suggested: Radioactive material considered waste and must be retained in containers for disposition by the authorizing institution. Drain disposal is prohibited. It is the responsibility of the operating institution to arrange for the proper disposal of all forms of any radioisotopes. The use, storage, transportation, labeling, and disposal of radioactive material are regulated through the Nuclear Regulatory Commission (NRC) using 10 CFR (Code of Federal Regulations) as the regulatory basis and 49 CFR (Transportation). (The CFR's are available at no cost on the internet at http://www.access.gpo.gov/nara/cfr/index.html.)

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Likely to be carcinogenic to humans.

California Proposition 65 Chemical[102]: Cancer (7/1/2008); Developmental/Reproductive toxin (7/1/2008).

Hazard Alert: Poison, Combustible, Reproductive toxin: Possible risk of gene damage/impaired fertility; possible endocrine disruptor, Environmental hazard.

EPA Acceptable Daily Intake (ADI): EPA Oral reference dose (RfD) = 0.03 mg/kg/day

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N; Risk phrases: R22; R50/53; R62; Safety phrases: S1; S2; S29 S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Off-white to tan waxy solid or colorless crystals. Chrysanthemum-like odor. Commercial products may be dissolved in flammable organic solvents. Molecular weight = 338.48 (all isomers); Specific gravity (H_2O:1) = 0.96 @ 20°C; Boiling point = (decomposes); Freezing/Melting point = 56−57°C; Vapor pressure = 1×10^{-8} mmHg @ 20°C; Flash point = 129°C. Henry's Law constant = 1.3×10^{-7} atm-m^3/mol @ 25°C (est)[83]. Low solubility in water. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Resmethrin is pyrethroid insecticide used for mosquito control (by aerial application) in the USA, and may can also be used in greenhouses to control white fly. Resmethrin is a synthetic Type I pyrethroid insecticide registered for control of insects in residential, commercial, and industrial settings, and in animal living areas. It is also registered for use in food handling establishments and as a restricted use pesticide when used in ULV spray to control adult mosquitoes in the interest of public health[83]. A United States Restricted Use Pesticide (RUP) when formulated for use in mosquito abatement and pest control treatments at nonagricultural sites. Restricted due to extreme fish toxicity.

Incompatibilities: Decomposed by air, light, alkaline media, and temperatures >175°C. May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate.

Permissible Exposure Limits in Air:

NIOSH(2) IDLH = 5,000 ppm

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum.

Permissible Concentration in Water: EPA Acceptable Daily Intake (ADI) = 0.1250 mg/kg/day.

Determination in Water: Octanol-water coefficient: Log K_{ow} = > 5.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Pyrethrins can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, restlessness, and rhinorrhea (discharge of thin nasal mucous). Potential thyroid toxin. LD50 (oral, rat) = >2 g/kg; LD50 (dermal, rat) = >3 g/kg.

Long-Term Exposure: High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic "pneumonia" can also occur with cough, chest pain, breathing difficulty, and abnormal chest x-ray. Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Dermal contact can cause rash with redness, blisters, and intense itching. A severe generalized allergy can occur with weakness and collapse.

Points of Attack: Respiratory system, skin, central nervous system; thyroid.

Medical Surveillance: Comprehensive physical examination with emphasis on the genitourinary tract analysis to include sperm count, motility, and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum luteinizing hormone (LH) may be carried out if, in the opinion of a physician, they are indicated. Before beginning employment and at regular times after that, the following are recommended: Employees should be screened for history of certain medical conditions which might place the employee at increased risk from pyrethroid exposure. Chronic respiratory disease: In persons with chronic respiratory disease, especially asthma, the inhalation of pyrethroids might cause exacerbation of symptoms due to its sensitizing properties. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest x-ray if lung symptoms are present. Skin disease: Pyrethroids can cause dermatitis which may be allergic in nature. Persons with pre-existing skin disorders may be more susceptible to the effects of this agent. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Any employee developing the above-listed conditions should be referred for further medical examination[9].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested*. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240 (d)(4−6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved self-contained breathing apparatus and full protective clothing.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: *50 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full-facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *250 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full-facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any self-contained breathing apparatus with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *5000 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied- air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location at temperature $<35°C$ and away from alkaline materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3352 Pyrethroid pesticide, liquid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3349 Pyrethroid pesticide, solid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. *On a small fire*: Use dry chemical, CO2, water spray, or regular *foam*. *On a large fire*: Use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165. Follow recommendations for the disposal of pesticides and pesticide containers[83]. Bury in noncrop land away from water. It would be better to mix the product with lime. Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amount of combustible material. Recommendable methods: Hydrolysis, landfill, incineration, and open burning. *Not recommendable method*: Discharge to sewer. Mix with sawdust and burn at a remote place[UN].

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; NCI: Carcinogenesis studies (feed); clear evidence: Mouse, rat, 1980.

California Proposition 65 Chemical[102]: Cancer 10/1/1989

Hazard Alert: Poison, Combustible, Alkaloid drug, Suspected of causing genetic defects, Suspected reprotoxic hazard.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U200

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xi, Xn; Risk phrases: R45; R10; R22; R36/37/37; R41; R50/53; R60; R61; R62; R63; R67; Safety phrases: S22; S26; S36/37/S39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Reserpine is a white to pale buff to slightly yellow crystalline substance that darkens on exposure to light. Molecular weight = 608.75; Freezing/Melting point = 264−265°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. May be combustible.

Potential Exposure: Reserpine, a pharmaceutical, is a naturally occurring substance that is isolated from the roots of the plant *rauwolfia serpentina*. Insoluble in water. Reserpine is used as a hypertensive for humans and animals; tranquilizer, and sedative. Permitted for use as an additive in food for human consumption, and the feed and drinking water of food-producing animals.

Incompatibilities: A weak acid; keep away from bases. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and strong reducing agents such as hydrideds and active metals. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water, and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates, and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Massive overexposure may cause decreased blood pressure, convulsions, and coma. Reserpine is highly toxic to man. In humans, 0.014 mg/kg produces psychotropic effects. Symptoms include nausea, diarrhea, excessive salivation; nasal stuffiness; drowsiness, nightmares, emotional depression, and other psychotropic effects; extra systoles; angina pain; edema and weight gain sometimes associated with frank congestive heart failure; thrombocytopenia; tremor, muscular stiffness; severe hypotension in conjunction with general anesthetic administration.

Long-Term Exposure: May be a human carcinogen. There is limited evidence that this chemical causes breast cancer in humans, and breast and testes cancer in animals. Reproductive activity; may also be a mutagen and teratogen. Reserpine may damage the developing fetus. People taking reserpine daily for medical purposes have developed nightmares, severe depression; cramps, diarrhea, and weight gain. It is unknown if these symptoms occur from repeated occupational exposure.

Points of Attack: Nervous system. *Cancer site*: Breast in humans; breast and testes in animals.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. There is no special test for this chemical. If overexposure or illness is suspected, medical attention is recommended.

First Aid: *Skin Contact*: Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others[52]. *Eye Contact*: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required for drug manufacture by the Food and Drug Administration. Refer to 21CFR210, *FDA Regulation for Good Manufacturing Practices*.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or in a cool, dry place. Protect from exposure to light and acids. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1544 Alkaloids, solid, n.o.s. or Alkaloid salts, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources:[52] Remove all sources of ignition and dampen spilled material with toluene to avoid airborne dust, then transfer material to a suitable container. Ventilate the spill area and use absorbent dampened with toluene to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazardous to aquatic life or environment, with possible long lasting effects[291][194].
Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N, Xi; Risk phrases: R22; R36/37/38; R43; R51/53; R62; Safety phrases: S2; S26; S29; S41; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: Resorcinol is a white crystalline solid with a characteristic odor and a sweetish taste. Turns pink on exposure to air or light, or contact with iron. Molecular weight = 110.1; Specific gravity (H2O:1) = 1.3 @ 20°C; Boiling point = 277°C; Freezing/Melting point = 109°C; Vapor pressure = 0.0002 mmHg @ 25°C; Flash point = 127.2°C (cc); Autoignition temperature = 607°C. Explosive limits: LEL = 1.4% @ 200°C. UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity. Highly soluble in water; solubility = 110%.
Potential Exposure: Resorcinol is weakly antiseptic; resorcinol compounds are used in the production of resorcinol-formaldehyde adhesives; or as an intermediate; in pharmaceuticals and hair dyes for human use. Major industrial uses are as adhesives in rubber products and tires, wood adhesive resins, and as ultraviolet absorbers in polyolefin plastics. Resorcinol is also a by-product of coal conversion and is a component of cigarette smoke. Thus, substantial opportunity exists for human exposure.
Incompatibilities: Reacts with oxidizers, nitric acid; oil, ferric salts; methanol, acetanilide, albumin, antipyrene, alkalies, urethane, ammonia, amino compounds. Hygroscopic; absorbs moisture from the air.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 4.50 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 10 ppm/45 milligram per cubic meter TWA; 20 ppm/90 milligram per cubic meter STEL
ACGIH TLV[1]: 10 ppm/45 milligram per cubic meter TWA; 20 ppm/90 milligram per cubic meter STEL; not classifiable as a human carcinogen Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 20 ppm
PAC-2: 28 ppm
PAC-3: 170 ppm
DFG MAK: Danger of skin sensitization
Australia: TWA 10 ppm (45 milligram per cubic meter); STEL 20 ppm, 1993; Austria: MAK 10 ppm (45 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (45 milligram per cubic meter); STEL 20 ppm, 1993; Denmark: TWA 10 ppm (45 milligram per cubic meter), 1999; EU OEL: TWA 10 ppm, 45 milligram per cubic meter; 2000; Finland: TWA 10 ppm (45 milligram per cubic meter); STEL 20 ppm (90 milligram per cubic meter), 1999; France: VME 10 ppm (45 milligram per cubic meter), 1999; Hungary: TWA 45 milligram per cubic meter; STEL 90 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 45 milligram per cubic meter, 2003; Poland: MAC (TWA) 45 milligram per cubic meter; MAC (STEL) 90 milligram per cubic meter, 1999; Sweden: NGV 10 ppm (45 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 10 ppm (45 milligram per cubic meter), 1999; United Kingdom: TWA 10 ppm (46 milligram per cubic meter); STEL 20 ppm (92 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 20 ppm. Several states have set guidelines or standards for resorcinol in ambient air[60] ranging from 3.1 μ/m^3 (Massachusetts) to 450.0–900.0 μ/m^3 (North Dakota) to 750.0 μ/m^3 (Virginia) to 900.0 μ/m^3 (Connecticut, Florida, New York) to 1,071.0 μ/m^3 (Nevada).
Determination in Air: OSHA versatile sampler-7; Methanol; Gas chromatography/Flame ionization detection;

NIOSH Analytical Method (IV) #5701; OSHA Analytical Method: PV-2053.

Permissible Concentration in Water: Russia[35][43] set a MAC in water bodies used for domestic purposes of 0.1 mg/L and in water bodies used for fishery purposes of 0.004 mg/L. The state of Maine has set a guideline for drinking water of 140 μg/L[61].

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 1$. Unlikely to bioaccumulate in marine organisms.***Routes of Entry***: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact causes a severe rash and blistering. Eye contact can cause burns and permanent damage. May affect the blood, causing formation of methemoglobin, cyanosis, convulsions; restlessness, increased heart rate; dyspnea (breathing difficulty), dizziness, drowsiness, hypothermia, hemoglobinuria. High exposure can cause kidney and/or liver damage. *Inhalation*: Humans occupationally exposed to 10 ppm showed no effects. Experiments with animals showed no toxic effects after 8 hour exposure to 625 ppm. *Skin*: Itching, irritation, redness, swelling, and chemical burns have been reported from contact with solutions of 3%−25% strength. Skin absorption is significant and leads to loss of oxygen carrying capacity of blood, convulsions, and death. *Eyes*: Animal tests suggest that 10% solution may cause irritation, pain, and corneal damage. Powdered resorcinol may cause chemical burns to the cornea resulting in blindness. *Ingestion*: May cause excessive sweating, low blood pressure; slowed breathing; tremors, breakdown of blood cells and death. One teaspoonful may cause death.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Repeated exposure can cause lung damage. May cause kidney, liver, spleen damage.

Points of Attack: Eyes, skin, respiratory system; cardiovascular system; central nervous system; blood, spleen, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for resorcinol. Tests for kidney and liver function. Methemoglobin level. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine. Emergency treatment and management is similar to phenol.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 10* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full-facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposure exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous-flow mode; or use NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, oil, ferric salts; methanol, acetanilide, albumin, antipyrine, and urethane. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2876 Resorcinol, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Establish forced ventilation to keep levels below explosive limit. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Liquid solutions should be absorbed on sand or vermiculite and shoveled into suitable containers. Scrub spill area with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in a combustible solvent and incinerate.

RTECS Number: VI9069000 (metal)

UN/NA & ERG Number: UN3089 (metal powder, flammable, n.o.s.)/170

EC Number: 231-125-0; 234-846-9 [Rhodium(III) oxide, hydrate]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable solid (powder, dust), Strong reducing agent, reactive hazard (known catalytic activity).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%., elemental.

WGK[100] (German Aquatic Hazard Class): Nonhazard to water. (metal, particle size > 1 mm.)

Description: Rhodium, together with platinum, palladium, iridium, ruthenium, and osmium, is one of the platinum-group metals in Group VIII of the Periodic Table. Rhodium metal is a white, hard, ductile, malleable solid with a bluish-gray luster. Molecular weight = 103; Specific gravity [metal] (H2O:1) = 12.41 @ 25°C; Boiling point = 3727°C; Freezing/Melting point = 1966°C. Insoluble in water.

Potential Exposure: Rhodium has few applications by itself, as in rhodium plating of white gold jewelry or plating of electrical parts, such as commutator slip rings, but, mainly, rhodium is used as a component of platinum alloys. Rhodium-containing catalysts have been proposed for use in automotive catalytic converters for exhaust gas cleanup.

Incompatibilities: Flammable as a dust, fume, or powder may form explosive mixture with air. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, bromine pentafluoride, and bromine trifluoride; chlorine trifluoride; oxygen difluoride.

ACGIH TLV[1] (*elemental*): 1 mg[Rh]/m^3; not classifiable as a human carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

metal

NIOSH IDLH = 100 mg[Rh]/m^3

PAC-1: 3 milligram per cubic meter

PAC-2: 33 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

DFG MAK: Carcinogen Category 3B

Australia: TWA 1 mg[Rh]/m^3, 1993; Belgium: TWA 1 mg [Rh]/m^3, 1993; Finland: TWA 0.1 mg[Rh]/m^3, 1999; France: VME 1 mg[Rh]/m^3, 1999; Norway: TWA 0.1 mg [Rh]/m^3, 1999; the Philippines: TWA 0.1 mg[Rh]/m^3, 1993; Switzerland: MAK-W 0.1 mg[Rh]/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg[Rh]/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

soluble compounds
NIOSH IDLH = 2 mg[Rh]/m^3
OSHA PEL: 0.001 mg[Rh]/m^3 TWA
NIOSH REL: 0.001 mg[Rh]/m^3 TWA
ACGIH TLV[1]: 0.01 mg[Rh]/m^3; not classifiable as a human carcinogen
DFG MAK (*inorganic only*): Carcinogen Category 3B
Several states have guidelines or standards for rhodium in ambient air[60] ranging from 0.16 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut), to 10.0 μ/m^3 (North Dakota) to 24.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH II(3) Method #S-188.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: May cause metal fume fever. Rhodium (III) chloride and its hydrate are extremely toxic. May cause serious eye damage.

Long-Term Exposure: Possible respiratory sensitization

Points of Attack: Respiratory system. Ingestion [Rhodium (III) chloride].

Medical Surveillance: Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Lung function tests. Consider chest X-ray following acute overexposure to metal fume or dust.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If metal fume fever develops, it may last less than 36 hours.

Note to Physician: In case of fume inhalation, treat for pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 1 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators]. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 100 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code-Red (*powder*): Flammability Hazard: Store in a flammable materials storage area. Prior to working with this material all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and sources of ignition. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Sipping: Flammable powder, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Powder is a flammable solid. Thermal decomposition products may include metal oxides. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water*. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery in view of the high economic value. Recovery techniques for recycling of rhodium in plating wastes and spent catalysts have been described in the literature.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to waters.

Description: Rhodium trichloride is a red-brown or black, odorless solid or liquid. Molecular weight = 209.26; 263.32 (trihydrate); Boiling point = 775°C (sublimes); Freezing/Melting point = 400−500°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Insoluble in water. *Rhodium trichloride trihydrate*, RhCl3 · xH2O, is a deep-red crystalline solid. Soluble in water.

Potential Exposure: Rhodium trichloride is used in hydrosilylation, hydrogenation, carbonylation, oxidation, arylation. See also "Rhodium Metal." In plating operations and in catalyst preparation, the metal will be used as the trichloride.

Incompatibilities: Sensitive to humidity. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

OSHA PEL: 0.001 mg[Rh]/m^3 TWA

NIOSH REL: 0.001 mg[Rh]/m^3 TWA

ACGIH TLV[1]: 0.01 mg[Rh]/m^3; not classifiable as a human carcinogen

Protective Action Criteria (PAC) not available

DFG MAK: Carcinogen Category 3B

Australia: TWA 1 mg[Rh]/m^3, 1993; Belgium: TWA 1 mg [Rh]/m^3, 1993; Denmark: TWA 0.001 mg[Rh]/m^3, 1999; Finland: TWA 0.001 mg[Rh]/m^3, [skin], 1999; France: VME 1 mg[Rh]/m^3, 1993; Norway: TWA 0.1 mg[Rh]/m^3, 1999; the Philippines: TWA 0.1 mg[Rh]/m^3, 1993; Switzerland: MAK-W 0.1 mg[Rh]/m^3, 1999; United Kingdom: TWA 0.001 mg[Rh]/m^3; STEL 0.003 mg[Rh]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Not classifiable as a human carcinogen. Several states have guidelines or standards for rhodium in ambient air[60] ranging from 0.16 μ/m^3 (Virginia); to 2.0 μ/m^3; (Connecticut); to 10.0 μ/m^3 (North Dakota); to 24.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH II(3), Method #S-189.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This material is corrosive. May cause eye irritation, possible serious damage. Delayed effects of inhaling dust may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. In animals: Irritation of the eyes; central nervous system damage. LD_{50} = (oral-rat) 1302 mg/kg.

Long-Term Exposure: May cause central nervous system damage. Tumorigenic and mutagenic effects have been reported in experimental lab animals.

Points of Attack: Eyes, central nervous system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider the point of attack in preplacement and periodic physical examinations.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 1 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators]. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 100 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of metal. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and reclaiming wherever possible in view of high economic value. See "Rhodium Metal."

EC Number: None assigned.

Regulatory Authority and Advisory Information

Report any release of WMD to National Response Center 1-800-424-8802

Hazard Alert: Exposure can be lethal, Biotoxin, Environmental hazard, Suspected of causing genetic defects, Teratogen.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; Risk phrases: R26/27/28; R42/43; Safety phrases: S23; S28; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class) No value assigned to these CAS numbers. *However, based on toxicity the following may apply*: 3-Severe hazard to water.

Description: Ricin is a lethal, delayed-action cytotoxin; it is persistent in the environment. Ricin is a white powder. Molecular weight = (approx.) 64,000−66,000 daltons; Volatility = negligible; Vapor Pressure = Negligible @ 20°C; Boiling point = decomposes; Ricin is detoxified in 10 minutes @80°C/176°F or in 1 hr at 50°C/122°F @ pH 7.8. Hazard Identification (based on NFPA-704 M Rating System): Health 4; Flammability 1; Reactivity 0[92]. Ricin is stable under ambient conditions and destroyed by heat and contact with solution household bleach. Michaelis constant (KM) = 0.1 ìmol/L for ribosomes; Enzymatic constant (*K*cat) = 1500/min. The toxin is soluble in water.

Detection: Various tests for the detection of Ricin are available, including "Pro-Strips" from Avant Technologies, the BIO-911™ test strip developed by Osborn Scientific Group, Lakeside AZ. This one-step test is reported to detect, within minutes, the presence of minute quantities of the toxin (less than 50 nanograms); the freeze-dried assay kit to detect crude Ricin called Ruggedized Advanced Pathogen Identification Device (Rapid)™, Rapid LT, and Razor instrument developed by Idaho Technologies, Inc. Ricin is detectable in urine, plasma, and environmental samples. *Instant Chek Abrin/Ricin Detection Kit*, Catalog Number: IC-RA-003-10 Kit Contents: 10 test units each test contains two tests (one Abrin and one Ricin) per unit, lyophilized reagent, reconstitution buffer, wash buffer, transfer pipettes, instruction booklet. Ey Laboratories, Inc, 107 N. Amphlett Blvd, San Mateo, CA. 94401 USA, Toll Free (North America)1-800-821-0044; Telephone: 1-650-342-3296, Option 2 or 3 Fax. +1 (650) 342 2648. Also, in 2009, researchers at Yeshiva University's Albert Einstein College of Medicine have developed an accurate test. Polymerase Chain Reaction (PCR) can detect castor bean DNA in most Ricin preparations. See also "Water Detection," below.

History of the material: Ricin is a lectin—a plant glycoprotein that binds and agglutinates animal cells. Ricin comes from the seeds (or beans) of the castor bean plant, *Ricinus communis*. The beans are processed to form castor oil, formerly used as a laxative and now used in industry as a lubricant. Annual worldwide processing of castor beans is approximately 1 million tons to produce castor oil; waste mash from this production is 3% to 5% Ricin by weight. Large-scale production and use of Ricin by an enemy is fairly difficult. It is estimated that a ton of Ricin would be required to produce a mass casualty biological weapon; therefore an enemy would have to produce a very large quantity in order to cover a large area of a battlefield. For centuries farmers have known the dangers to farm animals that have eaten castor beans. In fact, people found castor beans in 6000-year-old Egyptian tombs. Castor oil has been used for centuries as medicine, and scientist have known about Ricin's effect on stopping the body from making proteins since 1800. During WWII, the United States and Britain worked together on building bombs carrying Ricin, but the only reported military use was by Iraq in their war with Iran. The United States Army discovered large stores of Ricin in Al Qaeda caves in Afghanistan. This relatively inexpensive, accessible, natural source allows easy preparation of large quantities of Ricin; therefore, there is little motivation to produce it synthetically. Large-scale production of Ricin by recombinant DNA techniques is probably possible. Certain governments have successfully used Ricin to murder political enemies. In 1978, Georgi Markov, a Bulgarian journalist living in London, was assassinated when a Ricin pellet was injected into his leg using a specialized gun disguised as an umbrella. In February 2004, Ricin was found in the Senate mail room on Capitol Hill in Washington, D.C. No one became ill from that exposure. Since 1978, worldwide, there have been more than a dozen other known incidents involving Ricin. Although Ricin has the potential for use as a terrorist weapon, it is also being investigated as a treatment for cancer and AIDS.

Potential Exposure: Potentially Fatal. Ricin, a protein found in castor beans, is one of the most incredibly potent and lethal substances known to humankind − 500 μg (an amount capable of fitting on the head of a pin)—is capable of killing an adult within a few days. The castor plant, and their beans, is an important industrial plant and vast amounts of castor plants and beans are grown commercially. The castor plant, originally native to Africa, is an attractive plant that can be found in people's yards as ornamentals. If the flowers are removed before they produce seeds, the risk of accidents can be averted. Ricin poisoning can occur following accidental ingestion of castor beans. In some countries castor beans are used as beads on necklaces; both children and adults have eaten just a few beans and died from the poison. This invasive 8 to 10 foot tall plant can be found in more than 25 US states and other places, including Australia. The plants die in freezing weather. The beans are turned into important and valuable industrial products. After the castor oil is squeezed from the castor beans, about 5% of what's left is Ricin. Although people have used weak castor oil as a laxative, purgative, and general folk-medicine "cure all," pure Ricin kills in a few days. Ricin gets into the body's cells and inhibits protein synthesis. Once this essential mechanism is halted, within hours the body's systems begins to shut down and the body begins to die. Ricin poisoning is not contagious and does not spread from person to person. Because Ricin isn't a living thing but rather a chemical made by living things, it probably would NOT make as effective a military weapon as viruses or bacteria like the ebola virus or anthrax. Nevertheless, it would make an effective terrorist weapon because it's easy to make and easy to use. It is estimated that a ton of Ricin would be required to produce a mass casualty biological weapon. With no known antidote*, vaccine, or other effective therapy available for Ricin poisoning, the threat of this agent being released into the environment as an aerosol, or added to the food or water supply, could be catastrophic. Ricin is extremely hazardous when freeze-dried, forming a light, easily-dispersed powder. For this reason, research laboratory personnel are usually directed to avoid freeze-drying Ricin. **Note*: Various public and private sector organizations are working on the development of antibody therapy that shows promise in neutralizing Ricin in animals. If successful, this therapy could result in a vaccine for humans and potentially reduce the threat of Ricin being used as a terrorist weapon.

Incompatibilities: Product is considered stable at ambient temperature. Ricin and other protein toxins can be destroyed by exposure to 0.1% sodium hypochlorite solution (household bleach) for 10 minutes. The toxic portion of Ricin is heat stable at ambient temperatures and begins to decompose at 60°C/140°F. At 80°C/176°F most of the toxicity is lost in about 30 minutes. When heated to decomposition, Ricin emits toxic nitrogen oxides. Avoid contact with strong oxidizers.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 8.20E-06

PAC-2: 9.00E-05

PAC-3: 5.40E-04

ChemWatch: 0.00006 milligram per cubic meter Ceiling limit (sensitizer)[92]

Determination in Air: No NIOSH or OSHA methods available.

Permissible Concentration in Water: Unknown.

Determination in Water:

Detecting Ricin in Water; Summary of Results

Technology	Contaminant Presence/ Absence	False Pos (+)/Neg(−) Responses	Consistency	Lowest Detectable Conc.
BADD Test Strips	9/21	0/0	100%	20 mg/L
BioVerify Test Kits	15/22	0/3	97%	0.0005 mg/L
RAMP Test	12/15	0/0	100%	5 mg/L
BioThreat Hazard Alert Test Strips[a]	15/15	2/1	100%	0.035 mg/L
Enzyme Linked Immunosorbent Assay (ELISA)	12/15	0/0	100%	0.0075 mg/L
QTL Biosensor	12/15	2/2	90%	0.25 mg/L

[a] *The most accurate results for Ricin using the Bio-Threat Alert test strips (Tetracore, Inc.) detected 15/15 for Ricin (2004−06).*

Source: EPA/Homeland Security (2004−06): See full report at: http://www.epa.gov/nhsrc/tte_immtestkitpandb.html

Routes of Entry: Can be absorbed by all routes of exposure. Ricin normally enters the body by ingestion. Aerosolized Ricin would enter the body by inhalation. The toxin attaches to cell surfaces of a variety of tissues, particularly the stomach lining if ingested or the moist, upper respiratory tissues if inhaled.

Harmful Effects and Symptoms

The symptoms depend on purity of the Ricin, the level of exposure, and route of exposure (inhalation, ingestion, or injection), the dose received. The LD_{50} = (oral-ingestion) 1 to 20 mg/kg (the equivalent of eight castor beans); (human-injection) 1 to 1.75 μg/kg; (human-inhalation) 21 to 42 μg/kg. As little as 500 μg of Ricin (about what might fit on the head of a pin; 1/228th of an aspirin tablet) may be enough to kill an adult. When Ricin toxins get inside the victim's body, they block protein synthesis (the body's ability to regenerate protein). Initial symptoms usually appear between 6 and 10 hours and 3 days. Clinical signs may appear as early as 45 minutes after ingestion if the victim has an empty stomach. Death can occur within 36−72 hours of exposure, depending on the route exposure and upon the dose received. Death from Ricin poisoning could take place within 36 to 48 hours of exposure, whether by injection, ingestion, or inhalation. Victims may linger for 10−12 days before death or recovery, also depending upon the level of exposure. However, if a person lives longer than 5 days after Ricin poisoning, without complications, they are less likely to die. Ricin is detoxified in 10 mins at 176°F (80°C) and in 1 hr at 122°F (50°C); it is stable under ambient conditions. Lethal dose = 1 mg/kg. Urinary excretion of ricin is probably slow and limited with the estimated half-life being about 8-days[92].

Short-Term Exposure:

The following lists do not convey prioritization or indicate specificity.

Inhalation: Within a few hours of inhaling significant amounts of Ricin, the likely symptoms would be respiratory distress, difficult or labored breathing; shortness of breath; chest tightness, hypoxemia, fever, cough, nausea, sweating, aching muscles. Heavy sweating may follow as noncardiogenic pulmonary edema develops.* This would make breathing even more difficult, and the skin might turn blue. Excess fluid in the lungs would be diagnosed by X-ray or by listening to the chest with a stethoscope. Finally, low blood pressure, Blue skin, multisystem organ failure, respiratory failure may occur, and possible death.

Skin: Its uncertain if Ricin can be absorbed through the skin. It is generally believed that the risk of toxicity is low from contact with unbroken skin; however, Ricin may be absorbed through irritated, damaged, abraded, wounded, or injured skin; or, through normal skin when Ricin is dissolved in a solvent carrier. If enough Ricin gets through the skin, the symptoms will be similar to those described for ingestion. If Ricin is injected, the muscles and lymph nodes near the injection site would die. This could lead to liver and kidney failure and death. *Eyes*: Tearing, swelling of the eye-lids, pain, redness, corneal injury. Urinary excretion of Ricin is probably slow and limited with the estimated half-life being about 8-days. LD50 = (humans) 1 mg/kg; a single seed can be fatal. LD50 = (oral-mice) about 3 μg/kg by injection or aerosol.

Ingestion: Generally within a few hours symptoms will appear, including nausea, vomiting, abdominal pain and cramping, diarrhea (possibly bloody), lowered blood pressure, hallucinations, and bloody urine, gastrointestinal bleeding, low or no urinary output, dilation of the pupils, fever, thirst, sore throat, headache, vascular collapse, and shock. Severe vomiting and diarrhea may result from severe dehydration and multisystem organ failure. In a few days, organs (liver, spleen, and kidneys) might stop working, and possible death.

**Note*: Ricin-induced pulmonary edema would be expected to occur much later (1−3 days post exposure) compared to other agents such as phosgene (about 6 hours post exposure).

Late phase complications: Ricin's cell killing (cytotoxic) effects on the liver, central nervous, kidneys, and adrenal glands, typically two to five days after exposure. The patient may be asymptomatic (showing no symptoms of exposure) during the preceding one to five days[92].

Pulmonary edema would be expected to occur much later (1−3 days post exposure) compared to that induced by other agents such as phosgene (about 6 hours post exposure).

Long-Term Exposure: Repeated exposures to Ricin may cause allergic/asthma-like symptoms with congestion of nose and throat; itchy, watery eyes; hives; tightness of the chest; and in acute cases, wheezing. May affect kidneys, liver, pancreas. Based on animal studies Ricin may be capable of causing severe lung damage in humans. Information about carcinogenicity, developmental toxicity, or reproductive toxicity from chronic or repeated exposure to Ricin is unknown at this time.

Points of Attack: Lungs, eyes, skin (primarily through cuts and bruises). The risk of toxicity from unbroken skin exposure to Ricin is low but there is still a danger of allergic skin reactions.

Medical Surveillance: Unfortunately Ricin symptoms resemble those that are similar to other diseases, especially the common flu. Laboratory testing might include metabolic acidosis; increased liver function tests; increased renal function tests; hematuria; leukocytosis (2-to-5-fold higher than normal).

First Aid: No antidote exists for Ricin. Make all exposed people go to the nearest hospital emergency department. Make all potentially exposed people shower and change clothes. In case you have gotten Ricin on your skin or your clothing, immediately shower and change clothes. See a doctor as soon as possible: Since it can take only a day and a half for symptoms to appear, all exposed persons should get to a doctor that same day. If exposure includes contact with Ricin, remove it off or out of the body as quickly as possible. Treatment needs to be provided in a hospital setting. Make the doctors and nurses aware of the potential for exposure so that they can protect themselves; and provide the most appropriate treatments and therapies. If you have to wait for medical assistance, make the victim comfortable. If Ricin has been ingested, the airway must be secured and stomach pumping (gastric lavage) may be considered. Vigorous gastric lavage is recommended only if it can be done shortly after ingestion (generally within 1 hour). Risk of aggravating injury to the lining of the gastrointestinal (GI) tract must be considered.

To minimize the effects of the poisoning and to keep the patient stable, Ricin poisoning is treated through supportive therapy. The types of supportive medical care would depend on several factors, such as the route by which victim(s) were poisoned (i.e., whether poisoning was by inhalation, ingestion, eye, or skin exposure). Do not induce vomiting. Rinse mouth, flush stomach with activated charcoal* (if the Ricin has been very recently ingested), washing out the victim's eyes with water, especially if the eyes are red and irritated. Supportive care could include intravenous fluid input and support of circulation and respiration; giving medications to treat conditions such as seizure and low blood pressure. Fluid input is critical, as fluid losses of up to 2-½ liters are probable. If individual is drowsy or unconscious, do not give anything by mouth. In the event of vomiting, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration. Fluid and electrolyte balance should be monitored and restored if abnormal. Early and aggressive IV fluid and electrolyte replacement. If the victim's lungs fill with fluid, you administer oxygen if his breathing is difficult or labored.

**Note*: Superactivated charcoal may be of little value for large molecules such as Ricin[163].

Decontamination: When Ricin symptoms appear and you know the location of the attack, the area should be decontaminated with responders wearing level A (Fully encapsulated suit with SCBA). Otherwise, stay away. Move as fast as possible; extra minutes before decontamination might make a big difference. If the Ricin attack was aerosolized (by small particles floating in the air), and you have the equipment, (*this is very important*) then you have to decontaminate as soon as possible. If you don't have the equipment and training, don't enter the hot zone to rescue and decontaminate victims. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident. If possible, place all clothing in a labeled durable 6-mil polyethylene bags. If the victim can't move, decontaminate, if possible, without touching and without entering the hot zone. To prevent spreading the agent, be certain that victims are decontaminated as much as possible before allowing them to leave the area. During the decontamination process, be careful not to break the patient/victim's skin, and take care to cover all open wounds. The CDC recommends a decontamination procedure solution of detergent and water (with a pH value in the alkaline range of more than eight but less than 10.5). Soft brushes should be available to remove contamination from the personal protective equipment. Also recommended for cleanup of people and surfaces is household bleach. Use a fresh (made daily) solution of 0.5% sodium hypochlorite [diluted household bleach (10%, or one part bleach to nine parts water)]. Contact time: 15 minutes. Do not get bleach solution in the victim's eyes, open wounds (especially of the abdomen, spinal cord, or brain), or mouth. Wash off the diluted bleach solution after 15 minutes. Labeled, durable 6-mil polyethylene bags should be available for disposal of clothing and contaminated personal protective equipment. In the absence of pH adjusted solutions, wash the victim with lots of warm water with soap. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing (at least down to undergarments), begin washing immediately. Immediate flush the eyes with water for at least 15 minutes. Wash—strip—wash—evacuate up wind and uphill: The idea is to immediately wash with water, then have the victim (not the responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and uphill direction.

Personal Protective Methods:

General information: First responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) self-contained breathing apparatus (SCBA) with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (RED ZONE): Select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally-encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight- fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Recommenced protective clothing and materials may include Tychem BR or Responder CSM. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Safe use of protective clothing and equipment requires specific skills developed through training and experience.

Respirator Selection: Pressure demand, self-contained breathing apparatus [SCBA; Chemical, Biological, Radiological, Nuclear (CBRN)], [if available] is recommended in response to nonroutine emergency situations.

Storage: Color code-Blue: Health Hazard/Poison (Toxic): Store in a secure, locked poison location. Store in a cool, dry, and well-ventilated area and away from food stuff containers.

Shipping: UN3172 Toxins, extracted from living sources, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3462 Toxins, extracted from living sources, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances: Consider initial evacuation for 800 m/0.5 mi in all directions. This agent is not included in the DOT ERG 2004 Table of Initial Isolation and Protective Action Distances. In the DOT ERG 2004 orange-bordered section of the guidebook, there are public safety recommendations on how to immediately isolate a Ricin (Guide 153) spill or leak area for at least 50 m/150 ft for liquids and 25 m/75 ft for solids in all directions[190].

You must be careful! Avoid generating dust. Since a Ricin attack may be by small particles of Ricin floating in the air (aerosol), don’t breathe it or get it on you. Remember that the victim’s clothes or body may have Ricin; touch them and you can become a victim. If you think Ricin particles might be in the area, stay out until you are equipped with level A (Fully encapsulated suit with SCBA), proper personal protective equipment (PPE), including protective clothing and respiratory protection. Shut off heating, ventilation, and air conditioning (HVAC) systems to prevent the tiny aerosolized (floating in the air) Ricin droplets from spreading throughout the building. Keep the public away. Immediately call for medical assistance. For those contaminated by Ricin, don’t allow anyone to leave the hot zone. The Ricin chemical doesn’t dissipate quickly, and “survives” in clothing and bedding for long periods of time. Consequently, people as well as “things” must be quarantined and decontaminated. Don’t allow anyone leave until medical people examine them. Don’t breathe, touch, or eat anything that might be contaminated with Ricin. Notify the federal authorities, local health, and pollution/environmental agencies. See Decontamination.

Fire Extinguishing: Ricin is combustible. Thermal decomposition products may include nitrogen oxides. Ricin is not volatile, but it may be spread by efforts to extinguish the fire. Avoid generating dust. Use foam, dry chemical powder, BCF [bromochlorodiflouromethane (Halon 1211)] (where regulations permit), carbon dioxide, water spray, or fog (large fires only). If the situation allows, control and properly dispose of run-off (effluent). If a tank, rail car, or tank truck is involved in a fire, isolate it for 0.5 mi/800 m in all directions; also, consider initial evacuation for 0.5 mi/800 m in all directions. This agent is not included in the DOT ERG 2004 Table of Initial Isolation and Protective Action Distances. In the DOT ERG 2004 orange-bordered section of the guidebook, there are public safety recommendations on how to immediately isolate a ricin (Guide 153) spill or leak area for at least 150 ft/50 m for liquids and 75 ft/25 m for solids in all directions.

Disposal Method Suggested: Do not clean-up or dispose of Ricin, except under supervision of a specialist.

Riddelliine R:0136

Formula: $C_{18}H_{23}NO_6$

Synonyms: Aids-020850; 13,19-Didehydro-12,18-dihydroxysenecionan-11,16-dione; *trans*-15-Ethylidene-12β-hydroxy-12α-hydroxymethyl-13-methylenesenec-1-enine; Riddeliin; Riddeliine; Senecionan-11,16-dione, 13,19-didehydro-12,18-dihydroxy-; Stereoisomer of 3-ethylidene-3,4,5,6,9,11,13,14,14α,14β-decahydro-6-hydroxy-6-(hydroxymethyl)-5-methylene(1,6)dioxacyclododecino[2,3,4-gh]-pyrrolizidine-2, 7-dione

CAS Registry Number: 23246-96-0

HSDB Number: 7147

RTECS Number: VJ3850000

UN/NA & ERG Number: UN1544 (alkaloid, solid, n.o.s.)/151

EC Number: Not found

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Human Inadequate Evidence, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B

California Proposition 65 Chemical[102]: Cancer, 12/3/2004

Hazard Alert: Poison, Alkaloid, Poison, Possible risk of forming tumors, Suspected of causing genetic defects.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Risk phrases: R45; Safety phrases: S1; S29; S41 (see Appendix 4)

Description: Colorless to yellowish crystalline solid. Starts turning brown at approximately 165°C; turns blackish-brown at 187°C. Molecular weight = 349.40; Freezing/Melting point = (decomposes) >195°C. Practically insoluble in water; solubility = <1 mg/mL @ 25°C.

Potential Exposure: Riddelline is a natural alkaloid product used a laboratory chemical and reference standard.

Incompatibilities: Riddelline is sensitive to light, air, and heat, causing oxidation; reacts slowly with atmospheric oxygen. This chemical is probably combustible; dust mixed with air may be explosive. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Contact with alkalis and bases may cause hydrolysis.

Permissible Exposure Limits in Air: No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of acute exposure to a mixture containing Riddelline include abdominal pain, hepatomegaly, emaciation, nausea, diarrhea and liver cirrhosis. Death occurred in several cases. Ingestion of mixtures in which Riddelline is a component has caused infant hepatic veno-occlusive disease and early death. LD_{50} = (oral-mouse) ~100 mg/kg.

Long-Term Exposure: Possible risk of forming tumors, Suspected of causing genetic defects

Points of Attack: Liver, Reproduction system.

Medical Surveillance: Riddelline is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum luteinizing hormone (LH) may be indicated.

First Aid: *Eyes*: First check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20−30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. *Immediately* transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin: Immediately* flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, *immediately* call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation: Immediately* leave the contaminated area; take deep breaths of fresh air. *Immediately* call a physician and be prepared to transport the victim to a hospital even if no symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, Self-Contained Breathing Apparatus (SCBA) should be used; if not available, use a level of protection greater than or equal to that advised under Protective Clothing. *Ingestion*: If the victim is conscious and not convulsing, give one or two glasses of water to dilute the chemical and *immediately* call a hospital or poison control center. Generally, the induction of vomiting is not recommended outside of a physician's care due to the risk of aspirating the chemical into the victim's lungs. However, if the victim is conscious and not convulsing and if medical help is not readily available, consider the risk of inducing vomiting because of the high toxicity of the chemical ingested. Ipecac syrup or salt water may be used in such an emergency. *Immediately* transport the victim to a hospital. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. *Do not induce vomiting*. *Immediately* transport the victim to a hospital[101].

Personal Protective Methods:

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus)

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Protect Riddelline from exposure to light, air and heat. Keep the container tightly closed under an inert atmosphere (nitrogen), and store under refrigerated temperatures (15°C).

Shipping: UN1544 Alkaloids, solid, n.o.s. or Alkaloid salts, solid, n.o.s. poisonous, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: *Small spills and leakage*: Should a spill occur while you are handling this chemical, *first remove all sources of ignition*, then you should dampen the solid spill material with 60%−70% ethanol and transfer the dampened material to a suitable container. Use absorbent paper dampened with 60%−70% ethanol to pick up any remaining material. Seal the absorbent paper, and any of your clothes, which may be contaminated, in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60%−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the Safety Officer (or other responsible person) has verified that the area has been properly cleaned. For a large spill increase, in the downwind direction, as necessary, the isolation distance shown below.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon (carbon monoxide and CO_2). This chemical is probably combustible. Fires involving this material can be controlled with a dry chemical, carbon dioxide or Halon extinguisher. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. If tank, rail car or tank truck is involved in a fire, *isolate* for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/ 0.5 mile in all directions.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste product such as lab chemicals by flushing them down the toilet or discarding them to the trash. Larger quantities shall carefully take into consideration applicable EPA, and FDA regulations. If possible return the lab chemicals to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste lab chemicals shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Ronnel R:0140

Formula: $C_8H_8Cl_3O_3PS$; $Cl_3C_6H_2OP(S)(OCH_3)_2$

Synonyms: Dermaphos; *O*,*O*-Dimethyl *O*-2,4,5-trichlorophenyl phosphorothioate; *O*,*O*-Dimethyl *O*-(2,4,5-trichlorophenyl) thiophosphate; Dimethyl trichlorophenyl thiophosphate; *O*,*O*-Dimethyl-*O*-(2,4,5-trichlorphenyl)-thionophosphat (German); Dow ET 14; Dow ET 57; Ectoral; ENT 23,284; ET 14; ET 57; Etrolene; Fenchlorfos; Fenchlorophos; Fenchlorphos; Karlan; Korlan; Korlane; Nanchor; Nanker; Nankor; Phosphorothioic acid, *O*,*O*-dimethyl *O*-(2,4,5-trichlorophenyl) ester; Thiophosphate de *O*,*O*-dimethyle et de *O*-(2,4,5-trichlorophenyle) (French); Trichlorometafos; 2,4,5-Trichlorophenol, *O*-ester with *O*,*O*-dimethyl phosphorothioate; *O*-(2,4,5-Trichlor-phenyl)-*O*,*O*-dimethyl-monothiophosphat (German); Trolen; Trolene; Viozene

CAS Registry Number: 299-84-3

HSDB Number: 667

RTECS Number: TG0525000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN2783 (organophosphorus pesticides, solid, toxic)/152

EC Number: 206-082-6 [*Annex I Index No.*: 015-052-00-X]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Possible cumulative neurotoxin, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N; Risk phrases: R21/22; R22; R33; R50/53; R62; R63; Safety phrases: S2; S25; S29; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Ronnel is a white to light tan crystalline solid. Molecular weight = 321.54; Specific gravity (H_2O:1) = 1.48 @ 25°C; Boiling point = (decomposes); Freezing/Melting point = 41°C. Practically insoluble in water; solubility = 0.004% @ 25°C.

Potential Exposure: Ronnel is both an organochlorine and organophosphorus compound; potential danger to those involved in manufacture, formulation and application of this insecticide for farm (livestock) and household uses. Degrades readily in the environment by hydrolysis and oxidation[101].

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Store at temperatures <25−30°C. Organothiophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 300 milligram per cubic meter

OSHA PEL: 15 milligram per cubic meter TWA

NIOSH REL: 10 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA measured as inhalable fraction and vapor; not classifiable as a human carcinogen; BEI_A issued for Acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC) not available

Australia: TWA 10 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; the Philippines: TWA 10 milligram per cubic meter, 1993; Russia: STEL 0.3 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; United Kingdom: TWA 10 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Not classifiable as a human carcinogen

Several states have set guidelines or standards for ronnel in ambient air[60] ranging from 100 μ/m^3 (North Dakota) to 160 μ/m^3 (Virginia) to 200 μ/m^3 (Connecticut) to 238 μ/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides; OSHA Analytical Method PV-2054.

Permissible Concentration in Water: Mexico[35] has set maximum permissible concentration of 50 μg/L in estuaries and 5 μg/L in coastal waters.

Determination in Water: Octanol-water coefficient: Log Kow = ~5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

In varying degrees, organochlorines are absorbed from the gut and also by the lung and across the skin[72].

Short-Term Exposure: Irritates the eyes. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. There is limited evidence that ronnel may damage the developing fetus. May cause personality changes, such as depression, anxiety, and irritability. High or repeated exposure may cause nerve damage causing weakness, a feeling of "pins and needles" in the arms and legs; and poor coordination.

Points of Attack: Skin, central nervous system; blood plasma.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 100 milligram per cubic meter*: CcrOv95 (APF = 10) [Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 250 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 300 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full-facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter];* or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Store at temperatures <25−30°C. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Organophosphorus compounds

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon and trichlorophenol. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with added flammable solvent in furnace equipped with afterburner and alkali scrubber[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Carcinogenesis Studies (feed); equivocal evidence: Rat; no evidence: Mouse.

Hazard Alert: Poison, Combustible, Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N; Risk phrases: R25; R36/37/38; R50/53; R62; R63; Safety phrases: S1/2; S22; S24/25; S29/35; S36; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Rotenone is a colorless to red odorless crystalline solid; a white crystalline solid when pure; oxidation will cause yellowing to bright red coloring. Odorless. Molecular weight = 394.45; Boiling point = (decomposes below BP); 210−220°C @ 0.5 mm; Freezing/Melting point = 165.6°C; Vapor pressure = 1×10^{-6} mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 10−12 ppm @ 100°C. Sprays may be dissolved in xylene or kerosene.

Potential Exposure: A potential danger to those involved in extraction from derris root, formulation or application of this insecticide. Rotenone is used as a pharmaceutical and veterinary drug.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and alkalies.

Permissible Exposure Limits in Air

NIOSH IDLH = 2500 milligram per cubic meter

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA; not classifiable as a human carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 420 milligram per cubic meter

PAC-3: 2500 milligram per cubic meter

DFG MAK: [skin]

Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; Finland: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 1993; the Philippines: TWA 5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Turkey: TWA 5 milligram per cubic meter, 1993; United Kingdom: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for rotenone in ambient[60] ranging from 1.67 μ/m^3 (New York); to 50.0 μ/m^3 (Florida and South Carolina); to 50.0−100.0 μ/m^3 (North Dakota);to 80.0 μ/m^3 (Virginia); to 100.0 μ/m^3 (Connecticut); to 119.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5007, Rotenone.

Permissible Concentration in Water: The state of Maine has set a guideline for rotenone in drinking water of 4.0 μg/L[61].

Determination in Water: Fish Tox = 1.49403000 ppb (HIGH); Octanol-water coefficient: Log K_{ow} = >4. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact can cause severe irritation and permanent damage. Exposure can cause numbness of the mucous membrane, nausea, vomiting, abdominal pain; muscular tremors; incoherence, colonic convulsions; stupor. May cause a severe drop in blood sugar. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May affect the liver and kidneys. There is limited evidence that rotenone causes cancer of the liver and breast in animals, and damage to the developing fetus. There is limited evidence that this chemical is stored in breast milk and passed on to nursing infants. Repeated skin contact can cause severe rash. Human Tox = 28.00000 ppb (INTERMEDIATE).

Points of Attack: Central nervous system; eyes, respiratory system; liver and kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Blood sugar. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 50 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 125 milligram per cubic meter*: Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 250 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full-facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied- air respirator with a full facepiece). *Up to 2,500 milligram per cubic meter*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere and protect from prolonged exposure to light. Keep away from oxidizers and alkalis. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 10000 (estimate).

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Rotenone is decomposed by light and alkali to less insecticidal products. It is readily detoxified by the action of light and air. It is also detoxified by heating; 2 hours @ 100°C results in 76% decomposition. Oxidation products are probably nontoxic. Incineration has been recommended as a disposal procedure. Burial with lime would also present minimal danger to the environment[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171
EC Number: 201-321-0 [1,2-benzisothiazol-3(2*H*)-one 1,1-dioxide]

Regulatory Authority and Advisory Information

Carcinogenicity: International Agency for Research on Cancer (IARC): Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3

California Proposition 65 Chemical[102]: *Delisted 4/6/01. Saccharin and Saccharin sodium*

Hazard Alert: Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U202

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R40; R51; R62; R63; R68; safety phrases: S24/25; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Saccharin is a crystalline solid with a sweet taste (500 times sweeter than sugar). Molecular weight = 183.19; freezing/melting point = 229°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: The information provided has to do, primarily, with the manufacturing of saccharin. Saccharin has been used as a nonnutritive sweetening agent. At one point the United States consumption pattern for all forms of saccharin has been estimated as 45% in soft drinks; 18% in tabletop sweeteners; 14% in fruits, juices, sweets, chewing gum, and jellies; 10% in cosmetics and oral hygiene products; 7% in drugs, such as coating on pills; 2% in tobacco; 2% in electroplating; and 2% for miscellaneous uses. Human exposure to saccharin occurs primarily through ingestion because of its use in many dietic foods and drinks and some personal hygiene products, including toothpastes and mouthwashes. The general public is exposed to saccharin, especially by persons required to reduce sugar intake.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

Nuisance dusts; particulates not otherwise classified

Occupational Safety and Health Administration (OSHA) PEL: 5 milligram per cubic meter (15 mppcf) TWA

NIOSH REL: none

ACGIH TLV: 3 milligram per cubic meter (respirable particles)

Determination in Air: NIOSH Method 0600, Issue 3, *Particulates not otherwise regulated, respirable*.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May cause skin irritation. Exposure to very high levels can cause loss of appetite; nausea, vomiting and diarrhea.

Long-Term Exposure: Saccharin in very high doses has been shown to cause bladder cancer in male rats. Other animal species have not shown this effect. High exposures in certain susceptible individuals may cause skin allergy.

Points of Attack: Bladder, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Urine cytology (a special test for abnormal cells in the urine). Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00018-1

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and cardiopulmonary resuscitation (CPR) if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: At any exposure level, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus (SCBA) with a full facepiece operated in pressure demand or other positive-pressure mode.

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. Use extinguishers suitable for surrounding fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Safrole is a colorless to yellow liquid with an odor of camphor or sassafras. Molecular weight = 162; specific gravity (H_2O:1) = 1.1 @ 20°C; boiling point = 233°C; freezing/melting point = 11°C; vapor pressure = 1 mmHg @ 64°C; flash point = ~95°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Practically insoluble in water.

Potential Exposure: This compound has been used to flavor beverages and foods. It is also reported to be used in soap manufacture, perfumery, sleep aids, sedatives, and pesticides. The FDA estimated exposure to safrole of the general public through food consumption was extremely low since the Agency prohibited its used in food. Derived from oil of sassafras or camphor. Minimal exposure may occur through the use of edible spices, including nutmeg and mace, which contain low levels of naturally occurring safrole.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Safrole, an acetal, is readily hydrolyzed in acidic solution to give 4-allylpyrocatechol and formaldehyde (or formaldehyde polymers)[101].

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 5.9 milligram per cubic meter

PAC-2: 64 milligram per cubic meter

PAC-3: 390 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Contact can cause severe skin and eye irritation. Ingestion may cause abdominal burning, nausea and vomiting; diarrhea, dysuria, hematuria, unconsciousness, shallow respiration, and convulsions. Inhalation may cause dizziness; rapid and shallow breathing; tachycardia, bronchial irritation, and unconsciousness or convulsions. This compound can cause vomiting, shock, cyanosis, delirium and probably convulsions. Other effects may include circulatory collapse.

Long-Term Exposure: May be a carcinogen in humans.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others[52]. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than this body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources:[52] Remove all sources of ignition, ventilate the spill area, and use absorbent to pick up spilled material. Follow by washing surfaces well, first with 60% to 70% ethanol and water, then with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States Environmental Protection Agency Gene-Tox Program, Positive: *S. cerevisiae*-reversion; Negative: Histidine reversion-Ames test.

Hazard Alert: Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

FDA-over the counter drug

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R36/37/38; R41; R62; R63; safety phrases: S16; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Salicylic acid is a white to tan crystalline solid; needles. Molecular weight = 138.13; specific gravity (H_2O:1) = 1.4 @ 20°C; boiling point = 76°C (sublimes); freezing/melting point = 158°C; flash point = 157°C; autoignition temperature = 540°C. Explosive limits: LEL = 1.1% @ 200°C; UEL-unknown. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 1. Practically insoluble in water; solubility = 1700 ppm @ 20°C; 2059 ppm @ 25°C.

Potential Exposure: Used as a topical keratolytic agent; in manufacture of aspirin, salicylates, resins, as a dyestuff intermediate; prevulcanization inhibitor; analytical reagent; fungicide, antiseptic, and food preservative.

Incompatibilities: iron salts; lead acetate; iodine. Forms an explosive mixture in air.

Permissible Exposure Limits in Air

PAC Ver. 27. No value in Ver. 29[138]

PAC-1: 0.11 milligram per cubic meter

PAC-2: 1.2 milligram per cubic meter

PAC-3: 180 milligram per cubic meter

Routes of Entry: Ingestion, inhalation, eyes and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Overexposure may affect the central nervous system (CNS) and the body's acid–base balance, causing delirium and tremors. *Inhalation:* May cause ringing in the ears, confusion, rapid pulse, and breathing; headache, dizziness, nausea, and vomiting. *Skin:* May be very irritating and cause skin sores. May act as a systemic poison if applied to large areas of the skin. *Eyes:* Causes irritation; may be severe. *Ingestion:* 10 g may cause headache, dizziness, nausea, and vomiting. Ingestion of about 1 oz may be fatal.

Long-Term Exposure: Repeated large doses may cause, in addition to the symptoms listed above: abdominal pain; loss of appetite; heartburn, poor digestion; stomach ulcers; bleeding of the stomach; iron-deficiency anemia; restlessness, incoherent speech; tremor, kidney damage; coma, convulsions, and death. Repeated or prolonged contact with skin may cause acne-like skin sores.

Points of Attack: Skin, blood, kidneys.

Medical Surveillance: Complete blood count (CBC). Kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. *Skin contact*: remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Induced emesis, gastric lavage; activated charcoal; or a combination of these, may be necessary to clear the gastrointestinal tract. Sodium bicarbonate (IV) with added potassium may be necessary for blood acidosis.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from light.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include phenol and oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g (*107-44-8; 1445-76-7 Chlorosarin, a precursor*).

Carcinogenicty: GB is not listed by the IARC; American Conference of Governmental Industrial Hygienists (ACGIH); OSHA; or National Toxicology Program (NTP) as a carcinogen.

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Combustible, Danger! Nerve agent (deadly, quick acting nerve gas); Poor warning properties.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 100 lb (45 kg)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

United States Department of Transportation (DOT) 49CFR172.101, Inhalation Hazard Chemical *Note:* Army Regulation, AR 50-6, deals specifically with the shipment of chemical agents; must be escorted in accordance with Army Regulation, AR 740-32.

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R27/28; R33; R50/53; safety phrases: S1; S13; S28; S41; S45 (see Appendix 4)

Description: Sarin (GB), a nerve agent, is one of the most toxic of the known chemical warfare agents. Exposure to sarin can cause death in minutes. A fraction of an ounce (1 to 10 mL) of GB on the skin can be fatal. GB is an odorless, colorless, tasteless, nonflammable liquid @ 15°C and 1 atm. *GB has no warning properties, especially when pure, and it can take away your sense of smell.* Molecular weight = 140.09; specific gravity (H_2O:1) = 1.080 @ 25°C; 1.10 @ 20°C; boiling point = 147°C; freezing/melting point = −57°C; vapor pressure = 2.86 mm @ 25°C; 2.1 mmHg @ 20°C; liquid density = 1.10 g/mL @ 20°C; relative vapor density (air = 1) = 4.86; vapor density = 4.9; volatility = 22,000 milligram per cubic meter @ 25°C. Flash point = > 280°C; 78°C (cc)[77]. Explosive limits: LEL = 10,000 ppm[138], UEL: unknown; Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0. Sinks in water; soluble in water and hydrolyzes, yielding hydrochloric acid, thiodiglycol, and nonvesicant arsenic compounds. The hydrolysis products are considerably less toxic than the material itself. *Note:* If it is used as a weapon, notify United States Department of Defense: Army. If a means of detection is available, use M-8 paper (detection: yellow) or M256-A1 Detector Kit (detection limit: 0.005 milligram per cubic meter). *Warning: A single drop on the skin can be fatal.* Damage and/or death may occur before chemical detection can take place.

Potential Exposure: GB is used as a quick-acting chemical warfare nerve agent; nerve gas. Both the liquid and the vapor can kill you. Very small amounts can hurt you in one minute or less, and can quickly lead to death. *A single drop, if vaporized, can kill everyone in a room*[136]! Sarin is 26 times more deadly than cyanide gas and 20 times more deadly than Potassium cyanide.

Persistence of Chemical Agent: Sarin (GB): Summer: 10 minutes to 24 hours; Winter: 2 hours to 3 days.

Incompatibilities: Attacks tin, magnesium, cadmium plated steel; and some aluminums. GB decomposes tin, magnesium, cadmium-plated steel, and aluminum. Slightly corrosive to brass, copper, and lead. No attack on 1020 steel, Inconel, and K-Monel. Hydrolyzed by water. In acid conditions, GB hydrolyzes, forming hydrofluoric acid (HF). Rapidly hydrolyzed by dilute aqueous sodium hydroxide (NaOH), or sodium carbonate, forming relatively nontoxic products of polymers and isopropyl alcohol. Contact with metals may evolve flammable hydrogen gas.

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

Worker population limit: 0.00003 milligram per cubic meter

The suggested permissible airborne exposure concentration of Sarin (GB) for an 8-hour work-day or a 40-hour work-week is an 8-hour time weighted average (TWA) of 0.00003 milligram per cubic meter (2×10^{-5} ppm). This value is based on the TWA of GB as proposed in the USAEHA Technical Guide No. 169, *Occupational Health Guidelines for the Evaluation and Control of Occupational Exposure to Nerve Agents GA, GB, GD, and VX.*

GPL (General population limit): 0.000001 milligram per cubic meter

Also, the general population limits (as recommended by the Surgeon General's Working Group, United States Department of Health): 0.000003 milligram per cubic meter. *Human Toxicity:* The human lethal dose (man) is approximately 0.01 mg/kg. LCt_{50} = 100 mg-min/m^3. LD_{50} [skin] = 1.7 g/70 kg [man] (*Medical Aspects of Chemical and Biological Warfare, Part I*, Walter Reed Medical Center, 1997)

Determination in Air: Available monitoring equipment for agent GB is the M8/M9 detector paper, detector ticket, Blue band tube, M256/M256A1 kits, bubbler, Depot Area Air Monitoring System; Automatic Continuous Air Monitoring System; Real Time Monitoring; Demilitarization Chemical Agent Concentrator; M8/M43, M8A1/M43A2, Hydrogen Flame Photometric Emission

Detector; CAM-M1, Miniature Chemical Agent Monitor; and the Real Time Analytical Platform. Real-time, low-level monitors (with alarm) are required for GB operations. In their absence, an IDLH atmosphere must be presumed. Laboratory operations conducted in appropriately maintained and alarmed engineering controls require only periodic low-level monitoring.

Determination in Water: Use M-272 Chemical Agent Water Testing Kit. Detection limit for nerve agents is 0.02 mg/L. Also, for cyanides, distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid). *Food chain concentration potential:* sarin is soluble in water; bioconcentration in aquatic organisms is not expected to be an important fate process [United States Army Corps of Engineers. Special Report 86−38, Britton, K. B., *Low Temperature Effects on Sorption, Hydrolysis, and Photolysis of Organophosphates: A Literature Review, p. 23*. Washington DC, 1986]. Octanol−water coefficient: Log K_{ow} (estimated) = −1.4.

Water pollution: If used as a weapon, utilize an M272 Water Detection Kit (Detection limit: 0.02 mg/L). Dangerous to aquatic life in high concentrations. May be dangerous if it enters water intakes. Notify local health and pollution control officials. Notify operators of nearby water intakes. This material will be broken down in water quickly, but small amounts may evaporate. This material will be broken down in moist soil quickly. Small amounts may evaporate into the air or travel below the soil surface and contaminated groundwater.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Extremely toxic; vapor $LCt_{50} = 100$ mg min/m^3. Extremely active cholinesterase inhibitor. Toxic effects similar to, but more severe than those of parathion. Liquid, LD_{50} (skin) = 1.7 g/70 kg man; sarin: (mice) 200 μg/kg. A single drop on the skin can cause death. Death may occur within 15 minutes after fatal dose is absorbed. Symptoms of overexposure may occur within minutes or hours-depending upon dose. They include: miosis (constriction of pupils) and visual effects; headache and pressure sensation; runny nose and nasal congestion; salivation, tightness in the chest; nausea, vomiting, giddiness, anxiety, difficulty in thinking; difficulty sleeping, nightmares, muscle twitches, tremors, weakness, abdominal cramps; diarrhea, involuntary urination, and defecation.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions and respiratory failure. Limited data suggest that chronic or repeated exposure to GB may result in a delayed postural sway and/or impaired psychomotor performance (neuropathy).

Points of Attack: Respiratory system; CNS; skin, eyes, plasma, and red blood cell cholinesterase. Liver and kidney damage.

Medical Surveillance: Patients/victims who have severe exposure should be evaluated for persistent CNS effects. Consider the points of attack in preplacement and periodic physical examinations. CBC. Evaluation of thyroid function. Lung function tests. CNS tests. Liver and kidney function tests.

First Aid: Administration of antidotes is a critical step in managing a patient/victim. However, this may be difficult to achieve in the Red Zone, because the antidotes may not be readily available, and procedures or policies for their administration in the Red Zone may be lacking. Do not administer antidotes preventatively; there is no benefit to doing so. Diazepam (or other benzodiazepines) should be administered when there is evidence of seizures, usually seen in cases of moderate to severe exposure to a nerve agent. Remember, physical findings of localized exposure often precede systemic exposure and physical findings[77]. *Inhalation*: Hold breath until respiratory protective mask is donned. If severe signs of agent exposure appear (chest tightens, pupil constriction; a lack of coordination; etc.), immediately administer, in rapid succession, all three Nerve Agent Antidote Kit(s), Mark I injectors (or atropine if directed by the local physician). Injections using the Mark I kit injectors may be repeated @ 5 to 20 minutes intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. If breathing has stopped, give artificial respiration. Mouth-to-mouth resuscitation should be used when approved mask-bag or oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. If breathing is difficult, administer oxygen. *Seek medical attention immediately*. *Eye contact:* Immediately flush eyes with water for 10−15 minutes, then don respiratory protective mask. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection will not be administered when miosis is the only sign present. Instead, the individual will be taken *immediately* to the medical treatment facility for observation. *Skin contact:* Don respiratory protective mask and remove contaminated clothing. Immediately wash contaminated skin with copious amounts of soap and water, 10% sodium carbonate solution, or 5% liquid household bleach. Rinse well with water to remove decontaminant. Administer an intramuscular injection with the *Mark I* Kit injectors only if local sweating and muscular twitching symptoms are observed. *Seek medical attention immediately*.

Ingestion: Do not induce vomiting. First symptoms are likely to be gastrointestinal. Immediately administer an intramuscular injection of the *Mark I* kit auto-injectors.

Medical Treatment: Electrocardiogram (ECG), and adequacy of respiration and ventilation, should be monitored. Supplemental oxygenation, frequent suctioning of secretions, insertion of a tube into the trachea (endotracheal intubation), and assisted ventilation may be required. Diazepam (5 to 10 mg in adults and 0.2 to 0.5 mg/kg in children) may be used to control convulsions. Lorazepam or other benzodiazepines may be used, but barbiturates, phenytoin, and other anticonvulsants are not effective. Administration of atropine (if not already given) should precede the administration of benzodiazepines in order to best control seizures. Patients/victims who have inhalation exposure and who complain of chest pain, chest tightness, or cough should be observed and examined periodically for 6 to 12 hours to detect delayed-onset inflammation of the large airways (bronchitis), inflammatory lung disease (pneumonia), accumulation of fluid in the lungs (pulmonary edema), or respiratory failure[77].

Decontamination: This is very important. The rapid physical removal of a chemical agent is essential. If you don't have the equipment and training, don't enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim can't move, decontaminate without touching and without entering the hot or the warm zone. Nerve gasses stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a sealed double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Don't wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 minutes. Use caution to avoid hypothermia in children and the elderly. Wash−strip−wash−evacuate up wind and uphill: Patients exposed to nerve agent by vapor only should be decontaminated by removing all clothing in a clean-air environment and shampooing or rinsing the hair to prevent vapor-off gassing; Patients exposed to liquid nerve agent should be decontaminated by washing in available clean water at least three times. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. Decontaminate with diluted household bleach* (0.5%, or one part bleach to 200 parts water), but don't let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Remember that the water you use to decontaminate the victims is dangerous. Be sure you've decontaminated the victims as much as you can before they are released from the area, so they don't spread the nerve gas. Rinse the eyes, mucous membranes; or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction.

**Note*: The following can be used in addition to household bleach: (1) solids, powders, and solutions containing various types of bleach (NaOCl or $Ca(OCl)_2$); (2) DS2 (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether) (3) towelettes moistened with NaOH dissolved in water, phenol, ethanol, and ammonia. *Note:* Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gal of water) to decontaminate scissors used in clothing removal, clothes, and other items.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered APR (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Wear protective "A-Level" PPE: rubber gloves, protective clothing; goggles, respirators. butyl rubber gloves M3 and M4, Norton chemical protective glove set; and Tyvek "F" decontamination suit provides barrier protection against chemical warfare agents. Airtight, impermeable clothing was developed for personnel who must enter heavily contaminated areas. This clothing is made of butyl rubber or a coated fabric, such as Tyvek "F" and provides barrier protection against liquid chemical warfare agents. Although resistant to liquid chemical agents, impermeable protective clothing may be penetrated after a few hours of exposure to heavy concentration of agent. Consequently, liquid contamination on the clothing must be neutralized or removed as soon as possible. If the proper equipment is not available, or if the rescuers have not been trained in its use, call for assistance from the United States Soldier and Biological Chemical Command—Edgewood Research Development and Engineering Center (from 0700-1630 EST call 410-671-4411, and from 1630-0700 EST call 410-278-5201; ask for the Staff Duty Officer). All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Swatch Test Results for Level A Suits and Chemical Protective Gloves for GB (Sarin)

Item	*Breakthrough*
25-mil Chemical protective gloves	>480 min

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Emergency or planned entry into unknown concentrations or* IDLH *conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *ESCAPE:* GmFOvHie [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister having a high efficiency particulate filter]; or SCBAE (any appropriate escape-type, SCBA). The United States Army standard M40 Series (which replaced the M17A1 protective mask) provides complete respiratory protection against all known military toxic chemical agents, but it cannot be used in an oxygen deficient environment and it does not afford protection against industrial toxics, such as ammonia and carbon monoxide. *It is not approved for civilian use.*

The following is taken from the Riegle Report:

Less than 0.0001 milligram per cubic meter: A full facepiece, chemical canister, air purifying protective mask will be on hand for escape. (The M9-, or M40-series masks are acceptable for this purpose). *0.0001 to 0.2 milligram per cubic meter:* A NIOSH/MSHA (US) or EN149 (Europe)-approved pressure demand full facepiece SCBA or supplied air respirator with escape air cylinder may be used. Alternatively, a full facepiece, chemical canister air purifying protective mask is acceptable for this purpose (for example, M9-, M17-, or M40-series mask or other mask certified as equivalent) is acceptable. *Greater than 0.2 milligram per cubic meter or unknown concentration:* NIOSH/MSHA or European Standard EN 149-approved pressure demand full facepiece SCBA suitable for use in high agent concentrations with protective ensemble.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure, locked, well-marked, poison location. In handling, the buddy system will be incorporated. No smoking, eating, and drinking in areas containing agent is permitted. Containers should be periodically inspected for leaks (either visually or by a detector kit). Stringent control over all personnel practices must be exercised. Decontamination equipment shall be conveniently located. Exits must be designed to permit rapid evacuation. Chemical showers, eye-wash stations, and personal cleanliness facilities must be provided. Wash hands before meals and each worker will shower thoroughly with special attention given to hair, face, neck, and hands, using plenty of soap before leaving at the end of the work-day.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, Technical Name Required. Driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32. Passenger aircraft/rail: FORBIDDEN; Cargo aircraft only: FORBIDDEN. The packaging and shipping of samples are subject to strict regulations established by the Department of Transportation (DOT), Center for Disease Control, United States Postal Service, OSHA, and International Air Transport Association). Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:
UN2810 Toxic liquids, organic, n.o.s.
Initial isolation and protective action distances
Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

GB when used as a weapon
Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.7/1.3

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1250/400
Then: Protect persons downwind (mi/km)
Day 1.3/2.0
Night 3.0/4.8

Spills must be contained by covering with vermiculite, diatomaceous earth; clay, fine sand; sponges, and paper or cloth towels. Decontaminate with copious amounts of aqueous NaOH solution (a minimum 10 wt.%). Scoop up all material and place in a fully removable head drum with a high density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, and DOT regulations. Dispose of material used to decontaminate exterior of drum. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If 10 wt.% aqueous NaOH solution is not available then the following decontaminants may be used instead and are listed in the order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate; and Super-tropical Bleach Slurry (STB).

Fire: If tank, rail car, or tank truck is involved in fire, isolate for at least 800 m (1/2 mi) in all directions; also, consider initial evacuation for 800 m (1/2 mi) in all directions. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Rapidly hydrolyzed by dilute aqueous NaOH or sodium carbonate forming relatively nontoxic products. Water alone removes the fluorine atom producing a nontoxic acid. Decontaminants include bleach slurry; dilute alkali; hot soapy water; steam, and ammonia. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. See also above "Determination in Water." Soil: 2 to 24 hours @ 5−25°C.

Fire Extinguishing: Highly volatile poison! (organophosphate). Breathing the vapor, skin [A single drop on the skin can be fatal] or eye contact, or swallowing the material can kill you; symptoms may be delayed for several hours. Thermal decomposition products may include fluorides and oxides of phosphorus and carbon. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. Vapors are heavier than air and will collect and stay in low areas. *Combustion products are less deadly than the material itself.* Toxic products of combustion may include carbon monoxide, fluorine, and phosphorus oxide. GB will react with steam or water to produce toxic & corrosive vapors. All persons not engaged in extinguishing the fire should be evacuated. Fires involving GB should be contained to prevent contamination to uncontrolled areas. When responding to a fire alarm in buildings or areas containing agents, firefighting personnel clothing (without TAP clothing) during chemical agent firefighting and fire rescue operations. Respiratory protection is required. Positive pressure, full facepiece, NIOSH-approved SCBA will be worn where there is danger of oxygen deficiency and when directed by the fire chief or chemical accident/incident (CAI) operations officer. In cases where firefighters are responding to a CAI for rescue/reconnaissance purposes, they will wear appropriate levels of protective clothing. Complete protection required; have available decontaminants (bleach, alkali) and atropine. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Principles and methods for destruction of chemical weapons: "Destruction of chemical weapons" means a process by which chemicals are converted in an essentially irreversible way to a form unsuitable for production of chemical weapons, and which in an irreversible manner renders munitions and other devices unusable as such. Each nation shall determine how it shall destroy chemical weapons, except that the following processes may not be used: dumping in any body of water, land burial, or open-pit burning. It shall destroy chemical weapons only at specifically designated and appropriately designed and equipped facilities. Each nation shall ensure that its chemical weapons destruction facilities are constructed and operated in a manner to ensure the destruction of the chemical weapons; and that the destruction process can be verified under the provisions of this Convention (Organization for the Prohibition of Chemical Weapons; Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and Their Destruction). Open pit burning or burying of GB or items containing or contaminated with GB in any quantity is prohibited. The detoxified GB using procedures above can be thermally destroyed by incineration in an EPA approved incinerator in accordance with appropriate provisions of federal, state and local RCRA regulations. A minimum of 56 g of decon solution is required for each gram of GB. A minimum of 65 g of decontamination fluid per gram of HD is allowed to agitate for a minimum of 1 hour. Agitation is not necessary following the first hour. At the end of the 1 hour, the resulting solution should be adjusted to a pH greater than 11.5. If the pH is below 11.5, NaOH should be added until a pH above 11.5 can be maintained for 60 minutes. An alternate solution for the decontamination of GB is 10% wt. Sodium carbonate in place of the 10% NaOH solution above. Continue with 56 g of decon to 1 g of agent. Agitate for 1 hour but allow 3 hours for the reaction. The final pH should be adjusted to above 10. It is also permitted to substitute 5.25% sodium hypochlorite or 25 wt.% monoethylamine (MEA) for the 10% NaOH solution above. MEA must be completely dissolved in water prior to addition of the agent. Continue with 56 g of decon for each gram of GB and provide agitation for 1 hour. Continue with same ratios and time stipulations. Scoop up all material and place in a fully removable head drum with a high density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled per IAW, EPA, and DOT regulations. All leaking containers shall be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW, EPA and DOT regulations. Dispose of the material per IAW waste disposal methods provided below. Dispose of material used to decontaminate exterior of drum in accordance with IAW, Federal, state, and local regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit.

Sethoxydim S:0205

Formula: $C_{17}H_{29}NO_3S$
Synonyms: Aljaden; Alloxol S; ARD 34/02; BASF 9052; Caswell No. 072A; Checkmate; Conclude; 2-Cyclohexen-1-one, 2-[1-(ethoxyimino)butyl]-5-[2-(ethylthio)propyl]-3-hydroxy-; Cyethoxydim; (±)-2-[1-(Ethoxyimino)butyl]-5-[2-(ethylthio)propyl]-3-hydroxy-2-cyclohexen-1-one; 2-[1-(Ethoxyimino) butyl]-5-[2-(ethylthio)propyl]-3-hydroxyl-2-cyclohexen-1-one; 2-[1-(Ethoxyimino)butyl]-5-[2-(ethylthio)propyl]-3-hydroxy-2-cyclohexen-1-one; 2-[1-(Ethoxyimino)butyl]-5-[2-(ethylthio)propyl]-3-hydroxyl-2-cyclohexen-1-one; (*ZE*)-2-(1-Ethoxyiminobutyl)-5-[2-(ethylthio)propyl]-3-hydroxycyclohex-2-enone; Expand; Fervinal; Grasidim; Grassout; Nabu; NP-55; Poast; Sethoxydim cyclohexanone herbicide; Tritex-extra; Ultima; Vantage
CAS Number: 74051-80-2
HSDB Number: 7342
RTECS Number: GW7191000
UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171
EC Number: 277-682-3
Regulatory Authority and Advisory Information
Carcinogenicity[83]: EPA Not likely to be carcinogenic to humans.
Hazard Alert: Combustible, Suspected reprotoxic hazard, Reproductive toxin[138]
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R23/25; R33; R51/53; safety phrases: S1/2; S20/21; S28; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: Oily, amber liquid. Odorless. Flammable. Commercial product is available as an emulsifiable concentrate. Molecular weight = 327.53; specific gravity (H_2O:1) = 1.04 @ 20°C; vapor pressure = 1.6×10^{-7} mmHg @ 20°C. Hazard identification (based on NFPA-704M Rating System): Health 2, flammability 2, reactivity 0. Highly soluble in water. Henry's Law constant = 2.2×10^{-11} atm m^3/mol @ 25°C (est)[83]. Highly soluble in water. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.
Potential Exposure: A selective postemergence cyclohexadione/cyclohexenone herbicide used to control both annual and perennial grass weeds in broad-leaved vegetables, field crops, fruit, ornamentals, and indoor applications.
Incompatibilities: Incompatible with strong acids, oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.). Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with all copper compounds.
Permissible Concentration in Air:
PAC Ver. 29[138]
PAC-1: 9.6 milligram per cubic meter
PAC-2: 110 milligram per cubic meter
PAC-3: 630 milligram per cubic meter
Determination in Water: Octanol–water coefficient: Log K_{ow} = > 4.0 @ (pH = 5). Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.
Routes of Entry: Ingestion, inhalation, dermal and/or eye contact. May be absorbed through the unbroken skin.
Harmful Effects and Symptoms
Short-Term Exposure: Contact may burn eyes, skin, and respiratory tract. Toxic if ingested. If swallowed, this chemical may cause pulmonary edema and other lung damage. LD_{50} (oral, rat) = 3145 mg/kg [FR48128(8/5/1998)]; LD_{50} (dermal, rat) = > 5 g/kg[9].
Long-Term Exposure: May cause liver, thyroid, bladder, or bone marrow damage. Reproductive and fetal effects.
Points of Attack: Liver, bladder, thyroid, lungs, bone marrow; reproductive cells.
Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Consult a physician if poisoning is suspected or if redness, itching, or burning of the eyes or skin develop. CBC. Thyroid and liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls:

When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: SCBA >9.6 milligram per cubic meter. Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of nitrogen, sulfur, and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. In addition, waste generators must consult and follow all regional, national, state, and local hazardous waste laws to ensure complete and accurate classification and disposal methods. Follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Siduron S:0208

Formula: $C_{14}H_{20}N_2O$

CAS Number: 1982-49-6

Synonyms: Greenfield; Gro-tone; H-1318; 1-(2-Methylcyclohexyl)-3-phenylurea; *N*-(2-Methylcyclohexyl)-*N*′-phenylurea; Trey; Tupersan; Urea, *N*-(2-methylcyclohexyl)-*N*′-phenyl-

CAS Registry Number: 1982-49-6

HSDB Number: 1764

RTECS Number: YT7350000

UN/NA & ERG Number: UN2767 (solid)/151; UN3002 (liquid)/151

EC Number: 217-844-2

Regulatory Authority and Advisory Information.

Hazard Alert: Poison, Suspected reprotoxic hazard, Environmental hazard.

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, N; risk phrases: R36/37/38; R51/53; R63; safety phrases: S2; S26; S29/35; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Colorless or white crystalline solid or powder. Odorless. Commercial product is available as an emulsifiable concentrate. Molecular weight = 232.33; specific gravity (H_2O:1) = 1.08 @ 20°C; boiling point = (decomposes); freezing/melting point = 136°C; vapor pressure = 4×10^{-9} mmHg @ 20°C. Low solubility in water; solubility = 18.3 ppm @ 25°C. Henry's Law constant = 6.8×10^{-11} atm m^3/mol @ 25°C (est)[83]. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: A phenyl urea preemergence herbicide used to control annual grasses (e. g., crabgrass, foxtail, and barnyard grass) and on newly seeded or established turf and lawn grasses and as bare soil treatment following spring seeding.

Determination in Water: Octanol−water coefficient: Log K_{ow} = > 3.5. Values above 3.0 are likely to bioaccumulate in marine organisms.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved APR for pesticides. May be harmful if swallowed. Dermal contact may cause severe irritation or burns. LD_{50} (oral, rat) = >5 g/kg; LD_{50} (dermal, rat) = > 5 g/kg.

Long-Term Exposure: May cause skin sensitization. May cause reproductive and fetal effects.

Points of Attack: Skin. Reproductive cells.

Medical Surveillance: Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water. Do not induce vomiting when formulations containing petroleum solvents are ingested. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where the neat (undiluted) test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with a combination filter cartridge, i.e., organic vapor/acid gas/HEPA (specific for organic vapors, HCl, acid gas, SO_2, and a high efficiency particulate filter)[88].

Storage: Color code—Blue: Health Hazard/Poison. Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2767 Phenyl urea pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3002 Phenyl urea pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m (1/2 mi) in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in a unit with effluent gas scrubbing. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects[195]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23/25; R33; R51/53; R62; safety phrases: S1/2; S20/21; S28; S29; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Selenium exists in three forms: a red amorphous powder, a gray form, and red crystals. Occurs as an impurity in most sulfide ores. Selenium, along with tellurium, is found in the sludges and sediments from electrolytic copper refining. It may also be recovered in flue dust from burning pyrites in sulfuric acid manufacture. Molecular weight = 78.96; specific gravity (H_2O:1) = 4.28 @ 25°C; 4.81 @ 20°C; boiling point = 685°C; freezing/melting point = 221°C (red crystalline form); 217°C (gray crystalline form). Hazard identification (based on NFPA-704 M Rating System): (powder) Health 3, flammability 1, reactivity 1. Insoluble in water.

Potential Exposure: Most of the selenium produced is used in the manufacture of selenium rectifiers. It is also utilized as a pigment for ruby glass, paints, and dyes; as a vulcanizing agent for rubber; a decolorizing agent for green glass; a chemical catalyst in the Kjeldahl test; as an insecticide; in the manufacture of electrodes, selenium photocells, selenium cells, and semiconductor fusion mixtures; in photographic toning bathes; and for dehydrogenation of organic compounds. It is also used in veterinary medicine and in antidandruff shampoos. Se is used in radioactive scanning for the pancreas and for photostatic and X-ray xerography. It may be alloyed with stainless steel; copper, and cast steel. Selenium is a contaminant in most sulfide ores of copper, gold, nickel, and silver; and exposure may occur while removing selenium from these ores.

Incompatibilities: Reacts violently with strong acids and strong oxidizers, chromium trioxide; potassium bromate;

cadmium. Reacts with incandescence on gentle heating with phosphorous and metals, such as nickel, zinc, sodium, potassium, platinum. Reacts with water @ 50°C forming flammable hydrogen and selenious acids.

Permissible Exposure Limits in Air

NIOSH IDLH = 1 mg[Se]/m^3

The PEL and REL also apply to other selenium compounds (as Se) except selenium hexafluoride; the MAK applies to Se and its inorganic compounds.

OSHA PEL: 0.2 mg[Se]/m^3 TWA

NIOSH REL (*except selenium hexafluoride*): 0.2 mg[Se]/m^3 TWA

ACGIH TLV[1]: 0.2 mg[Se]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 0.6 milligram per cubic meter

PAC-2: 6.6 milligram per cubic meter

PAC-3: 40 milligram per cubic meter

DFG MAK (*metal and inorganic compounds*): 0.05 mg [Se]/m^3, inhalable fraction TWA; Peak Limitation Category II(4); Carcinogen Category 3B; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.2 mg[Se]/m^3, 1993; Austria: MAK 0.1 milligram per cubic meter, 1999; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; Finland: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, 1999; Hungary: STEL 0.1 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 0.1 mg[Se]/m^3, 2003; the Philippines: TWA 0.2 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.1 milligram per cubic meter; MAC (STEL) 0.3 milligram per cubic meter, 1999; Sweden: NGV 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, 1999; Turkey: TWA 0.2 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.2 mg[Se]/m^3. Russia[43] set a MAC in workplace air of 2.0 milligram per cubic meter. Several states have set guidelines or standards for selenium compounds as selenium in ambient air[60] ranging from 0.26−1.57 μ/m^3 (Montana) to 0.27 μ/m^3 (Massachusetts) to 0.66 μ/m^3 (New York) to 2.0 μ/m^3 (Florida and North Dakota) to 3.5 μ/m^3 (Virginia) to 4.0 μ/m^3 (Connecticut) to 5.0 μ/m^3 (Nevada).

Determination in Air: NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = 0.05 mg[Se]/L; MCL = 0.05 mg[Se]/L as selenium. State Drinking Water Standards: Arizona 10 μg[Se]/L; New York 10 μg[Se]/L; State Drinking Water Guidelines: Arizona 45 μg[Se]/L; Connecticut 10 μg[Se]/L; Maine 35 μg[Se]/L; Minnesota 30 μg[Se]/L.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μ filtration prior to the above analysis.

Routes of Entry: Inhalation of dust or vapor, percutaneous absorption of liquid, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

The normal dietary intake of selenium, about 50−150 μg/day, is sufficient to meet the daily nutritional requirement for this essential nutrient. Selenium compounds can be toxic. However, at levels of daily intake that are only moderately higher than the nutritional requirement. The severity of the toxic effects of selenium would depend upon how much selenium was eaten and how often. Swallowing a quantity of concentrated sodium selenate or sodium selenite (for example, part of a bottle of sodium selenate designed to be administered to a flock of sheep, or large numbers of selenium supplement pills) would be life-threatening without immediate treatment. If amounts of selenium that were moderately higher than the daily nutritional requirement were eaten over long periods of time, several health effects could occur, including brittle hair, deformed nails; and in extreme causes, numbness and a lack of coordination in arms and legs. These health effects have been observed in people living in several villages in the People's Republic of China who were exposed to foods that were high in selenium for months to years. There have been no reports of populations in the United States exhibiting these symptoms of extreme chronic selenium poisoning.

Short-Term Exposure: Selenium can affect you when breathed in. Fumes can irritate the eyes and the respiratory tract. Contact can burn the eyes and skin. Inhalation of fume may cause symptoms of asphyxiation, chills and fever, and bronchitis. High levels can cause troubled breathing; lung irritation (pneumonitis) and headaches. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Symptoms of exposure can cause visual disturbance; headache, chills, fever, dyspnea (breathing difficulty), bronchitis, metallic taste; garlic breath; gastrointestinal disturbance. Tellurium compounds are both an oral and dermal toxic hazard. The material is toxic by ingestion. Oral ingestion of tellurium compounds is generally regarded as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between seven drops and one teaspoonful for a 70 kg (150 lb) person. Tellurium compounds are regarded as super toxic for skin exposures.

Long-Term Exposure: Hair or fingernail loss; numbness in fingers or toes; circulatory problems. Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the CNS; blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium; after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic-breath.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys, blood, spleen. In animals: anemia, liver necrosis; cirrhosis, kidney, spleen damage.

Medical Surveillance: NIOSH lists the following tests: Body Hair/Nail; whole blood (chemical/metabolite); blood plasma; blood serum; liver function tests; urine (chemical/metabolite); urine (chemical/metabolite), 24-hour collection; urinalysis; white blood cell count/differential. Urine test for selenium (normal is less than 100 μg/L of urine). If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning, *do not* use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator); or 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PAPRDM if not present as a fume (any powered, air-purifying respirator with a dust and mist filter); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Selenium must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water.

Shipping: UN3283 Selenium compound, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of metal, selenium. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Powdered selenium: dispose in a chemical waste landfill. When possible, recover selenium and return to suppliers[22].

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: O, T, N, Xn; risk phrases: R5; R8; R20/21/22; R23/25; R33; R36/38; R44; R49; R51/53; R62; R63; safety phrases: S17; S20/21; S26; S28; S29/35; S36/37/39; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Selenium dioxide is white to slightly reddish crystalline solid or yellow liquid which forms a yellow-green vapor. It has a sour and pungent odor. Odor threshold in air = 0.0002 milligram per cubic meter. Molecular weight = 110.96; sublimation point = 315°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, ₩reactivity 0 **OX**. Soluble in water; solubility = 40%. Readily soluble; reacts with water forming corrosive selenious acid.

Potential Exposure: Selenium dioxide is used in the manufacture of selenium compounds, a reagent for alkaloids; an oxidizing agent; in paint and ink pigments; in metal "blueing" and etching; as a chemical catalyst; in photographic toners; in electric and photoelectric components; and others.

Incompatibilities: Selenium dioxide is and inorganic oxidizer; reacts, possibly violently, with reducing agents such as hydrides, nitrides, alkali metals, and sulfides. Contact with strong acids may cause release of toxic hydrogen selenide gas. Water solution is a medium-strong acid (selenious acid). Rapidly absorbs dry hydrogen fluoride, hydrogen bromide, hydrogen chloride, to form corresponding selenium oxohalides. Reacts with many substances producing toxic selenium vapors. Attacks many metals in presence of water.

Permissible Exposure Limits in Air

NIOSH IDLH = 1 mg[Se]/m^3

OSHA PEL: 0.2 mg[Se]/m^3 TWA

NIOSH REL: 0.2 mg[Se]/m^3 TWA

ACGIH TLV[1]: 0.2 mg[Se]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 0.84 milligram per cubic meter

PAC-2: 1.6 milligram per cubic meter

PAC-3: 9.5 milligram per cubic meter

DFG MAK: 0.05 mg[Se]/m^3, inhalable fraction TWA; Peak Limitation Category II(4); Carcinogen Category 3B; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 0.2 mg[Se]/m^3, 1993; Australia: TWA 0.2 mg[Se]/m^3, 1993; Austria: MAK 0.1 mg[Se]/m^3, 1999; Belgium: TWA 0.2 mg[Se]/m^3, 1993; Denmark: TWA 0.1 mg[Se]/m^3, 1999; Finland: TWA

0.1 mg[Se]/m^3; STEL 0.3 mg[Se]/m^3, 1999; Hungary: STEL 0.1 mg[Se]/m^3, 1993; Japan: 0.1 mg[Se]/m^3, 1999; Norway: TWA 0.1 mg[Se]/m^3, 1999; the Philippines: TWA 0.2 mg[Se]/m^3, 1993; Poland: MAC (TWA) 0.1 mg[Se]/m^3; MAC (STEL) 0.3 mg[Se]/m^3, 1999; Sweden: NGV 0.1 mg [Se]/m^3, 1999; Switzerland: MAK-W 0.1 mg[Se]/m^3, 1999; Turkey: TWA 0.2 mg[Se]/m^3, 1993; United Kingdom: TWA 0.1 mg[Se]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.2 mg[Se]/m^3. Russia[43] set a MAC in ambient air in residential areas of 0.1 μ/m^3 on a momentary basis and 0.05 μ/m^3 on a daily average basis.

Determination in Air: Use NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = 0.05 mg[Se]/L; MCL = 0.05 mg[Se]/L as selenium. State Drinking Water Standards: Arizona 10 μg[Se]/L; New York 10 μg[Se]/L; State Drinking Water Guidelines: Arizona 45 μg[Se]/L; Connecticut 10 μg[Se]/L; Maine 35 μg[Se]/L; Minnesota 30 μg[Se]/L.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μ filtration prior to the above analysis.

Routes of Entry: Inhalation, ingestion, skin, and/or eyes. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. *Inhalation:* Low level exposures may cause garlic breath and metallic taste in the mouth. Tiredness, pallor and indigestion have been reported. Unknown high levels have caused intense irritation of nose, throat, and lungs, with coughing, sneezing, congestion, dizziness, and headache. Inhalation may cause chemical pneumonitis. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* May cause dermatitis with itchy red bumps forming. Chemical burns may also occur. Intense pain will occur if selenium oxide penetrates under the fingernail. *Eyes:* May cause pain and irritation. Eyelids may become puffy, an allergic reaction known as "rose eye." *Ingestion:* No information specific to selenium oxide. Based on other selenium compounds, may cause nausea, vomiting, abdominal pain; diarrhea, metallic taste, and garlic odor on breath. Animal studies suggest that the lethal dose for an adult may be as low as 1/200 oz.

Long-Term Exposure: Hair or fingernail loss; numbness in fingers or toes; circulatory problems. Allergic sensitization may occur resulting in onset of skin rash and rose eye at very low levels. Discoloration of hair and nails may also affect the many organ systems. Animal feeding studies suggest that liver, spleen, and kidney damage is possible. Nasopharyngeal irritation, gastrointestinal distress, and persistent garlic breath may also occur. Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the CNS; blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic-breath.

Points of Attack: Skin, eyes, liver, kidneys, spleen.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Inhalation: bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Note to Physician: 10% sodium thiosulfate solutions, creams and eye ointments will rapidly convert selenium oxide to less harmful red selenium. Urinary selenium may be useful indicator of degree of exposure. Liver function tests are suggested.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin

is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator); or 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PAPRDM if not present as a fume (any powered, air-purifying respirator with a dust and mist filter); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store away from acids and water. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3283Selenium compound, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous material, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. For liquids, absorb on sand or vermiculite and shovel slurry into sealed container. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include selenium and oxygen which may increase intensity of fire. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Description: Selenium hexafluoride is a nonflammable, colorless gas. Repulsive odor. Molecular weight = 192.95; specific gravity (H_2O:1) = 7.9 @ 20°C; boiling point = −34.4°C (Sublimation point = −46°C); freezing/melting point = −50.5°C[77]; vapor pressure = 750 mmHg @ −47°C; relative vapor density (air = 1) = 6.66. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Insoluble in water; slow reaction.

Potential Exposure: Selenium hexafluoride, a gas, is utilized as a gaseous electric insulator.

Incompatibilities: Hydrolyzes very slowly in cold water. Decomposes on heating, producing hydrogen fluoride, fluoride, and selenium. Contact with metal or acid will produce toxic gaseous hydrogen selenide.

Australia: TWA 0.05 ppm (0.2 milligram per cubic meter), 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; MAK 0.1 mg[Se]/m^3, 1999; Belgium: TWA 0.05 ppm (0.16 milligram per cubic meter), 1993; Denmark: TWA 0.05 ppm (0.4 milligram per cubic meter), 1999; Finland: TWA 0.05 ppm (0.4 milligram per cubic meter); STEL 0.15 ppm (1.2 milligram per cubic meter), 1999; France: VME 0.05 ppm (0.2 milligram per cubic meter), 1999; Japan 0.1 mg[Se]/m^3, 1999; the Netherlands: MAC-TGG 0.2 mg[Se]/m^3, 2003; Norway: TWA 0.05 ppm (0.4 milligram per cubic meter), 1999; the Philippines: TWA 0.05 ppm (0.4 milligram per cubic meter), 1993; Poland: MAC (TWA) 1 mg[HF]/m^3, 1999; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 0.05 ppm (0.4 milligram per cubic meter), 1999; United Kingdom: TWA 0.1 mg [Se]/m^3, 2000; TWA 2.5 mg[F]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.05 ppm. Several states have set guidelines or standards for SeF6 in ambient air[60] ranging from 2 μ/m^3 (North Dakota); to 3.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (Connecticut); to 5.0 μ/m^3 (Nevada).

Determination in Air: Collection by impinger or fritted bubbler, analysis by atomic absorption spectrometry.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation can be fatal. Highly corrosive to the eyes and respiratory tract. Can cause permanent damage and possible blindness. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Contact with the liquid can cause frostbite.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. May affect the CNS; liver and kidneys.

Points of Attack: Respiratory system, liver, kidneys, skin. In animals: pulmonary irritation, edema.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, ECG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; urinalysis (routine); white blood cell count/differential. Urine test for selenium (should not exceed 100 μg/L of urine). Lung function tests. Consider chest X-ray following acute overexposure. Liver and kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticoste roid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. *Note to physician:* For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5* ppm*:* Sa (APF = 10) (any supplied-air respirator). *Up to 1.25* ppm*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 2* ppm*:* SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical, personnel should be trained on its proper handling and storage. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Selenium hexafluoride, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material Inhalation, Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 2.3/3.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 2500/800
Then: Protect persons downwind (mi/km)
Day 3.1/5.0
Night 7.0 + /11.0 + *

* + means distance can be larger in certain atmospheric conditions.

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride, fluoride and metal oxides of selenium (fumes). Extinguish fire using agent suitable for type of surrounding fire. The material itself does not burn or burns with difficulty. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. If possible, convert selenium compounds to an insoluble form with SO_2 before landfill or solidification.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R14; R20/22; R23/25; R29; R33; R35; R50/53; R61; R62; safety phrases: S20/21; S26; S29; S36/37/39; S28; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Selenium oxychloride is a colorless to yellowish liquid. Fumes in air. Molecular weight = 165.86; specific gravity (H_2O:1) = 2.42 @ 22°C; boiling point = 176.3°C; freezing/melting point = 11°C; vapor pressure = 2.5 mmHg @ 25°C;. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 1₩. Violent reaction with water forming hydrochloric acid and selenious acid.

Potential Exposure: This material is used as a solvent for many substances, including metals and as a chlorinating agent; and resin plasticizer; as an ionizing solvent; for monochlorination of ketones.

Incompatibilities: Water and air reactive releasing strong acids. The aqueous solution is a strong acid and oxidizer.

Reacts violently with bases, reducing agents, hydrides, powdered antimony, red, and white phosphorus, disilver oxide, lead oxide; powdered metals, and potassium. *Note: Never* pour water into this substance; when dissolving or diluting always add it slowly to the water.

Permissible Exposure Limits in Air

NIOSH IDLH = 1 mg[Se]/m^3

OSHA PEL: 0.2 mg[Se]/m^3 TWA

NIOSH REL: 0.2 mg[Se]/m^3 TWA

ACGIH TLV[1]: 0.2 mg[Se]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 1.3 milligram per cubic meter

PAC-2: 10 milligram per cubic meter

PAC-3: 60 milligram per cubic meter

DFG MAK: 0.05 mg[Se]/m^3, inhalable fraction TWA; Peak Limitation Category II(4); Carcinogen Category 3B; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 0.2 mg[Se]/m^3, 1993; Australia: TWA 0.2 mg[Se]/m^3, 1993; Belgium: TWA 0.2 mg[Se]/m^3, 1993; Denmark: TWA 0.1 mg[Se]/m^3, 1999; Finland: TWA 0.1 mg[Se]/m^3; STEL 0.3 mg[Se]/m^3, 1999; Hungary: STEL 0.1 mg[Se]/m^3, 1993; Norway: TWA 0.1 mg[Se]/m^3, 1999; the Philippines: TWA 0.2 mg [Se]/m^3, 1993; Poland: MAC (TWA) 0.1 mg[Se]/m^3, 1993; Sweden: NGV 0.1 mg[Se]/m^3, 1999; Switzerland: MAK-W 0.1 mg[Se]/m^3, 1999; Turkey: TWA 0.2 mg[Se]/m^3, 1993; United Kingdom: TWA 0.1 mg[Se]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.2 mg[Se]/m^3. Several states have set guidelines or standards for selenium compounds as selenium in ambient air[60] ranging from 0.26−1.57 μ/m^3 (Montana); to 0.27 μ/m^3 (Massachusetts); to 0.66 μ/m^3 (New York); to 2.0 μ/m^3 (Florida and North Dakota); to 3.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (Connecticut); to 5.0 μ/m^3 (Nevada).

Determination in Air: NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = 0.05 mg[Se]/L; MCL = 0.05 mg[Se]/L as selenium. State Drinking Water Standards: Arizona 10 μg[Se]/L; New York 10 μg[Se]/L; State Drinking Water Guidelines: Arizona 45 μg[Se]/L; Connecticut 10 μg[Se]/L; Maine 35 μg[Se]/L; Minnesota 30 μg[Se]/L.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μ filtration prior to the above analysis.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This material is very toxic and may cause death or permanent injury after very short exposures to small quantities. Inhalation of small quantities may be corrosive and irritating to the respiratory tract. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. It can burn and severely irritate the skin and eyes and cause burns to the mouth, esophagus, and stomach when ingested. Inhalation of this material may cause garlic breath, odor, nausea, vomiting, indigestion, fever, headache, lassitude, irritability, and unstable blood pressure.

Long-Term Exposure: Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the CNS; blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic-breath.

Points of Attack: Skin, lungs, liver.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, ECG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; urinalysis (routine); white blood cell count/differential. Urine test for selenium (should not exceed 100 μg/L of urine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All

protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 milligram per cubic meter:* DM if not present as a fume (any dust and mist respirator); or any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PAPRDM if not present as a fume (any powered, air-purifying respirator with a dust and mist filter); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2879 Selenium oxychloride, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride and metal oxides of selenium. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%, selenium (IV) disulfide (SeS_2).

Hazardous to aquatic life or environment, with possible long-lasting effects[192]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N: risk phrases: R23/25; R33; R50/53; R62; safety phrases: S20/21; S28; S29; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: There are various selenium sulfides: Selenium monosulfide, SeS, is orange-yellow powder or tablets, Molecular weight = 111.02; specific gravity (H_2O:1) = 3.1 @ 20°C; boiling point = (decomposes) 118−119°C; freezing/melting point = 111.06°C. Selenium disulfide, SeS_2 which is a bright red to yellow material; freezing/melting point ≤100°C. Se_2S_6 which is a light orange crystalline solid. Freezing/Melting point = 121.5°C. Se_4S_4 is a red crystalline solid. Molecular weight = 143.08; freezing/melting point = 113°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: Selenium sulfide is used for the treatment of seborrhea, especially in shampoos. The chemical is available over the counter as Selsun, a stabilized buffered suspension. FDA reports that selenium sulfide is an active ingredient in some drug products used for the treatment of dandruff and certain types of dermatitis. A dandruff shampoo containing 1% selenium sulfide is available without a prescription and is recommended for use once or twice a week. By prescription, selenium sulfide is available in a 2.5% shampoo or lotion, with the recommended application limited to 10 minutes for 7 days to avoid the possibility of acute toxic effects. Selenium sulfide is also used topically in veterinary medicine for eczemas and dermatomycoses.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Violent reaction with silver oxide.

DFG MAK: 0.05 mg[Se]/m^3, inhalable fraction TWA; Peak Limitation Category II(4); Carcinogen Category 3B; Pregnancy Risk Group C

Several states have set guidelines or standards for selenium compounds as selenium in ambient air[60] ranging from 0.26−1.57 μ/m^3 (Montana); to 0.27 μ/m^3 (Massachusetts); to 0.66 μ/m^3 (New York); to 2.0 μ/m^3 (Florida and North Dakota); to 3.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (Connecticut); to 5.0 μ/m^3 (Nevada).

Determination in Air: NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = 0.05 mg[Se]/L; MCL = 0.05 mg[Se]/L as selenium. State Drinking Water Standards: Arizona 10 μg[Se]/L; New York 10 μg[Se]/L; State Drinking Water Guidelines: Arizona 45 μg[Se]/L; Connecticut 10 μg[Se]/L; Maine 35 μg[Se]/L; Minnesota 30 μg[Se]/L.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μ filtration prior to the above analysis. Hazardous to the aquatic environment. Do not allow release to the environment unless proper permits are obtained from the federal government.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact can cause irritation. The dust irritates the respiratory tract. Higher exposure can cause headaches, troubled breathing; and pneumonitis. Symptoms of exposure include irritation of the skin (dermatitis), eyes, and mucous membranes; eye injury; hair loss; discoloration of hair; garlic odor of the breath; depression, languor, giddiness, emotional instability; excess dental caries; pallor, nervousness; digestive disturbances, and nausea[52].

Long-Term Exposure: A probable carcinogen in humans, it has been shown to cause liver and lung cancer in animals. Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the CNS; blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic-breath.

Points of Attack: Liver.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, ECG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; urinalysis (routine); white blood cell count/differential. Urine test for selenium (should not exceed 100 μg/L of urine).

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others[52]. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Note to Physician: Inhalation: Bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool dry place. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2657 Selenium disulfide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen sulfide, hydrogen selenide, and oxides of sulfur. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T +, N, Xi; risk phrases: R8; R20/21/22; R23/25; R33; R36/38; R43; R44; R49; R50/53; R63; safety phrases: S17; S20/21; S26; S28; S29/35; S36/37/39; S45; S53; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Selenious acid is a colorless, crystalline solid. Molecular weight = 128.98; freezing/melting point = 70°C (decomposition). Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 1 (Oxidizer). Soluble in water; solution forms a strong acid.

Potential Exposure: Selenious acid is used as a reagent for alkaloids and as an oxidizing agent. Isotope is used in labeling radiopharmaceuticals.

Incompatibilities: A strong oxidizer. Reacts exothermically with many reducing agents including hydroiodic acid, sulfurous acid, sodium hyposulfite, hydroxylamine salts, hydrazine salts, hypophosphorous acid, phosphorous acid[206, 136]. Incompatible combustibles, organic material, oxidizable materials, strong acids, strong bases. Contact with acids produce toxic and gaseous hydrogen selenide. Attacks metals.

Permissible Exposure Limits in Air

NIOSH IDLH = 1 mg[Se]/m^3

OSHA PEL: 0.2 mg[Se]/m^3 TWA

NIOSH REL: 0.2 mg[Se]/m^3 TWA

ACGIH TLV[1]: 0.2 mg[Se]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 23 milligram per cubic meter

PAC-2: 250 milligram per cubic meter

PAC-3: 1500 milligram per cubic meter

DFG MAK: 0.05 mg[Se]/m^3, inhalable fraction TWA; Peak Limitation Category II(4); Carcinogen Category 3B; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 0.2 mg[Se]/m^3, 1993; Australia: TWA 0.2 mg[Se]/m^3, 1993; Austria: MAK 0.1 mg[Se]/m^3, 1999; Belgium: TWA 0.2 mg[Se]/m^3, 1993; Denmark: TWA 0.1 mg[Se]/m^3, 1999; Finland: TWA 0.1 mg[Se]/m^3; STEL 0.3 mg[Se]/m^3, 1999; Hungary: STEL 0.1 mg[Se]/m^3, 1993; Norway: TWA 0.1 mg[Se]/m^3, 1999; the Philippines: TWA 0.2 mg[Se]/m^3, 1993; Poland: MAC (TWA) 0.1 mg[Se]/m^3, 1993; Sweden: NGV 0.1 mg [Se]/m^3, 1999; Switzerland: MAK week 0.1 mg[Se]/m^3, 1999; Turkey: TWA 0.2 mg[Se]/m^3, 1993; United Kingdom: TWA 0.1 mg[Se]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.2 mg[Se]/m^3. Several states have set guidelines or standards for selenium compounds as selenium in ambient air[60] ranging from 0.26−1.57 μ/m^3 (Montana); to 0.27 μ/m^3 (Massachusetts); to 0.66 μ/m^3 (New York); to 2.0 μ/m^3 (Florida and North Dakota); to 3.5 μ/m^3 (Virginia); to 4.0 μ/m^3 (Connecticut); to 5.0 μ/m^3 (Nevada).

Determination in Air: NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121, and ID-125G.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = 0.05 mg[Se]/L; MCL = 0.05 mg[Se]/L as selenium. State Drinking Water Standards: Arizona 10 μg[Se]/L; New York 10 μg[Se]/L; State Drinking Water Guidelines: Arizona 45 μg[Se]/L; Connecticut 10 μg[Se]/L; Maine 35 μg[Se]/L; Minnesota 30 μg[Se]/L.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μ filtration prior to the above analysis.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Selenious acid and its salts are capable of penetrating the skin and can produce acute poisonings. Corrosive to the eyes, skin, and respiratory tract. May affect the eyes, resulting in "rose-eye," an allergic-type reaction of the eyelids. It is highly toxic orally. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Inorganic selenium compounds may cause dermatitis. Toxic effects are similar to those of selenium and other selenium compounds. Garlic odor of breath is a common symptom. Pallor, nervousness, depression, and digestive disturbances have been reported in cases of chronic exposure. The most common industrial injuries are irritations and burns of the skin.

Long-Term Exposure: Repeated or prolonged contact may cause skin dermatitis. May affect the CNS; blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic-breath.

Points of Attack: Skin, eyes, liver, kidneys, nervous system.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, ECG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; urinalysis (routine); white blood cell count/differential. Urine test for selenium (should not exceed 100 μg/L of urine). Examination of the nervous system. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from reducing agents; acids, combustibles. Where possible, automatically transfer material from drums or other storage containers to process containers. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3283Selenium compound, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous material, Technical Name Required. UN3440 Selenium compound, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Liquid containing selenium inorganic compounds should be absorbed in vermiculite, dry sand; earth or similar material. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include toxic oxides of metal. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R22; R23/24/25; R36/37/38; R34; R40; R45; R50; R62; R63 Safety phrases: S1; S22; S24/25; S26; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (mfg.)

Description: Semicarbazide hydrochloride is a white crystalline solid. Molecular weight = 111.55; freezing/melting point = (decomposes) 172−175°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Soluble in water.

Potential Exposure: This material is used as a reagent for ketones and aldehydes with which it affords crystalline compounds having characteristic freezing/melting points. Also used in isolation of hormones and certain fractions from essential oils.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May ignite combustible materials (wood, oil, paper).

Permissible Exposure Limits in Air

PAC Ver. 29[138]

563-41-7

PAC-1: 9.1 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 600 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes and skin. Toxic by ingestion. Symptoms of exposure include convulsions, irritation of skin, eyes, and mucous membranes; gastroenteric disturbances; and anemia. High level of exposure may affect the nervous system.

Long-Term Exposure: There is limited evidence that this chemical causes lung cancer in animals. High or repeated exposure may cause nerve damage with weakness, a feeling of "pins and needles," and loss of coordination in the limbs.

Points of Attack: Nervous system.

Medical Surveillance: Examination of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator and protect from oxidizers, combustible materials; moisture. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. This material may burn, but does not ignite readily. For small fires use dry chemical, carbon dioxide; water spray; or alcohol resistant foam. For large fires, use water spray, fog, or foam. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Semustine S:0205

Formula: $C_{10}H_{18}ClN_3O_2$

Synonyms: 1-(2-Chloroethyl)-3-(4-methylcyclohexyl-1-nitrosourea); 1-(2-Chloroethyl)-3-(4-methylcyclohexyl)-1-nitroso-; 1-(2-Chloroethyl)-3-(trans-4-methyl-cyclohexyl)-1-nitrosourea; *N*-(2-Chloroethyl)-N′-(*trans*-4-methylcyclohexyl)-*N*-nitrosourea; ICIG-1110; Lomustine, methyl-; ME-CCNU; Methyl-CCNU; *trans*-Methyl-CCNU; NCI-C04955; NSC-95441; SeMustine; Urea, 1-(2-chloroethyl)-3-(4-methylcyclohexyl)-1-nitroso-; Urea, *N*-(2-chloroethyl)-*N*′-(4-methylcyclohexyl)-*N*-nitroso-

CAS Registry Number: 13909-09-6

HSDB Number: 7760

RTECS Number: YS500000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

Regulatory Authority and Advisory Information

Carcinogenicty: NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen.

California Proposition 65 Chemical[102]: Cancer 10/1/1988

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R45; R23/24/25; R33; R36/37/39; R46; R62; safety phrases: S22; S26; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: A crystalline solid or light yellow powder. Molecular weight = 247.76; freezing/melting point = (decomposes) ~64°C; vapor pressure = 5.6×10^{-6} mmHg @ 25°C (est.)[72]; Henry's Law constant = 2.5×10^{-10} atm m^3/mol @ 25°C (est)[72]. Low solubility in water; solubility = 38 mg/L @ 25°C (est.)[72].

Potential Exposure: Semustine is chemotherapy agent; an antineoplastic agent which functions as an alkylating agent[NIH].

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from strong acids, alkaline materials, strong bases. Semustine, an organic amide, reacts with azo and diazo compounds, releasing toxic gases. Amides are very weak bases but they can react as acids, forming salts. Contact with reducing agents can release flammable gases. Mixing amides with dehydrating agents such as such as phosphorus pentoxide or thionyl chloride generates the corresponding nitrile.

Permissible Exposure Limits in Air:

Determination in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol–water coefficient: Log K_{ow} => 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Ingestion, inhalation, through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic, may be fatal if inhaled, swallowed or absorbed through skin. Avoid any skin contact or eye. Effects of contact or inhalation may be delayed. May be fatal if inhaled. Toxic if absorbed through skin. Causes skin, eye, and respiratory tract irritation. Symptoms of exposure to this compound may include delayed bone marrow depression, nausea, and vomiting.

Long-Term Exposure: Possible risk of forming tumors, Mutagen. Abnormalities of renal function, including three cases of renal failure, were noted some patients. Pulmonary fibrosis is a serious side effect of nitrosourea. Possible leukemia or preleukemia.

Points of Attack: Lungs, kidneys, lymph nodes, bone marrow.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method* if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed.

Personal Protective Methods: Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure, dry, poison location. Protect from moisture. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials. PG II.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Keep unauthorized personnel away. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind. Keep out of low areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Cover with plastic sheet to prevent spreading. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Noncombustible, substance itself does not burn but may decompose upon heating to produce corrosive and/or toxic fumes. Containers may explode when heated. Runoff from fire control or dilution water may be corrosive and/or toxic and may cause pollution. Runoff may pollute waterways. If tank, rail car, or tank truck is involved in a fire, ISOLATE for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Small Fire: Use dry chemical, CO_2 or water spray. *Large Fire*: Water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: It is inappropriate to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Silane is a colorless, pyrophoric gas with a repulsive odor. Molecular weight = 32.13; boiling point = −169°C; specific gravity (H_2O:1) = 1.31 @ 25°C; boiling point = −185; freezing/melting point = −111.7°C; flash point = −236°C. Relative vapor density (air = 1) = 1.11. Explosive limits: LEL = 1.37%; UEL: 100%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 3₩. Slight solubility in water; slowly decomposes forming silicon hydroxides and flammable hydrogen gas.

Potential Exposure: Silane is used as a doping agent for solid-state devices; as a source of silicon for semiconductors; and in the production of amorphous silicon.

Incompatibilities: An extremely flammable gas. Forms explosive mixture with air; may spontaneously ignite in air. A strong reducing agent. Reacts slowly with water forming silicon hydroxides and flammable hydrogen gas. Reacts with oxidizing agents; halogens [bromine, chlorine, carbonyl chloride; antimony pentachloride; tin(IV) chloride], potassium hydroxide solution. Explodes in oxygen. Decomposes on heating or on burning producing silicon and hydrogen.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 ppm/7 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/6.6 milligram per cubic meter TWA

Protective Action Criteria PAC* Ver. 29[138]

PAC-1: **100**$_{\mathbf{A}}$ ppm

PAC-2: **130**$_{\mathbf{A}}$ ppm

PAC-3: **270**$_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

Australia: TWA 5 ppm (7 milligram per cubic meter), 1993; Belgium: TWA 5 ppm (6.6 milligram per cubic meter), 1993; Denmark: TWA 0.5 ppm (0.7 milligram per cubic meter), 1999; Finland: TWA 0.5 ppm (0.7 milligram per cubic meter); STEL 1.5 ppm (2.0 milligram per cubic meter), 1999; France: VME 5 ppm (7 milligram per cubic meter), 1999; Japan: 100 ppm (130 milligram per cubic meter), 1999; Norway: TWA 0.5 ppm (0.7 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.7 milligram per cubic meter, 2003; United Kingdom: TWA 0.5 ppm (0.67 milligram per cubic meter); STEL 1 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 ppm. Several states have set guidelines or standards for silane in ambient air[60] ranging from 70 μ/m^3 (North Dakota); to 140 μ/m^3 (Connecticut); to 167 μ/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Silicon tetrahydride can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Skin or eye contact with the liquid may cause frostbite. Not much is known about the effects of exposure to high levels, but somewhat similar chemicals cause severe irritation of the eyes, skin and lungs.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Flammable gas. (1) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. This gas is spontaneously flammable. Store in an area that is roofed, shaded, and well ventilated with the cylinders stored off the ground, separated from all other products assigned to other hazard categories, and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Silicon tetrahydride must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Silicon tetrahydride should be stored and used under a blanket of inert gas as it explodes on contact with air. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where silicon tetrahydride is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of silicon tetrahydride. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2203 Silane, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an extremely flammable and unstable gas. *Use extreme caution*. Thermal decomposition products may include silicon and explosive hydrogen. For small fires, use dry chemical or CO_2 extinguishers. Avoid halons. Do not use CO_2 extinguishers on large fires; use water spray or fog. Dolomite powder or graphite is recommended dry chemical agents[24]. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dispose by controlled burning or seal cylinders and return to suppliers[24].

Regulatory Authority and Advisory Information

Carcinogenicity: see S:0230: NTP 13th Report on Carcinogens, 2014: *Silica, crystalline (respirable size).* Known to be a human carcinogen; IARC: Animal Inadequate Evidence; Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1997; NIOSH (*Silica, amorphous silica, fused*): Potential occupational carcinogen.

Hazard Alert: Possible risk of forming tumors, Sensitization hazard, Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, Xi; risk phrases: R22; R36/37/38; R43; R52/53; safety phrases: S26; S29/35; S36/37/39; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Amorphous silica, the noncrystalline form of SiO_2, is a transparent to gray, odorless, amorphous powder. *Hydrated*: Molecular weight = 60.08; specific gravity (H_2O:1) = 2.2 @ 20°C; boiling point = 2230°C; 4046°C (fume); freezing/melting point = 1710°C; 3110°C (fume). Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Insoluble in water. *Fumed:* Molecular weight = 60.09.

Potential Exposure: Amorphous fumed silica is used as a mineral, natural or synthetic fiber. A potential danger to those involved in the production and handling of fumed silica for paint pigments or catalysts. Diatomaceous earth is used in clarifying liquids, in manufacture of fire brick and heat insulators; used as a filtering agent; as a filler in construction materials; pesticides, paints, and varnishes. A potential danger to those involved in mining of diatomaceous earth or fabrication of products there from.

Incompatibilities: Silica, amorphous is a noncombustible solid. Generally unreactive chemically. Incompatible with fluorine, oxygen difluoride, chlorine trifluoride. Soluble in molten alkalis and reacts with most metallic oxides at high temperature[101].

Permissible Exposure Limits in Air

Silica, amorphous silica, fused

OSHA PEL: 30 milligram per cubic meter total dust/ divided by the value "%SiO_2 +2" TWA; *either one* of the following methods: 250 mppcf respirable dust/divided by the value "%SiO_2 +5" *or* 10 milligram per cubic meter respirable dust/divided by the value "%SiO_2 + 2"

NIOSH REL: 0.05 milligram per cubic meter, respirable dust TWA; See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: withdrawn.

DFG MAK (*CAS: 60676-86-0 & 7699-41-4*): 0.3 milligram per cubic meter respirable fraction; Pregnancy Risk Group C.

Silica, amorphous precipitated and gel & diatomaceous earth, uncalcined

NIOSH IDLH = 3000 milligram per cubic meter

OSHA PEL*: either one of the methods:* 20 mppcf [millions of particles per cubic foot of air, based on impinger samples counted by light-field techniques] *or* 80 milligram per cubic meter divided by the value "%SiO_2," TWA

NIOSH REL: 6 milligram per cubic meter TWA

ACGIH TLV[1]: withdrawn for the following: silica amorphous, precipitated and gel; silica fume; silica fused; diatomaceous earth, calcined.

PAC Ver. 29[138]

7631-86-9, amorphous hydrated

PAC-1: 18 milligram per cubic meter

PAC-2: 740 milligram per cubic meter

112945-52-5, amorphous fumed

PAC-1: 18 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 630 milligram per cubic meter

DFG MAK (*diatomaceous earth, uncalcined)*: 4 milligram per cubic meter, inhalable fraction; Pregnancy Risk Group C.

Austria: MAK 4 milligram per cubic meter, 1999; Norway: TWA 1.5 milligram per cubic meter (respirable dust), 1999; Switzerland: MAK-W 4 milligram per cubic meter, 1999; Thailand: TWA 80 milligram per cubic meter, 1993; United Kingdom: TWA 6 milligram per cubic meter, total dust, 2000; United Kingdom: TWA 1.2 milligram per cubic meter, (respirable dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 3 milligram per cubic meter (respirable fraction, for particulate matter containing no asbestos and <1% crystalline silica). Russia[43] set a MAC of 2 milligram per cubic meter in work-place air.

PAC Ver. 29[138]

69012-64-2, silica amorphous fume

PAC-1: 45 milligram per cubic meter

PAC-2: 500 milligram per cubic meter

PAC-3: 3000 milligram per cubic meter

Determination in Air: Use NIOSH(IV) Method #7501 (any form); OSHA Analytical method ID-125G (fumed)

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Amorphous fused silica can affect you when breathed in. Exposure can cause a very serious lung disease called silicosis, with cough and shortness of breath. Very high exposures can cause this problem to develop in a few weeks, or with lower exposures it may occur over many years. Silicosis can cause death. If silicosis develops, chances of getting tuberculosis are increased. The disease may progress, with or without continued exposure. If it does, this can be crippling or even fatal.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: The fused material is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. Chest X-ray every 1 to 3 years. If abnormal chest X-ray develops, the following should be done periodically: skin test for TB.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical has been inhaled, remove from exposure. Transfer promptly to a medical facility.

Personal Protective Methods: All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 30 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *Up to 60 milligram per cubic meter:* 95XQ (APF = 10) [Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator).*Up to 150 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 300 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 3000 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Amorphous fused silica must be stored to avoid contact with powerful oxidizers including fluorine, oxygen difluoride; chrome trifluoride; and manganese trioxide; since violent reactions occur.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Amorphous fused silica itself does not burn. Thermal decomposition products may include oxides of metal. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sanitary landfill.

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Silicon dioxide/crystalline silica is a component of many mineral dusts and materials which melts to a glass at very high temperature. Molecular weight = 60.09; specific gravity (H_2O:1) = 2.65; 2.3 (cristolbalite); boiling point (quartz) = 2950°C; freezing/melting point (quartz) = 573°C; 1722°C (cristobalite). Explosive limits (SiO_2): LEL = 13,700 ppm[138]; 11,000 ppm[138]; UEL: unknown; Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: Cristobalite is used in the manufacture of water glass, refractories, abrasives, ceramics and enamels. Quartz is used as a mineral, natural or synthetic fiber. Tridymite is used as a filtering and insulating media and as a refractory material for furnace linings. Workers are potentially exposed to crystalline silica in such industries as granite quarrying and cutting, foundry operations; metal, coal, dentistry, painting, and nonmetallic mining; and manufacture of clay and glass products.

Incompatibilities: Violent reactions with powerful oxidizers: fluorine, chlorine trifluoride; manganese trioxide; oxygen difluoride, hydrogen peroxide, etc.; acetylene; ammonia.

Permissible Exposure Limits in Air

OSHA PEL: (*silica, crystalline α-quartz, CAS: 14808-60-7 & Silica, crystalline tripoli CAS: 1317-95-9*): 30 milligram per cubic meter total dust/divided by the value "%SiO_2 +2" TWA; *either one* of the following methods: 250 mppcf respirable dust/divided by the value "%SiO_2 +5" *or* 10 milligram per cubic meter respirable dust/divided by the value "% SiO_2 + 2; For Silica crystalline, tridymite, CAS: 15468-32-3 & Silica, crystalline cristobalite, CAS 14464-46-1 use 1/2 the values calculated above using the count or mass formula for quartz. Routes of Entry: Inhalation of dust, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes. Inhalation can cause cough, dyspnea (breathing difficulty), wheezing.

Long-Term Exposure: Can cause decreased pulmonary function, progressive respiratory symptoms; fibrosis (silicosis). A potential occupational carcinogen. Silicosis is a very serious lung disease that can cause cough and shortness of breath. Silicosis can develop in a few weeks at very high exposures, or it may occur over many years with lower exposures. Silicosis can cause death. If silicosis develops, risk of developing tuberculosis is increased. The disease may progress with or without continued exposure. If it does, this can be crippling or even fatal. Very fine silica, or "silica flour" is even more hazardous.

Points of Attack: Eyes, respiratory system. Cancer site in animals: lung cancer.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Chest X-ray every 1 to 3 years. Chest X-rays should be read by a "B-reader," a doctor with special training for reading X-rays of the lungs. If abnormal chest X-ray develops, the following should be done periodically, skin test for tuberculosis.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in the NIOSH document CT-112-23b, *Control Technology for Bag Filling Operations at Manville Products Corporation, Lompoc, CA.* NIOSH recommends that *silica sand* or materials containing *more than 1% free silica* be prohibited as abrasive substances in abrasive blasting and cleaning operations. The New Jersey Department of Health and Senior Services document, *Stop Silicosis in Sandblasters; Use Silica Substitutes* recommends the substitution of less toxic *alumina* in pottery, and *quartz free grit* in abrasive blasting for silica, cristobalite. Follow OSHA regulations (OSHA Standard 1910.94) for abrasive blasting operations.

Respirator Selection: NIOSH: *Up to 0.5 milligram per cubic meter:* 95XQ (APF = 10) (any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100). *Up to 1.25 milligram per cubic meter:* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 2.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter). *Up to 25 milligram per cubic meter:* Sa:Pd, Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF =
10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Silica must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Silica itself does not burn. Thermal decomposition may include oxides of metal. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sanitary landfill.

Silicon S:0240

Formula: Si
Synonyms: Defoamer S-10; Elemental silicon; Silicon, amorphous powder
CAS Registry Number: 7440-21-3
HSDB Number: 5033
RTECS Number: VW0400000
UN/NA & ERG Number: UN1346 (powder, amorphous)/170
EC Number: 231-130-8

Regulatory Authority and Advisory Information
Hazard Alert: Highly flammable (dust, powder only), Primary irritant (w/o allergic reaction)
Hazard symbols, risk, & safety statements: Hazard symbol: T, F (powder); risk phrases: R11; safety phrases: S7; S16; S26; S36/37; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Silicon is a nonmetallic element which is known as silicon metal. Not occur freely in nature, but is found in silicon dioxide (silica) and in various silicates[77]. It is a steel-gray crystalline solid or a black-brown amorphous material. Molecular weight = 28.09; specific gravity (H_2O:1) = 2.33; boiling point = 3265°C[138]; freezing/melting point = 1414°C. Minimum Explosive Concentration = $160\ g/m^3$. Ignition temperature of dust cloud = Unknown; minimum explosive concentration = $0.11\ oz/ft^3$[209]. Relative explosion hazard of dust: Strong. Hazard identification (based on NFPA-704 M Rating System): [powder] Health 1, flammability 2, reactivity 1. Nearly insoluble in water. Does not occur free in nature, but is found in silicon dioxide (silica) and in various silicates.

Potential Exposure: Silicon may be used in the manufacture of silanes, silicon tetrachloride, ferrosilicon, silicones. It is used in purified elemental form in transistors and photovoltaic cells.

Incompatibilities: Dust or powder may form explosive mixture with air. A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, calcium, carbonates, chlorine, fluorine, oxidizers, cesium carbide; alkaline carbonates.

Permissible Exposure Limits in Air
OSHA PEL: 15 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction
NIOSH REL: 10 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction
ACGIH TLV[1]: withdrawn
PAC Ver. 29[138]
PAC-1: 45 milligram per cubic meter
PAC-2: 100 milligram per cubic meter
PAC-3: 630 milligram per cubic meter
Australia: TWA 10 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter, 1993; Denmark: TWA 10 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; Norway: TWA 10 milligram per cubic meter, 1999; Switzerland: MAK-W 4 milligram per cubic meter, 1999; United Kingdom: TWA $10\ mg/m^2$, total inhalable dust, 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 milligram per cubic meter

Determination in Air: Filter; none; Gravimetric; NIOSH IV, Particulates NOR: Method #0500, total dust; Method #0600 (respirable dust).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms
Short-Term Exposure: Causes irritation of the eyes, skin, and upper respiratory system; cough. Silicon dust does not produce significant organic disease or toxic effect when exposures are kept under reasonable control. Unpleasant deposits may be caused in eyes, ears and nasal passages, and injury to the skin and mucous membranes may be caused by the dust itself or by cleansing procedures used for its removal.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function test. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when

skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.
Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and other incompatible materials.
Shipping: UN1346 Silicon powder, amorphous requires, Hazard Class: 4.1; Labels: 4.1-Flammable solid.
Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include silicon oxide. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Silicon Carbide S:0250

Formula: CSi; SiC
Synonyms: Carbon silicide; Carborundum, Crystolon, Carbonite, Electrolon; Silicon monocarbide
CAS Registry Number: 409-21-2; *(alt.)* 12504-67-5; *(alt.)* 66039-27-8
HSDB Number: 681
RTECS Number: VW0450000
EC Number: 206-991-8
Regulatory Authority and Advisory Information
Hazard Alert: Combustible (dust. Powder), Possible risk of forming tumors.
Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R36/37; safety phrases: S16; S26; S36/37/39 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Silicon carbide is a yellow to green to bluish-black, iridescent crystalline substance. Colorless when pure. Molecular weight = 40.1; specific gravity (H_2O:1) = 3.23; 3.16[138]; boiling point = (sublimes); freezing/melting point = (sublimes with decomposition) 2700°C; 2830°C[138]. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Insoluble in water.
Potential Exposure: A potential danger to those involved in the manufacture of silicon carbide abrasives, refractories, and semiconductors. Silicon carbide fibers are also produced in fibrous form as reinforcing fibers for composite materials.
Incompatibilities: Dust may form explosive mixture with air. Sublimes with decomposition @ 2700°C.
Permissible Exposure Limits in Air
OSHA PEL: 15 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction
NIOSH REL: 10 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction
ACGIH TLV[1]: *nonfibrous:* 10 milligram per cubic meter TWA, inhalable fraction; particulate matter containing no asbestos and <1% crystalline silica; 3 milligram per cubic meter TWA, respirable fraction, for particulate matter containing no asbestos and <1% crystalline silica; *fibrous (including whiskers):* 0.1 f/cc, TWA, respirable fibers; length >5 μm; aspect ratio ≥3:1, as determined by the membrane filter method @ 400−450× magnification (4-mm objective), using phase-contrast illumination; Suspected Human Carcinogen
PAC Ver. 29[138]
PAC-1: 45 milligram per cubic meter
PAC-2: 500 milligram per cubic meter
PAC-3: 3000 milligram per cubic meter
DFG MAK: 1.5 milligram per cubic meter, respirable fraction (previously "fine dust"); 4 milligram per cubic meter, inhalable fraction; Pregnancy Risk Group C.

Australia: TWA 10 milligram per cubic meter, 1993; Austria: MAK 4 milligram per cubic meter, 1999; Belgium: TWA 10 milligram per cubic meter, 1993; France: VME 10 milligram per cubic meter, 1999; Switzerland: MAK-W 4 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; United Kingdom: TWA 4 milligram per cubic meter, (respirable dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen

Determination in Air: Use NIOSH IV Method #0500, total dust, Method #0600 (respirable dust), Particulates NOR.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, upper respiratory system; cough.

Long-Term Exposure: Silicon carbide can alter the course of inhalation tuberculosis leading to extensive fibrosis and progressive disease.

Points of Attack: Respiratory system.

Medical Surveillance. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides of silicon and carbon. Use any extinguishing agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfill.

Silicon Tetrafluoride S:0255

Formula: SiF_4

Synonyms: Perfluorosilane; Silicon fluoride; Silicon tetrafluoride, compressed; Tetrafluorosilane

CAS Registry Number: 7783-61-1

HSDB Number: 684

RTECS Number: VW2327000

UN/NA & ERG Number: (PIH) UN1859/125

EC Number: 232-015-5

Regulatory Authority and Advisory Information

Carcinogenicity: ACGIH A4 Not classifiable as a human carcinogen, as fluorides

Hazard Alert: Poison inhalation hazard, Corrosive, Dangerously water reactive, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg[F]/L, as Fluoride.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. As fluoride compounds

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C; risk phrases: R6; R14; R26/27/28; R29; R31; R34;

R35; R37; R51/53; safety phrases: S7/9; S23; S24/25; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: A colorless, nonflammable, corrosive and toxic gas. Sharp, pungent suffocating odor, similar to hydrogen chloride. Vapor is heavier than air; density = 3.6. Molecular weight = 104.09; specific gravity (H_2O:1) = 1.66 @ 20°C; boiling point = −86°C; freezing/melting point = −90°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 2₩. Dangerous reaction with water, releasing silicon dioxide, silicic acid, and hydrofluoric acid.

Potential Exposure: Silicon tetrafluoride is not used in industry but may be a discharge byproduct of certain processes, including ore refining and smelting operations. It has been used in the manufacture of silane and fluosilicic acid, and pure electronic silicon.

Incompatibilities: Water and air reactive Fluorides form explosive gases on contact with strong acids, acid fumes, and sodium. Water and air reactive. Corrosive. Fumes in air. Decomposed exothermically by water, alcohols, or moisture in the air to hydrofluoric acid and silicic acid, forming flammable and potentially explosive hydrogen gas. Attacks many metals in the presence of moisture.

Permissible Exposure Limits in Air:

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 minutes Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; Biological Exposure Index (BEI): 3 mg [F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg[HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 milligram per cubic meter), 1993; Sweden: NGV 2 mg [F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg[F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Several states have set guidelines or standards for fluorides in ambient air[60] ranging from 2.85 μ/m^3 (Iowa) to 25.0 μ/m^3 (North Dakota) to 34.0 μ/m^3 (Massachusetts) to 40.0 μ/m^3 (Virginia).

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.05_A}$ ppm

PAC-2: $\mathbf{3.3_A}$A ppm

PAC-3: $\mathbf{10_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

Exposure Period AEGL-1/AEGL-2/AEGL-3 (NAC/NRC)

10 minutes 0.05 ppm/6.3 ppm/19 ppm

30 minutes 0.05 ppm/4.3 ppm/13 ppm

60 minutes 0.05 ppm/3.3 ppm/10 ppm

4 hours 0.05 ppm/0.87 ppm/2.6 ppm

8 hours 0.05 ppm/0.43 ppm/1.3 ppm

Determination in Air: Gaseous fluorides collected by impinger using caustic; particulates by filter. Analysis is by ion-specific electrode per NIOSH Analytical Method 7902[18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg[F]/L.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Very toxic and irritating by inhalation and ingestion. Corrosive to the eyes and respiratory system.

LD$_{50}$ (oral-rat) = < 3 g/kg; (rat, inhalation) = 450 ppm.

Long-Term Exposure: Repeated high exposures to fluorides may affect kidneys. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability, and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite; diarrhea, or constipation. Nosebleeds and sinus problems may also occur.

Eyes, respiratory system; CNS; skeleton, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure to fluorides (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method* if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. Keep victim warm and quiet. Keep victim under observation Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: *Caution*: Liquids with this reactive group classification have been known to react with the following absorbents: Cellulose-Based Absorbents, Mineral-Based & Clay-Based Absorbents, Dirt/Earth[101]. In addition to positive pressure SCBA, wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations only; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)*+ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code—Blue: Health Hazard/Poison: Store in tightly closed containers in a secure poison location. This gas is highly toxic. Even slight exposure to this gas can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association

Shipping: UN1859 Silicon tetrafluoride, Hazard Class: 2.3; Labels 2.3-Poisonous gas; 8-Corrosive material; Inhalation Hazard Zone B. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Silicon tetrafluoride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.5/0.8
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.6/2.5

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stop the release if it can be done safely from a distance. Ventilate confined area if it can be done without placing personnel at risk Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic fumes of hydrogen fluoride. This gas is under pressure; containers may rupture and explode when heated. Noncombustible, poisonous and corrosive. Water reactive. Thermal decomposition products may include toxic fumes of hydrogen fluoride. Under prolonged exposure to heat the containers may rupture violently and rocket. Stop the release if it can be done safely from a distance. *Small fire:* Use *dry* chemical, CO_2. Large fire: Use water spray, fog, or regular foam. *If tanks are involved or in case of Large fire*: Fight fire from maximum distances or use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Cool exposed containers with large quantities of water from unattended equipment until well after fire is out, or remove intact containers if it can be done safely. Damaged cylinders should be handled only by specialists. Do not direct water at source of leak or safety devices; icing may occur. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: For laboratory quantities, transfer into an evaporating dish containing sodium bicarbonate, spray with ammonia (6M NH_4OH)/6 M-ammonium hydroxide/while stirring and then spread with crushed ice. Continue spraying with ammonia until the smoke of ammonium chloride partly subsides and add iced water while stirring. Neutralize and slowly transfer the mixture into a drain with running water.

Silver S:0260

Formula: Ag
Synonyms: Argentum; C.I. 77820; Elemental silver; Shell silver; Silber (German); Silver metal
soluble compounds: Silver acetate; Silver bromate; Silver bromide; Silver carbonate; Silver chloride; Silver chromate; Silver cyanide; Silver cichromate; Silver hydroxide; Silver iodate; Silver iodide; Silver nitrite; Silver oxalate; Silver sulfate; Silver sulfide; Silver thiocyanate
CAS Registry Number: 7440-22-4
HSDB Number: 5034
RTECS Number: VW3500000
UN/NA & ERG Number: Not regulated in bulk. UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.
EC Number: 231-131-3
Regulatory Authority and Advisory Information
Carcinogenicity (*metal*): EPA: Not Classifiable as to human carcinogenicity.
Hazard Alert: (powder/dust): Combustible, Highly reactive with known catalytic activity.
United States National Primary Drinking Water Regulations: SMCL = 0.10 mg[Ag]/L as Silver
Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/1992); 40CFR401.15 Section 307 Toxic Pollutants as *silver and compounds*
United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): D011
RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed
RCRA Toxicity Characteristic (Section 261.24), Maximum Concentration of Contaminants, regulatory level, 5.0 mg/L

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.43; Nonwastewater (mg/L), 0.30 TCLP

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 6010 (70); 7760 (100)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0% (includes any unique chemical substance that contains silver as part of that chemical's infrastructure).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R40; R10 (powder); R20/21; R22; R23/24/25; R34; R38; safety phrases: S24/25; S36/37/39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (*metal with a particle size >= 1 mm*); 3-Severe hazard to water. (*colloidal*)

Description: Silver is a white lustrous metal that is extremely ductile and malleable. Molecular weight = 107.87; specific gravity (H_2O:1) = 10.5 (metal); boiling point = 2212°C; 2162°C[138]; freezing/melting point = 962°C. Hazard identification (based on NFPA-704 M Rating System) (*powder*): Health 0, flammability 0, reactivity 1 Insoluble in water but soluble in hot sulfuric and nitric acids. Perhaps the most common soluble silver compounds are silver nitrate, $AgNO_3$ and silver cyanide, AgCN.

Potential Exposure: Silver may be alloyed with copper, aluminum, cadmium, lead, or antimony. The alloys are used in the manufacture of silverware, jewelry, coins, ornaments, plates, commutators, scientific instruments; automobile bearing; and grids in storage batteries. Silver is used in chrome-nickel steels, in solders and brazing alloys; in the application of metallic films on glass and ceramics, to increase corrosion resistance to sulfuric acid, in photographic films, plates and paper; as an electroplated undercoating for nickel and chrome; as a bactericide for sterilizing water; fruit juices; vinegar, etc.; in bus bars and windings in electrical plants; in dental amalgams; and as a chemical catalyst in the synthesis of aldehydes. Because of its resistance to acetic and other food acids, it is utilized in the manufacture of pipes, valves, vats, pasteurizing coils and nozzles for the milk, vinegar, cider, brewing, and acetate rayon silk industries.

Incompatibilities: Dust may form explosive mixture with air. Powders are incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides May react and/or form dangerous or explosive compounds, with acetylene, ammonia, halogens, hydrogen peroxide; bromoazide, concentrated or strong acids, oxalic acid, tartaric acid, chlorine trifluoride, ethyleneimine.

Permissible Exposure Limits in Air

Silver metal dust and fume

NIOSH IDLH = 10 mg[Ag]/m^3

OSHA PEL: 0.01 mg[Ag]/m^3 TWA

NIOSH REL: 0.01 mg[Ag]/m^3 TWA

ACGIH TLV[1]: *silver metal dust and fume*: 0.1 mg[Ag]/m^3 TWA; *silver salts*: 0.01 mg[Ag]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 990 milligram per cubic meter

DFG MAK: *silver metal dust and fume*: 0.1 mg[Ag]/m^3, inhalable fraction TWA; Peak Limitation Category II(8); Pregnancy Risk Group D. *silver salts:* 0.01 mg[Ag]/m^3, inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group D

Australia: TWA 0.1 milligram per cubic meter, 1993; Austria: MAK 0.01 milligram per cubic meter, 1999; Belgium: TWA 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.01 milligram per cubic meter, 1999; Finland: TWA 0.1 milligram per cubic meter, 1999; France: VME 0.1 milligram per cubic meter, 1999; Japan: 0.01 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Norway: TWA 0.01 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter, 1993; Sweden: NGV 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.01 milligram per cubic meter, 1999; United Kingdom: TWA 0.1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 milligram per cubic meter *silver metal dust*. Several states have set guidelines or standards for silver in ambient air[60] ranging from 0.01−0.08 μ/m^3 (Montana); to 0.2 μ/m^3 (Connecticut and Nevada); to 1.0 μ/m^3 (North Dakota); to 16,000 μ/m^3 (Virginia).

As silver soluble compounds

OSHA PEL: 0.01 milligram per cubic meter TWA

NIOSH REL: 0.01 milligram per cubic meter TWA

ACGIH TLV[1]: 0.01 milligram per cubic meter TWA

Determination in Air: NIOSH Analytical Method #7300 Elements by ICP; #8005, Elements in blood or tissue, #8310 Metals in urine; OSHA Analytical Method ID-121.

Permissible Concentration in Water: United States National Primary Drinking Water Regulations: SMCL = 0.10 mg[Ag]/L as silver Federal Drinking Water Guidelines: EPA 100 μg[Ag]/L; State Drinking Water Standards: Connecticut 50 μg[Ag]/L; State Drinking Water Guidelines: Arizona 50 μg[Ag]/L; Maine 35 μg[Ag]/L; Minnesota 30 μg[Ag]/L. Wisconsin 50 μg[Ag]/L.

Determination in Water: Digestion followed by atomic absorption, or colorimetric determination (with Dithizone); or by inductively coupled plasma (ICP) optical emission spectrometry. This gives total silver. Dissolved silver may be determined by these same methods preceded by 0.45 μ filtration.

Routes of Entry: Inhalation of fumes or dust; ingestion of solutions or dust, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Causes irritation of the eyes, skin and respiratory tract. Ingestion of dust can cause gastrointestinal disturbance.

Long-Term Exposure: Silver can affect you when breathed in. Repeated exposure to fine silver dust or fumes can cause blue-gray staining of the eyes, mouth, throat, internal organs, and skin. This occurs slowly and may take years to develop. Once present, it does not go away. It can be very disfiguring. Skin contact can cause silver to become imbedded in small cuts in the skin, forming a permanent tattoo. Can cause sores on the inner lining of the nose and may cause perforation of the nasal septum.

Points of Attack: Nasal septum, skin, eyes.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); blood serum; biologic tissue/biopsy; Pigmentation Evidence; urine (chemical/metabolite). Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: Slit lamp exam by an eye doctor. Exam of the skin, nose, and throat. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *0.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *10 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Green (*solid metal*): General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Silver is highly reactive and must be stored to avoid contact with incompatible materials such as acetylene, ammonia, hydrogen peroxide; or ethyleneimine; since violent reactions could result.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible bulk solid, but flammable in the form of dust or powder. Thermal decomposition products may include metal oxides. Use dry chemical, metal extinguishers, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery, wherever possible, in view of economic value of silver. Techniques for silver recovery from photoprocessing and electroplating wastewaters have been developed and patented.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R23/24/25; R32; R33; R26/27/28; R36/37/38; R41; R50/53; R52/53; safety phrases: S7; S26; S28; S29; S36/37/39; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Silver cyanide is a white or grayish, odorless powder which darkens when exposed to light. Molecular weight = 133.89; specific gravity (H_2O:1) = 3.95; freezing/melting point = 320°C (decomposition). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Practically insoluble in water.

Potential Exposure: It is primarily used in silver plating.

Incompatibilities: Acetylene, ammonia, and hydrogen peroxide (H_2O_2). Contact with moisture, CO_2, acid and acid fumes release hydrogen cyanide. Contact with fluorine is violently explosive at normal temperatures. Incompatible with phosphorus cyanide.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[CN]/m^3

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min, Ceiling Concentration

ACGIH TLV[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration

PAC Ver. 29[138]

PAC-1: 0.37 milligram per cubic meter

PAC-2: 4.1 milligram per cubic meter

PAC-3: 24 milligram per cubic meter

Silver salts

DFG MAK*:* 0.01 mg[Ag]/m^3, respirable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group D

NIOSH IDLH = 10 mg[Ag]/m^3

Determination in Air: Use NIOSH Analytical Method #7904; #6010, cyanides. See also entry for Silver.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L. The Clean Water Act ambient water quality criterion for silver and silver compounds is recommended to be 50 μg[Ag]/L. Federal Drinking Water Standards: EPA 100 μg[Ag]/L; State Drinking Water Standards: Connecticut 50 μg[Ag]/L; State Drinking Water Guidelines: Arizona 50 μg[Ag]/L; Maine 35 μg[Ag]/L; Minnesota 30 μg[Ag]/L; Wisconsin 50 μg[Ag]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Silver cyanide can affect you when breathed in and by passing through your skin. Heating releases deadly cyanide gas. Skin or eye contact can cause irritation. A deadly poison if ingested.

Long-Term Exposure: Repeated exposure can slowly cause the eyes, inner nose, throat, skin, and body organs to turn a blue-gray color. This may take years to develop but is permanent. High or repeated exposure may cause kidney damage.

Points of Attack: Kidneys, skin.

Medical Surveillance: To detect early changes in body color, careful periodic exams of the eyes, inner nose, throat, and skin are useful. Persons with high or frequent exposure should consider periodic tests for kidney function. If cyanide exposure is suspected, immediate medical attention is recommended. Consider urine test for thiocyanates to detect cyanide exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note:* Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1–2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *0.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *10 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acetylene, ammonia, and hydrogen peroxide. Protect from light. Silver cyanide and fluorine are violently explosive at normal temperatures.

Shipping: UN1684 Silver cyanide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen, metal, and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: O, C, N; risk phrases: R8; R34; R50/53; R62; R63; safety phrases: S1/2; S17; S26; S29; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Silver nitrate is a colorless to dark gray, odorless, crystalline solid. Molecular weight = 169.9; specific gravity (H_2O:1) = 4.35 @ 20°C; boiling point = 444°C (decomposes); freezing/melting point = 210°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 3 OX. Soluble in water.

Potential Exposure: Silver nitrate is used in photography, silver plating; as an antiseptic; in chemical reactions; and mirror manufacturing; as starting material in production of other silver compounds.

Incompatibilities: A strong oxidizer. Reacts violently with combustible and reducing materials. Reacts with acetylene forming a shock-sensitive explosive. Reacts with alkalis, antimony salts; ammonia, arsenites, bromides, carbonates, chlorides, iodides, hydrogen peroxide; thiocyanates, ferrous salts; oils, hypophosphites, morphine salts; creosote, phosphates, tannic acid; tartarates, halides, vegetable extracts, and others. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Permissible Concentration in Water: United States National Primary Drinking Water Regulations: SMCL = 0.10 mg[Ag]/L as silver Federal Drinking Water

Guidelines: EPA 100 μg[Ag]/L; State Drinking Water Standards: Connecticut 50 μg[Ag]/L; State Drinking Water Guidelines: Arizona 50 μg[Ag]/L; Maine 35 μg[Ag]/L; Minnesota 30 μg[Ag]/L. Wisconsin 50 μg[Ag]/L.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. May affect the blood, causing formation of methemoglobin. *Inhalation:* May cause irritation of the nose, throat, and lungs. *Skin:* May cause irritation. Concentrated solutions may cause burns, sores, and discoloration of skin. Solid materials will cause chemical burns especially if skin is wet. *Eyes:* May cause irritation which can be severe. Solid material may cause chemical burns and permanent damage.

Ingestion: May cause burns to mouth and throat, abdominal pain; diarrhea and dizziness. Shock and convulsions may develop. Estimated lethal dose is 2 g or 1/14 oz for a 150 lb adult.

Long-Term Exposure: All forms of silver accumulate and are excreted very slowly. Blue-gray discoloration (argyreia) of eyes, nose, throat and, skin may occur. This discoloration is likely to be permanent. May affect the blood causing formation of methemoglobin. Very irritating substances can cause lung effects. High or repeated exposure may cause kidney damage. Infants below the age of 6 months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.

Points of Attack: Skin, kidneys, blood.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. Exam of the eyes, nose, throat, and skin for changes in color. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Test for blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Note to Physician: If swallowed, perform gastric lavage, using 1%−2% sodium chloride water every 15 minutes, followed by saline catharsis. Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with solutions containing silver nitrate. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *0.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *10 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Silver nitrate must be stored to avoid contact with oils and fuels, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and alkalis. Silver nitrate should not be stored in plastic containers. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA

1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1493 Silver nitrate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Solid material: evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and metal. Nonflammable but is a strong oxidizer capable of increasing the intensity of an existing fire and the flammability of combustible, organic, or other oxidizable materials. Use type of extinguisher appropriate to other burning materials. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Explosive (dried material only)

Silver compounds:

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as silver and compounds

United States National Primary Drinking Water Regulations: SMCL = 0.10 mg[Ag]/L as Silver

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, as silver compounds, n.o.s., waste number not listed

EPCRA (Section 313): Includes any unique chemical substance that contains silver as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%. Section 313 Category Code N740 (silver compounds)

EPCRA Section 313: Includes any unique chemical substance that contains silver as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as silver, soluble compounds.

Description: Silver picrate is a yellow powder or crystalline material which turns brown when heated or exposed to light.

Commercial product is a white to light tan solid paste. Contains about 35% water, which reduces its tendency toward rapid decomposition or explosion. Considered safe for storage, handling and shipping, but should be treated as an explosive[101]. Molecular weight = 335.98. Soluble in water.

Potential Exposure: Used in antibacterial medicines.

Incompatibilities: Organics or other oxidizable materials. Dried out material is unstable and a severe explosion risk; protect from shock, light, and vibration.

Permissible Exposure Limits in Air

As silver soluble compounds

NIOSH IDLH = 10 mg[Ag]/m^3

OSHA PEL: 0.01 milligram per cubic meter TWA

NIOSH REL: 0.01 milligram per cubic meter TWA

Determination in Air: NIOSH Analytical Method #7300 Elements by ICP; #8005, Elements in blood or tissue, #8310 Metals in urine; OSHA Analytical Method ID-121.

Permissible Concentration in Water: United States National Primary Drinking Water Regulations: SMCL = 0.10 mg[Ag]/L as silver Federal Drinking Water Guidelines: EPA 100 μg[Ag]/L; State Drinking Water Standards: Connecticut 50 μg[Ag]/L; State Drinking Water Guidelines: Arizona 50 μg[Ag]/L; Maine 35 μg[Ag]/L; Minnesota 30 μg[Ag]/L. Wisconsin 50 μg[Ag]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Silver picrate can affect you when breathed in and by passing through your skin. Eye contact can cause burns with possible damage. Skin contact can cause severe irritation or burns.

Long-Term Exposure: Repeated exposure can slowly cause the eyes, inner nose, throat, skin, and body organs to turn a blue-gray color. This usually takes years to develop but is permanent. High or repeated exposure can cause kidney damage.

Points of Attack: Skin, eyes, kidneys.

Medical Surveillance: To detect early changes in body color, careful periodic exams of the eyes, inner nose, throat, and skin are useful. Persons with high or frequent exposure should consider periodic tests for kidney function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *0.5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *10 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Treat as an explosive material. Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from organics or other readily oxidizable material. Protect from shock, light, and vibration. Sources of ignition, such as smoking and open flames, are prohibited where silver picrate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever silver picrate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1347 Silver picrate, wetted with not <30 % water, by mass, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep silver picrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Silver picrate is a flammable material; may be ignited by heat, sparks, or flames. Thermal decomposition products may include oxides of nitrogen, metal, and carbon. Containers may explode if exposed to heat, flame, or shock. Cover with sand, earth, or water spray, and keep it wet. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Simazine is a combustible, white crystalline solid. Practically odorless. Molecular weight = 201.68. Freezing/Melting point = (decomposes) 225°C; vapor pressure = 2.2×10^{-8} mmHg 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Practically insoluble in water; solubility = 4 ppm @ 20°C.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this preemergence herbicide. Pesticide not in use; TRI and/or IUR indicates importers or manufacturers are unlikely[88]. Banned for use in the EU.

Incompatibilities: Powder may form explosive mixture with air. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air Russia set a MAC for simazine in work-place air[35] of 2.0 milligram per cubic meter and a MAC for ambient air in residential areas of 0.02 milligram per cubic meter both on a momentary and a daily average basis.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.004 mg/L; MCLG, 0.004 mg/L. A lifetime health advisory of 35 μg/L has been developed by EPA. Various states have developed guidelines for simazine in drinking water[61] ranging from 150 μg/L (California); to 430 μg/L (Maine); to 2150 μg/L (Wisconsin).

Determination in Water: Analysis of simazine is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen-phosphorus-containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen−phosphorus detector. The method detection limit has not been determined for this compound but it is estimated that the detection limits for the method analytes are in the range of 0.1−2 μg/L. Fish Tox = 1732.04831000 ppb (VERY LOW). Octanol−water coefficient: Log $K_{ow} = 2.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May cause skin or eye irritation. Moderately poisonous if ingested. Approximate lethal dose = 1.5 cupful/150 lb man. No case of poisoning in humans from simazine has been reported, although exposure to simazine has caused acute and subacute dermatitis in Russia, characterized by erythema, slight edema; moderate pruritus; and burning lasting 4−5 days.

Long-Term Exposure: Problems with blood; repeated exposure may cause weight loss and reduced red blood cell count. *Chronic Toxicity*-simazine fed to rats for 2 years @ 1.0, 10, and 100 ppm produced no difference between treated and control animals in gross appearance or behavior. The rats fed 100 ppm had approximately twice as many thyroid and mammary tumors as the control animals, but it was stated that these were not attributable to simazine. A 2-year chronic-feeding study of simazine in dogs with simazine 80 W fed @ 15, 150, and 1500 ppm showed only a slight thyroid hyperplasia @ 1500 ppm and slight increases in serum alkaline phosphatase and serum glutamic oxalacetic transaminase in several of the dogs fed 1500 ppm. Human Tox = 4.00000 ppb (HIGH).

Points of Attack: Blood.

Medical Surveillance: CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 130.

Fire Extinguishing: This chemical pesticide is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Strong acid or alkaline hydrolysis leads to complete degradation of simazine. However, large quantities of simazine should be incinerated in a unit operating @ 850°C equipped with off-gas scrubbing equipment[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Soapstone S:0320

Formula: $H_2Mg_3O_{12}Si4$; $3MgO \cdot 4SiO_2 \cdot H_2O$

Synonyms: Massive talc; Silicate soapstone; Soapstone silicate; Soapstone superfine powder; Steatite; Talc

CAS Registry Number: None listed or assigned.

HSDB Number: 830 as Talc

RTECS Number: VV8780000

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence (talc not containing asbestiform fibers); Sufficient (for talc containing asbestiform fibers)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Description: Soapstone is an odorless gray-white crystalline solid. Molecular weight = 351.31; specific gravity (H_2O:1) = 2.7−2.8 @ 25°C; freezing/melting point = 900−1000°C. Negligible solubility in water.

Potential Exposure: Soapstone is used as a pigment in paints, varnishes, rubber, and soap. It is used in lubricating molds and machinery. In massive form, it is used as a heat insulator.

Incompatibilities: fine powder can form explosive mixture with air. Silicates can react violently with lithium.

Permissible Exposure Limits in Air

NIOSH IDLH = 3000 milligram per cubic meter

OSHA PEL: 20 mppcf TWA

NIOSH REL: 6 milligram per cubic meter, total dust TWA; 3 milligram per cubic meter (respirable dust) TWA

ACGIH TLV[1]: 6 milligram per cubic meter (for particulate matter containing no asbestos and $<1\%$ crystalline silica) TWA; 3 milligram per cubic meter (respirable fraction, for particulate matter containing no asbestos and $<1\%$ crystalline silica) TWA

Talc, superfine powder

PAC Ver. 28, no listing in Ver. 29[138]

PAC-1: 6 milligram per cubic meter

PAC-2: 66 milligram per cubic meter

PAC-3: 400 milligram per cubic meter

DFG MAK: *for talcum* suspended 2004; Carcinogen Category 3B

The Netherlands: MAC-TGG 5 milligram per cubic meter (total dust); 2.5 milligram per cubic meter (respirable dust), 2003

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and respiratory tract causing coughing, wheezing.

Long-Term Exposure: Pneumoconiosis: cough, dyspnea (breathing difficulty); digital clubbing; cyanosis, basal crackles; or pulmonale.

Points of Attack: Respiratory system, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 second). Consider the points of attack in preplacement and periodic physical examinations. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 30 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *Up to 60 milligram per cubic meter*: 95 XQ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 150 milligram per cubic meter:* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 300 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50)* (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter);* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 3000 milligram per cubic meter:* SaF:Pd, Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with water to avoid airborne dust then transfer material to a suitable container for disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of silicon and metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sanitary landfill.

Sodium S:0330

Formula: Na

Synonyms: Elemental sodium; Natrium; Sodio (Spanish); Sodium element; Sodium, metal liquid alloy; Sodium metal

CAS Registry Number: 7440-23-5

HSDB Number: 687

RTECS Number: VY0686000

UN/NA & ERG Number: UN1428/138

EC Number: 231-132-9 [*Annex I Index No.:* 011-001-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Pyrophoric hazard, Highly flammable, Strong reducing agent, Violent, possibly explosive, Violently reactive with water.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: F, C; risk phrases: R11; R14/15; R29; R34; safety phrases: S1/2; S5 (If appropriate); S8; S21; S43; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sodium is a soft silvery white metallic element. Pyrophoric solid or molten liquid. Odorless. Molecular weight = 22.99; specific gravity (H_2O:1) = 0.97; boiling point = 883°C; freezing/melting point = 98°C; Autoignition temperature ≥ 115°C (in dry air). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 2₩. Violent reaction with water, forming corrosive NaOH fume and explosive decomposition.

Potential Exposure: A potential danger to those involved in tetra-alkyl lead manufacture using lead-sodium alloy as a reactant; those using sodium as a liquid metal coolant, as a catalyst, or in the manufacture of sodium hydride, borohydride, or peroxide.

Incompatibilities: A strong reducing agent. A dangerous fire hazard when exposed to heat and moisture. Violent reaction with water, forming NaOH. Violent reaction with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. halogenated hydrocarbons; phosphorus and phosphorus compounds; sulfur and sulfur compounds; and many other chemicals.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 13 milligram per cubic meter

PAC-2: 140 milligram per cubic meter

PAC-3: 870 milligram per cubic meter

Permissible Concentration in Water: The metal reacts with water. Sodium ion limit is 10 mg/L as desirable in drinking water; 200 mg/L may be injurious to humans.

Russia[43] set a MAC in water bodies used for domestic purposes of 120 mg/L. Several states have set guidelines for sodium in drinking water[61] ranging from 20 mg/L (Massachusetts); to 100 mg/L (Kansas).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Contact with water, including perspiration, causes the formation of NaOH fumes which are highly irritating to skin, eyes, nose, and throat. May cause sneezing and coughing. Very severe exposures may result in difficult breathing; coughing, and chemical bronchitis. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* Contact may cause itching, tingling, thermal and caustic burns, and may cause permanent damage. *Eyes:* May cause tearing, very painful irritation; and burns. Contact with eyes may result in permanent damage and loss of sight. *Ingestion:* Causes immediate intense burning sensation in mouth, throat, and stomach, followed by salivation, vomiting, rapid breathing; symptoms of shock; diarrhea, loss of consciousness, and death.

Long-Term Exposure: Very irritating substances may affect the lungs. It is not known; however, if sodium causes lung damage.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposure to sodium metal, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. Wipe the chemical off the skin with a dry cloth. Then quickly remove contaminated clothing. Immediately wash area with large amounts of water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to sodium, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—Red Stripe: Store material under an inert gas blanket. Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Sodium must be stored to avoid contact with water, halogenated hydrocarbons; phosphorus and phosphorus compounds; and sulfur and sulfur compounds; since violent reactions occur. Protect storage containers from physical damage. Keep in an inert atmosphere or under oil. Requires special precautions to avoid contact with moisture, including condensation from other objects and perspiration. Store in a dry, fire resistive room exclusively for sodium storage. Sprinkler systems should not be used, so keep combustibles away. Remove only the amount of sodium needed for immediate use and place dry in a friction top metal can under a layer of oil. Transport in a special container with a tight fitting cover. Where sodium is used, handled, manufacture, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1428 Sodium, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material. *Note:* Finely divided sodium is pyrophoric.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until

clean-up is complete. Remove all ignition sources. Put on proper protective equipment. Blanket with appropriate inert material. Scoop up and place in a suitable, sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. A severe fire risk on contact with water or moisture. Thermal decomposition products may include sodium oxide. Blanket with dry soda-ash, graphite, salt, dry limestone, or other approved dry powder. *Do not use water*, carbon dioxide or halogenated extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with absorption of oxide fumes.

Regulatory Authority and Advisory Information

Hazard Alert: Corrosive, Water reactive.

United States National Primary Drinking Water Regulations: SMCL = 0.05 to 0.2 mg[Al]/L as aluminum.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R20/21/22; R35; R34; R36/37/38; safety phrases: S26; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sodium aluminate is a white crystalline solid or solution. Molecular weight = 82.1; specific gravity (H_2O:1) = 1.6 @ 20°C; freezing/melting point = 1650°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Soluble in water, may generate heat.

Potential Exposure: Used in water and waste treatment; papermaking industry; in printing on fabrics; in the manufacture of pigments, milk glass, and soap; hardening building stone; sizing paper; as a water softener.

Incompatibilities: The aqueous solution is a strong base. Reacts violently with acid. Incompatible with organic anhydrides; isocyanates, alkylene oxides; epichlorohydrin, aldehydes, alcohols, glycols, caprolactum, chlorocarbons. Corrosive to metals; attacks copper, tin, aluminum, and zinc.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 2 mg[Al]/m^3 TWA

ACGIH TLV[1]: 2 mg[Al]/m^3 TWA as soluble salts and alkyls, n.o.s.

PAC Ver. 29[138]

PAC-1: 18 milligram per cubic meter

PAC-2: 200 milligram per cubic meter

PAC-3: 1200 milligram per cubic meter

Australia: TWA 2 mg[Al]/m^3, 1993; Belgium: TWA 2 mg [Al]/m^3, 1993; Denmark: TWA 2 mg[Al]/m^3, 1999; France: VME 2 mg[Al]/m^3, 1999; Norway: TWA 2 mg[Al]/m^3, 1999; Russia: TWA 2 mg[Al]/m^3, 1993; Sweden: NGV 2 mg[Al]/m^3, 1999; Switzerland: MAK-W 2 mg[Al]/m^3, 1999; United Kingdom: TWA 10 milligram per cubic meter, total dust inhalable dust; TWA 4 mg.m^3, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 mg[Al]/m^3

Determination in Air: Use NIOSH #7013 Aluminum; #7300, Elements; #7303; OSHA Analytical Method ID-121.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Sodium aluminate can affect you when breathed in. Sodium aluminate solution is a corrosive chemical. Skin or eye contact can cause severe irritation or burns, with possible damage. Breathing sodium aluminate dust can irritate the air passages. This may cause cough with phlegm and/or shortness of breath. Inhalation of dust may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Corrosive on ingestion.

Long-Term Exposure: Irritating substances may affect the lungs. It is not known whether sodium aluminate causes lung damage.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. consider chest X-ray following acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Respirator Selection: Where there is potential exists for exposure to solid sodium aluminate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a PAPR. Where there is potential for high exposures or liquid sodium aluminate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilate area away from incompatible materials. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN2812 Sodium aluminate, solid, Hazard class: 8; Labels: 8-Corrosive material. UN1819 Sodium aluminate, solution, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is nonflammable. Use agent suitable for surrounding fire. Thermal decomposition products may include oxides of nitrogen and metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Sodium Aluminum Fluoride S:0350

Formula: AlF_6Na_3; Na_3AlF_6

Synonyms: Aluminum sodium fluoride; Cryolite; ENT 24,984; Kryolith (German); Natriumaluminumfluorid (German); Natriumhexafluoroaluminate (German); Sodium aluminofluoride; Sodium fluoaluminate; Sodium hexafluoroaluminate; Trisodium hexafluoroaluminate; Villiaumite

CAS Registry Number: 15096-52-3; 13775-53-6 (synthetic)

HSDB Number: 1548

RTECS Number: WA9625000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 239-148-8 [*Annex I Index No.:* 009-016-00-2]

Regulatory Authority and Advisory Information

Hazard Alert: Suspected reprotoxic hazard, Environmental hazard.

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2 mg[F]/L, as fluorides; SMCL = 0.05 to 0.2 mg [Al]/L as aluminum.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard Symbol (*natural and synthetic*): T, N; risk phrases: R20/22; R48/23/25; R50/53; safety phrases: S1/2; S22; S29; S37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sodium aluminum fluoride is a snow-white crystalline solid, powder or vitreous mass. The crystalline solid (natural product (cryolite) may be colored reddish or brown or even black but loses this discoloration on heating); synthetic product is an amorphous powder. Odorless. Molecular weight = 209.9; boiling point = (decomposes); freezing/melting point = 995−1000°C. Very slightly soluble in water; solubility = 0.4%[77].

Potential Exposure: Sodium aluminum fluoride is used in making pesticides, ceramics, glass, and polishes; in refining reduction of aluminum, flux, glass, and enamel.

Incompatibilities: Incompatible with strong acids such as sulfuric, strong oxidizers, hydrogen fluoride.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 mg[F]/m^3

As fluorides [F]

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA

ACGIH TLV: 2.5 mg[F]/m^3 TWA; Excursion Limit Recommendation: Excursions in worker exposure levels may exceed three times the TLV-TWA for no more than a total of 30 minutes during a work day, and under no circumstances should they exceed five times the TLV-TWA, provided that the TLV-TWA is not exceeded. BEI: Determinant: fluorides in urine; Sampling Time: prior to shift; BEI: 3 mg/g creatinine. Determinant: fluorides in urine; Sampling Time: end of shift; BEI: 10 mg/g creatinine. The determinant may be present in biological specimens collected from subjects who have not been occupationally exposed, at a concentration which could affect interpretation of the result. Such background concentrations are incorporated in the BEI value. The determinant is nonspecific, since it is also observed after exposure to other chemicals.

As aluminum, soluble salts

OSHA PEL: None

NIOSH REL: 2 mg[Al]/m^3 TWA

ACGIH TLV: 1 milligram per cubic meter [Al] (soluble fraction) TWA; Excursion Limit Recommendation: Excursions in worker exposure levels may exceed three times the TLV-TWA for no more than a total of 30 minutes during a work day, and under no circumstances should they exceed five times the TLV-TWA, provided that the TLV-TWA is not exceeded.

PAC not available

Australia: TWA 2 mg[Al]/m^3, 1993; Belgium: TWA 2 mg [Al]/m^3, 1993; Denmark: TWA 2 mg[Al]/m^3, 1999; France: VME 2 mg[Al]/m^3, 1993; Russia: TWA 2 mg[Al]/m^3, 1993; Sweden: NGV 2 mg[Al]/m^3, 1999; Switzerland: MAK-W 2 mg[Al]/m^3, 1999; United Kingdom: LTEL 2 mg [Al]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 mg[Al]/m^3

As fluoride

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 milligram per cubic meter), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg[F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New

Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen
Determination in Air: Use NIOSH Analytical Method (IV) #7902, Fluoride; for aluminum, soluble salts, use NIOSH #7013 Aluminum; #7300, Elements; #7303; OSHA Analytical Method ID-121.
Permissible Concentration in Water: Drinking water, *aluminum* guidelines[61] are 1.43 mg/L in Massachusetts and 5.0 mg/L in Kansas. *Fluoride*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg[F]/L.
Routes of Entry: Inhalation, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Sodium aluminum fluoride can affect you when breathed in. Eye contact can cause severe irritation, burns with possible loss of vision. Skin contact can cause irritation and even burns, especially if prolonged. Breathing can irritate the nose, throat and air passages. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause nausea, abdominal pain; diarrhea; salivation, thirst, sweating
Long-Term Exposure: Repeated exposure can cause stiff spine; calcification of ligaments of ribs, pelvis. Repeated or high exposures may cause permanent lung damage.
Points of Attack: Eyes, skin, lungs, skeletal system.
Medical Surveillance: NIOSH lists the following tests: chest X-ray, ECG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential. Urine fluoride test (levels above 3−4 mg/L at the end of exposure represent increased exposure).
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76−103: *Inorganic fluorides*.
Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)$^{*+}$ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.
Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be

trained on its proper handling and storage. Sodium aluminum fluoride must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not flammable. Thermal decomposition products may include hydrogen fluoride and oxides of sodium and metal. Use dry chemicals appropriate for metal fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Sodium Aluminum Fluoride, Trenton, NJ (April 2000).

Sodium Aluminum Hydride S:0360

Formula: AlH_4Na; $NaAlH_4$

Synonyms: Aluminate(1-), tetrahydro-, sodium, (*t*-4)-; Aluminum sodium hydride; Sah 22; Sodium aluminum tetrahydride; Sodium tetrahydroaluminate(1-)

CAS Registry Number: 13770-96-2

HSDB Number: 690

RTECS Number: BD0180000

UN/NA & ERG Number: UN2835/138

EC Number: 237-400-1

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Corrosive (skin), Pyrophoric hazard, Dangerously water reactive, Strong reducing agent.

United States National Primary Drinking Water Regulations: SMCL = 0.05 to 0.2 mg[Al]/L as aluminum.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C, Xn; risk phrases: R11; R14/15; R17; R19; R22; R29; R34; R36/37/38; R40; safety phrases: S16; S26; S33; S36/37; S36/37/39; S43; S45; S7/8; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sodium aluminum hydride is a white crystalline solid. Molecular weight = 54.01; specific gravity (H_2O:1) = 1.24 @ 20°C; freezing/melting point = (decomposes) 183°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity ₩. Reaction with water can be violent/dangerous, releasing NaOH and flammable hydrogen gas plus heat, which may cause ignition.

Potential Exposure: Used in chemical synthesis.

Incompatibilities: A strong reducing agent. Very sensitive to moisture; reaction with water may cause fire or explosion. Also incompatible with iron, aluminum, and zinc in the presence of water. Hydrides are incompatible with acids, alcohols, amines, and aldehydes. Violent reaction, possibly explosive, on contact with water, air, oxidizers, acids, alcohols, and ethers. May ignite spontaneously in moist air. Does not react in dry air at room temperature. Reacts with water to form corrosive NaOH and flammable hydrogen gas. The heat of reaction may be sufficient to ignite[101].

Permissible Exposure Limits in Air

13770-96-2

PAC Ver. 29[138]

PAC-1: 1.2 milligram per cubic meter

PAC-2: 13 milligram per cubic meter

PAC-3: 80 milligram per cubic meter

The limits for "aluminum pyro powders" may be applicable (NJ).

OSHA PEL: None

NIOSH REL: 5 mg[Al]/m^3 TWA

ACGIH TLV[1]: 5 mg[Al]/m^3 TWA

The limits for aluminum soluble salts, for reference

OSHA PEL: None

NIOSH REL: 2 mg[Al]/m^3 TWA

ACGIH TLV[1]: 2 mg[Al]/m^3 TWA as soluble salts and alkyls, n.o.s.

Determination in Air: Use NIOSH #7300; #7301; #7303.

Permissible Concentration in Water: This material reacts vigorously with water so this category is not pertinent.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Sodium aluminum hydride can affect you when breathed in. Exposure can irritate the eyes, skin, and respiratory tract. If wet, sodium aluminum hydride may cause burns and permanent damage.

Long-Term Exposure: May cause lung injury; pulmonary fibrosis.

Points of Attack: Skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Dangerous if any form of moisture is present. (1) Color code—Red Stripe: Store under inert gas. Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard: Store under inert gas. Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Sodium aluminum hydride must be stored to avoid contact with water, air, oxidizers, acids, alcohols, and ethers, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where sodium aluminum hydride is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of sodium aluminum hydride. Wherever sodium aluminum hydride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2835 Sodium aluminum hydride, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include sodium oxides and flammable hydrogen gas. Sodium aluminum hydride is a flammable solid. It can ignite spontaneously in moist air. The flame may be invisible. *Do not use water*. Use dry chemical, soda ash; or lime extinguishers. Fires may restart after it has been extinguished. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%. sodium arsenate; 1% [disodium hydrogen arsenate (dibasic)]

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), NPRI arsenic compounds.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R14/15; R23/25; R29; R50/53; R62; R63; safety phrases: S1/2; S20/21; S28; S29; S45; S60; S61; (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sodium arsenate and sodium arsenate, dibasic are both white crystalline, odorless solids. Molecular weight = 203; 185.91 (dibasic); 427.00 (heptahydrate); boiling point = 180°C (decomposition); freezing/melting point = 86°C; 57°C (dibasic). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0₩. Soluble in water; reacts forming flammable hydride of arsenic.

Potential Exposure: (dibasic): Sodium arsenate is used in dyeing and printing; making other arsenates; as a germicide; in dyeing with turkey-red oil.

Incompatibilities: Sodium arsenate reacts with moisture, steam, and water; forming flammable and toxic arsenic hydride. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Sodium arsenate is a weak oxidizing agent that may react with reducing agents, including hydrides. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, chemically active metals. Arsine, a very deadly gas, can be released in the presence of acid, acid mists; or hydrogen gas. Attacks many metals (such as aluminum, iron, and zinc) in presence of moisture producing arsenic and arsine fumes.

Permissible Exposure Limits in Air

Inorganic arsenic compounds

NIOSH IDLH = 5 mg[As]/m^3, potential occupational carcinogen.

OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled. See [1910.1018]

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. A potential occupational carcinogen. Limit exposure to lowest feasible concentration; See Appendix A.

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen

PAC Ver. 29[138]

PAC-1: 4.1 milligram per cubic meter

PAC-2: 45 milligram per cubic meter

PAC-3: 270 milligram per cubic meter

DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/ end-of-shift; Carcinogen Category 1

Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India: TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air:[60] 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L [40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic:* The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the CNS; digestive tract; circulatory system, causing loss of fluids and electrolytes; collapse, shock, and death. Exposure at low level may result in death. Death can occur due to a severe decrease in blood pressure. Thickening of skin on palms and soles following chronic low-level exposures. Symptoms of exposure include a feeling of constriction of throat, difficulty in swallowing; abdominal discomfort with pain, vomiting, watery diarrhea; sweetish metallic taste; garlicky odor of breath and stools; and dizziness with frontal headaches. Symptoms usually appear one-half to 1 hour after ingestion but may be delayed many hours.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Repeated or prolonged contact may cause skin sensitization and dermatitis. May affect the peripheral nervous system; skin, mucous membranes; causing neuropathy, skin thickening and pigmentation disorders; ulcers and perforation of nasal septum; and liver cirrhosis. Nerve damage may include "pins and needles," burning, numbness, and later weakness in the limbs. This substance is carcinogenic to humans. A probable teratogen in humans.

Points of Attack: Skin, nervous system; liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before first exposure and every 6 to 12 months thereafter, a medical history and exam are recommended, including: exam of the nose, skin eyes, nails, and nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work-day). At NIOSH recommended exposure levels, urine arsenic should not be greater than 100 μg/g creatinine in the urine. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures: For severe poisoning, BAL have been used. For milder poisoning, penicillamine (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75−149, *Inorganic Arsenic*.

***Respirator Selection*: Requirements for Respiratory Protection for Inorganic Arsenic Particulate *Except for Those With Significant Vapor Pressure*:** $<$ or $= 100\ \mu g/m^3$ (micrograms per cubic meter) (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. $<$ or $= 20{,}000\ \mu g/m^3$ Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $>20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting. Any full-facepiece SCBA operated in positive-pressure mode.* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm (micrometers) in diameter or higher. Or, *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Sodium arsenate must be stored to avoid contact with chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Sodium arsenate must be stored to avoid contact with acids. Store in tightly closed containers in a cool, well-ventilated area away from heat. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1685 Sodium arsenate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Sodium arsenate itself does not burn. Thermal decomposition products may include oxides of sodium and arsenic fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in minimum quantity of concentrated, reagent hydrochloric acid. Filter if necessary. Dilute with water until white precipitate forms. Add just enough 6M HCl to redissolve. Saturate with hydrogen sulfide. Filter, wash the precipitate; dry, package, and ship to the supplier. (Sax, DPIMR see below).

Canada: Priority Substance List & Restricted Substances/Ocean Dumping FORBIDDEN (CEPA), NPRI (arsenic compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R21; R22; R23/24/25; R34 R50/53; R62; R63; safety phrases: S20/21; S26; S28; S29; S36/37/39; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sodium arsenite is a white or grayish-white powder or flakes. Molecular weight = 129.9; freezing/melting point = 615°C; boiling point = decomposes. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Highly soluble in water.

Potential Exposure: This material is used in manufacturing of arsenical soap for use on skin; treating vines against certain scale diseases; wood preservation; as a reagent in preparation of Methylene iodide; corrosion inhibitor; and for herbicidal and pesticidal purposes.

Incompatibilities: Chemically active metals. Arsine, a very deadly gas, can be released in the presence of acid, acid mists, or hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 mg[As]/m^3, potential occupational carcinogen.

OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled. See [1910.1018]

NIOSH REL: 0.002 mg[As]/m^3 [15 min] Ceiling Concentration. A potential occupational carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L [40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic:* The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin

Harmful Effects and Symptoms

Short-Term Exposure: Sodium arsenite may irritate or burn the skin, eyes, and mucous membranes. Skin contact can cause burning sensation; itching, and rash. Extremely toxic: probable oral lethal dose (human) 5−50 mg/kg, between seven drops and one teaspoon for 70 kg person (150 lb). Poisonous if swallowed or inhaled. Signs and symptoms of acute exposure to sodium arsenite may be severe and include headache, vomiting, stomach pain; vomiting, cough, dyspnea (shortness of breath), Hypotension (low blood pressure), and chest pain. Gastrointestinal effects include difficulty in swallowing; intense thirst; generalized abdominal pain; vomiting, and painful diarrhea; blood may be noted in the vomitus and feces. A weak pulse, cyanosis (blue tint to the skin and mucous membranes), and cold extremities may also be observed. Neurological effects include giddiness, delirium, mania, stupor, weakness, headache, dizziness, and fainting. Convulsions, paralysis, and coma may occur.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Repeated or prolonged contact may cause skin sensitization and dermatitis. May affect the peripheral nervous system; skin, mucous membranes; causing neuropathy; skin thickening and pigmentation disorders; ulcers and perforation of nasal septum, and liver cirrhosis. Nerve damage may include “pins and needles,” burning, numbness, and later weakness in the limbs. This substance is carcinogenic to humans. A probable teratogen in humans.

Points of Attack: Liver, kidneys, skin, lungs, lymphatic system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: exam of the nose, skin, eyes, nails, and nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work-day). At NIOSH recommended exposure levels, urine arsenic should not be greater than 100 μg/g creatinine in the urine.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Antidotes and Special Procedures:* For severe poisoning, BAL has been used. For milder poisoning penicillamine (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75−149, *Inorganic Arsenic.*

Respirator Selection**: Requirements for Respiratory Protection for Inorganic Arsenic Particulate *Except for Those With Significant Vapor Pressure*:** < or = 100 μg/m^3 (1) Half-mask air-purifying respirator equipped with high-efficiency filter*; or (2) Any half-mask supplied air respirator. < or = 500 μg/m^3 (1) Full facepiece air-purifying respirator equipped with high-efficiency filter*; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. < or = 10,000 μg/m^3 (1) Powered air-purifying respirators in all inlet face coverings with high-efficiency filters*; or (2) Half-mask supplied-air respirators operated in positive-pressure mode. < or = 20,000 μg/m^3 Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. >20,000 μg/m^3, unknown concentrations, or firefighting. Any full-facepiece SCBA operated in positive-pressure mode.

* A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Shipping: UN2027 Sodium arsenite, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN1686 Sodium arsenite, aqueous solutions, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is

complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of arsenic sodium. Extinguish fire using an agent suitable for type of surrounding fire. Sodium arsenite itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: The arsenic may be precipitated as calcium arsenite. It should be stored until recycled[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R28; R31; R32; R50/53; R62; safety phrases: S1/2; S28; S29; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Sodium azide is a colorless to white, odorless, crystalline solid. Combustible solid above 300°C. Molecular weight = 65.02; specific gravity (H_2O:1) = 1.85 @ 25°C; boiling point = (decomposes); freezing/melting point = (the solid crystals decompose with the evolution of nitrogen gas, leaving a residue of sodium oxide) 275°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 3. Soluble in water; reaction; solubility = 42% @ 17°C.

Potential Exposure: Sodium azide is used as preservative and diluent. It has been used for a wide variety of military, laboratory, medicine, and commercial purposes. It is used extensively as an intermediate in the production of lead azide, commonly used in detonators, and other explosives. Reported to be used in automobile air-bag inflation. One of the largest potential exposure is that to automotive workers, repairmen, and wreckers, if sodium azide is used as the inflation chemical. Commercial applications include use as a fungicide, nematocide, and soil sterilizing agent and as a preservative for seeds and wine. The lumber industry has used sodium azide to limit the growth of enzymes responsible for formation of brown stain on sugar pine, while the Japanese beer industry used it to prevent the growth of a fungus which darkens its product. The chemical industry has used sodium azide as a retarder in the manufacture of sponge rubber, to prevent coagulation of styrene and butadiene latexes stored in contact with metals; and to decompose nitrites in the presence of nitrates.

Incompatibilities: Reacts explosively and/or forms explosive and/or shock sensitive compounds with acids and many metals. Contact with water forms hydrazoic acid. Combustible solid (if heated above 275°C). May explode when heated above its melting point, especially if heating is rapid. Reacts with acids; producing toxic, shock-sensitive, and explosive hydrogen azide. It forms explosive compounds with phosgene, brass, zinc, trifluoroacrylol fluoride, and nitrogen-diluted bromine vapor. Reacts with benzoyl chloride and potassium hydroxide, bromine, carbon disulfide; copper, lead, nitric acid; barium carbonate; sulfuric acid; chromium (II) hypochlorite; dimethyl sulfate; dibromomalononitrile, silver, mercury. Over a period of time, sodium azide may react with copper, lead, brass, or solder in plumbing systems to form an accumulation of the *highly explosive* and shock-sensitive compounds of lead azide and copper azide.

Permissible Exposure Limits in Air

OSHA PEL: Vacated 1989 OSHA PEL:0.1 ppm Ceiling Limit [skin] (as HN_3); 0.3 milligram per cubic meter Ceiling Limit [skin] (as NaN_3) designation is still enforced in some states.

NIOSH REL: 0.1 ppm (as HN_3) [skin] Ceiling Concentration; 0.3 milligram per cubic meter (as NaN_3) [skin] Ceiling Concentration

ACGIH TLV[1]: 0.11 ppm (as HN_3) [skin] Ceiling Concentration; 0.29 milligram per cubic meter (as NaN_3) [skin] Ceiling Concentration; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 0.026 milligram per cubic meter

PAC-2: 0.29 milligram per cubic meter

PAC-3: 5.3 milligram per cubic meter

DFG MAK: 0.2 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group D

Australia: TWA 0.1 ppm (0.3 milligram per cubic meter), 1993; Austria: MAK 0.07 ppm (0.2 milligram per cubic meter), 1999; Belgium: STEL 0.11 ppm (0.3 milligram per cubic meter), 1993; Denmark: TWA 0.3 milligram per cubic meter, 1999; Finland: TWA 0.1 ppm (0.3 milligram per cubic meter); STEL 0.3 ppm (0.9 milligram per cubic meter), 1999; France: VLE 0.1 ppm (0.3 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter [skin], 2003; Switzerland: MAK-W 0.07 ppm (0.2 milligram per cubic meter), 1999; United Kingdom: STEL 0.3 mg [NaN_3], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.29 milligram per cubic meter. Several states have set guidelines or standards for sodium azide in ambient air[60] ranging from 0.7 μ/m³ (Nevada); to 2.5 μ/m³ (Virginia); to 3.0 μ/m³ (North Dakota).

Determination in Air: Use OSHA Analytical Method ID-121.

Permissible Concentration in Water: No criteria set. (Sodium azide reacts with water to produce hydrazoic acid).

Routes of Entry: Inhalation, ingestion, skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Severely irritates the eyes, skin, and respiratory tract. Contact of skin causes redness and pain. Contact with eyes causes redness, pain, and blurred vision; may cause loss of vision. Inhalation or ingestion causes dizziness, weakness; blurred vision; slight shortness of breath; Hypotension, slowed heart rate; abdominal pain and spasms. Serious cases of exposure may result in convulsions, unconsciousness, and death. Exposure slightly above the exposure limits in air can cause death by affecting the CNS. Azides can cause blood pressure to drop and thus have action similar to cyanides and nitrites. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Sodium azide is a broad-spectrum, metabolic poison that interferes with oxidation enzymes and inhibits nuclear phosphorylation. Although the effects in these systems are complex, there is general agreement that azide causes a dissociation of phosphorylation and cellular respiration. For this reason parallels have been drawn to other metabolic inhibitors, such as cyanide, malonitrile, and fluoride.

Long-Term Exposure: May cause kidney damage. Sodium azide is a potent mutagen in barley, peas, rice, and soybeans. It is also a very effective mutagen in bacteria. However, several studies have been performed to determine whether it is carcinogenic but results were negative.

Points of Attack: Brain, eyes, skin, CNS; cardiovascular system, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: exam of the nervous system and vision (including visual fields). Lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APR or PAPR are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination, or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Where sodium azide may be present in solution, wear splash-proof chemical goggles and face shield, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 0.1 ppm as a dust, fume or mist, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, or for exposures to hydrazoic acid vapor, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Sodium azide must be stored to avoid contact with benzoyl chloride; potassium hydroxide; bromine, copper and lead, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, heat and acids. On contact with water it forms hydrazoic acid which is explosive. Danger of explosion exists from friction, heat or contamination. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1687 Sodium azide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an unstable combustible solid. Rapid heating above 275°C can cause rapid decomposition and explosion. Thermal decomposition products may include sodium and oxides of nitrogen. May form toxic hydrazoic acid fumes in fire. Containers may explode in fire. If material is on fire or involved in fire, use water in flooding quantities as fog. Use foam, carbon dioxide or dry chemical. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Disposal may be accomplished by reaction with sulfuric acid solution and sodium nitrate in a hard rubber vessel. Nitrogen dioxide is generated by this reaction and the gas is run through a scrubber before it is released to the atmosphere. Controlled incineration is also acceptable (after mixing with other combustible wastes) with adequate scrubbing and ash disposal facilities.

Sodium Benzoate S:0400

Formula: $C_7H_5NaO_2$: C_6H_5COONa

Synonyms: Antimol; Benzoate of soda; Benzoate sodium; Benzoesaeure (Na-salz) (German); Benzoic acid, sodium salt; Sobenate; Sodium benzoic acid

CAS Registry Number: 532-32-1

HSDB Number: 696

RTECS Number: DH6650000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 208-534-8

Regulatory Authority and Advisory Information.

United States Environmental Protection Agency Gene-Tox Program, Negative: TRP reversion.

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R62; R63; safety phrases: S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sodium benzoate is a white crystalline solid. It is odorless and nonflammable. Molecular weight = 144.11; decomposes @ 120°C; freezing/melting point = > 300°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 1. Soluble in water.

Potential Exposure: Sodium benzoate is used as a food and feed additive, flavor, packaging material; pharmaceutical; preservative for food products and tobacco; anti-fungal agent; antiseptic, rust, and mildew inhibitor; intermediate in the manufacture of dyes. Used as a human hygiene biocidal product.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 61 milligram per cubic meter

PAC-2: 680 milligram per cubic meter

PAC-3: 810 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: An eye and skin irritant. The accumulation of dust in the eyes, ears, nose, throat, and lungs may be sufficiently unpleasant and distracting to make work near machinery hazardous. Irritation may result from abrasion or chemical action. Sodium benzoate can cause allergic reactions. Sodium benzoate has been given GRAS status by the Food and Drug Administration at the levels currently being used as a food preservative. Ingestion of 8−10 g (1/3 oz) may cause nausea and vomiting. 12 g has caused gastric pain and loss of appetite. These symptoms disappear when exposure stops. LD_{50}(oral-rat) = 27 mg/kg.

Long-Term Exposure: Sodium benzoate may produce an allergic reaction and, in addition, may intensify the symptoms of allergies to other substances.

Points of Attack: Skin, lungs.

Medical Surveillance: Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Lung function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Avoid prolonged skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium benzoate is combustible. It may emit acrid fumes when heated to decomposition (@ 120°C/248°F). Thermal decomposition products may include oxides of sodium and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard Alert: Strong reducing agent, Corrosive, Sensitization hazard, Possible risk of forming tumors, Suspected reprotoxic hazard.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R31; R41; R63; safety phrases: S2; S25; S26; S31; S39; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sodium bisulfite is a white crystalline solid. Slight odor of sulfur dioxide and a disagreeable taste. Slowly oxidized to the sulfate on exposure to air. Molecular weight = 104.06; specific gravity (H_2O:1) = 1.48 @ 25°C; boiling point = (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Sodium bisulfite is used in the digestion of wood pulp, in the tanning of leather; in the dyeing of textiles; as a photographic reducing agent; as a food preservative; as an additive in electroplating; as disinfectant, bleach, antioxidant, and as inhibitor of yeast and bacteria in winemaking.

Incompatibilities: Aqueous solution is a weak acid. Incompatible with strong mineral acids forming a toxic sulfur dioxide gas. A strong reducing agent, sodium bisulfite is incompatible with oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates. Reacts with bases forming sulfate. Slowly oxidizes to sulfate in air. Heat causes decomposition. Slowly oxidized to the sulfate on exposure to air. Contact with oxidizers or acids forms sulfur dioxide gas. Attacks some metals in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 66 milligram per cubic meter

PAC-3: 400 milligram per cubic meter

DFG MAK: Sensitizing substances as sulfites

Australia: TWA 5 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, 1999; United Kingdom: TWA 5 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for sodium bisulfite in ambient air[60] ranging from 5.0 μ/m^3 (North Dakota); to 80.0 μ/m^3 (Virginia); to 100.0 μ/m^3 (Connecticut); to 119.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Permissible Concentration in Water: Maryland[61] has set a guideline for sodium bisulfite in drinking water of 70.0 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive can cause severe skin and eye irritation and burns. Irritates the respiratory tract causing cough, wheezing, and shortness of breath. Ingestion may cause irritation to mouth, throat, and stomach. Allergic response may occur. This could include itching of ears and legs, nausea, cough, tightening of throat, and reddening of the skin.

Long-Term Exposure: An asthma-like allergy may develop after repeated exposure. Skin allergy may develop. May irritate the lungs, causing bronchitis to develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs, skin, eyes.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. Evaluation by a qualified allergist.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Converted to sulfuric acid in stomach. Acute obstruction of alimentary canal may occur Up to 3 weeks following ingestion.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, proved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full operated in pressure-demand or other positive-pressure mode.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area away from strong acids, such as hydrochloric and nitric; and oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates.

Shipping: UN2693 Bisulfites, inorganic, aqueous solutions, n.o.s., Hazard class: 8; Labels: 8-Corrosive material. UN3260 Bisulfites, inorganic, solid, n.o.s., Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Cover spilled liquid with soda ash, absorb on vermiculite, or other inert material. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is noncombustible. Extinguish fire using an agent suitable for type of surrounding fire. Sodium bisulfite itself does not burn. Thermal decomposition products may include sulfur dioxide and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dump into water, add soda ash, then neutralize with HCl; flush to sewer with large volumes of water.

EC Number: 223-160-4

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1999; EPA: Likely to produce cancer in humans (inhalation, as bromates); Available data are inadequate for an assessment of human carcinogenic potential (oral route, as bromates); Limited evidence of carcinogenicity based on epidemiologic studies[72].

California Proposition 65 Chemical[102]: Carcinogen (as bromate) 5/31/2002

Hazard Alert: Strong oxidizer, Narcotic, Possible risk of forming tumors,

United States National Primary Drinking Water Regulations: MCLG = 0 mg[BrO_3^-]/L; MCL = 0.010 mg [BrO_3^-]/L, as bromates/bromate ion

Hazard symbols, risk, & safety statements: Hazard symbol: O, Xi, Xn; risk phrases: R8; R20/21/22; R36/37/38; R45; R50; safety phrases: S17; S22; S26; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sodium bromate is a colorless or white crystalline solid. Odorless. Molecular weight = 150.90; specific gravity (H_2O:1) = 3.34 @ 20°C; boiling point = 1390°C; freezing/melting point = (decomposes) 381°C; flash point = 381°C. Soluble in water; solubility = 35 g/100 g @ 20°C.

Potential Exposure: Used for research and development; as an analytical reagent; for separating gold from ores; making vat dyes; boiler cleaning.

Incompatibilities: Dust may form explosive mixture with air. A strong oxidizer capable of increasing the intensity of an existing fire. Can react, possibly violently, with combustible, organic, or other oxidizable materials, alcohols, glycols, reducing agents, strong acids, finely divided metals, especially aluminum. Contamination with carbon, organic matter, and finely divided metal can cause sodium bromate become shock-sensitive. Decomposes at 381°C. Sodium bromate may explode in heat of fire.

Permissible Exposure Limits in Air:
PAC* Ver. 29[138]
PAC-1: 0.46 milligram per cubic meter
PAC-2: 5.1 milligram per cubic meter
PAC-3: 30 milligram per cubic meter

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg/L as bromate ion. Safe Drinking Water Act (47FR 9352): MCLG = 0 mg/L; MCL = 0.010 mg/L, as bromates

Routes of Entry: Inhalation, ingestion, dermal, or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of the skin, eyes, and respiratory tract. Toxic by ingestion. Inhalation of dust is toxic Contact with substance may cause severe burns to skin and eyes. Acute effects: Hematological effects (unspecified). Narcotic, brain, CNS; nervous system toxin; kidney. A respiratory toxin-acute effects other than severe or moderate irritation; gastrointestinal tract[138]. LD_{50}(oral-mouse) = 140 mg/kg.

Long-Term Exposure: Bromates may cause an increased risk of cancer. May cause tumors, kidney, and nervous system problems.

Points of Attack: Brain, nervous system, CNS, kidney, gastrointestinal tract.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. Contaminated clothing may be a fire risk when dry. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. Keep victim warm and quiet. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing will only provide limited protection. Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing will only provide limited protection.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCB that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1494 Sodium bromate, Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN1450 Bromates, inorganic, n.o.s., Hazard Class: 5.1; Labels: 5.1-Oxidizer, Technical Name Required.

Spill Handling: *Caution:* Incompatible absorbents: Cellulose-Based Absorbents, Expanded Polymeric Absorbents[101]. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Keep unauthorized personnel away. Stay upwind. Keep out of low areas. Ventilate closed spaces before entering. *Evacuation*: *Large Spill*: Consider initial downwind evacuation for at least 100 m/330 ft. Fire: If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Small Dry Spill: With clean shovel place material into clean, dry container and cover loosely; move containers from spill area. Large Spill: Dike far ahead of spill for later disposal.[31]

Fire Extinguishing: Thermal decomposition products may include hydrogen bromide gas. A strong oxidizer. Sodium bromate may explode in heat of fire. Oxidizers will accelerate burning when involved in a fire. May explode from heat or contamination. Some may burn rapidly. Some will react explosively with hydrocarbons (fuels). May ignite combustibles (wood, paper, oil, clothing, etc.). Containers may explode when heated. Runoff may create fire or explosion hazard. *Small Fire*: Use water. Do not use dry chemicals or foams. CO_2 or Halon may provide limited control. *Large Fire*: Flood fire area with water from a distance. Do not move cargo or vehicle if cargo has been exposed to heat. Move containers from fire area if you can do it without risk. Fire involving Tanks or Car/Trailer Loads: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Cool containers with flooding quantities of water until well after fire is out. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: SRP: The most favorable course of action is to use an alternative chemical product with less inherent propensity for occupational exposure or environmental contamination. Recycle any unused portion of the material for its approved use or return it to the manufacturer or supplier. Ultimate disposal of the chemical must consider: the material's impact on air quality; potential migration in soil or water; effects on animal, aquatic, and plant life; and conformance with environmental and public health regulations. See also Sigma-Aldridge data sheet (Sodium Bromate >99%).

Sodium Cacodylate S:0420

Formula: $C_2H_6AsNaO_2$: $(CH_3)_2AsOONa$

Synonyms: Alkarsodyl; Ansar 160; Arsecodile; Arsycodile; Bolls-Eye; Cacodilato sodico (Spanish); Cacodylate de sodium (French); Cacodylic acid sodium salt; Chemaid; Dimethylarsinic acid, sodium salt; [(Dimethylarsino)oxy] sodium-arsenic-oxide; [(Dimethylarsino)oxy]sodium As-oxide; Dutch-treat; Hydrodimethylarsine oxide, sodium salt; Kakodylan Dodny; Phytar 560; Rad-E-Cate; Rad-E-Cate 16; Rad-E-Cate-25; Rad-E-Cate-35; Silvisar; Sodium dimethylarsinate; Sodium dimethyl arsonate; Sodium salt of cacodylic acid

CAS Registry Number: 124-65-2; 6131-99-3 (trihydrate)

HSDB Number: 731

RTECS Number: CH7890000

UN/NA & ERG Number: UN1688/152; UN3465 (organoarsenic compound, solid, n.o.s.)/151

EC Number: 204-708-2

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, classification: D; not classifiable as to human carcinogenicity. Basis for classification: No human data and inadequate data in animals.

Hazard Alert: Poison, Environmental hazard, Suspected reprotoxic hazard.

Banned or Severely Restricted (Portugal) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

As arsenic compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds

Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, D004 (arsenic compounds)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: organics 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), NPRI (arsenic compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23/25; R50/53; R63; safety phrases: S29; S53; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Sodium cacodylate is a white crystalline solid which occurs as the trihydrate. It liquefies in the water of hydration @ 60°C and becomes anhydrous @ 120°C. Molecular weight = 159.99. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: This material has been used as a non-selective herbicide and for general weed control.

Incompatibilities: Incompatible with oxidizers, strong bases; acids, active metals (iron, aluminum, zinc). Contact with acids react to form highly toxic dimethylarsine gas. Attacks some metals.

Permissible Exposure Limits in Air

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA

NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

124-65-2

PAC Ver. 29[138]

PAC-1: 3.2 milligram per cubic meter

PAC-2: 86 milligram per cubic meter

PAC-3: 510 milligram per cubic meter

Determination in Air: Filter; Reagent: Ion chromatography/hydride atomic absorption: NIOSH IV [#5022, Arsenic, organo-][18].

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons. Federal Drinking Water Guidelines: EPA 10 μg/L; State Drinking Water Guidelines: Arizona 10 μg/L; Connecticut 10 μg/L. Toxic pollutant designated pursuant to section 307 (a) (1) of the Clean Water Act and is subject to effluent limitations (arsenic and inorganic and organic arsenic) [40 CFR 401.15 (7/1/1987)]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: See OSHA Analytical Method ID-105 for arsenic. The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Sodium cacodylate is corrosive to the skin, eyes, and mucous membranes. Moderately toxic; probable oral lethal dose in humans is 0.5−5 g/kg or between 1 oz and 1 pt (or 1 lb) for a 70 kg (150 lb) person. It may cause disturbances of the blood, kidneys, and nervous system. Acute exposure to sodium cacodylate may be fatal. Headache, red-stained eye; and a garlicky odor of the breath may be the first effects noticed. Other signs and symptoms include generalized weakness, intense thirst; muscle cramping; seizures, toxic delirium; and shock. Nausea, vomiting, anorexia, abdominal pain; and diarrhea may occur. Hypotension (low blood pressure), tachycardia (rapid heart rate), pulmonary edema; ventricular fibrillation; and other cardiac abnormalities are usually found following severe exposure.

Long-Term Exposure: Repeated exposure may cause ulcers and hole in the nasal septum. Hoarseness and sore eyes also occur. Repeated contact may cause thickened skin, pigmentation changes. May cause liver damage and nerve damage causing sensation of "pins and needles," weakness and loss of coordination in the limbs. May cause gastrointestinal tract and reproductive effects. Repeated exposures can cause metallic taste; poor appetite; nausea, vomiting, diarrhea and stomach pain; seizures and death.

Points of Attack: Skin, respiratory system; kidneys, CNS; liver, gastrointestinal tract; reproductive system.

Medical Surveillance: Examination of the nose, skin, eyes, and nails. Examination of the nervous system. Liver function tests. Test for urine arsenic. NIOSH recommended exposure levels should not exceed 100 μg/L of creatinine in the urine. Results may be accurate within 2 days of eating shellfish or fish (which may increase arsenic levels); they are most accurate at the end of a work-day.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Rush to health care facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Note to physician: For severe poisoning, BAL, Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, *Inorganic Arsenic.*

Respirator Selection: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN1688 Sodium cacodylate Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3465 Organoarsenic compound, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required

Spill Handling:

Organoarsenic compound, solid or liquid

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/60
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills:* take up with sand or other noncombustible absorbent material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium cacodylate itself does not burn. Thermal decomposition products may include arsenic hydride and oxides of arsenic and carbon. Poisoning potential is high when heated to decomposition, or on contact with acids or acid fumes, because it emits highly toxic fumes of arsenic. Avoid water solution in contact with active metals such as iron, aluminum, zinc[101]. Use any agent suitable for surrounding fire. Stay upwind; keep out of low areas. Wear SCBA and full protective clothing. Move container from fire area, if you can do so without risk. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For cacodylic acid, precipitate as calcium arsenate and calcium arsenite by treatment with excess lime water. Recycle if possible. If not, put in secure storage for possible disposal in leach-proof dumps[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 400 (Commercial grade).

United States Environmental Protection Agency, FIFRA, 1998 Status of Pesticides: Supported.

Hazard Alert: Strong oxidizer, Highly Reactive Substance, Explosive World bank[15]. Agricultural chemical, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: O, E, Xn, N; risk phrases: R8; R9; R22; R51/53; R62; safety phrases: S1; S13; S17; S29/35; S46; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Sodium chlorate is a white crystalline solid. Molecular weight = 106.44; Decomposes below boiling point @ ca. 300°C; freezing/melting point = 248°C (also listed @ 255°C and 264°C). Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity, reactivity 2 (Oxidizer). Soluble in water.

Potential Exposure: Sodium chlorate is used to manufacture dyes, explosives, in paper pulp processing and as a weed killer; used as a constituent of atratol and pramitol.

Incompatibilities: A strong oxidizer. Potentially explosive. Reacts violently with combustibles, sulfuric acid; and reducing materials. Reacts with strong acids giving off carbon dioxide. Explosions may be caused by contact with ammonia salts; ammonium thiosulfate; antimony sulfide; arsenic, carbon, charcoal, organic matter; organic acids; thiocyanates, chemically active metals; oils, metal sulfides; nitrobenzene, powdered metals; sugar. Reacts with some organic contaminants forming shock-sensitive mixtures. Decomposes on heating above 300°C or on burning, producing oxygen and toxic chlorine fumes. Attacks zinc, magnesium, and steel.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 3.6 milligram per cubic meter

PAC-2: 40 milligram per cubic meter

PAC-3: 240 milligram per cubic meter

Permissible concentration in Water: *Chlorates:* State Drinking Water Guidelines: California 800 μg/L; Maine 7 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Sodium chlorate can affect you when breathed in. Eye or skin contact can cause severe irritation and even burns. Breathing sodium chlorate, especially dust or mist, can irritate the nose and throat. It can also cause cyanosis, causing the skin to turn Blue (methemoglobinemia), because it interferes with the blood's ability to carry oxygen. Damage to red blood cells (hemolytic anemia) can also occur. If severe or repeated, this can cause kidney damage. Ingestion can cause kidney damage. The effects may be delayed.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Kidney damage can occur from severe or repeated damage to red blood cells resulting from exposure. Very irritating substances may cause lung damage.

Points of Attack: Kidneys, lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: CBC. Test for methemoglobin if skin is blue.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim under medical observation.

Antidotes and Special Procedures: Do not use Methylene Blue to treat methemoglobinemia from sodium chlorate as it can cause increased toxicity.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to sodium chlorate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Oxidizer. Potentially explosive. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Sodium chlorate must be stored to avoid contact with ammonium thiosulfate, antimony sulfide; arsenic, carbon, charcoal, organic matter; organic acids; sulfuric acid; thiocyanates and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Protect storage containers against physical damage. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1495 Sodium chlorate, Hazard Class: 5.1; Labels: 5.1-Oxidizer. UN2428 Sodium chlorate, aqueous solution, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep sodium chlorate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium chlorate may burn, but does not readily ignite. Thermal decomposition products may include oxides of chlorine, sodium and carbon. Heat above 300°C produces oxygen which can increase the intensity of fire and may ignite other combustible materials. Flood areas with water unless that is incompatible with other materials in the fire area. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Sodium Chloroplatinate S:0440

Formula: $Cl_6Pt \cdot 2Na \cdot 4H_2O$

Synonyms: Platinate(2-), hexachlorodisodium, tetrahydrate; Platinic sodium chloride; Sodium hexachloroplatinate(IV); Sodium platinic chloride; Sodium platinic chloride

CAS Registry Number: 1307-82-0; 16923-58-3

EC Number: 240-983-5 [*Annex I Index No.:* 078-006-00-8]

Regulatory Authority and Advisory Information

Hazard Alert: Sensitization hazard (skin, resp.), Corrosive.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1% as platinum, water-soluble salts.

Hazard symbols, risk, & safety statements: Hazard symbol: T, C; risk phrases: R20/21/22; R25; R27/28; R41; R42/43; safety phrases: S22; S26; S36/37/39; S45 (see Appendix 4)

Description: Sodium chloroplatinate is a yellow-orange or red-brown crystalline solid. Odorless. Molecular weight = 561.9; freezing/melting point = loses water @ 100°C; vapor pressure = essentially zero. Soluble in water; solubility = 50 g/100 g @ 20°C.

Potential Exposure: Used as a catalyst.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 4 mg[Pt]/m^3

OSHA PEL: 0.002 mg[Pt]/m^3 TWA

NIOSH REL: 0.002 mg[Pt]/m^3 TWA

ACGIH TLV[1]: 10.002 mg[Pt]/m^3 TWA

PAC not available

DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates

Several states have set limits on platinum in ambient air[60] as well. See the entry on platinum for details.

Determination in Air: Use NIOSH II(7) Method #S-19 (soluble salts)

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Chloroplatinates can affect you when breathed in. Severe allergy can develop to chloroplatinates. Symptoms include asthma (with cough, wheezing, and/or shortness of breath); runny nose, and/or skin rash, sometimes with hives. If allergy develops, even small future exposure can trigger significant symptoms. Some persons exposed to this type of chemical have developed lung scarring. Family members can develop allergy to dust carried home on work clothing. It may irritate the eyes, nose, and throat. High exposure may cause irritability and even seizures.

Long-Term Exposure: May cause skin sensitization and dermatitis and/or asthma-like allergy. Repeated exposures can cause sores or ulcers in the lining of the nose. Tetrachloroplatinates are mutagens.

Points of Attack: Skin, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: chest X-ray every 3 years should be considered if above tests are not normal. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (for soluble Pt salts): *Up to 0.05 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.1 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 4 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance cause eye irritation and damage; eye protection needed.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include hydrogen chloride and oxides of sodium and metal. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Sufficient Evidence, *carcinogenic to humans*, Group 1, 1997; NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen; EPA *(inhalation)*: Known human carcinogen; EPA *(oral)*: Not Classifiable as to human carcinogenicity; NTP: Known to be a human carcinogen. United States Environmental Protection Agency Gene-Tox Program, Positive/dose response: TRP reversion.

California Proposition 65 Chemical[102]: (*hexavalent chromium*) Cancer 2/27/1987; Developmental/Reproductive toxin (male, female) 12/19/2008.

Hazard Alert: Poison, Strong oxidizer, Sensitization hazard, Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard, Environmental hazard.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

As chromium compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

United States National Primary Drinking Water Regulations: MCLG = 0.01 mg[Cr]/L; MCL = 0.1 mg[Cr]/L as Chromium

Clean Water Act: Toxic Pollutant (Section 401.15); 40CFR401.15 Section 307 Toxic Pollutants as chromium and compounds.

EPA Acceptable daily intake (ADI): Chromium(VI) = 0.175 mg/day/man. EPA estimated adequate and safe intake (EASI) levels for chromium: **Infants:** age 0.0−0.5 years: 0.01−0.04 mg/day; age 0.5−1.0 years: 0.02−0.06 mg/day. **Children** age 1−3 years: 0.02−0.08 mg/day; age 4−6 years: 0.03−0.12 mg/day; age 7−10 years: 0.05−0.20 mg/day; age > or = to 11 years: 0.05−0.20 mg/day. **Adults:** 0.05−0.20 mg/day.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, D007 (chromium compounds)

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: O, T+, N, Xi; risk phrases: R45; R8; R21; R25; R26; R34; R42/43; R46; R48/23; R50/53; R60; R61; R62; R63; safety phrases: S29; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sodium chromate, including the hexahydrate, is yellow crystalline solids that can also be used in solution. Disodium dichromate (10588-01-9): Molecular weight = 161.98; specific gravity (H_2O:1) = 2.4 @ 13°C; freezing/melting point = 357°C. Soluble in water. The dichromate is a red or red-orange crystalline solid. Molecular weight = 161.98; freezing/melting point = 357°C (decomposes @ 400°C). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Soluble in water. Dihydrate (7789-12-0): Molecular weight = 298; specific gravity (H_2O:1) = 2.35 @ 13°C. Disodium chromate (7775-11-3): Molecular weight = 161.97; specific gravity (H_2O:1) = 2.7; freezing/melting point = 794°C. Decahydrate (13517-17-4): Molecular weight = 342.18. Tetrahydrate (10034-82-9): Molecular weight = 303.

Potential Exposure: Used to make dyes, inks, pigments, and other chromates; in leather tanning, a corrosion inhibitor in circulating water systems; metal treatment; a drilling mud additive; chemical intermediate for chromium catalysts; colorimetry, oxidizing agent; bleaching agent; an algicide, fungicide, insecticide; in wood preservation.

Incompatibilities: Aqueous solution in a base. A strong oxidizer. Violent reaction with reducing agents; combustibles, strong acids; organic materials.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

10588-01-9, disodium dichromate

PAC-1: 0.38 milligram per cubic meter
PAC-2: 6.5 milligram per cubic meter
PAC-3: 39 milligram per cubic meter

7775-11-3, dichromate

PAC-1: 0.47 milligram per cubic meter
PAC-2: 8.2 milligram per cubic meter
PAC-3: 49 milligram per cubic meter

7789-12-0, dihydrate

PAC-1: 0.43 milligram per cubic meter
PAC-2: 7.5 milligram per cubic meter
PAC-3: 45 milligram per cubic meter

13517-17-4, decahydrate

PAC-1: 0.99 milligram per cubic meter
PAC-2: 17 milligram per cubic meter
PAC-3: 100 milligram per cubic meter

10034-82-9, tetrahydrate

PAC-1: 0.87 milligram per cubic meter
PAC-2: 15 milligram per cubic meter
PAC-3: 91 milligram per cubic meter

As chromium(VI) inorganic soluble compounds

NIOSH IDLH = 15 mg[Cr(VI)]/m^3

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued
DFG MAK: Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift. United Kingdom: carcinogen, 2000. The former USSR-UNEP/IRPTC joint project[43] gives a MAC in work-place air of 0.01 milligram per cubic meter. Connecticut[60] has set a guideline for chromium trioxide in ambient air of 0.25 μ/m^3.

Determination in Air: Use NIOSH Analytical Methods #7600,#7604, #7605, #7703, #9101; OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: The EPA[6] has designated chromium as a priority toxic pollutant. State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr(VI)]/L.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry, (diphenylcarbazide); or by ICP optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods[49].

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Sodium chromate can affect you when breathed in. It can also pass into inner layers of the skin. A corrosive. Eye contact can cause severe damage with possible loss of vision. Irritation of nose, throat and bronchial tubes can occur; with cough and/or wheezing. Skin contact can cause severe irritation, deep ulcers; or an allergic skin rash.

Long-Term Exposure: Chromium may cause allergic dermatitis. Sodium chromate is a human carcinogen. Sodium chromates can cause a sore or perforated nasal septum, with bleeding, discharge or crusting. May cause skin allergy with eczema-like rash. Can cause lung irritation or allergy; bronchitis may develop. May cause kidney damage.

Points of Attack: Skin, lungs, kidneys. *Cancer site:* throat and lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Blood gas analysis, CBC; chest X-ray, ECG, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Exam of the nose and skin. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Also check your skin daily for little bumps or blisters, the first sign of "chrome ulcers." If not treated early, these can last for years after exposure. Urine test for chromates. This test is most accurate shortly after exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact (as chromic acid and chromates) **8 hours** (more than 8 hours of resistance to breakthrough >0.1 μg/cm/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex coated suits; **4 hours** (At least 4 but <8 hours of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH criteria document #76-129 [Chromium(VI)].

Respirator Selection: NIOSH: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. (1) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (3) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustibles, organics, or other easily oxidized materials. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3087 Oxidizing solid, toxic, n.o.s., Hazard Class: 5.1; Labels: 5.1-Oxidizer, 6.1-Poisonous materials, Technical Name Required. UN3085 Oxidizing solid, corrosive, n.o.s., Hazard Class: 5.1; Labels: 5.1-Oxidizer, 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include oxides of chromium oxide and sodium. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

EPCRA Section 313: See cyanide compounds

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%. NPRI; CEPA Priority Substance List, Ocean dumping prohibited.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C, N; risk phrases: R15; R26/27/28; R32; R34; R48/25; R50/53; R62; R63; safety phrases: S1/2; S7; S28; S29/35; S45, S60, S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

As cyanide compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants, as cyanide, total

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, as cyanides, soluble salts, and complexes, n.o.s.

Description: Sodium cyanide is found as white granules, flakes or lumps. Sodium cyanide is shipped as pellets or briquettes. Odorless when dry. It absorbs water from air (is hygroscopic or deliquescent). Hydrogen cyanide gas released by sodium cyanide has a distinctive mild, bitter almond odor, but a large proportion of people cannot detect it; the odor does not provide adequate warning of hazardous concentrations. Molecular weight = 49.01; boiling point = 1496°C; freezing/melting point = 564°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0₩. Soluble in water forming a strong base. Sodium cyanide releases highly flammable and toxic hydrogen cyanide gas on contact with acids or water.

Potential Exposure: Sodium cyanide is used as a solid or in solution to extract metal ores, in electroplating and metal cleaning baths; in metal hardening; in treatment of rabbit and rat burrows and holes and termite nests; in insecticides.

Incompatibilities: Sodium cyanide decomposes on contact with acids, acid salts, water, moisture, alcohols, and carbon dioxide, releasing highly toxic and flammable hydrogen cyanide gas. Aqueous solution is a strong base; it reacts violently with acid and is corrosive. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Absorbs moisture from the air forming a corrosive syrup. Corrosive to active metals, such as aluminum, copper, and zinc. Under acid conditions, sarin hydrolyzes to form hydrofluoric acid.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[CN]/m^3

OSHA PEL: 5 mg[CN]/m^3 TWA

NIOSH REL: 4.7 ppm/5 mg[CN]/m^3 [10 min] Ceiling Concentration

ACGIH TLV[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration

PAC* Ver. 29[138]

PAC-1: **4.0**$_{\mathbf{A}}$ milligram per cubic meter

PAC-2: **14**$_{\mathbf{A}}$ milligram per cubic meter

PAC-3: **30**$_{\mathbf{A}}$ milligram per cubic meter

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 3.8 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C

Skin contact may contribute significantly in overall exposure.

Australia: TWA 5 milligram per cubic meter [skin], 1993; Austria: MAK 5 mg[CN]/m^3 [skin], 1999; Denmark: TWA 5 milligram per cubic meter [skin], 1999; France: VME 5 mg [CN]/m^3 [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 milligram per cubic meter, KZG-W 10 milligram per cubic meter [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3 [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 5 milligram per cubic meter [skin]. Russia[43] has set MAC values for ambient air in residential areas of 0.009 milligram per cubic meter on a momentary basis and 0.004 milligram per cubic meter on an average daily basis. Several states have set guidelines or standards for cyanides in ambient air[60] ranging from 16.7 μ/m^3 (New York); to 50.0 μ/m^3 (Florida and North Dakota); to 80.0 μ/m^3 (Virginia); to 100 μ/m^3 (Connecticut and South Dakota); to 125 μ/m^3 (South Carolina); to 119.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides. See also Method #6010, Hydrogen cyanide[18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 200 μg[CN$^-$]/L; Federal Drinking Water Guidelines: EPA 200 μg[CN$^-$]/L; State Drinking Water Standards: California 150 μg[CN$^-$]/L; State Drinking Water Guidelines: Arizona 220 μg[CN$^-$]/L; Maine 140 μg[CN$^-$]/L; Minnesota 100 μg[CN$^-$]/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid). Octanol−water coefficient: Log K_{ow} (estimated) = −1.69.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Sodium cyanide releases hydrogen cyanide gas, a highly toxic chemical asphyxiant that interferes with the body's ability to use oxygen. Exposure to sodium cyanide can be rapidly fatal. It has whole-body (systemic) effects, particularly affecting those organ systems most sensitive to low oxygen levels: the CNS (brain), the cardiovascular system (heart and blood vessels), and the pulmonary system (lungs)[77].

Short-Term Exposure: Sodium cyanide can be absorbed through the skin, thereby increasing exposure. Sodium cyanide is corrosive to the eyes, skin, and respiratory tract. Contact can cause skin and eye burns, and possible permanent eye damage. Inhalation can cause lung irritation with coughing, sneezing, and difficult breathing; slow gasping respiration. Corrosive if swallowed. These substances may affect the CNS. Symptoms include headaches; confusion; nausea, pounding heart, weakness, and unconsciousness.

Long-Term Exposure: Repeated or prolonged contact with sodium cyanide may cause thyroid gland enlargement and interfere with thyroid function. May cause nosebleed and sores in the nose; changes in blood cell count. May cause CNS damage with headache, dizziness, confusion; nausea, vomiting, pounding heart, weakness in the arms and legs, unconsciousness and death. May affect liver and kidney function. Repeated lower exposures can cause sores in the nose with nosebleeds.

Points of Attack: Liver, kidneys, skin, cardiovascular system; CNS; thyroid gland.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. Blood cyanide levels. CBC. Evaluation of thyroid function. Liver function tests. Kidney function tests. CNS tests. EKG. Smokers may have somewhat higher blood cyanide and urine thiocyanate levels.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APR or PAPR are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. *Polyethylene (for sodium cyanide, less than 30%, only) is among the recommended protective materials.* All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (*as cyanides*): *25 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Up to 25 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, acid salts; oxidizers, light, and moisture. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN1689 Sodium cyanide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:
(*Initial isolation and protective action distances*
Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

When spilled in water: large amounts of hydrogen cyanide may be produced
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.96/1.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Eliminate all ignition sources (no smoking, flares, sparks, or flames in immediate area). All equipment used when handling the product must be grounded. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. A vapor-suppressing foam may be used to reduce vapors. *Do not get water inside containers*. Use water spray to reduce vapors or divert vapor cloud drift. Avoid allowing water runoff to contact spilled material. Prevent entry into waterways, sewers, basements, or confined areas. *Small spill*: Cover with DRY earth, DRY sand or other noncombustible material followed with plastic sheet to minimize spreading or contact with rain. Use clean, nonsparking tools to collect material and place it into loosely covered plastic containers for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: If a tank, rail car, or tank truck is involved in a fire, isolate it for 0.5 mi/800 m in all directions; also consider initial evacuation for 0.5 mi/800 m in all directions. *Small spills/when spilled in water*: First isolate in all directions: 200 ft/60 m. Then protect persons downwind during the day: 0.1 mi/0.2 km. Then protect persons downwind during the night: 0.4 mi/0.7 km). Large spills (when spilled in water). First isolate in all directions: 1300 ft/390 m. Then protect persons downwind during the day: 0.8 mi/1.3 km). Then protect persons downwind during the night: 3.0 mi/4.9 km. Material does not burn. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen. NaCN decomposes in the presence of water, damp air, or carbon dioxide, producing highly toxic and flammable hydrogen cyanide gas and oxides of nitrogen. *NO* acidic dry chemical extinguishers; *NO* hydrous agents; *NO* water; *NO* carbon dioxide directly on material. Fight surrounding fire with an agent appropriate for the burning material. Vapors are heavier than air and may collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not allow water to enter open containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Add strong alkaline hypochlorite and react for 24 hours. Then flush to sewer with large volumes of water[22].

Regulatory Authority and Advisory Information

Hazard Alert: Powerful Oxidize, Water reactive, Thermally unstable, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R8; R22; R31; R36/37/38; R51/53; R62; safety phrases: S2; S8; S17; S26; S29; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Dichloroisocyanuric acid, sodium salt, is a white crystalline powder. Chlorine odor. Thermally unstable. Molecular weight = 220.96; specific gravity (H_2O:1) = 1.10 @ 25°C; freezing/melting point = (decomposes) 230°C. NFPA 704M Hazard identification (anhydrous): Health 2, flammability 0, reactivity 2 OX₩. Soluble in water; solubility = 25% (reactive).

Potential Exposure: Dichloroisocyanuric acid salts, are used in cleaning; making dry bleaches, detergents, sanitizers, and disinfectants; in swimming pool and sewage treatment.

Incompatibilities: A powerful oxidizer. Dust may form explosive mixture with air. Violent reaction with reducing agents; organic matter; easily chlorinated or oxidized materials. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acyl-chlorides may cause explosive polymerization. Contact with metals may evolve flammable hydrogen gas. Attacks some plastics, rubber and coatings.

May accumulate static electrical charges, and may cause ignition of its vapors. Incompatible with ammonium salts, amines forming nitrogen trichloride.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause severe eye and permanent damage. Skin contact can cause severe irritation especially if skin is moist or material is in solution. Inhalation can cause irritation of the respiratory tract. The dry material is less irritating to the skin. A strong poison and corrosive if ingested; may cause liver damage.

Long-Term Exposure: Highly irritating substances may affect the lungs.

Points of Attack: Lungs, eyes, skin, liver.

Medical Surveillance. Lung function tests. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from ammonium compounds, hydrated salts; moisture and combustible materials. Where possible, automatically transfer material from drums or other storage containers to process containers. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2465 Dichloroisocyanuric acid, dry or Dichloroisocyanuric acid salts, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Keep water away from release. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid but it is a powerful oxidizer and may increase the activity of an existing fire. May burn rapidly. Thermal decomposition products may include hydrogen chloride and oxides of sodium, metal, and carbon. Use flooding quantities of water, from a distance. Do *NOT* use extinguishers containing ammonia. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, Likely to be Carcinogenic to Humans.

California Proposition 65 Chemical[102]: Developmental/Reproductive toxin 3/30/1999.

Hazard Alert: Poison, Possible thyroid effects, Environmental hazard, Water reactive, Reproductive toxin: Suspected of causing genetic defects, Agricultural chemical, Drug.

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: organics 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xn; risk phrases: R45; R22; R29; R36; R50/53; R60; R61; safety phrases: S26; S29; S41; S46; S61 (see Appendix 4).

R62; WGK (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sodium dimethyldithiocarbamate is a clear yellow liquid or yellow crystalline solid. Molecular weight = 143.12; specific gravity (H_2O:1) = 1.17 @ 20°C; freezing/melting point = (decomposes) 121°C; flash point = 127°C (oc)[NFPA]. Becomes anhydrous at 130°C. ₩ Soluble in water; slowly decomposes in water, forming carbon disulfide and various amines, including methylamine.

Potential Exposure: The slow release of poisonous gases from hydrolysis of many thio and dithiocarbamates requires the use of respirators during handling. Used as an antimicrobial/fungicidal agent in paints, water treatment; a registered biocide for cutting oils and aqueous systems in industries such as leather tanning and paper manufacturing. Used in the rubber industry as a vulcanization accelerator for making synthetic and natural rubbers (i.e., butadiene rubber, latex). Used as a fungicide on melons (tolerance set as 25 ppm). Also used as an indirect food additive for use only as a component of adhesives[72].

Incompatibilities: Slowly decomposes in water, forming carbon disulfide, oxides of sulfur and nitrogen, hydrogen sulfide, ammonia, and amines, including methylamine; this decomposition is accelerated in the presence of acids. Flammable gases are generated by the combination with aldehydes, nitrides, and hydrides. Incompatible with acids, peroxides, and acid halides. Thiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of thiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of thiocarbamates with aldehydes, nitrides, and hydrides. Thiocarbamates are incompatible with carboxylic acid acids, peroxides, and acid halides.

Permissible Exposure Limits in Air: No OELs have been established. However this chemical is a suspected carcinogen and a reproductive/developmental hazard. Exposure should be reduced to the lowest possible level.

Permissible Concentration in Water: Acute hazard to the aquatic environment. Do not allow release to the environment unless proper permits are obtained from the federal government.

Determination in Water: EPA EMSLC Method 630. The determination of dithiocarbamate pesticides in municipal and industrial wastewater by UV-VIS spectrophotometry. Log K_{ow} = 1.50 (est)[72]. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Poisoning can occur by inhalation, ingestion, and absorption through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: The slow release of poisonous gases from hydrolysis of many thio- and dithiocarbamates requires the use of respirators during handling. Highly toxic, may be fatal if inhaled, swallowed, or absorbed through skin. Avoid any skin contact or eye. Effects of contact or inhalation may be delayed. LD_{50}(oral-rat) = <1 g/kg; (dermal-rat) = >5 g/kg.

Long-Term Exposure: Suspected carcinogen. Developmental/reproductive hazard. Thyroid effects.

Points of Attack: Thyroid function (may cause goiter).

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Thyroid function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method* if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed.

Personal Protective Methods: Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location.

Shipping: UN2771 Dithiocarbamate and Thiocarbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Keep unauthorized personnel away. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind. Keep out of low areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Cover with plastic sheet to prevent spreading. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur, sodium, and carbon. Containers may explode when heated. Runoff from fire control or dilution water may be corrosive and/or toxic and may cause pollution. Runoff may pollute waterways. If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Small Fire: Use dry chemical, CO_2 or water spray. *Large Fire*: Water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information
Carcinogenicity: NCI: Carcinogenesis Studies (water); equivocal evidence: rat; no evidence: mouse; IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.
United States Environmental Protection Agency Gene-Tox Program, Positive: *D. melanogaster*-whole sex chrom. loss; Negative: *D. melanogaster*-nondisjunction; *N. crassa-aneuploidy*; Negative: In vivo SCE-nonhuman; *S. cerevisiae* gene conversion; Inconclusive: *D. melanogaster*-partial sex chrom. Loss; Inconclusive: Histidine reversion-Ames test; Inconclusive: *D. melanogaster* sex-linked letha.
Hazard Alert: Poison, High acute toxicity, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), FDA-over the counter drug.
United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg[F]/L, as Fluoride.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg).
Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xi; risk phrases: R25; R32; R36/38; R62; R63; safety phrases: S1/2; S22; S36; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Sodium fluoride is a white powder or colorless crystals. Often used in a solution. Odorless. Pesticide grade is often dyed blue. Molecular weight = 41.99; specific gravity (H_2O:1) = 2.78 @ 25°C; boiling point = 1703.9°C; freezing/melting point = 992.8°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Slightly soluble in water; solubility = 4%.
Potential Exposure: Widely used in the chemical industry; in water treatment and fluoridation of drinking water; as an insecticide, fungicide, and rodenticide; chemical cleaning; electroplating, glass manufacture; vitreous enamels; preservative for adhesives; toothpastes, disinfectant, dental prophylaxis; also used orally in the treatment of various bone diseases to increase bone density and to relieve bone pain.
Incompatibilities: Contact with acids release toxic gas. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.
Permissible Exposure Limits in Air
NIOSH IDLH: 250 mg[F]/m^3
OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA
NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 minutes Ceiling Concentration
ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift
PAC Ver. 29[138]
PAC-1: 17 milligram per cubic meter
PAC-2: 90 milligram per cubic meter
PAC-3: 1100 milligram per cubic meter
DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift
Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 milligram per cubic meter), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg[F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set limits for fluoride in ambient air[60] ranging from as low as 2.85 μ/m^3 (Iowa); to as high as 60,000 μ/m^3 (Kentucky).
Determination in Air: Use NIOSH Analytical Method (IV) #7902, Fluorides; #7906; OSHA Analytical Method ID-110.
Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware

2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg[F]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Liquid can be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Sodium fluoride can affect you when breathed in. Inhalation of dust or mist can cause severe irritation and burns of the eyes and skin. Irritates the eyes and respiratory system. May cause permanent eye damage. Exposure can cause nausea, abdominal pain; diarrhea, salivation, thirst, sweating.

Long-Term Exposure: Repeated or prolonged industrial contact can cause dermatitis. Repeated exposure can cause fluoride to build-up in the body. Can irritate the lungs; bronchitis may develop. Repeated exposure can cause fluoride to build up in the body causing stiffness, brittle bones; stiff spine; calcification of ligaments of ribs, pelvis; and crippling. Repeated exposures can cause weakness and muscle twitching; tremors, convulsions, coma and even death. May cause kidney damage. Prolonged contact can cause sores in the nose and perforated septum. High concentrations can damage the developing fetus. These effects *Do NOT* occur when sodium fluoride is used in drinking water for dental cavity prevention.

Points of Attack: Eyes, skin, respiratory system; CNS; skeleton, kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, ECG, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)$^{*+}$ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN1690 Sodium fluoride, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Determination in Air: Use NIOSH II(5) Method #S-301.

Routes of Entry: Inhalation, skin absorption; ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: May affect the cardiovascular system and CNS; causing cardiac disorders and respiratory failure. Exposure may result in death. This material is super toxic. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. The probable oral lethal dose in humans is less than 5 mg/kg, or a taste (less than seven drops) for a 150 lb person. Symptoms include nausea, vomiting; apprehension, auditory hallucinations; facial paresthesia; twitching face muscle; pulsus altenans; ectopic heartbeat; ventricular fibrillation. Symptoms are usually seen within one-half hour of exposure, but severe effects may be delayed as long as 20 hours. A rebuttable presumption against registration of sodium fluoroacetate for pesticidal uses was issued on December 1, 1976 by the United States Environmental Protection Agency. On the basis of reductions in nontarget and endangered species and because there is no human antidote.

Long-Term Exposure: May cause liver and kidney damage. Affects the CNS causing epileptiform convulsive seizures that may be followed by severe depression.

Points of Attack: Cardiovascular system, lungs, kidneys, liver, CNS.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Up to 0.25 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *Up to 0.5 milligram per cubic meter:* 95QX [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 2.5 milligram per cubic meter:* 100SaT (100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2629 Sodium fluorosilicate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include hydrogen fluorine and oxides of sodium metal and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. This compound is unstable at temperatures above 110°C and decomposes @ 200°C. Thus, careful incineration has been suggested as a disposal procedure. According to their procedure, the produce should be mixed with large amounts of vermiculite, sodium bicarbonate, and sand-soda ash. Slaked lime should also be added to the mixture. Two incineration procedures for this mixture are suggested. The better of these procedures is to burn the mixture in a closed incinerator equipped with an afterburner and an alkali scrubber. The other procedure suggests that the mixture be covered with scrap wood and paper in an open incinerator. (The incinerator should be lighted by means of an excelsior train)[22].

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1987.

Hazard Alert: Poison, Possible risk of forming tumors, Primary irritant (w/o allergic reaction).

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2 mg[F]/L, as fluorides.

Banned or Severely Restricted (In U.K.) (UN)[13]

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R23/24/25; safety phrases: S1/2; S26; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Sodium hexafluorosilicate is a white crystalline solid. Molecular weight = 188.1; specific gravity (H_2O:1) = 2.7 @ 20°C;. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Practically insoluble in water.

Potential Exposure: Sodium hexafluorosilicate is as a rodenticide; as an intermediate in production of synthetic cyrolite; as an insecticide in delousing and in mothproofing of woolens.

Incompatibilities: Reacts with acids to produce hydrogen fluoride, a highly corrosive and poisonous gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration
ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift
PAC Ver. 29[138]
PAC-1: 12 milligram per cubic meter
PAC-2: 140 milligram per cubic meter
PAC-3: 820 milligram per cubic meter
DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift
Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 milligram per cubic meter), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg[F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Determination in Air: Use NIOSH Analytical Method (IV) #7902, Fluorides; #7906.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May cause difficult breathing and burning of the mouth, throat and nose which may result in bleeding. These may be felt @ 7.5 milligram per cubic meter. Nausea, vomiting, profuse sweating, and excess thirst may occur at higher levels. *Skin:* May cause rash, itching and burning of skin. Solutions of 1% strength may cause sores if not removed promptly. *Eyes:* May cause severe irritation. *Ingestion:* Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. Five to 40 mg may cause diarrhea and vomiting. More severe symptoms of burning and painful abdomen, sores in mouth, throat and digestive tract; tremors, convulsions, and shock will occur around a dose of 1 g. Death may result by ingestion of 2−5 g.

Long-Term Exposure: Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 milligram per cubic meter or higher. May cause mottling of the bones or teeth at this level, resulting in fluorosis. May cause lung damage.

Points of Attack: Bones, lungs.

Medical Surveillance. Lung function tests. DEXA bone densitometry scan.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)*$^+$ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry area that is well-ventilated. Protect from damage and acids.

Shipping: UN2674/Sodium fluorosilicate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Enter spill area only with protective clothing and devices. Treat with soda ash or slaked lime. Use an industrial vacuum cleaner to remove the spill. Clean up with soap and water is allowed only if exposure and contamination are not increased to above the recommended levels. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is nonflammable. Use agents suitable to surrounding fire. Thermal decomposition products may include hydrogen fluoride and silicon tetrafluoride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C, Xi; risk phrases: R22; R35; R52/53; R62; safety phrases: S24/25; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: NaOH is a white, odorless, deliquescent material sold as pellets, flakes, lumps, or sticks. Aqueous solutions are known as soda lye. Molecular weight = 40.00; specific gravity (H_2O:1) = 2.13 @ 25°C; boiling point = 1390°C; freezing/melting point = 318.3°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Highly soluble in water; solubility = 111%.

Potential Exposure: NaOH is utilized to neutralize acids and make sodium salts in petroleum refining, viscose rayon; cellophane, plastic production; and in the reclamation of solutions of their salts. It is used in the manufacture of mercerized cotton, paper, explosives, and dyestuffs in metal cleaning; electrolytic extraction of zinc; tin plating; oxide coating; laundering, bleaching, dishwashing; and it is used in the chemical industries.

Incompatibilities: A strong base and a strong oxidizer. Violent reaction with acid. Incompatible with water; flammable liquids; organic halogens, nitromethane, and nitrocompounds, combustibles. Rapidly absorbs carbon dioxide and water from air. Contact with moisture or water may generate heat. Corrosive to metals. Contact with zinc, aluminum, tin and lead in the presence of moisture, forming explosive hydrogen gas. Attacks some forms of plastics, rubber or coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 10 milligram per cubic meter

OSHA PEL: 2 milligram per cubic meter

NIOSH REL: 2 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 2 milligram per cubic meter Ceiling Concentration

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.5_E}$ milligram per cubic meter

PAC-2: $\mathbf{5_E}$ milligram per cubic meter

PAC-3: $\mathbf{50_E}$ milligram per cubic meter

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

DFG MAK: No numerical value established.

Australia: TWA 2 milligram per cubic meter, 1993; Austria: MAK 2 milligram per cubic meter, 1999; Belgium: STEL 2 milligram per cubic meter, 1993; Denmark: TWA 2 milligram per cubic meter, 1999; Finland: TWA 2 milligram per cubic meter, 1999; France: VME 2 milligram per cubic meter, 1999; Japan: 2 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 2 milligram per cubic meter, 2003; Norway: TWA 2 milligram per cubic meter, 1999; the Philippines: TWA 2 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter; MAC (STEL) 1 milligram per cubic meter, 1999; Sweden: TGV 2 milligram per cubic meter, 1999; Switzerland: MAK-W 2 milligram per cubic meter, KZG-W 4 milligram per cubic meter, 1999; Thailand: TWA 2 milligram per cubic meter, 1993; Turkey: TWA 2 milligram per cubic meter, 1993; United Kingdom: STEL 2 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 2 milligram per cubic meter. Russia has set 10 μ/m^3 as a MAC for ambient air in residential areas on a once-daily basis. Several states have set guidelines or standards for NaOH in ambient air[60] ranging from 16.0 μ/m^3 (Virginia); to 20.0 μ/m^3 (North Dakota and South Carolina); to 40.0 μ/m^3 (Connecticut and South Dakota); to 48.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7401, alkaline Dusts; OSHA Analytical Method ID-121.

Permissible Concentration in Water: NaOH is designated as a hazardous substance under section 311(b)(2) (A) of the Federal Water Pollution Control Act and further regulated by the Clean Water Act Amendments of 1977 and 1978. These regulations apply to discharges of this substance. This designation includes any isomers and hydrates, as well as any solutions and mixtures containing this substance. To protect freshwater aquatic life: pH 6.5−9.0; to protect saltwater aquatic life: pH 6.5−8.5; and to protect humans' drinking water-pH 5−9.

Routes of Entry: Inhalation of dust or mist, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Highly corrosive to the eyes, skin, and the respiratory tract. *Inhalation:* Can cause severe irritation of the nose and throat and inflammation of the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* Can cause severe irritation and deep burns. *Eyes:* Can cause severe irritation, corneal burns, and blindness. *Ingestion:* Can cause burning of the mouth and throat, nausea, vomiting, abdominal pains, and diarrhea (occasionally with blood). Can also cause swelling of the larynx and subsequent suffocation, holes in stomach and intestines; heart failure; coma. Death has resulted from swallowing less than 1/3 oz of the solid.

Long-Term Exposure: Skin irritation may develop from repeated exposure to the solid or low concentrations of the liquid. Irritation to the lungs, nose, throat and mouth may occur if exposed to low levels for long periods of time. May cause temporary loss of hair.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation.

For 30−70% solution: Sealed chemical materials with good to excellent resistance: butyl rubber; natural rubber; Neoprene, nitrile rubber; polyethylene, PVC, Teflon, Viton, Viton/chlorobutyl rubber; Saranex, Silvershield, Sol-vex nitrile.

For less than 30%. solution: Viton + chlorobutyl rubber, Silvershield, polyvinyl chloride; polyethylene, Nitrile + polyvinyl chloride; and chlorinated polyethylene are among the recommended protective materials. Neoprene + Natural rubber and polyethylene.

All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 milligram per cubic meter:* Sa:Cf[£] (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprHie[£] (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter[£]); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

[£] *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals.(2) Color code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical, personnel should be trained on its proper handling and storage. NaOH must be stored to avoid contact with water, acids, flammable liquids; organic halogen compounds; metals, or nitro compounds; because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1823 NaOH, solid, Hazard class: 8; Labels: 8-Corrosive material. UN1824 NaOH, solution, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Wear protective clothing. For the solid, sweep into large vessel containing a large amount of water. Neutralize with weak hydrochloric acid. For solution, neutralize with weak hydrochloric acid. Pick up with mop or water vacuum. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. NaOH itself does not burn, but it is a strong oxidizer and may ignite combustibles, such as wood, paper, oil, etc. Thermal decomposition products may include sodium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Discharge into tank containing water, neutralize, then flush to sewer with water.

EC Number: 218-495-9
Regulatory Authority and Advisory Information
Carcinogenicity: EPA, Not likely to be carcinogenic to humans
Hazard Alert: Poison, Suspected reprotoxic hazard, Agricultural chemical, Environmental hazard.
CLEAN AIR ACT: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds.
CLEAN WATER ACT: Toxic Pollutant (Section 401.15) as arsenic and compounds.
RCRA Section 261 Hazardous Constituents, RCRA Section 261 Hazardous Constituents, waste number D004 (arsenic compounds)
EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg).
EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimus* concentration reporting level: (inorganics) 0.1%.; organics 1.0%. Form R, Toxic Chemical Category Code: N020
United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.
Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xn; risk phrases: R22; R23/25; R31; R50/53; R63; safety phrases: S2; S20/21; S28; S29/35; S45; S46; S60; S61; S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]
Description: Colorless solid or colorless to red or green solution. Odorless. Specific Gravity: (DSMA) 1.0 @ 20°C; (MSMA solutions) 1.4−1.6 @ 20°C (liquid); molecular weight: 161.96; boiling point: Decomposes; melting point: 235 to 241F (NTP, 1992). Solid may float or sink in water; solid; solutions mix with water; solubility: greater than or equal to 100 mg/mL @ 25°C.
Potential Exposure: Those exposed to this organometallic, selective pesticide used for postemergence control of grasses, sedges, and weeds.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with reducing agents.
Permissible Exposure Limits in Air:
Arsenic, organic compounds
OSHA PEL: 0.5 mg[As]/m^3 TWA
NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A
ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.
PAC Ver. 27, no values found in Ver. 29[138]
PAC-1: 1.1 milligram per cubic meter
PAC-2: 4 milligram per cubic meter
PAC-3: 510 milligram per cubic meter
Determination in Air: Filter; Reagent: Ion chromatography/hydride atomic absorption: NIOSH IV [#5022, Arsenic, organo-][18].
Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons. Federal Drinking Water Guidelines: EPA 10 μg/L; State Drinking Water Guidelines: Arizona 10 μg/L; Connecticut 10 μg/L. Toxic pollutant designated pursuant to section 307 (a) (1) of the Clean Water Act and is subject to effluent limitations (arsenic and inorganic and organic arsenic) [40 CFR 401.15 (7/1/1987)]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L. Runoff from spills or fire control may cause water pollution.
Determination in Water: See OSHA Analytical Method ID-105 for arsenic. The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry.
Routes of Entry: Ingestion, inhalation, skin or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Toxic, may be fatal if inhaled, swallowed, or absorbed through skin. Avoid any skin or eye contact. Effects of contact or inhalation may be delayed. LD_{50}(oral-rat) = 700 mg/kg.
Long Term Exposure; Suspected reprotoxic hazard.
Points of Attack: Eye and skin irritant.
Medical Surveillance: Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most

accurate at the end of a work-day). Levels should not be greater than 100 μg/g of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests. Before first exposure and every 6−12 months thereafter, a medical history and exam are recommended, including: exam of the nose, skin eyes, nails, and nervous system. Employees shall be counseled by the physician to ensure that employee is aware that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone, and serum luteinizing hormone (LH) may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning, BAL, Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, *Inorganic Arsenic.*

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with arsenic compounds all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents; chemically active metals; strong bases; moisture, fertilizers, seeds, insecticides, and fungicides.

Shipping: UN2994 Arsenical pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3280 Organoarsenic compound, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required, Potential Inhalation Hazard (Special Provision 5).

Spill Handling:

Organoarsenic compound, solid or liquid

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/60

Then: Protect persons downwind (mi/km)

Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills:* take up with sand or other noncombustible absorbent material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Noncombustible, substance itself does not burn but may decompose upon heating to produce corrosive and/or toxic fumes, including arsenic and oxides of carbon. Containers may explode when heated. Runoff from fire control or dilution water may be corrosive and/or toxic and may cause pollution. Runoff may pollute waterways. If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Small Fire: Use dry chemical, CO_2 or water spray. *Large Fire*: Water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: Disposal of unused product must be undertaken by qualified personnel who are knowledgeable in all applicable regulations and follow all pertinent safety precautions including the use of appropriate protective equipment. For proper handling and disposal, always comply with federal, state, and local regulations.

Sodium Metabisulfite S:0510

Formula: $O_5S_2 \cdot 2Na$; $Na_2S_2O_5$

Synonyms: Disodium disulfite; Disodium disulfite; Disodium pyrosulfite; Disulfurous acid, disodium salt; Pyrosulfurous acid, sodium salt; Sodium disulfite; Sodium metabisulfite; Sodium metabisulfite; Sodium pyrosulfite

CAS Registry Number: 7681-57-4; *(alt.)* 7757-74-6; *(alt.)* 15771-29-6

HSDB Number: 378

RTECS Number: UX8225000

UN/NA & ERG Number: UN1759/154; UN2693 (solution)/154

EC Number: 231-673-0 [*Annex I Index No.:* 016-063-00-2] (disodium disulfite)

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1992. United States Environmental Protection Agency Gene-Tox Program, Negative: TRP reversion.

Hazard Alert: Possible risk of forming tumors, Sensitization hazard, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R31; R32; R36; R41; R43; R62; R63; safety phrases: S2; S25; S26; S39; 46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sodium metabisulfite is a white crystalline powder. Sulfur dioxide odor. It may be considered the anhydride of 2 molecules of sodium disulfite. Molecular weight = 190.1; specific gravity (H_2O:1) = 1.40 @ 25°C; boiling point = (decomposes); freezing/melting point = (decomposes) $\geq 150°C$. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0₩. Soluble in water; solubility = 54%; forms a corrosive acid with water.

Potential Exposure: Sodium metabisulfite is used as an antioxidant in pharmaceutical preparations and as a preservative in foods. People with asthma have a greater chance of having an allergic reaction with this chemical. Individuals allergic to *sodium bisulfite* (a food preservative found in some wine, fresh shrimp; packaged foods; and restaurant salads and potatoes) may have a severe reaction when exposed to sodium metabisulfite.

Incompatibilities: A strong reducing agent. Keep away from oxidizers. Mixtures with water forms a strong corrosive. Contact with acids releases toxic fumes. Heat causes decomposition. Slowly oxidized to the sulfate on exposure to air and moisture. Attacks metals.

Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: 5 milligram per cubic meter TWA
ACGIH TLV[1]: 5 milligram per cubic meter TWA; not classifiable as a human carcinogen
PAC Ver. 29[138]
PAC-1: 15 milligram per cubic meter
PAC-2: 64 milligram per cubic meter
PAC-3: 390 milligram per cubic meter
DFG MAK: Sensitizing substances as sulfites
Australia: TWA 5 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, 1999; United Kingdom: TWA 5 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for sodium metabisulfite in ambient air[60] ranging from 50.0 μ/m^3 (North Dakota); to 80.0 μ/m^3 (Virginia); to 100.0 μ/m^3 (Connecticut); to 119.0 μ/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation, skin and/or eye contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Sodium metabisulfite can affect you when breathed in. Exposure can irritate the nose, throat and sinuses. It can also irritate the lungs, causing coughing, wheezing, and shortness of breath. Very severe general (anaphylactic) reactions can also occur in those allergic to sodium metabisulfite that can be fatal. Contact can irritate the skin.

Long-Term Exposure: Sodium metabisulfite may cause an asthma-like allergy. Future exposures can cause asthma attacks with cough, shortness of breath; wheezing, and/or chest tightness. Can cause lung irritation; bronchitis may develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose lung or skin allergy.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand, or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustible materials, such as wood and paper. DOT requires sodium metabisulfite to be packed in earthenware; glass, metal, or plastic during transport.

Shipping: UN1759 Corrosive solids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name required. UN2693 Bisulfites, inorganic, aqueous solutions, n.o.s., Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium metabisulfite may burn, but does not readily ignite. Thermal decomposition products may include sulfur and sodium oxides. Use dry chemical, CO_2, water spray; or foam extinguishers. Sodium metabisulfite may ignite nearby combustible materials. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R24/24; R26; R36/37/38; R40; R50/53; R62; R63; safety phrases: S1/2; S28; S28; S52; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Sodium pentachlorophenate is a crystalline solid. Phenolic odor. Molecular weight = 288.3. Soluble in water; solubility = 33% @ 25°C.

Potential Exposure: Uses include: wood preservative; as a fungicide in water-based latex paints; preservation of cellulose products, textiles, adhesives, leather, pulp, paper, and industrial waste systems; a contact and preemergence herbicide; general disinfectant and control of the intermediate snail host of schistosomiasis. The technical grade of sodium pentachlorophenate usually contain toxic micro-contaminants including polychlorinated dibenzodioxins and dibenzofurans (132-64-9, and others).

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.22 milligram per cubic meter

PAC-2: 2.4 milligram per cubic meter

PAC-3: 8.4 milligram per cubic meter

Russia[43] set a MAC of 0.1 milligram per cubic meter in work-place air and MAC values for ambient air in residential areas as follows: 0.005 milligram per cubic meter on a momentary basis and 0.001 milligram per cubic meter on a daily average basis.

Determination in Air: No method available.

Permissible Concentration in Water: Russia[43] a MAC in water bodies used for domestic purposes of 5 milligram per cubic meter and in water bodies used for fishery purposes of 0.0005 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure to fine dusts or sprays cause burning in eyes and painful irritation in upper respiratory tract. If inhaled, it will induce violent coughing and sneezing. Skin irritation results from brief exposures, causing a burning sensation or rash. Symptoms of severe systemic intoxication include loss of appetite; respiratory difficulties; anesthesia, fever, sweating, difficulty in breathing, and rapidly progressive coma. Severe intoxications, including fatalities, have been reported from uncontrolled use. This compound causes inflamed gastric mucosa, congestion of the lungs; edema in the brain; cardiac dilatation; degeneration of the liver and kidneys. Individuals suffering from kidney and liver diseases have a lowered resistance and should not be exposed.

Long-Term Exposure: May cause skin allergy. May cause anemia. May damage the liver and kidneys. Repeated exposure can cause headache, weakness, sweating, fever, muscle twitching; dizziness, confusion, and death.

Points of Attack: Skin. blood, liver, kidneys.

Medical Surveillance: CBC. Liver and kidney function tests. Evaluation by a qualified allergist.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2567 Sodium pentachlorophenate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill. Collect spilled material in most convenient manner and deposit in sealed containers for later disposal. Liquids should be absorbed in vermiculite, dry sand; earth, or similar material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do so without risk. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel, place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. It is noncombustible. Thermal decomposition products may include hydrogen chloride, chlorine and oxides of sodium and carbon. *For small fires*, use dry chemical, carbon dioxide; water spray; or foam. *For large fires*, use water spray, fog, or foam. Wear self-contained (positive pressure) breathing apparatus and full protective clothing. Move container from fire area if possible. Runoff from fire control or dilution water may cause pollution. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any

signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 233-251-1

Regulatory Authority and Advisory Information

Hazard Alert: Strong oxidizer, Neurotoxic (cumulative) as Mn, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112), as manganese compounds

List 2, DEA chemical code 6588 (Title 21 CFR1310.02)

Safe Drinking Water Act (47FR 9352): SMCL = 0.05 mg/L

EPA TSCA CHEMICAL INVENTORY Section 8(b) as manganese

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%, manganese compounds, Form R Toxic Chemical Category Code: N450

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as manganese compounds, n.o.s.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: O, C, N; risk phrases: R8; R17; R34; R50/53; safety phrases: S17; S26; S29; S36/37/39; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: A reddish-black or purple crystalline solid. Molecular weight = 141.93; specific gravity (H_2O:1) = 1.972 @ 20°C. Soluble in water; solubility = > 850 g/L @ 20°C.

Potential Exposure: Used in medicine, as a disinfectant, and for many other uses: an oxidizer in reaction for making other chemicals, etchant for electronic boards; an antidote drug for chemical poisons

Incompatibilities: Oxidizers accelerates the burning of combustible material. Some may decompose explosively when heated or involved in a fire. May ignite combustibles: wood, paper, oil, organic matter, clothing, etc. Contact with finely divided metal may by explosive. May spontaneously ignite in contact with liquid combustible materials, hydrocarbons, benzene, fuels, diethyl ether, carbon disulfide. Incompatible with acetic anhydride, acetic acid. Contact with sulfuric acid may cause fires or explosions. Heat or contamination may cause explosion.

Permissible Exposure Limits in Air:

10101-50-5

PAC Ver. 29[138]

PAC-1: 7.8 milligram per cubic meter

PAC-2: 13 milligram per cubic meter

PAC-3: 78 milligram per cubic meter

Manganese:

NIOSH IDLH = 500 mg[Mn]/m^3

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume)

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL

ACGIH TLV[1] 0.02 mg[Mn]/m^3, respirable fraction; 0.1 mg[Mn]/m^3, inhalable fraction; not classifiable as a human carcinogen.

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

Determination in Air: ***Manganese:*** Use NIOSH Analytical Method, Elements by ICP, #7300; #7301; #7303; #9102; Elements in blood or tissue, #8005; Metals in urine, #8310; OSHA Analytical Method, ID-125G or ID121.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50 μg[Mn]/L; State Drinking Water Standards: New York: 300 μg[Mn]/L; State Drinking Water Guidelines: California 500 μg[Mn]/L; Connecticut: 500 μg [Mn]/L; Maine: 500 μg[Mn]/L; Minnesota: 300 μg[Mn]/L; New Hampshire: 100 μg[Mn]/L. World Health Organization (WHO) limit: 400 μg(Mn)/L

Determination in Water: The manganese detection limit by direct flame atomization is 2 μg/L. However, solvent extraction is used for many determinations. Analytic conditions are more critical for the extraction of manganese than for most other metals, because many manganese-chelate complexes are unstable in solution. With pH control and immediate analysis after extraction, accurate determinations are possible. When the graphite furnace is used to increase sample atomization, the detection limit is lowered to 0.01 μg/L or ng/L according to NAS/NRC.

Routes of Entry: Inhalation, ingestion, eye and, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: A severe skin, eye, and respiratory irritant. Inhalation, ingestion or skin or eyes contact with vapors or substance may cause severe injury, burns, or death. Hematological effects-acute, unspecified; Gastrointestinal tract-acute effects; Nervous system toxin-acute effects; Respiratory toxin-acute effects other than severe or moderate irritation; Respiratory irritant-acute, severe, or moderate but not mild irritant effects; Eye irritant-severe; Skin irritant-severe; Kidney-acute effects.

Long-Term Exposure: See manganese M:0250

Points of Attack: Respiratory system; CNS; lungs, blood, kidneys.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); biologic tissue/biopsy; CBC; chest X-ray; pulmonary function tests; urine (chemical/metabolite); urinalysis (routine). For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: A complete exam of the nervous system. CBC. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours. Medical observation is recommended.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 50 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); SCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from ammonium compounds, hydrated salts; moisture and combustible materials. Where possible, automatically transfer material from drums or other storage containers to process containers. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1503 Sodium Permanganate, Hazard Class: 5.1; Labels: 5.1-Oxidizer. PG2

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Large spill:* Consider initial downwind evacuation for at least 100 m/330 ft. Stay upwind and uphill. Isolate the area of release or fire and deny entry. Keep material away from combustible materials, fuels, etc. Remove all ignition sources. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. Keep combustibles (wood, paper, oil, etc.) away from spilled material. *Small dry spill:* Use clean shovel to collect material and place material into loosely covered *dry* containers for later disposal. *Small Liquid Spill:* Use noncombustible material like vermiculite, sand, or earth to soak up material and place in a container for later disposal. *Large Spill:* Dike far ahead of spill for later disposal. Following product recovery, flush with water. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Ventilate confined area if it can be done without placing personnel at risk.

Fire Extinguishing: Thermal decomposition products may include oxides of sodium and manganese metal. If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Containers may explode when heated. Runoff from fire control or dilution water may cause pollution) may create fire/explosion hazard or pollution. *Small fire*: Use water. Do not use dry chemicals or foams. CO_2 or Halon may provide limited control. *Large fire*: Flood area with water from a distance. Move containers from fire area it can be done without risk. Do not move cargo or vehicle if cargo has been exposed to heat. If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not allow water to get inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number N450, must conform to USEPA regulations for storage, transportation, treatment and disposal of waste. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Dispose of contents and container to an approved waste disposal plant. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. All federal, state, and local environmental regulations must be observed. Do not discharge into drains or sewers.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xi; risk phrases: R23; R28; R31; R43; R51/53; R62; R63; safety phrases: S1/2; S28; S29/35; S36/37; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Sodium selenite is a white crystalline substance. Molecular weight = 172.94; freezing/melting point = (decomposes) 320°C; 710°C[138]. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Highly soluble in water; solubility = > 80% @ 20°C.

Potential Exposure: Sodium selenite is used in glass manufacturing and as an alkaloidal reagent; for removing green color from glass during its manufacture; alkaloidal reagent; reagent in bacteriology; testing germination of seeds; decorating porcelain; as a livestock feed additive.

Incompatibilities: The aqueous solution is a medium strong base. Reacts with water, strong acids; hot surfaces; causing decomposition and a toxic hazard.

Permissible Exposure Limits in Air
NIOSH IDLH = 1 mg [Se]/m^3
OSHA PEL: 0.2 mg[Se]/m^3 TWA
NIOSH REL: 0.2 mg[Se]/m^3 TWA
ACGIH TLV[1]: 0.2 mg[Se]/m^3 TWA

Russia[43] set a MAC in ambient air in residential areas of 0.1 μ/m^3 on a momentary basis and 0.05 μ/m^3 on a daily average basis.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = 0.05 mg[Se]/L; MCL = 0.05 mg[Se]/L as selenium. State Drinking Water Standards: Arizona 10 μg[Se]/L; New York 10 μg[Se]/L; State Drinking Water Guidelines: Arizona 45 μg[Se]/L; Connecticut 10 μg[Se]/L; Maine 35 μg[Se]/L; Minnesota 30 μg[Se]/L.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and the respiratory tract. Inhalation of the dust can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the liver, kidneys, heart, nervous system, and gastrointestinal tract. *Inhalation:* Dust or fumes can cause irritation of the nose, throat, and lungs; nausea, vomiting, intestinal disturbance; garlic odor on breath; headache, fatigue and irritability. *Skin:* Can cause irritation, burning, and red or yellow discoloration. *Eyes:* Can cause irritation and injury. *Ingestion:* Can cause nausea, vomiting, abdominal pain; diarrhea, metallic taste, and garlic odor on breath. Elemental selenium has low acute systemic toxicity, but dust or fumes can cause serious irritation of the respiratory tract. In humans, a concentration of 5 ppm in food or 0.5 ppm in milk or water has been estimated to be dangerous (selenium compounds). Animal studies suggest that the lethal dose for an adult may be as low as 1/200 oz.

Long-Term Exposure: Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the CNS; blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite; containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic-breath.

Points of Attack: Liver, kidneys, heart, nervous system; gastrointestinal tract.

Medical Surveillance: Urine test for selenium (should be less than 100 μg/L of urine). Liver and kidney function tests. Examination of the nervous system. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Wear protective gloves when inducing vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning, *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Change gloves frequently. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: For levels Up to 2 milligram per cubic meter use a respirator with full facepiece and dust and mist filters. For levels Up to 7.5 milligram per cubic meter use a powered air-purifying respirator with dust and mist filters or supplied-air respirator operated in continuous flow mode. For levels Up to 10 milligram per cubic meter use a high-efficiency particulate filter respirator with a full facepiece. For levels Up to 100 milligram per cubic meter use a Type C supplied-air respirator with a full facepiece operated in a positive-pressure mode. For levels above 100 milligram per cubic meter or use in areas of unknown concentrations use a self-contained Type C supplied-air respirator with an auxiliary SCBA, both with full facepiece and operated in a positive-pressure mode. For firefighting use a SCBA with a full facepiece operated in a positive-pressure mode. For escape from a contaminated area use a high-efficiency particulate filter respirator with a full facepiece or an escape SCBA with a full facepiece.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store at room temperature in water tight containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2630 Selenates or Selenites, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May burn but will not ignite readily. Thermal decomposition products may include oxides of sodium and metal. *Small fires:* dry chemical carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Thermal decomposition products may include selenium and sodium oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Liquid or solid: make a strongly acidic solution using hydrochloric acid. Slowly add sodium sulfite to the cold solution. Stir mixture producing sulfur dioxide. Heat, forming dark-gray selenium and black tellurium. Let stand overnight. Filter and dry. Ship to supplier.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R62; R63;?; safety phrases: (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sodium sulfate is a white crystalline solid. It frequently is found as the decahydrate. Molecular weight = 142.04; specific gravity(H_2O:1) = 2.7 @ 20°C; freezing/melting point = 888°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 1. Soluble in water.

Potential Exposure: Sodium sulfate is used in the manufacture of glass; as a precipitating agent in the manufacture of silver emulsions; as an analytical reagent; in making ultramarine and paper pulp; in ceramic glazes and pharmaceuticals; as a food additive; and a filler in synthetic detergents.

Incompatibilities: Violent reaction with aluminum, magnesium. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 9.8 milligram per cubic meter

PAC-2: 110 milligram per cubic meter

PAC-3: 650 milligram per cubic meter

Permissible Concentration in Water: Maryland[61] has set a guideline of 210 μg/L for sodium sulfate in drinking water.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May cause irritation of nose and throat at high dust levels. *Skin:* No information found. *Eyes:* May cause irritation of nose and throat at high dust levels. *Ingestion:* Irritation of the digestive tract; vomiting and diarrhea may result from ingestion of 1/2 oz.

Long-Term Exposure: No information found.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wear a dust mask if necessary.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Keep tightly closed in a cool place. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2630 Selenates or Selenites, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge waste sodium sulfate directly into sewers or surface waters. Recovered sodium sulfate may be disposed of by burial in a landfill.

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence Group 3, 1992. United States Environmental Protection Agency Gene-Tox Program, Positive: *S. cerevisiae*-reversion.

Hazard Alert: Strong reducing agent, Sensitization hazard, Possible risk of forming tumors, Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R22; R31; R36/37/38; R43; R63; safety phrases: S22; S24/25; S26; S36; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Sodium sulfite is a white crystalline solid. Molecular weight = 126.04; specific gravity (H_2O:1) = 2.63 @ 20°C; freezing/melting point = (decomposes) 538°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Highly soluble in water; aqueous solution is basic.

Potential Exposure: Sodium sulfite is used as a reducing agent; in boiler water treatment; food applications; in photographic developers and fixers; in bleaching of wool, paper, textiles, straw and silk; manufacture of dyes; dechlorination; preservation of meat, fruit and egg products; silvering of glass.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases. Reacts with strong acids producing toxic sulfur dioxide.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 11 milligram per cubic meter
PAC-2: 120 milligram per cubic meter
PAC-3: 710 milligram per cubic meter

Permissible Concentration in Water: Maryland[61] has set a guideline for sodium sulfite in drinking water of 100 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May cause asthmatic reactions Animal studies indicate that levels of 1 milligram per cubic meter may cause slight swelling of lung tissue and irritation. *Skin:* Corrosive. Causes irritation and burns. *Eyes:* Corrosive. Causes severe irritation and burns. *Ingestion:* Solutions cause gastric irritation by the liberation of sulfurous acid. Because of rapid oxidation to sulfate, sulfites are well tolerated until large doses are reached; then violent colic and diarrhea, circulatory disturbances; central nervous depression; and death can occur. Increased dosage will result in sudden, violent colic and diarrhea, circulatory disturbances; slowed breathing; fainting, rapid pulse; and death. The lethal dose may be about 10 g (about 1/3 oz).

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. Repeated or prolonged inhalation exposure may cause asthma.

Points of Attack: Skin, lungs.

Medical Surveillance: Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry location in closed containers.

Shipping: UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable. Use agents suitable for surrounding fire. Decomposes at >538°C. Thermal decomposition products may include sulfur dioxide and oxides of sodium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R23/24/25; R62; safety phrases: S22; S36/37/39; S45 (see Appendix 4)

Description: Sodium tellurite is a white crystalline solid. Molecular weight = 221.6. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Slightly soluble in water.

Potential Exposure: Used in bacteriology and medicine. Formerly used as pesticide.

Incompatibilities: A weak reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, cadmium, halogens. Reaction with oxidizers may generate heat and products that may be flammable, combustible, or otherwise reactive[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 25 mg[Te]/m^3 OSHA PEL: 0.1 mg[Te]/m^3 TWA

NIOSH REL: 0.1 mg[Te]/m^3 TWA

ACGIH TLV[1]: 0.1 mg[Te]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 1.8 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 120 milligram per cubic meter

DFG MAK: 0.1 mg[Te]/m^3, inhalable fraction

Australia: TWA 0.1 milligram per cubic meter, 1993; Austria: MAK 0.1 milligram per cubic meter, 1999; Belgium: TWA 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; Finland: TWA 0.1 milligram per cubic meter, STEL 0.3 milligram per cubic meter, 1999; France: VME 0.1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 mg[Te]/m^3, 2003; the Philippines: TWA 0.1 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter; MAC (STEL) 0.03 milligram per cubic meter, 1999; Sweden: NGV 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, KZG-W 0.5 milligram per cubic meter, 1999; Turkey: TWA 0.1 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 mg[Te]/m^3. Several states have set guidelines or standards for tellurium in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota); to 1.6 μ/m^3 (Virginia); to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7900. See also #7300, Elements; #7301; #7303; #9102; OSHA Analytical Method ID-121.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects. Russia[43] set a MAC for tellurium in water bodies used for domestic purposes of 0.01 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin and eyes. Irritates the respiratory tract causing cough and wheezing. Tellurium compounds are both an oral and dermal toxic hazard. The material is toxic by ingestion. Oral ingestion of tellurium compounds is generally regarded as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between seven drops and one teaspoonful for a 70 kg (150 lb) person. Tellurium compounds are regarded as super toxic for skin exposures. Symptoms of exposure are as follows: sleepiness, fatigue, stupor; loss of appetite; nausea, vomiting, stomach pain; metallic taste; garlic odor of the breath and sweat; dryness of the mouth or excessive salivation; renal pain; bronchitis, irregular breathing; cyanosis, fatty degeneration of the liver; and unconsciousness.

Long-Term Exposure: Repeated or prolonged exposure to tellurium compounds may cause reproductive damage; liver and kidney damage; lung irritation. Bronchitis may develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Liver, kidneys, lungs.

Medical Surveillance: Lung function tests, liver and kidney function tests.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others[52]. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. If medical advice is not readily available, consider inducing vomiting of this toxic material. Transport at once to a medical facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *Up to 1 milligram per cubic meter:* 95QX [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 25 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place.

Shipping: UN3284 Tellurium compound, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2811: *Isolation Distance, Spill*: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products including metal oxides of tellurium and sodium. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Do not use halogens. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Synonyms: EA 1210; Fluoromethylpinacolyloxyphosphine Oxide; GD (military designation); Methyl-fluoropinacolylphosphonate; Methyl-pinacolyloxyfluorophosphine oxide; Methyl-pinacolyloxyphosphonyl flouride; PFMP; Phosphonofluoridic acid, methyl-, 1,2,2-trimethylpropyl ester; Pinacolyl methylphosphonofluoridate; Pinacolyl methanefluorophosphonate; Pinacolyl methylfluorophosphonate; Pinacolyloxymethylphosphonyl flouride; Somain; Thickened GD; TGD; 1,2,2-Trimethylpropylmethylphosphonofluoridate; 1,2,2,-Trimethylpropoxyfluoromethyl phosphine oxide; Zoman

Chlorosoman

O-Pinacolyl methylphosphonochloridate; méthylphosphonochloridate de O-pinacolyle (French)

CAS Registry Number: 96-64-0; 50642-24-5; 7040-57-5 (Chlorosoman); 89254-46-6 (C−)−Soman)

HSDB Number: 6764

RTECS Number: TA8753000 (C−)−Soman)

UN/NA & ERG Number: (PIH) UN2810 (toxic liquid, organic, n.o.s.)/153

EC Number: Not assigned

Regulatory Authority

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g (*96-64-0; 7040-57-5 chloro-soman*).

Carcinogenicty: GD is not listed by the IARC, ACGIH, OSHA, or NTP as a carcinogen.

Hazard Alert: Poison inhalation hazard, Extremely toxic inhalation hazard, Dangerous nerve agent, Combustible, Dangerously water reactive, Possible Environmental hazard. Information on GD is limited.

United States DOT 49CFR172.101, Inhalation Hazard Chemical.

WGK[100] (German Aquatic Hazard Class): No value found. *Note*: Hydrolyzed by water forming hydrogen fluoride and the nontoxic phosphonic acid derivative.

Description: Soman (GD), a fluorinated organophosphorus compound. Exposure to soman can cause death in minutes. A fraction of an ounce (1 to 10 mL) of soman on the skin can be fatal[77]. When pure, GD is a colorless liquid with fruity odor. With impurities, or upon aging, GD is an amber to dark brown oily liquid with an odor of rotten fruit or camphor (like Vicks Vapo-Rub). *Do not rely on odor for detection; not everyone can smell low concentrations of this chemical.* Molecular weight = 182.2; boiling point = 198°C; 167−200°C; specific gravity (h20 = 1) = 1.022 @ 20°C; melting point: − 42°C; vapor pressure = 0.4 mmHg @ 25°C; vapor density (air = 1) = 6.3; volatility = 3900 milligram per cubic meter @ 25°C; flash point = 121°C (oc). Flammability limits: Unknown. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0 ₩. Slightly soluble in water; reacts with (hydrolyzed by) water to form hydrofluoric acid and the nontoxic phosphonic acid derivative.

Thickened agent GD [TGD] is essential the same as GD except for viscosity. Viscosity = (approximately) 1180 centistokes uses "K125" (acryloid copolymer, 5%) to create TGD. K125 is not known to be a hazardous material except in a finely divided, powder form[92]. *Chlorosoman*: Molecular weight = 198.63.

Potential Exposure: Agent GD, an organic fluoride compound, is a quick-acting chemical warfare nerve agent (nerve gas). Medical treatment of soman is difficult because it permanently binds to receptors in the body in minutes. Large amounts of the vapor or liquid can hurt you in minutes, and can quickly lead to death.

Persistence of Chemical Agent: Soman (GD): Summer: 10 minutes to 24 hours; Winter: 2 hours to 3 days.

Incompatibilities: Hydrolyzed by water to form hydrogen fluoride and the nontoxic phosphonic acid derivative. It is rapidly hydrolyzed by dilute aqueous NaOH[101] Stable after storage in steel for 3 months @ 65°C. Raising the pH increases the rate of decomposition significantly. GD decomposes slowly in water; will hydrolyze to form HF-H-H-O-CH_3 and $(CH_3)_3$-C-C-O-P-OH. GD reacts readily with bases and weak acids. Under acid conditions, GD hydrolyzes, forming hydrofluoric acid (HF). Flammable hydrogen gas produced by the corrosive vapors reacting with metals, concrete, etc., may be present. Corrosive to steel and possibly other ferrous metals. GD corrodes steel at the rate of 1×10^{-5} in/month. When heated to decomposition or on contact with steam, it emits very toxic fumes of fluorides and oxides of phosphorus.

4 hours—0.0098 ppm
8 hours—0.0071 ppm

The suggested permissible airborne exposure concentration of Soman (GD) for an 8 hours work-day or a 40 hours work week is an 8 hours TWA of 0.00003 milligram per cubic meter (2×10^{-5} ppm). This value is based on the TWA of GB as proposed in the USAEHA Technical Guide No. 169, *Occupational Health Guidelines for the Evaluation and Control of Occupational Exposure to Nerve Agents GA, GB, GD, and VX*. Also, the general population limits (as recommended by the Surgeon General's Working Group, United States Department of Health): 0.000003 milligram per cubic meter.

Determination in Air: Available monitoring equipment for soman (GD) is the Automatic Chemical Agent Detector Alarm (ACADA), bubblers (GC method), and Chemical Agent Monitor (CAM).

Determination in Water: Octanol−water coefficient: Log K_{ow} (estimated) = 1.02:Log $K_{benzene\text{-}water}$ = 1.61. Soman dissolves in water and remains very dangerous. To prevent anyone from drinking water mixed with soman, notify local health and pollution control officials. Also, notify operators of nearby water intakes and advise shutting water intakes. Hydrolysis by acidic, neutral, and basic mechanisms; giving fluoride and pinacolyl methylphosphonate. Rapidly hydrolyzed in basic solutions e.g., Na_2CO_3, NaOH, or KOH) with a half-life of approximately 1 minute at pH 11 @ 25°C. Soman and its hydrolysis products exhibit no significant phototransformations in sunlight. Soman and its hydrolysis products are thermally stable at temperatures less than 49°C. Use M272 Chemical Agent Water Testing Kit. Detection limit for nerve agents is 0.02 mg/L. Bleaching powder (chlorinated lime) destroys soman but gives rise to cyanogen chloride (CAS: 506-77-4). See table of contents or name index for location of entry for: "Cyanogen chloride."

Routes of Entry: Skin absorption, absorption through eyes; and inhalation.

Harmful Effects and Symptoms

Soman (military designation GD) is one of the nerve agents, which are the most toxic of the known chemical warfare agents. It has an odor like camphor or rotting fruit. Exposure to soman can cause death in minutes. A fraction of an ounce (1 to 10 mL) of soman on the skin can be fatal. Nerve agents are chemically similar to organophosphate pesticides and exert their effects by interfering with the normal function of the nervous system[77].

Short-Term Exposure: Soman (GD) is a lethal anticholinesterase agent with the median lethal dose in humans being: LCt_{50} (inhalation) = 70 mg min/m^3 (t = 10 min); LD_{50} (PC, bare skin) = 0.35 g/man (70 kg). *One to several minutes following overexposure to airborne Soman (GD)* the following acute symptoms appear: *Local effects* (lasting 1−15 days, increase with dose): *Eyes:* Miosis (constriction of pupils); redness, pressure sensation on eyes. *Inhalation:* Rhinorrhea (runny nose), nasal congestion, tightness in chest; wheezing, salivation, nausea, vomiting. *Systemic effects* (increases with dose): When inhaled soman (GD) will cause excessive secretion causing coughing/breathing difficulty: salivation and sweating: vomiting, diarrhea, stomach cramps; involuntary urination/defecation; generalized muscle twitching/muscle cramps; CNS depression including anxiety, restlessness, giddiness, insomnia, excessive dreaming, and nightmares. With more severe exposure, also headache, tremor, drowsiness, concentration difficulty; memory impairment; confusion, unsteadiness on standing or walking; and progressing to death. After exposure to liquid soman (GD), the following acute symptoms appear: *Local effects*: *Eyes:* Miosis (constriction of pupils); redness, pressure sensation on eyes. *Ingestion:* salivation, anorexia, nausea, vomiting, abdominal cramps; diarrhea, involuntary defecation; heartburn. *Skin:* Sweating, muscle twitching. If recovery from nerve agent poisoning occurs, it will be complete unless anoxia or convulsions have gone unchecked so long that irreversible CNS changes due to anoxemia have occurred.

Long-Term Exposure: Limited data suggest delayed neuropathy (postural sway, psychomotor performance). Miosis has been noted Up to 62 days[92]. Chronic exposure to soman (GD) causes forgetfulness, thinking difficulty; vision disturbances; muscular aches/pains. Mild or moderately exposed people usually recover completely. Severely exposed people are not likely to survive. Unlike some organophosphate pesticides, nerve agents have not been associated with neurological problems lasting more than 1 to 2 weeks after the exposure. Although certain organophosphate pesticides have been shown to be teratogenic in animals, these effects have not been documented in carefully controlled toxicological evaluations for soman (GD). The inhibition of cholinesterase enzymes throughout the body by nerve agents is more or less irreversible so that their effects are prolonged. Until the tissue cholinesterase enzymes are restored to normal activity, probably by very slow regeneration over a period of weeks or 2 to 3 months if damage is severe, there is a period of increased susceptibility to the effects of another exposure to any nerve agent. During this period the effects of repeated exposures are cumulative; after a single exposure, daily exposure to concentrations of a nerve agent insufficient to produce symptoms may result in the onset of symptoms after several days. Continued daily exposure may be followed by increasingly severe effects. After symptoms subside, increased susceptibility persists for one to several days. The degree of exposure required to produce recurrence of symptoms, and the severity of these symptoms, depend on duration of exposure and time intervals between exposures. Increased susceptibility is not limited to the particular nerve agent initially absorbed. Agent GD is not listed by the IARC; ACGIH; OSHA; or NTP as a carcinogen.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase. Liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. CBC. Evaluation of thyroid function. Liver function tests. Kidney function tests. CNS tests. EKG.

First Aid: *Inhalation:* Hold breath until respiratory protective mask is donned. If severe signs of agent exposure appear (chest tightens; pupil constriction; a lack of coordination; etc.); immediately administer, in rapid succession, all three Nerve Agent Antidote Kit(s); Mark I injectors (or atropine if directed by the local physician). Injections using the Mark I kit injectors may be repeated @ 5 to 20 minute intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. If breathing has stopped, give artificial respiration. Mouth-to-mouth resuscitation should be used when approved mask-bag of oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. If breathing is difficult, administer oxygen. Seek medical attention *Immediately*.

Eye contact: Immediately flush eyes with water for 10−15 minutes, then don respiratory protective mask. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection will not be administered when miosis is the only sign present. Instead, the individual will be taken *immediately* to the medical treatment facility for observation. *Skin contact:* Don respiratory protective mask and remove contaminated clothing. Immediately wash contaminated skin with copious amounts of soap and water; 10% sodium carbonate solution, or 5% liquid household bleach. Rinse well with water to remove decontaminant. Administer nerve agent antidote kit, Mark I, only if local sweating and muscular twitching symptoms are present. Seek medical attention *Immediately*. *Ingestion:* Do not induce vomiting. First symptoms are likely to be gastrointestinal. *Immediately* administer Nerve Agent Antidote kit, Mark I. Seek medical attention immediately. If there is no apparent breathing, artificial resuscitation will be started immediately, but *do not* use mouth-to-mouth resuscitation when facial contamination exists; in this case, use mechanical resuscitator. The situation will dictate method of choice. When appropriate and trained personnel are available, CPR may be necessary.

Notes for physician and qualified medical personnel: An individual who has received a known agent exposure or who exhibits definite signs or symptoms of agent exposure shall be given an intramuscular injection immediately with the MARK I kit auto-injectors. Some of the early symptoms of a *vapor exposure* may be rhinorrhea (runny nose) and/or tightness in the chest with shortness of breath (bronchial constriction). Some of the early symptoms of a *percutaneous exposure* may be local muscular twitching or sweating at the area of exposure followed by nausea or vomiting. Although myosis (pin-pointing of the pupils) may be an early sign of agent exposure, an injection shall not be administered when myosis is the only sign present. Instead, the individual shall be taken immediately to the medical facility for observation. Injections using the MARK I kit injectors (or atropine only if directed by the local physician) may be repeated @ 5 to 20 minutes intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. Administer, in rapid succession, all three MARK I kit injectors (or atropine if directed by the local physician) in the case of SEVERE signs of agent exposure. If indicated, CPR should be started immediately. Mouth-to-mouth resuscitation should be used when approved mask-bag or oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. *CAUTION:* atropine does not act as a prophylactic and shall not be administered until an agent exposure has been ascertained.

Medical treatment: ECG, and adequacy of respiration and ventilation, should be monitored. Supplemental oxygenation, frequent suctioning of secretions, insertion of a tube into the trachea (endotracheal intubation), and assisted ventilation may be required. Diazepam (5 to 10 mg in adults and 0.2 to 0.5 mg/kg in children) may be used to control convulsions. Lorazepam or other benzodiazepines may be used, but barbiturates, phenytoin, and other anticonvulsants are not effective. Administration of atropine (if not already given) should precede the administration of benzodiazepines in order to best control seizures. Patients/victims who have inhalation exposure and who complain of chest pain, chest tightness, or cough should be observed and examined periodically for 6 to 12 hours to detect delayed-onset inflammation of the large airways (bronchitis), inflammatory lung disease (pneumonia), accumulation of fluid in the lungs (pulmonary edema), or respiratory failure.

Decontamination: This is very important. The rapid physical removal of a chemical agent is essential. If you don't have the equipment and training, don't enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim can't move, decontaminate without touching and without entering the hot or the warm zone. Nerve gasses stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a sealed double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Don't wait for soap or for the victim to remove clothing; begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 minutes. Use caution to avoid hypothermia in children and the elderly. Wash−strip−wash−evacuate up wind and uphill: Patients exposed to nerve agent by vapor only. should be decontaminated by removing all clothing in a clean-air environment; and shampooing or rinsing the hair to prevent vapor-off gassing; patients exposed to liquid nerve agent should be decontaminated by washing in available clean water at least three times. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. Decontaminate with diluted household bleach* (0.5%, or one part bleach to 200 parts water), but don't let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Remember that the water you use to decontaminate the victims is dangerous. Be sure you've decontaminated the victims as much as you can before they are released from the area, so they don't spread the nerve gas. Rinse the eyes, mucous membranes; or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction.

**Note*: The following can be used in addition to household bleach: (1) solids, powders, and solutions containing various types of bleach (NaOCl or $Ca(OCl)_2$); (2) DS2 (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether); (3) towelettes moistened with NaOH (NaOH) dissolved in water, phenol, ethanol, and ammonia. *Note:* Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gal of water) to decontaminate scissors used in clothing removal, clothes, and other items.

Personal Protective Methods: *Protective gloves*: Butyl Glove M3 and M4; Norton chemical protective glove set. *Eye protection*: chemical goggles. For splash hazards use goggles and faceshield. *Other protective equipment*: Full protective clothing will consist of M9 mask and hood; butyl rubber suit (M3), M2A1 butyl boots; M3 and M4 gloves; unimpregnated underwear; or demilitarization protective ensemble (DPE). For laboratory operations; wear lab coats and have a protective mask readily available.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Positive pressure, full facepiece, NIOSH/MSHA or European Standard EN 149-approved SCBA will be worn where there is danger of oxygen deficiency and when directed by the fire chief or CAI operations officer. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a CAI for rescue/reconnaissance purposes they will wear appropriate levels of protective clothing.

From the Riegle Report

Less than 0.00003 milligram per cubic meter: M9, M17, or M40 series mask shall be available for escape as necessary. 0.00003 *milligram per cubic meter* to 0.06 *milligram per cubic meter:* M9 or M40 series mask with Level A or Level B ensemble. *Greater than 0.06 milligram per cubic meter:* or DPE or TAPES used with prior approval from AMC Field Safety Activity. *Note:* When DPE or TAPES is not available, the M9 or M40 series mask with Level A protective ensemble can be used. However, use time shall be restricted to the extent operationally feasible, and may not exceed 1 hour. As an additional precaution, the cuffs of the sleeves and the legs of the M3 suit shall be taped to the gloves and boots respectively to reduce aspiration.

Local Exhaust: Mandatory. Must be filtered or scrubbed to limit exit conc. to <0.00001 *milligram per cubic meter* (averaged over 8 hours/day, indefinitely).
Special: Chemical laboratory hoods shall have an average inward face velocity of 100 linear feet per minute (l fpm) + 10% with the velocity at any point not deviating from the average face velocity by more than 20%. Laboratory hoods shall be located such that cross-drafts do not exceed 20% of the inward face velocity. A visual performance test utilizing smoke-producing devices shall be performed in assessing the ability of the hood to contain agent GD. Emergency back-up power necessary: Hoods should be tested semi-annually or after modification or maintenance operations. Operations should be performed 20 cm inside hood face. *Other:* Recirculation of exhaust air from agent areas is prohibited. No connection between agent areas and other areas through ventilation system is permitted.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. In handling soman (GD), the "buddy system" will be incorporated. No smoking, eating, or drinking is permitted in areas containing agent GD. Containers should be periodically inspected for leaks (either visually or by a detector kit) and prior to transferring the containers from storage to work areas. Stringent control over all personnel practices must be exercised. Decontamination equipment shall be conveniently located. Exits must be designed to permit rapid evacuation. Chemical showers, eyewash stations, and personal cleanliness facilities shall be provided. Wash hands before meals and each worker will shower thoroughly with special attention given to hair, face, neck, and hands, using plenty of soap before leaving at the end of the work-day. *Other precautions:* Agent GD must be double-contained in liquid and vapor-tight containers when in storage or when outside of the ventilation hood.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, Technical Name Required. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:
UN2810 Toxic liquids, organic, n.o.s.
Initial isolation and protective action distances
Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).
Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5
GD (when used as a weapon)
Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 1.7/2.7
Warn pollution control authorities and advise shutting water intakes. Spills must be contained by covering with vermiculite, diatomaceous earth; clay, fine sand; sponges and paper or cloth towels. This containment is followed by treatment with copious amounts of aqueous NaOH solution (a minimum of 10%). Scoop up all material and place in a fully removable head drum with a high density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, state, and DOT regulations. Dispose of material used to decontaminate exterior of drum in accordance with IAW Federal, state, and local regulations. Contaminated clothing will be placed in a fully removable head drum with a high density polyethylene liner and the contents shall be covered with decontaminating solution as above before affixing the drum head. Conduct general area monitoring to confirm that the atmospheric concentrations do not exceed the exposure limits (see Section 8). If 10% wt. aqueous NaOH solution is not available then the following decontaminants may be used instead and are listed in the order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate, and STB.

Fire Extinguishing: Thermal decomposition products may include very toxic fumes of fluorides and oxides of phosphorus. When heated, vapors may form explosive mixture with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. Fires involving soman (GD) should be contained to prevent contamination of uncontrolled areas. All persons not engaged in extinguishing the fire should be evacuated immediately. Contact with soman (GD) or its vapors can be fatal. When responding to a fire alarm in buildings or areas containing nerve agents, firefighting personnel should wear full firefighter protective clothing (without TAP clothing) during chemical agent firefighting and fire rescue operations. Respiratory protection is required. Positive pressure, full facepiece, NIOSH/MSHA or European Standard EN 149-approved SCBA will be worn where there is danger of oxygen deficiency and when directed by the fire chief or CAI operations officer. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a CAI for rescue/reconnaissance purposes they will wear appropriate levels of protective clothing.

Disposal Method Suggested: Principles and methods for destruction of chemical weapons: "Destruction of chemical weapons" means a process by which chemicals are converted in an essentially irreversible way to a form unsuitable for production of chemical weapons, and which in an irreversible manner renders munitions and other devices unusable as such. Each nation shall determine how it shall destroy chemical weapons, except that the following processes may not be used: dumping in any body of water, land burial, or open-pit burning. It shall destroy chemical weapons only at specifically designated and appropriately designed and equipped facilities. Each nation/shall ensure that its chemical weapons destruction facilities are constructed and operated in a manner to ensure the destruction of the chemical weapons; and that the destruction process can be verified under the provisions of this Convention [Organization for the Prohibition of Chemical Weapons; Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and Their Destruction]. A minimum of 55 g of decontamination solution is required per gram of soman (GD). A minimum of 65 g of decontamination fluid per gram of soman (GD) is allowed to agitate for a minimum of 1 hour. Agitation is not necessary following the first hour provided a single phase is obtained. At the end of the first hour the pH should be checked and adjusted Up to 11.5 with additional NaOH as required. An alternate solution for the decontamination of soman (gd) is 10% sodium carbonate in place of the 10% NaOH solution above. Continue with 55 g of decon per gram of gd. Agitate for 1 hour and allow to react for 3 hours. At the end of the third hour, adjust the pH to above 10. It is also permitted to substitute 5.25% sodium hypochlorite for the 10% NaOH solution above. Continue with 55 g of decon per gram of soman (GD). Agitate for 1 hour and allow to react for 3 hours, then adjust the pH to above 10. Scoop up all material and place in a fully removable head and a high density polyethylene liner. Cover the contents with additional decontaminating solution before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW EPA, and DOT regulations. All contaminated clothing will be placed in a fully removable head drum with a high density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled per IAW EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW EPA, and DOT regulations. Conduct general area monitoring to confirm that the atmospheric concentrations do not exceed the exposure limits. *Waste disposal method*: Open pit burning or burying of soman (GD) or items containing or contaminated with soman (GD) in any quantity is prohibited. The detoxified soman (GD) (using procedures above) can be thermally destroyed by incineration in an EPA approved incinerator in accordance with appropriate provisions of federal, state and local RCRA regulations. *NOTE:* Several states define decontaminated surety material as a RCRA Hazardous Waste.

Stannic Chloride, Hydrated S:0570

Formula: $Cl_4H_{10}O_5Sn$; $SnCl_4 \cdot 5H_2O$

Synonyms: Stannic chloride pentahydrate; Tetrachlorostannane pentahydrate

CAS Registry Number: 7646-78-8; 10026-06-9 (hydrated)

HSDB Number: 781(7646-78-8)

RTECS Number: XP8870000

UN/NA & ERG Number: UN2440/154

EC Number: 050-001-00-5

Regulatory Authority and Advisory Information

Hazard Alert: Corrosive, Water and air reactive.

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R22; R34; R35; R36/37/38; R40; R42; R50/53; R67; safety phrases: S7/8; S23; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Stannic chloride is a white to yellow powder with a faint odor of HCl. Molecular weight = 350.59; boiling point = 114°C; freezing/melting point = −33°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. ₩ Soluble in water; dangerously reactive releasing hydrochloric acid and dense white fumes.

Potential Exposure: Hydrated stannic chloride is used for fixing certain textile dyes, and for treating silk to give weight to the fabric.

Incompatibilities: Reacts violently with water, forming corrosive hydrochloric acid and tin oxide fumes. Reacts with turpentine, alcohols, and amines, causing fire and explosion hazard. Attacks many metals; some forms of plastics, rubber, and coatings. Reacts with moist air to form hydrochloric acid and dense white fume.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 mg[Sn]/m^3
OSHA PEL: 2 mg[Sn]/m^3 TWA
NIOSH REL: 2 mg[Sn]/m^3 TWA
ACGIH TLV[1]: 2 mg[Sn]/m^3 TWA
DFG MAK: *tin, inorganic compounds:* No numerical value established. Data may be available.
PAC* Ver. 29[138]
7646-78-8, stannic chloride (for reference only), see also T:0550
PAC-1: 13 milligram per cubic meter
PAC-2: 150 milligram per cubic meter
PAC-3: 880 milligram per cubic meter

Permissible Concentration in Water: State Drinking Water Guidelines: Minnesota 4000 μg[Sn]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hydrated stannic chloride can affect you when breathed in. Corrosive the eyes, skin, and respiratory tract. Eye damage may be permanent. Breathing hydrated stannic chloride can irritate the throat and bronchial tubes, causing cough and/or difficulty breathing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Changes may occur on chest X-ray with repeated exposure; resulting in impaired lung functions. Tin may interfere with the body's ability to absorb iron from the diet or from vitamins, contributing to iron deficiency anemia.

Points of Attack: Lungs, blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. CBC. Hemoglobin or hematocrit. If acute breathing exposure to heated hydrated stannic chloride with chlorine gas is suspected, also consider chest X-ray.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *Up to 10 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *Up to 20 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 milligram per cubic meter:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 100 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter. Click here for information on selection of N, R, or P filters); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF:PD,PP:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Hydrated stannic chloride must be stored to avoid contact with water, moisture, chlorine, turpentine, ethylene oxide, and alkyl nitrates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Keep hydrated stannic chloride dry and out of direct sunlight. Hydrated stannic chloride can attack some plastics, rubbers, and coatings.

Shipping: UN2440 Stannic chloride, pentahydrate, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Hydrated stannic chloride itself does not burn. Thermal decomposition products may include hydrogen chloride, chlorine, and tin. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Stannous Chloride S:0580

Formula: Cl_2Sn; $Cl_2Sn \cdot 2H_2O$ (dihydrate); $SnCl_2$

Synonyms: C.I. 77864; NCI-C02722; Stannochlor; Tin(II) chloride; Tin dichloride; Tin protochloride

Dihydrate: Stannous dichloride dihydrate; Stannochlor; Stannous chloride dihydrate; Tin(II) chloride, dihydrate (1:2:2)

CAS Registry Number: 7772-99-8; 10025-69-1 (dihydrate)

HSDB Number: 582

RTECS Number: XP8700000; XP8850000 (dihydrate)

UN/NA & ERG Number: UN3260/154

EC Number: 231-868-0

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Carcinogenesis Studies (feed); equivocal evidence: rat; no evidence: mouse. United States Environmental Protection Agency Gene-Tox Program, Negative: *B. subtilis* rec assay; TRP reversion; Negative/limited: Carcinogenicity-mouse/rat.

Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects. *Dihydrate*: Suspected of causing genetic defects, Suspected reprotoxic hazard.

Air Pollutant Standard Set: ACGIH[1]; DFG[3]; OSHA[58]

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R62; R63;?; safety phrases: (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Stannous chloride is a white crystalline solid. Molecular weight = 189.59; 222.63 (dihydrate); specific gravity (H_2O:1) = 2.7 @ 20°C; boiling point = (decomposes) 652°C; 623°C; freezing/melting point = 246°C; 38°C (dihydrate). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Soluble in water; solubility = 90% @ 20°C.

Potential Exposure: Stannous chloride is used as a dye, pigment, and printing ink; in making chemicals; chemical preservatives; food additives; polymers, textiles, glass, silvering mirrors.

Incompatibilities: A strong reducing agent. Reacts violently with oxidants. Reacts violently with bromine trifluoride; potassium, hydrazine hydrate, sodium, sodium peroxide; ethylene oxide; and nitrates. Keep away from moisture, sources of oxygen, and combustible materials.

Permissible Concentration in Water: State Drinking Water Guidelines: Minnesota 4000 μg[Sn]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Stannous chloride can affect you when breathed in. Contact can cause skin and eye burns. Breathing stannous chloride dust or mist can irritate the throat and bronchial tubes, causing cough and/or difficulty breathing. May affect the CNS; blood when ingested.

Long-Term Exposure: Effects on the liver following ingestion. Changes may also occur on chest X-ray with repeated exposures; reduced lung function has been reported. Tin may interfere with the body's ability to absorb iron from the diet or from vitamins, contributing to iron deficiency anemia.

Points of Attack: Lungs, blood, liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. CBC; hemoglobin or hematocrit. Liver function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *Up to 10 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *Up to 20 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 milligram per cubic meter:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 100 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter. Click here for information on selection of N, R, or P filters); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF; PD,PP:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Stannous chloride must be stored to avoid contact with bromine trifluoride; nitrates, potassium hydrazine hydrate, sodium peroxide, ethylene oxide, and hydrogen peroxide, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture, sources of oxygen and combustible materials. Sources of ignition, such as smoking and open flames are prohibited where stannous chloride is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Stannous chloride itself does not burn. Stannous chloride may ignite combustible materials. Thermal decomposition products may include chlorine and stannous sulfate. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water [mfg]. 3-Severe hazard to water[lit]. *Note*: see "Permissible Concentration in Water" for Sn and F.

Description: Stannous fluoride is a white crystalline solid with a bitter, salty taste. Molecular weight = 156.69; boiling point = 849°C; freezing/melting point = 213°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Soluble in water; 30% @ 20°C.

Potential Exposure: Stannous fluoride is used in dental caries (tooth decay); as an ingredient of cavity-preventing toothpastes.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Reacts with acids, forming hydrogen fluoride fumes. Reacts violently with chlorine and metal nitrates. Reacts with metals releasing flammable hydrogen gas.

Permissible Concentration in Water: *Tin*: State Drinking Water Guidelines: Minnesota 4000 μg[Sn]/L. The EPA has set 4 mg/L as a standard for fluoride[61] *Fluoride*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Stannous fluoride can affect you when breathed in. Corrosive to the eyes. Irritates the skin and respiratory tract. Prolonged skin contact can cause burns. Breathing stannous fluoride can irritate the throat and bronchial tubes, causing cough and/or difficulty breathing. Changes may also occur on chest X-ray with repeated exposures. When heated, toxic fluorine gas can be released, causing pulmonary edema (fluid in the lungs), a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. If swallowed, may affect the gastrointestinal tract; causing shock.

Long-Term Exposure: May affect the teeth and bones. Repeated exposure, usually after years, may cause changes in the chest X-ray; reduced lung function has been reported. Tin released by stannous fluoride may interfere with the body's ability to absorb iron, contributing to iron deficiency anemia.

Points of Attack: Lungs, blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended. Lung function tests. For person exposed to levels 1/2 the TLV or greater, the following is recommended: hemoglobin or hematocrits. If acute breathing overexposure to heated stannous fluoride with fluorine gas is suspected, also consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. For heated stannous fluoride exposure medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If swallowed, watch for symptoms of shock.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *Up to 10 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *Up to 20 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 milligram per cubic meter:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 100 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter. Click here for information on selection of N, R, or P filters); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF; PD,PP:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Stannous fluoride must be stored to avoid contact with chlorine and turpentine, since violent reactions occur.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2923 Corrosive solids, toxic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous material, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical or CO_2 extinguishers. Poisonous fluorine gas is produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F+, Xn, N: risk phrases: R5; R12; R20/22; R21; R51/53; safety phrases: S1; S2; S9; S33; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Stibine is a colorless gas. Characteristic disagreeable odor. It is produced by dissolving zinc/antimony or magnesium-antimony in hydrochloride acid. Molecular weight = 124.78; boiling point = −18°C; freezing/melting point = −88°C; flash point = flammable gas; relative vapor density (air = 1) = 4.31; vapor pressure => 1 mmHg

@ 25°C; 2.26 mmgHg @ − 25°C[138]. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 4, reactivity 2. Poor solubility in water.

Potential Exposure: Stibine is used as a fumigating agent. Exposure to stibine usually occurs when stibine is released from antimony-containing alloys during the charging of storage batteries, when certain antimonial drosses are treated with water or acid, or when antimony-containing metals come in contact with acid. Operations generally involved are metallurgy, welding or cutting with blow torches; soldering, filling of hydrogen balloons; etching of zinc; and chemical processes.

Incompatibilities: A highly flammable gas. Incompatible with acids, halogenated hydrocarbons; oxidizers, moisture, chlorine, ammonia. Reacts violently with chlorine, concentrated nitric acid or ozone. Decomposes in air. Thermally unstable: quick decomposition >190°C producing metallic antimony and explosive hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 ppm
Conversion factor = 1 ppm = 5.10 mg/m.
OSHA PEL: 0.1 ppm/0.5 milligram per cubic meter TWA
NIOSH REL: 0.1 ppm/0.5 milligram per cubic meter TWA
ACGIH TLV[1]: 0.1 ppm/0.5 milligram per cubic meter TWA
PAC Ver. 29[138]
PAC-1: 0.3 ppm
PAC-2: $\mathbf{1.5_A}$ ppm
PAC-3: $\mathbf{9.6_A}$ ppm
*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values

Austria: MAK 0.1 ppm (0.5 milligram per cubic meter), 1999; Denmark: TWA 0.05 ppm (0.25 milligram per cubic meter), 1999; France: VME 0.1 ppm (0.5 milligram per cubic meter), 1999; Norway: TWA 0.05 ppm (0.25 milligram per cubic meter), 1999; Poland: MAC (TWA) 0.2 milligram per cubic meter; MAC (STEL) 1.5 milligram per cubic meter, 1999; Sweden: TWA 0.05 ppm (0.3 milligram per cubic meter), 1999; United Kingdom: TWA 0.1 ppm (0.52 milligram per cubic meter; STEL 0.3 ppm, 2000; the Netherlands: MAC-TGG 0.5 mg[Sb]/m^3. Several states have set guidelines or standards for stibine in ambient air[60] ranging from 5.0 μ/m^3 (North Dakota); to 8.0 μ/m^3 (Virginia); to 10.0 μ/m^3 (Connecticut); to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6008, Stibine.

Permissible Concentration in Water: See regulatory section.

Routes of Entry: Inhalation of gas.

Harmful Effects and Symptoms

Short-Term Exposure: Stibine can affect you when breathed in. May be fatal if absorbed through the skin or inhaled. A strong sensitizer. May cause severe allergic respiratory reaction. Exposure can cause rapid, fatal poisoning, with symptoms of headaches, nausea, dark or bloody urine; pain in the back and abdomen; slowed breathing and death. Exposure can also irritate the lungs and may lead to a build-up of fluid (pulmonary edema); a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Stibine destroys red blood cells and can also cause liver and kidney damage.

Long-Term Exposure: Stibine destroys red blood cells (hemolysis). May affect the kidneys, liver; hemoglobinuria, hematuria (blood in the urine), hemolytic anemia; jaundice. May affect the CNS. Antimony may cause an increase in blood cholesterol; a decrease in blood sugar.

Points of Attack: Blood, liver, kidneys, respiratory system; CNS.

Medical Surveillance: Antimony can be measured in the urine, feces, and blood[76]. NIOSH lists the following tests: liver function tests; red blood cells/count, RBC Hemolysis; urine (chemical/metabolite), Hemoglobin; urinalysis (routine); white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Examination of the CNS. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 5 ppm:* SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (3) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Stibine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); strong acids (such as hydrochloric, sulfuric, and nitric) and halogenated hydrocarbons, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks and flames. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. The storage area for flammable toxic gases should have electrical equipment conforming to Article 500 of the National Electrical Code.

Shipping: UN2676 Stibine, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Hazard Zone A. UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 1.1/1.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.2/1.9
Night 4.0/6.6

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Evolves hydrogen and Thermal decomposition products may include antimony. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Use flooding quantities of water. Do not use halogenated extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve in hydrochloric acid; add water to produce precipitate; add acid to dissolve again; precipitate with H_2S; filter and dry precipitate and return to supplier.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible liquid, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R36/37/38; R45; R46; R65; safety phrases: S53; S45. (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Stoddard solvent is a refined petroleum solvent containing >65% C10 or higher hydrocarbons (mineral spirits, 85% nonane & 15% trimethylbenzene)[138]. Stoddard solvent is a colorless liquid. Kerosene-like odor. Molecular weight can vary = 140−160; specific gravity (H_2O:1) = 0.765−0.795 @ 25°C; 0.75−0.85 mmHg (no temp.)[138]; boiling point = 154−202°C[1]; 130−230°C; freezing/melting point = −70°C; vapor pressure = 1.5 mmHg @ 25°C; flash point = 39−60°C; but, may vary from 21−60°C based on composition; autoignition temperature 229−240°C; but may vary based on composition. Explosive limits: LEL = 0.6%; UEL: 8.0%. Hazard identification (based on NFPA-704 M Rating System): Health20, flammability 2, reactivity 0. Insoluble in water. See also "Naphthas" for related materials.

Potential Exposure: Stoddard solvent is used as a diluent in paints, coatings, and waxes; as a paint thinner; as a dry-cleaning agent; as a degreaser for metal parts; as a herbicide.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 20,000 milligram per cubic meter

Odor threshold = 1 ppm(NY)−30 ppm.

OSHA PEL: 500 ppm/2900 milligram per cubic meter TWA

NIOSH REL: 350 milligram per cubic meter TWA; 1800 milligram per cubic meter [15-minutes] Ceiling Concentration

ACGIH TLV[1]: 100 ppm/525 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 300 ppm

PAC-2: 1800 ppm

PAC-3: 29,500 ppm

Australia: TWA 790 milligram per cubic meter, 1993; Belgium: TWA 100 ppm (525 milligram per cubic meter), 1993; Denmark: TWA 25 ppm (140 milligram per cubic meter), 1999; the Philippines: TWA 200 ppm (1150 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 575 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 100 ppm. Several states have set guidelines or standards for Stoddard solvent in ambient air[60] ranging from 5.25−10.50 milligram per cubic meter (North Dakota); to 7.0 milligram per cubic meter (Connecticut); to 12.5 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method 1550, Naphthas; OSHA Analytical Method 48.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.2−7.1. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Causes irritation of the eyes and respiratory tract. Exposure to levels above 2400 milligram per cubic meter may cause headache, dizziness, nose, and throat irritation. More severe exposures may cause nausea and vomiting, a feeling of intoxication;

weakness, muscle twitches; and in extreme cases, convulsions, unconsciousness and death. *Skin:* Contact with liquid may cause irritation and drying of skin. This can result in dermatitis. *Eyes:* Contact with liquid or vapor levels of 900−2400 milligram per cubic meter may cause irritation and tearing. *Ingestion:* Small amounts may cause headache, dizziness, nausea, vomiting, intoxication, weakness, muscle twitches; convulsions and unconsciousness. May cause aspiration into the lungs and chemical pneumonia. As little as 3 oz may be fatal. If liquid is breathed into the lungs, as little as 1 oz may cause death due to respiratory failure.

Long-Term Exposure: Prolonged or repeated contact with liquid may cause defatting of the skin with drying, irritation, and skin ulcers. Exposure to vapor may cause eye, nose, and throat irritation; fatigue, headaches, anemia, jaundice, and damage to the liver and bone marrow. In animals: kidney damage. Repeated exposure may cause a rare reaction in some people that destroys blood cells (aplastic anemia). This can be fatal. Many petroleum-based solvents have been shown to cause brain and/or nerve damage. Effects may include reduced memory and concentration, personality changes; fatigue, sleep disturbances; reduced coordination; effects on the autonomic nerves and/or nerves to the limbs.

Points of Attack: Eyes, skin, respiratory system; CNS; liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: CBC. Evaluation for brain effects. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do *NOT* induce vomiting.

Note to Physician: Treat symptomatically for CNS depression. Supportive treatment for pulmonary edema using oxygen may be needed when aspiration of liquids or massive exposure to vapors has occurred.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Some of these manufacturers recommend *nitrile* or *polyvinyl alcohol* as a protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For engineering controls see "Criteria for a Recommended Standard: Occupational Exposure to Refined Petroleum", NIOSH Document Number 77-192

Respirator Selection: NIOSH: *Up to 3500 milligram per cubic meter:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 8750 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode);* or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 17,500 milligram per cubic meter:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge (s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)];* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 20,000 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Stoddard solvent must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Stoddard solvent is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

UN1268 Petroleum distillates, n.o.s. or Petroleum products, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

PAC not available

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift

Arab Republic of Egypt: TWA 0.5 milligram per cubic meter, 1993; Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.5 milligram per cubic meter, 1993; Denmark: TWA 0.001 mg[Cr]/m^3, 1999; Finland: TWA 0.5 milligram per cubic meter; carcinogen, 1999; France: VME 0.05 mg[Cr]/m^3, 1999; [skin], 1993; India: TWA 0.5 milligram per cubic meter, 1993; Japan: 0.01 mg[Cr]/m^3, 1999; Norway: TWA 0.02 mg [CrO3]/m^3, 1999; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: TWA 0.5 milligram per cubic meter, 1999; Sweden: NGV 0.02 milligram per cubic meter, carcinogen, 1999; Switzerland: MAK-W 0.05 mg[Cr]/m^3, 1999; Thailand: TWA 1 milligram per cubic meter, 1993; United Kingdom: TWA 0.05 mg[Cr]/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 0.0005 mg[Cr]/m^3. The former USSR-UNEP/IRPTC joint project[43] gives a MAC in work-place air of 0.01 milligram per cubic meter. Connecticut[60] has set a guideline for chromium trioxide in ambient air of 0.25 μ/m^3.

Determination in Air: Use NIOSH Analytical Methods #7600,#7604, #7605, #7703, #9101; OSHA Analytical Methods ID-103, ID-215, W-4001. Permissible Concentration in Water: *Chromium:* The EPA[6] has designated chromium as a priority toxic pollutant. State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr(VI)]/L. *Strontium*: A suggested maximum ambient environmental level for strontium in potable water was set at 10 mg[Sr]/L. Federal Drinking Water Guidelines: EPA 4000 μg[Sr]/L; State Drinking Water Guidelines: Florida 4200 μg[Sr]/L; Maine 4200 μg[Sr]/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry, (diphenylcarbazide); or by ICP optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods[49].

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Strontium chromate can affect you when breathed in. Strontium chromate is a carcinogen; handle with extreme caution. Contact may burn the skin and eyes. The vapor or dust may irritate the mouth, nose, and air passages.

Long-Term Exposure: Chromium may cause allergic dermatitis. Repeated or prolonged exposure (at 20 milligram per cubic meter) may damage the lungs, heart, liver, kidneys, and affect the nervous system. May affect the blood and brain, resulting in changes in white and red blood cells and neurovegetative disorders. Strontium chromate accumulates in the body with repeated exposure and effects can persist after exposure. Repeated or prolonged contact with skin may cause skin sensitization, dermatitis or ulcers. Lungs may be affected or asthma may develop from repeated or prolonged exposure; and with some chromate exposures, nasal septim perforation has occurred. This substance is possibly carcinogenic to humans.

Points of Attack: Kidneys, liver, nervous system; heart, lungs, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: blood gas analysis, CBC; chest X-ray, ECG, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: tests for kidney and liver function. Exam of the nervous system. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and demulcents and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. (1) Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Strontium chromate must be stored to avoid contact with strong oxidizers (such as chlorine, bromine and fluorine), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3086 Toxic solids, oxidizing, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, 5.1-Oxidizer. Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides of metal. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. *Inhaling the hot fumes may cause cyanosis.* If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Strontium Nitrate S:0640

Formula: N_2O_6Sr; $Sr(NO_3)_2$
Synonyms: Nitrate de strontium (French); Nitric acid, strontium salt; Strontium(II) nitrate (1:2)
CAS Registry Number: 10042-76-9
HSDB Number: 787
RTECS Number: WK98000000
UN/NA & ERG Number: UN1507/140
EC Number: 233-131-9
Regulatory Authority and Advisory Information
Hazard Alert: Strong oxidizer, Environmental hazard.
As nitrate compounds (water dissociable):
United States National Primary Drinking Water Regulations: MCLG 10 mg[N]/L; MCL = 10 mg[N]/L nitrate measured as Nitrogen; MCLG = mg/L; MCL = 4 millirems[Sr_{90}]/yr, as *beta*-proton emitter.
EPCRA Section 313: Reportable only when in aqueous solution. Form R *de minimis* concentration reporting level: 1.0%.
United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), as nitrates, inorganic, n.o.s.
Hazard symbols, risk, & safety statements: Hazard symbol: O, Xi, Xn; risk phrases: R8, R36/37/38; R41; safety phrases: S17; S25; S26; S36/37/39; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: Strontium nitrate is a white crystalline solid. Molecular weight = 211.6; specific gravity (H_2O:1) = 3 @ 20°C; boiling point = 645°C; freezing/melting point = 570°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 2 (Oxidizer). Soluble in water.
Potential Exposure: Strontium nitrate is used in matches, pyrotechnics, marine signals; and railroad flares.
Incompatibilities: A strong oxidizer. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Violent reaction with reducing agents; combustibles, organics, or other readily oxidizable materials. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 5.7 milligram per cubic meter
PAC-2: 62 milligram per cubic meter
PAC-3: 370 milligram per cubic meter
Russia[43] set a MAC in work-place air of 1.0 milligram per cubic meter.
Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = 10 mg[N]/L; MCL = 10 mg [N]/L nitrate measured as Nitrogen. A suggested maximum ambient environmental level for strontium in potable water was set at 10 mg[Sr]/L. Federal Drinking Water Guidelines: EPA 4000 μg[Sr]/L; State Drinking Water Guidelines: Florida 4200 μg[Sr]/L; Maine 4200 μg[Sr]/L. Runoff from spills or fire control may cause water pollution.
Routes of Entry: Inhalation, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Strontium nitrate can affect you when breathed in. Contact may burn the skin and eyes. The vapor or dust can irritate eyes, mouth, nose, and air passages. Higher levels may cause a chemical pneumonia.
Long-Term Exposure: Repeated exposures (at 50 milligram per cubic meter) has caused damage to the lungs, heart muscle, liver, kidneys, and blood forming organs; and affect the nervous system in animals. Strontium nitrate accumulates in the body with repeated exposure and effects can persist after exposure stops. Infants below the age of 6 months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.
Points of Attack: Liver, kidneys, nervous system; blood
Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: tests for kidney and liver function. Exam of the nervous system. CBC. If respiratory symptoms are present, lung function tests are recommended. Persons on low calcium diets may be at greater risk of absorbing more strontium nitrate.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 hours in case chemical pneumonia or other respiratory symptoms are present.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential exists for exposure to strontium nitrate, use a NIOSH/MSHA (US) or

EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Strontium nitrate must be stored to avoid contact with combustible, organic or other readily oxidizable materials, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. Store in a cool, well-ventilated area away from incompatible materials listed above. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1507 Strontium nitrate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep strontium nitrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides of nitrogen and metal. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Strychnine S:0650

Formula: $C_{21}H_{22}N_2O_2$; $C_{21}H_{22}N_2O_2 \cdot \frac{1}{2}H_2O_4S$ (sulfate)

Synonyms: Boomer-Rid; Certox; Dolco mouse cereal; Estricnina (Spanish); Gopher bait; Gopher-gitter; Hare-rid; Kwik-kil; Mole death; Mouse-nots; Mouse-rid; Mouse-tox; Nux vomica; Pied piper mouse seed; Ro-Dex; Sanaseed; Strychnidin-10-one; Strychnin (German); Strychnos

Strychnine, sulfate (2:1): Antivampire; Strychinium sulfate; Strychnidin-10-one, sulfate (2:1); Strychnine hemisulfate; Strychnine sulfate; Vampirol

CAS Registry Number: 57-24-9; 60-41-3 (sulfate)

HSDB Number: 2001

RTECS Number: WL2275000; WL2550000 (sulfate)

UN/NA & ERG Number: UN1692/151

EC Number: 200-319-7 [*Annex I Index No.:* 614-003-00-5]; 200-477-7 (strychnine sulfate)

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Suspected of causing genetic defects, Environmental hazard. *sulfate*: Drug.

Banned or Severely Restricted (several countries) (UN)[13]

FDA-over the counter drug

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P108

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0% *(Strychnine and salts)*

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations *(Strychnine and salts)*: Hazard symbol: T+, N; risk phrases: R27/28; R50/53; R62; safety phrases: S1/2; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Strychnine is a colorless crystalline prisms or white powder. It is odorless; with a bitter taste. Molecular weight = 333.45; 383.49 (sulfate); specific gravity (H_2O:1) = 1.36 @ 25°C; boiling point = (decomposes) 270°C @ 5 mmHg; freezing/melting point = 267.8°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Slightly soluble in water; solubility = 0.02%.

Potential Exposure: Classified in the United States as a restricted use pesticide, requiring a certified applicator. Strychnine is an alkaloid compound that has been widely used as a rodenticide/bait to kill rodents; a medicine, respiratory stimulant. A potential danger to those involved in the extraction the seeds of the *Strychnos nux* vomica, *Strychnos ignatii* (*S. sancta* Ingnatius), and *Strychnos tiente* (Upas tree); formulation or application of this rodent poison. The sulfate is used to kill gophers and moles. A common adulterant in illicit street drugs. Listed as a potential WMD biotoxin[77].

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Dangerous when heated; forms toxic fumes, including nitrogen oxides. In the body, caffeine may increase the strychnine effect.

Permissible Exposure Limits in Air

NIOSH IDLH = 3 milligram per cubic meter

OSHA PEL: 0.15 milligram per cubic meter TWA

NIOSH REL: 0.15 milligram per cubic meter TWA

ACGIH TLV[1]: 0.15 milligram per cubic meter TWA

PAC Ver. 29[138]

57-24-9

PAC-1: 0.45 milligram per cubic meter

PAC-2: 0.5 milligram per cubic meter

PAC-3: 3 milligram per cubic meter

Australia: TWA 0.15 milligram per cubic meter, 1993; Austria: MAK 0.15 milligram per cubic meter, 1999; Belgium: TWA 0.15 milligram per cubic meter, 1993; Belgium: TWA 0.15 milligram per cubic meter, 1999; Finland: TWA 0.15 milligram per cubic meter; STEL 0.45 milligram per cubic meter, 1999; France: VME 0.15 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.15 milligram per cubic meter, 2003; the Philippines: TWA 0.15 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.15 milligram per cubic meter, 1999; Switzerland: MAK-W 0.15 milligram per cubic meter, KZG-W 0.3 milligram per cubic meter, 1999; Turkey: TWA 0.15 milligram per cubic meter, 1993; United Kingdom: TWA 0.15 milligram per cubic meter; STEL 0.45 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.15 milligram per cubic meter. Several states have set guidelines or standards for strychnine in ambient air[60] ranging from 1.5 μ/m^3 (North Dakota); to 2.5 μ/m^3 (Virginia); to 3.0 μ/m^3 (Connecticut); to 4.0 μ/m^3 (Nevada).

PAC Ver. 29[138]

60-41-3, sulfate

PAC-1: 0.45 milligram per cubic meter

PAC-2: 5 milligram per cubic meter

PAC-3: 30 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method (IV) #5016.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.68. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of dust, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Affects the CNS; causing convulsions; muscle contractions; and respiratory failure. Super toxic; probable oral lethal dose in humans is less than 5 mg/kg, a taste (less than seven drops) for a 70 kg (150 lb) person. It causes violent generalized convulsions. Death results from respiratory arrest as the respiratory muscles are in sustained spasm. The lowest lethal oral dose reported for humans if 30 mg/kg. Respiratory paralysis and arrest are likely to occur following severe exposure to strychnine. Signs and symptoms of acute exposure generally involve excitation of all portions of the CNS. Convulsions, bilateral horizontal nystagmus (rapid, synchronous, horizontal, oscillations of the eyeballs); agitation, restlessness, apprehension; and abrupt, jerking movements of the extremities may occur. Victims may also experience stiffness, painful muscle cramping (especially in the legs); and opisthotonos (spasm in which the spine and extremities are bent with convexity forward, the body resting on the head and heels). Vomiting and renal failure; as well as cyanosis (blue tint to skin and mucous membranes) and rhabdomyolysis (destruction of skeletal muscle), may be found.

Long-Term Exposure: Chronic allergen if inhaled or ingested.

Points of Attack: CNS.

Medical Surveillance: Be aware of possible convulsions. Consider the points of attack in preplacement and periodic physical examinations. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: Remove victims from exposure. Emergency personnel should avoid self-exposure to strychnine. Warning-Any unnecessary sensory input may induce seizures. Isolate the victims from any avoidable distractions. Rush to a health care facility! Evaluate vital signs including pulse and respiratory rate, and note any trauma. If no pulse is detected, provide CPR. If not breathing, provide artificial respiration. If breathing is labored, administer oxygen or other respiratory support. Remove contaminated clothing as soon as possible. If eye exposure has occurred, remove any contact lenses at once;

eyes must be flushed with lukewarm water for at least 15 minutes. Wash exposed skin areas thoroughly with soap and water. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.75 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *Up to 1.5 milligram per cubic meter:* 95 XQ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 3 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode.); or PaprHie (APF = 25) (any powered, air-purifying respirator with a dust and mist filter); or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode. *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and heat. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1692 Strychnine or strychnine salts, Hazard Class: 6.1; Labels: 6.1-Poisonous material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Avoid breathing dusts, and fumes from burning materials. Keep upwind. Avoid bodily contact with the material. *Do Not* handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using agent suitable for type of surrounding fire; material itself does not burn or burns with difficulty. Use water in flooding quantities as fog. Use alcohol foam, carbon dioxide; or dry chemical. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Careful incineration has been recommended for disposal. Two procedures are suggested[1]. Pour or sift onto a thick layer of sand and soda ash mixture (90-10). Mix and shovel into a heavy paper box with much paper packing Burn in incinerator. Fire may be augmented by adding excelsior and scrap wood. Stay on the upwind side[2]. Waste may be dissolved in flammable solvent (alcohols, benzene, etc.) and sprayed into fire box of an incinerator with afterburner and scrubber[22].

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Styrene is a colorless to yellowish, very refractive, oily liquid with a penetrating odor. Molecular weight = 104.15; specific gravity (H_2O:1) = 0.9 @ 20°C; boiling point = 145°C; freezing/melting point = −30.7°C; vapor pressure = 7.5 mmHg @ 29°C; flash point = 31°C; autoignition temperature 490°C. Explosive limits: LEL = 0.9%;UEL: 6.8%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 2. Practically insoluble in water; solubility = 0.03%.

Potential Exposure: Styrene is used in the production of plastics and polystyrene resins. It is also used in combination with 1,3-butadiene or acrylonitrile to form copolymer elastomers, butadiene-styrene rubber; and acrylonitrile-butadiene-styrene. It is also used in the manufacture of protective coatings; resins, polyesters; in making insulators and in drug manufacture.

Incompatibilities: Styrene May form explosive mixture with air. A storage hazard above 31°C. Upon heating to 200°C, styrene polymerizes to form polystyrene, a plastic. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a cool, dry area away from oxidizers, catalysts for vinyl polymers; peroxides, strong acids; aluminum chloride. May polymerize if contaminated, subjected to heat; under the influence of light; and on contact with many compounds, such as oxygen, oxidizing agents;

peroxides and strong acids. Usually contains an inhibitor, such as *tert*-butylcatechol. Corrodes copper and copper alloys. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 700 ppm

Conversion factor: 1 ppm = 4.26 milligram per cubic meter @ 25°C & 1 atm

The Odor Threshold = 0.02−0.47 ppm.

OSHA PEL: 100 ppm TWA; 200 ppm Ceiling Concentration; 600 ppm [5-min. max peak in any 3 hours]

NIOSH REL: 50 ppm/215 milligram per cubic meter TWA; 100 ppm/425 milligram per cubic meter STEL

ACGIH TLV[1]: 20 ppm/85 milligram per cubic meter TWA; 40 ppm/170 milligram per cubic meter STEL, not classifiable as a human carcinogen. BEI: 800 mg[mendelic acid]/g creatinine in urine/end-of-shift; 300 mg[mendelic acid]/g creatinine in urine, prior to next shift; 240 mg [phenylglyoxylic acid]/g creatinine in urine/end-of-shift; 100 mg[phenylglyoxylic acid]/g creatinine in urine, prior to next shift; 0.55 mg[styrene]/L in blood/end-of-shift; 0.02 mg[styrene]/L in blood, prior to next shift.

PAC* Ver. 29[138]

PAC-1: $\mathbf{20}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{130}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{1100}_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 20 ppm/86 milligram per cubic meter TWA; Peak Limitation Category II(2); Carcinogen Category 5; Pregnancy Risk Category C; BAT: 600 mg[mendelic acid plus phenyl glyoxylic acid]/g creatinine in urine/end-of-shift; for long term exposures: after several shifts.

Australia: TWA 50 ppm (215 milligram per cubic meter); STEL 100 ppm, 1993; Austria: MAK 20 ppm (85 milligram per cubic meter), 1999; Denmark: TWA 25 ppm (105 milligram per cubic meter) [skin], 1999; Finland: TWA 20 ppm (85 milligram per cubic meter); STEL 100 ppm (420 milligram per cubic meter), 1999; France: VME 50 ppm (215 milligram per cubic meter), 1999; Hungary: STEL 50 milligram per cubic meter, carcinogen, 1993; Japan: 50 ppm (210 milligram per cubic meter), 2B carcinogen, 1999; the Netherlands: MAC-TGG 107 milligram per cubic meter, 2003; Norway: TWA 25 ppm (105 milligram per cubic meter), 1999; the Philippines: TWA 100 ppm (420 milligram per cubic meter), 1993; Poland: MAC (TWA) 50 milligram per cubic meter; MAC (STEL) 200 milligram per cubic meter, 1999; Sweden: NGV 20 ppm (90 milligram per cubic meter), KTV 50 ppm (200 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 50 ppm (215 milligram per cubic meter), KZG-W 100 ppm (430 milligram per cubic meter), 1999; Thailand: TWA 100 ppm; STEL 200 ppm, 1993; Turkey: TWA 100 ppm (420 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (430 milligram per cubic meter); STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 40 ppm. Also, values for styrene in ambient air in residential areas vary. The Czech Republic[35] has set 0.015 milligram per cubic meter, both on a momentary and a daily average basis. Russia has set 0.003 milligram per cubic meter both on a daily average and momentary basis[43] but values are also given[35] as 0.04 milligram per cubic meter on a once-daily basis and 0.002 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for styrene in ambient air[60] ranging from zero (North Carolina); to 3.45 μ/m^3 (Indiana); to 30.0 μ/m^3 (Rhode Island); to 34.48 μ/m^3 (Kansas); to 39.0 μ/m^3 (Massachusetts); to 716.0 μ/m^3 (New York); to 2150.0−4250.0 μ/m^3 (North Dakota); to 3600.0 μ/m^3 (Virginia); to 4300.0 μ/m^3 (Connecticut); to 5119.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1501, Aromatic hydrocarbons; #3800. OSHA Analytical Method 9 or 89.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.1 mg/L; MCLG, 0.1 mg/L. A lifetime health advisory of 140 μg/L has been determined by EPA[48]. Russia set a MAC in water bodies used for domestic purposes of 100 μg/L[43]. This same limit applies to water bodies used for fishery purposes. Several states have set guidelines for styrene in drinking water[61] ranging from 10.0 μg/L (Wisconsin); to 140 μg/L (Arizona and Minnesota); to 270 μg/L Maine.

Determination in Water: Styrene may be determined by a purge-and-trap GC procedure[48]. Octanol−water coefficient: Log K_{ow} = > 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Irritates the eyes, skin, and respiratory tract. *Inhalation:* At or above 100 ppm, styrene causes immediate eye and nose irritation; persistent metallic taste; headache, fatigue, slight muscular weakness; loss of appetite; drowsiness, feelings of drunkenness, decreased coordination; depression, unconsciousness; inflammation of the lung, kidney and liver damage, and death. *Skin:* Can cause drying cracking, itching burning and sores. Absorption is moderate and can cause symptoms described above. *Eyes:* Can cause severe itching, tearing and injury to the surface of the eye. *Ingestion:* Symptoms are same as inhalation. Additional symptoms may include severe irritation of the mouth, throat, and stomach. Swallowing the liquid may cause chemical pneumonitis.

Long-Term Exposure: Liver, kidney, and/or circulatory system problems. Repeated exposure to low levels can cause concentration problems, memory problems, hearing disability, slowed reflexes; reduced coordination and manual dexterity; trouble with balance; nausea, headache, fatigue and a feeling of drunkenness. Continued exposures to levels near 400 ppm can cause eye and throat irritation, and slight impairment of coordination and balance. At higher air concentrations; nasal, eye, throat and skin irritation becomes pronounced. Prolonged inhalation of vapors may cause respiratory tract obstruction. Very high levels may affect brain function and cause liver damage and death. Cases of liver damage have been found in workers employed for over five years in polystyrene plants and exposed to a concentration of 20−150 ppm Styrene has been found to produce lung tumors in mice and cause changes in the genetic material of laboratory organisms. Whether it does so in humans is not known.

Points of Attack: Eyes, skin, respiratory system; CNS; liver, reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; whole blood (chemical/metabolite), end-of-work-week; whole blood (chemical/metabolite), prior to next shift; whole blood (chemical/metabolite), Prior to Shift, expired air, Expired Air, During Exposure. For those with frequent or potentially high exposure (half the TLV or grater, or significant skin contact) the following are recommended before beginning work and at regular times after that: exam of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: EEG (brain wave study).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Inhalation: bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Safety equipment manufacturers and styrene manufacturers recommend Teflon, Viton/chlorobutyl rubber, chlorinated polyethylene; and polyvinyl alcohol as the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Before entering a confined space where styrene monomer is present, check the oxygen level (at least 19% must be present) and that explosive concentration does not exist.

Respirator Selection: NIOSH: *500* ppm*:* CcrOv* [any chemical cartridge respirator with organic vapor cartridge(s)]; or SA* (any supplied-air respirator). *700* ppm*:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A storage hazard above 31°C. Before entering a confined space where styrene monomer is present, check the oxygen level (at least 19% must be present) and that explosive concentration does not exist. Styrene monomer must be stored to avoid contact with oxidizing agents; and catalysts for vinyl polymerization, such as peroxides, strong acids (such as hydrochloric, sulfuric, and nitric); and aluminum chlorides; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where styrene monomer is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of styrene monomer should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of styrene monomer. Wherever styrene monomer is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Styrene monomer will corrode copper and copper alloys and dissolve rubber. Styrene monomer must be stored with an inhibitor to prevent explosive reactions. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2055 Styrene monomer, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include styrene oxides. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. In some cases, recovery and recycle of styrene monomer is economic and the technology is available.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Styrene oxide is a colorless to pale straw-colored liquid. Pleasant, sweet odor. Molecular weight = 120.16; specific gravity (H2O:1) = 1.05 @ 25°C; boiling point = 194°C; freezing/melting point = −37°C; vapor pressure = mmHg 0.3 @ 20°C; flash point = 76°C; autoignition temperature 498°C. Explosive limits: LEL = 1%; UEL: 22%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Slightly soluble in water.

Potential Exposure: Styrene oxide is used as a reactive intermediate, especially to produce styrene glycol and its derivatives. Substantial amounts are also used in the epoxy resin industry as a diluent. It may also have applications in the preparation of agricultural and biological chemicals, cosmetics, and surface coatings and in the treatment of textiles and fibers. Styrene oxide is made in quantities in excess of a million pounds per year, and further, is a presumed metabolite of styrene which is produced in much greater quantities.

Incompatibilities: Vapors may form explosive mixture with air. May polymerize on heating above 200°C, under the influence of strong acids, strong bases; oxidizers, metal salts; such as aluminum chloride; catalysts for vinyl polymers. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.33 ppm

PAC-2: 3.6 ppm

PAC-3: 21 ppm

Austria: carcinogen, 1999; France: carcinogen, 1993.

Determination in Air: NIOSH Analytical Method (IV) #1501, aromatic Hydrocarbons

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Toxic by ingestion, inhalation, and skin absorption. May be corrosive. Irritates the skin, eyes, and mucous membranes. If inhaled, irritation to mucosal surfaces; headache, fatigue, weakness, nausea, vomiting, diarrhea, CNS depression; unsteadiness or feeling of drunkenness; peripheral neuropathies and hepatic. May cause you to pass out.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and skin allergy, with drying and cracking. May cause liver damage. Probable carcinogen in humans; has been shown to cause stomach and liver cancer in animals. May cause decreased fertility in females.

Points of Attack: Skin, liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests. Evaluation by a qualified allergist. Drinking alcohol may increase the liver damage caused by styrene oxide.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others[52]. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. If medical advice is not readily available, do not induce vomiting, and rush the victim to the nearest medical facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is recommended by some safety equipment manufacturers. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration (suspected carcinogen):* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

NIOSH as *styrene monomer*: *500 ppm:* CcrOv* [any chemical cartridge respirator with organic vapor cartridge(s)]; or SA* (any supplied-air respirator). *700 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a cool, dry place. A fireproof area separated from strong acids is recommended[57]. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well, first with 60%−70% ethanol, then with soap and with 60%−70% ethanol. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include styrene oxide. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: (BPN): Primary irritant (w/o allergic reaction); (Carlsburg). Primary irritant (w/o allergic reaction). Sensitization hazard (resp.), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%. Carcinogen), BPN CAS 1395-21-7.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R22; R36/37/39; R41; R42; R51; safety phrases: S2; S22; S23; S24; S26; S29/35; S36/37/39; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water[mfg]; 2-Hazard to water[lit.].

Description: These are proteolytic enzymes which take the form of light-colored, free-flowing powders. A protein containing numerous amino acids. Molecular weight = 28,000 (approx).

Potential Exposure: These commercial proteolytic enzymes are used in laundry detergent formulations.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.00006 milligram per cubic meter [60-minute] STEL

ACGIH TLV[1] (*as crystalline active enzyme*): 0.00006 milligram per cubic meter Ceiling Concentration

PAC not available

DFG MAK: Danger of airway sensitization

(*BPN*) Australia: TWA 0.00006 milligram per cubic meter, 1993; Denmark: TWA 0.00006 milligram per cubic meter, 1999; Norway: TWA 0.00006 milligram per cubic meter, 1999; Switzerland: MAK-W 0.00006 milligram per cubic meter, 1999; United Kingdom: LTEL 0.00006 milligram per cubic meter; STEL 0.00006 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.00006 milligram per cubic meter
