Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with daminozide all handlers should be trained on its proper handling and storage. Store in a cool, dry place or in a refrigerator. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested:

Danthron D:0125

Formula: $C_{14}H_8O_4$

Synonyms: Altan; Ailax; Anthraquinone, 1,8-dihydroxy-; Antrapurol; Capsuvac; Chrysazin; Codanthramer; Codanthrusate; Codalax; Conthram; Cotron; Danivac; Danlax; Danthro-lax; Danthrone; Dianthon; Diaquone; 1,8-Dihydroxy-9,10-anthracenedione; 1,8-Dihydroxy-9,10-anthraquinone; Dihydroxyanthraquinone; 1,8-Dihydroxyanthraquinone; Dionone; Dioxyanthrachinonum; 1,8-Dioxyanthraquinone; Dorbane; Dorbanex; Duolax; Fenogar; Istin; istizin; Laxanorm; Laxanthreen; Laxipur; Laxipurin ltan; Normax; Modane; Modaton; Zwitsalax

CAS Registry Number: 117-10-2

HSDB Number: 7764 as 1,8-Dihydroxyanthraquinone

RTECS Number: CB6650000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 204-173-5

Regulatory Authority and Advisory Information

Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen

California Proposition 65 Chemical[102]: Cancer January 1, 1992

Hazard Alert: Poison, combustible, Possible nervous system toxin, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Drug.

Restricted for sale in the United States under Section 201 (p),Federal Food, and Cosmetic Act [21 U.S.C. 321(p)]; Sec. 310.545(a)(12)(iv)(B); [64 CFR 4535-40 (½9/99)]

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; Xi; risk phrases: R36/37/38; R45; R620; safety phrases: S2; S22; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Red-orange to orange crystalline powder or reddish-brown crystalline solid. Molecular weight = 240.22; specific gravity (H_2O:1) = @ 20°C; boiling point = (decomposes); freezing/melting point = 192.8°C; vapor pressure = 8.6×10^{-10} mmHg @ 25°C (est.)[72]; flash point = > 190°C. Henry's Law constant = 5.5×10^{-11} atm-m^3/mol @ 25°C (est)[72]. Practically insoluble in water; solubility = < 1 mg/mL @ 20°C.

Potential Exposure: A potential liver carcinogen and possible narcotic, this compound is no longer sold or marketed in the United States Nervous system toxin-acute effects; Respiratory toxin-acute effects other than severe or moderate irritation; Liver-acute effects; Eye irritant-mild.

Incompatibilities: Keep away from strong reducing agents, such as hydrides, nitrides, alkali metals, and sulfides.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 6.7 milligram per cubic meter

PAC-2: 73 milligram per cubic meter

PAC-3: 440 milligram per cubic meter

Determination in Air:

Permissible Concentration in Water:

Determination in Water: Octanol-water coefficient: Log K_{ow} = 3.9 (est)[72]. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Eyes, skin, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: May cause mild eye irritation and skin rash. This compound may be an acute nervous system toxin; acute respiratory toxin and exhibit acute liver effects. Symptoms of exposure to this compound may include abdominal cramps, prolonged diarrhea. It colors the urine pink or red. It also colors the peri-anal skin pink or red. Other adverse effects, which are uncommon, include excessive bowel activity (griping, nausea, and vomiting), peri-anal irritation, weakness, dizziness, palpitations, and sweating. Superficial sloughing of discolored skin may occur in incontinent persons or children wearing napkins (diapers)[101].

Long-Term Exposure: May cause cancer.; Liver carcinogen; Liver chronic effects; GI tract-chronic effects; Leukopenia and liver damage have also been reported. There has been reported a suspected allergic reaction with facial swelling, redness and discomfort. Prolonged use may cause discoloration (staining) of mucosa of the large intestine. Large doses may produce nephritis. Enteritis may also occur from large doses. Frequent or prolonged use may result in dependence[101].

Points of Attack: Nervous system; Liver, kidneys, and GI tract

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA)

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products include oxides of carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full

facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence, 1987*, possibly carcinogenic to humans*, Group 2B; NCI: Carcinogenesis Studies (ipr); clear evidence: rat, no evidence, mouse, 1977

California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: Poison, Suspected of causing genetic defects, Suspected reprotoxic hazard, Drug.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U059

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA Land Ban Waste Restrictions

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

Description: Daunomycin is a thin red, needle-shaped material. Molecular weight = 527.6; freezing/melting point = 172°C[Santa Cruz Biotech]; 190°C (decomposes). Soluble in water.

Potential Exposure: An antibiotic. It is used as a medicine for treating cancer.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous if swallowed.

Long-Term Exposure: It may cause cancer in humans and may be teratogenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with daunomycin all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well ventilated area.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Human toxicity (long term)(101): Intermediate—24.500 ppb, Health advisory

Regulatory Authority and Advisory Information

Carcinogenicity: EPA Group D, Not classifiable as a human carcinogen.

Hazard Alert: Skin irritant/sensitizer

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

EPA Hazardous Waste Number (RCRA No.): U366

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn, N; risk phrases: R22; R36; R50/53; safety phrases: S2, S15; S22, S24; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: White crystalline solid. Nearly odorless. Molecular weight = 162.27; freezing/melting point = 102°C−105°C (decomposes prior to boiling); vapor pressure = 3.2×10^{-6} mm @ 20°C; flash point = 93°C. Combustible in dust form. Highly soluble in water; solubility = 1300 mg/L @ 25°C.

Potential Exposure: Dazomet is a dithiocarbamate insecticide, herbicide, fumigant, fungicide, nematicide. It is used as a soil fumigant used against germinating weed seeds, soil insects, nematodes, and soil-borne diseases in forest nursery seed beds, tobacco crops, greenhouse crops, and substrates for potted plants, turf, and ornamentals. It is also used as an antimicrobial agent for slimicide preparations and for adhesives, paper-mill slimicide, paint, and cooling water slimicides.

Incompatibilities: Sensitive to moisture and heat. Decomposes on heating above 102°C, producing toxic fumes including nitrogen oxides and sulfur oxides. Dithiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of Dithiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of dithiocarbamate with aldehydes, nitrides, and hydrides. Dithiocarbamate are incompatible with acids, peroxides, and acid halides.

Determination in Water: EPA EMSLC Method 630. The Determination of Dithiocarbamate Pesticides in Municipal and Industrial Wastewater by UV-VIS Spectrophotometry. Octanol-water coefficient: Log $K_{\mathrm{ow}} = 1.4$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)(101): Intermediate—16.769960 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Irritates skin and a severe eye irritant. Poisonous if swallowed. Unlike carbamates the dithiocarbamates are not cholinesterase inhibitors, but some of them may react with recently ingested alcohol or alcohol-containing products including wine, medications, and cold remedies such as cough-syrups. LD_{50} (oral, rat) = 300−350 mg/kg; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: Sensitization hazard, May cause liver damage.

Points of Attack: Skin and liver (possible toxin).

Medical Surveillance: Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Personal Protective Methods: Reacts with the following absorbent materials: Cellulose-Based; Mineral-and Clay-Based; Dirt/Earth[88]. Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Where there is potential exists for exposures over 2 milligram per cubic meter, use an NIOSH/MSHA or European Standard EN 149-approved full facepiece respirator with a pesticide cartridge. Increased protection is obtained from full facepiece air purifying respirators (APRs). If while wearing a filter, cartridge or canister respirator, you can smell, taste, or otherwise detect Disulfiram, or in the case of a full facepiece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in the pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Disulfiram itself does not burn readily. Thermal decomposition products may include oxides of nitrogen, sulfur and carbon If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. A potential candidate for liquid injection incineration at a temperature range of 650°C to 1600°C and a residence time 0.1 to 2 seconds. Also, a potential candidate for rotary kiln incineration at a temperature range of 820°C to 1600°C and residence times of seconds for liquids and gases, and hours for solids[83].In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

2,4-DB D:0133

Formula: $C_{10}H_{10}Cl_2O_3$

Synonyms: Acido 2,4-diclorofenoxibutirico (Spanish); Butirex; Butormone; Butoxon; Butoxone; Butoxone ester; Butoxone amine; Butyrac; Butyrac 118; Butyrac 200; Butyrac ester; Campbell's db straight; Campbell's redlegor; Butanoic acid, 4-(2,4-dichlorophenoxy)-; Butyric acid, 4-(2,4-dichlorophenoxy)-; Caswell No. 316; 4-(2,4-DB); 2,4-D butyric; 4-(2,4-Dichlorophenoxy)butyric acid; γ-(2,4-Dichlorophenoxy)butyric acid; 2,4-DM; Desormone 2,4, DB; Embutox klean-up; Embutone; Embutox; Legumex D

CAS Registry Number: 94-82-6

HSDB Number: 6603

RTECS Number: ES9100000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 202-366-9 [Annex I Index No.: 607-083-00-8]

Human toxicity (long term)(101): Low—70.00 ppb, Health advisory

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, Not likely to be carcinogenic to humans; IARC, Group 2b, Possibly carcinogenic to humans.

California Proposition 65 Chemical[102]: Developmental toxin, male, delisted (1/1/2005)

Hazard Alert: Suspected reprotoxic hazard, Developmental/Reproductive toxin: possible endocrine disruptor, Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides.

The "Director's List" (CAL/OSHA) as chlorophenoxy pesticides.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R22; R51/53; safety phrases: S2; S25; S29; S46; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: White to light-brown crystalline solid. May be shipped as a concentrate to be mixed with water and used as a spray. Slight phenolic odor. Molecular weight = 249.09; boiling point = 324°C; freezing/melting point = 115°C−119°C; vapor pressure = 3.5×10^{-6} mmHg @ 25°C(est); 9.44×10^{-3} mmHg @ 25°C. Highly soluble in water.

Potential Exposure: 2,4-DB is a chlorophenoxy/aryloxyalkanoic acid selective systemic herbicide used to control annual and perennial broadleaf weeds in many field crops such as alfalfa, peanuts, cereals and soybeans; used as a defoliant. In the plant, the compound changes to 2,4-D and inhibits growth at the tips of stems and roots.

Incompatibilities: 2,4-DB is a weak organic acid. Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, and epichlorohydrin. Corrosive to iron, aluminum, zinc, and possibly other metals, especially in the presence of moisture.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, and absorbed through the skin. Fish toxicity (threshold)(101): Low—269.85657 ppb, MATC (Maxmium AcceptableToxicant Concentration).

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin, and respiratory tract, with burning sensation, pain, redness, and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse persperation, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, and risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years. LD_{50} (oral, rat) = 700−800 mg/kg; LD_{50} (dermal, rat) = > 5 g/kg.

Long-Term Exposure: Workers exposed to chlorophenoxy compounds over a 5 to 10 year period at levels above 10 milligram per cubic meter complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure, and slowed heartbeat were also found. Based on animal tests, may affects human reproduction

Points of Attack: Eyes, skin, respiratory system, CNS, cardiovascular system, liver, and kidney

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. See a physician if poisoning is suspected for if redness, itching, or burning of the skin or eyes develop

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested*. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: For solids, isolate spill or leak area in all directions for at least 50 m/150 ft. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition in fire produces toxic hydrogen chloride fumes. On small fire, use dry chemical powder, carbon dioxide, or alcohol-resistant foam. On a large fire: Use water spray, fog or alcohol-resistant foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. Dike fire-control water for later disposal. Use water spray or fog; do not scatter material using straight water jet streams. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

DCPA D:0136

Formula: $C_{10}H_6Cl_4O_4$ *Note:* "DCPA" is also a synonym for Propanil (CAS 709-98-8)

Synonyms: Acme DCPA; Chlorthal dimethyl; Chlorthal-methyl; DAC 893; Dacthal; Dacthal w-75; Decimate (with Propachlor); Dimethyl tetrachloroterephthalate; Dimethyl 2,3,5,6-tetrachloroterephthalate; Fatal; Green weeder; 2,3, 5,6-Tetrachloro-1,4-benzenedicarboxylic acid, dimethyl ester; Tetrachloroterephthalic acid, dimethyl ester

CAS Registry Number: 1861-32-1

HSDB Number: 358

RTECS Number: WZ1500000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 217-464-7

Regulatory Authority and Advisory Information

Carcinogenicity: EPA Group C, possible human carcinogen.

Hazard Alert: Suspected reprotoxic hazard, Possible endocrine disruptor. (some alkyl phthalates)

Washington state requires supplemental labeling as "DACTHAL W-75"

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R51/53; R63; safety phrases: S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Colorless to gray crystalline solid. Practically odorless. Molecular weight 331.96; specific gravity (H_2O:1) = 1.56; boiling point = 345°C; freezing/melting point = 156°C; vapor pressure <0.4 mmHg @ 30°C. Practically insoluble in water; solubility = 0.5 ppm @ 25°C.

Potential Exposure: DCPA is an alkyl phthalate; benzenedicarboxylic acid herbicide, pesticide pre-emergent herbicide is used on annual broadleaf weeds and grasses in a wide spectrum of vegetable crops.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate.

Permissible Concentration in Water: Federal Drinking Water Guidelines: 70 ppb[93].

Determination in Water: EPA Methods 8081, 608.2, 515.2; Octanol-water coefficient: Log $K_{ow} = > 4.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. *State Drinking Water Guidelines*: Arizona 3500 ug/L; California 3500 ug/L; Washington 530 ug/L; Wisconsin 70 ug/L[83].

Routes of Entry: Inhalation and ingestion. Absorbed through the intact skin

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms include apprehension, anxiety, confusion, nervous excitation; dizziness; headache; numbness and weakness in limbs; muscle twitching, tremors; nausea and vomiting; slow, shallow respiration, bluish face; convulsions; loss of consciousness; breathing stops; death. LD_{50} (oral, rat) = > 3 g/kg; LD_{50} (dermal, rabbit) = > 10 g/kg.

Long-Term Exposure: May cause reproductive and fetal effects. May affect lungs, thyroid, liver, and kidneys. May cause skin sensitization.

Points of Attack: Reproductive cells. Lungs, liver, thyroid, and skin.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: Eyes: Speed in removing material from skin is of extreme importance. Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Directly, irrigate with large amounts of plain, tepid water or saline for 20 minutes, occasionally lifting the lower and upper lids. During this time, remove contact lenses, if easily removable without additional trauma to the eye. Get medical aid immediately. Have physician check for possible delayed damage. *Skin:* Get medical aid. Skin and/or eye contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately flush exposed skin, hair, and under nails with plain, running, tepid water for 20 minutes, then wash twice with mild soap. Shampoo hair promptly if contaminated; protect eyes. Do not scrub skin or hair, since this can increase absorption through the skin. Rinse thoroughly with water. Victims who are able and cooperative may assist with their own decontamination. Remove and double-bag contaminated clothing and personal belongings. Leather absorbs many organochlorines; therefore, items such as leather shoes, gloves, and belts should be discarded. If the skin is swollen or inflamed, cool affected areas with cold compresses. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. *Do not induce vomiting*. *In cases of ingestion, the patient is at risk of CNS depression or seizures, which may lead to pulmonary aspiration during vomiting. If the victim is conscious and able to swallow, *administer an aqueous slurry of activated charcoal at 1 gm/kg (usual adult dose 60−90 g, child dose 25−50 g). A soda can and straw may be of assistance when offering charcoal to a child. The efficacy of activated charcoal for some organochlorine poisoning (such as chlordane) is uncertain. If victim is *unconscious or having convulsions,* do nothing except keep victim warm. **In some cases you may be specifically instructed by Poison Control to induce vomiting by way of two tablespoons of syrup of ipecac (adult) washed down with a cup of water. Do not give activated charcoal before or with ipecac syrup. Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organochlorine pesticides, immediately remove the victim from the contaminated area to fresh air. For inhalation exposures, monitor for respiratory distress. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If cough or breathing difficulty develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. If breathing is difficult, administer 100% humidified supplemental oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended

Personal Protective Methods: Wear acid resistant protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquids or dust-proof goggles and faceshield when working with powders or dusts, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 1 ppm, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents; acid hydrides, and strong bases.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: *Liquid or wettable powder:* Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Powder: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are

required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include chlorine. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a unit with efficient gas scrubbing. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, N; risk phrases: R10; R25; R40; R48/25; R50/53; R62; R63; safety phrases: S1/2; S22; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: DDT is a waxy solid or slightly off-white powder of indefinite melting point with a weak, chemical odor. Molecular weight = 354.58; boiling point = 260°C; freezing/melting point = 107°C−109°C; flash point = 72°C−75°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Poor solubility in water.

Potential Exposure: DDT is a low-cost broad-spectrum insecticide. However, following an extensive review of health and environmental hazards of the use of DDT, United States Environmental Protection Agency decided to ban further use of DDT in December 1972. This decision was based on several properties of DDT that had been well evidenced[1]: DDT and its metabolites are toxicants with long-term persistence in soil and water[2]; it is widely dispersed by erosion, runoff, and volatization[3]; and the low-water solubility and high lipophilicity of DDT result in concentrated accumulation of DDT in the fat of wildlife and humans which may be hazardous.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard. Incompatible with salts of iron or aluminum, and bases. Do not store in iron containers.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 milligram per cubic meter

OSHA PEL: 1 milligram per cubic meter TWA [skin]

NIOSH REL: 0.5 milligram per cubic meter TWA; Suspected occupational carcinogen. Reduce exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 1 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 3 milligram per cubic meter

PAC-2: 34 milligram per cubic meter

PAC-3: 210 milligram per cubic meter

DFG MAK: 1 milligram per cubic meter TWA measured as the, inhalable fraction [skin]; Peak Limitation Category II (8).

Arab Republic of Egypt: TWA 1 milligram per cubic meter, 1993; Australia: TWA 1 milligram per cubic meter, 1993; Austria: MAK 1 milligram per cubic meter, [skin], 1999; Belgium: TWA 1 milligram per cubic meter, 1993; Denmark: TWA 1 milligram per cubic meter, 1999; Finland: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, [skin], 1999; France: VME 1 milligram per cubic meter, continuous; carcinogen, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; India: TWA 1 milligram per cubic meter, 1993; Norway: TWA 1 milligram per cubic meter, 1999; the Philippines: TWA 1 milligram per cubic meter, [skin], 1993; Poland: MAC (TWA) 0.1 milligram per cubic meter; STEL 0.8 milligram per cubic meter, 1999; Russia: STEL 0.1 milligram per cubic meter, 1993; Switzerland: MAK-W 1 milligram per cubic meter, [skin], 1999; Thailand: TWA 1 milligram per cubic meter, 1993; Turkey: TWA 1 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia[43] set a MAC for ambient air in residential areas of 0.005 milligram per cubic meter on a momentary basis and 0.001 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for DDT in ambient air[60] ranging from 1.8 μ/m^3 (Pennsylvania) to 2.38 μ/m^3 (Kansas) to 5.0 μ/m^3 (Connecticut) to 10.0 μ/m^3 (North Dakota) to 16.0 μ/m^3 (Virginia) to 24 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #S-274.

Permissible Concentration in Water: State Drinking Water Standards: Illinois 50 μg/L; State Drinking Water Guidelines: Arizona 0.10 μg/L; Florida 0.1 μg/L; Maine 1 μg/L; Minnesota 1 μg/L; New Hampshire 0.1 μg/L.

Determination in Water: Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log K_{ow} = >6. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption, ingestion, and eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Can cause irritation. 500−4200 milligram per cubic meter has produced dizziness. *Skin:* Can cause irritation in very high concentrations. DDT can be absorbed through the skin if dissolved in vegetable oils or other solvents. *Eyes:* Can cause irritation.

Ingestion: 1/30-1/4 ounce has caused nausea, vomiting, headache and convulsions. Other symptoms include weakness, restlessness, dizziness, a lack of coordination; numbness of face and extremities; abdominal pain; diarrhea, tremors, and death. Symptoms may be delayed from 1/2-3 hours. Estimated lethal dose is between one teaspoon and one ounce. Can cause a prickling or tingling sensation in the mouth, tongue, lower face; nausea, vomiting, confusion, a sense of apprehension, weakness; loss of muscle control; tremors, paresthesia tongue; lips, face, dizziness, confusion, malaise (vague feeling of discomfort), headache, fatigue, convulsions, and paresis hands. High exposures can cause convulsions and death.

Long-Term Exposure: DDT may cause liver and kidney damage. Prolonged or repeated exposure can cause irritation of the eyes, skin, and throat. Occupational exposure to DDT has been associated with changes in genetic material. DDT levels build up and stay in the body for long periods of time. Exposure to DDT and aldrin may increase retention of DDT in the body. DDT causes cancer in laboratory animals. Whether it causes cancer in humans is unknown.

Points of Attack: Eyes, skin, CNS, kidneys, liver, and peripheral nervous system. Cancer site in animals: liver, lung, and lymphatic tumors.

Medical Surveillance: Serum DDT level. Urine *dichlorodiphenyl acetic acid* level. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: (No longer manufactured). Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Any barrier will prevent contamination from the dry chemical. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DDT all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, strong bases, and heat. Should not be stored in iron containers. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not dry sweep. Use vacuum (use special HEPA vac, NOT a standard shop-vac) or a wet method to reduce dust during clean-up. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include toxic chlorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration has been successfully used on a large scale for several years; huge incinerator equipment with scrubbers to catch HCl, a combustion product, are in use at several facilities, such as Hooker Chemical, Dow Chemical and other producers of chlorinated hydrocarbon products. One incinerator operates @ 900°C–1400°C with air and steam added which precludes formation of Cl_2. A few companies also constructed incinerator-scrubber combinations of smaller size, e.g., a system built by Garver-Davis, Inc., of Cleveland, Ohio, for the Canadian government, can handle 200–500 lb DDT/day as a kerosene solution. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Decaborane D:0150

Formula: $B_{10}H_{14}$

Synonyms: Boron hydride; Decaborane; Decaborano (Spanish); Decarboron tetradecahydride

CAS Registry Number: 17702-41-9; *(alt.)* 1304-02-5

HSDB Number: 2515

RTECS Number: HD1400000

UN/NA & ERG Number: UN1868/134

EC Number: 241-711-8

Regulatory Authority and Advisory Information

Hazard Alert: Poison: high acute toxicity, Flammable solid, Strong reducing agent, Water reactive.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T +, F, risk phrases: R10; R5; R11; R24/25; R26; R36/37/38; safety phrases: S16; S27; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Decaborane is a colorless solid with a bitter odor. The Odor Threshold is 0.06 ppm. Molecular weight = 122.24; specific gravity (H_2O:1) = 0.94; boiling point = 212.7°C; freezing/melting point = 99.6°C; flash point = 80°C (cc); vapor pressure = 0.05 mmHg @ 25°C; Autoignition temperature = 149°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1 ₩. Very slightly soluble in cold water; slowly hydrolyzes. Reacts with hot water.

Potential Exposure: Decaborane is used as a catalyst in olefin polymerization; in rocket propellants; in gasoline additives and as a vulcanizing agent for rubber.

Incompatibilities: May ignite spontaneously on exposure to air. Decomposes slowly in hot water. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and oxygenated solvents; dimethyl sulfoxide (reaction may be violent), oxygen @ >100°C). Carbon tetrachloride, ethers, halocarbons, halogenated compounds form shock-sensitive mixtures. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 15 milligram per cubic meter

OSHA PEL: 0.05 ppm/0.3 milligram per cubic meter TWA [skin]

NIOSH REL: 0.05 ppm/0.3 milligram per cubic meter TWA; 0.15 ppm/0.9 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.05 ppm/0.25 milligram per cubic meter TWA; 0.15 ppm/0.75 milligram per cubic meter [skin] STEL

PAC Ver. 29[138]

PAC-1: 0.75 milligram per cubic meter

PAC-2: 10 milligram per cubic meter

PAC-3: 100 milligram per cubic meter

DFG MAK: 0.05 ppm/0.25 milligram per cubic meter, Peal Limitation Category II(2) [skin]

Australia: TWA 005 ppm (0.3 milligram per cubic meter); STEL 0.15 ppm, [skin], 1993; Austria: MAK 0.05 ppm (0.3 milligram per cubic meter), [skin], 1999; Belgium: TWA 0.05 ppm (0.25 milligram per cubic meter); STEL 0.15 ppm, [skin], 1993; Denmark: TWA 0.05 ppm (0.3 milligram per cubic meter), [skin], 1999; Finland: TWA 0.05 ppm (0.25 milligram per cubic meter); STEL 0.15 ppm, [skin], 1999; France: VME 0.05 ppm (0.3 milligram per cubic meter), [skin], 1999; Hungary: TWA 0.3 milligram per cubic meter; STEL 0.6 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 0.3 milligram per cubic meter, 2003; Norway: TWA 0.05 ppm (0.3 milligram per cubic meter), 1999; the Philippines: TWA 0.05 ppm (0.3 milligram per cubic meter), [skin], 1993; Switzerland: MAK-W 0.05 ppm (0.25 milligram per cubic meter), KZG-W 0.1 ppm, [skin], 1999; Turkey: TWA 0.05 ppm (0.3 milligram per cubic meter), [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 0.15 ppm/0.75 milligram per cubic meter [skin]. Several states have set guidelines or standards for decaborane in ambient air[60] ranging from 3−9 μ/m^3 (North Dakota) to 5 μ/m^3 (Virginia) to 6 μ/m^3 (Connecticut) and 7 μ/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, and eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Vapor exposure may cause clouding of the eyes with loss of vision. Contact can cause severe eye burns and may also irritate the skin. Sign and symptoms of acute exposure to decaborane may include tightness in the chest; dyspnea (shortness of breath), cough, and wheezing. Nausea and pulmonary edema may also occur. Neurological effects of acute exposure include dizziness, headache, weakness, a lack of coordination; muscle spasms; tremor, and seizures. Exposure to decaborane may irritate or burn the skin, eyes, and mucous membranes. Exposure to decaborane may irritate or burn the skin, eyes, and mucous membranes. Exposure can cause restlessness, headaches, dizziness, and nausea. High concentrations can cause muscle twitching; convulsions, unconsciousness, and death. High or repeated exposures may damage the liver and kidneys. Decaborane can be absorbed through the skin, thereby increasing exposure.

Long-Term Exposure: May cause damage to the CNS; liver and kidneys.

Points of Attack: CNS, liver, and kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Exam of the eyes and vision.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Any barrier will prevent contamination from the dry chemical. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Up to 3 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator). Up to 7.5 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). Up to 15 milligram per cubic meter: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* PD: PP (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type SCBA).

Storage: (1) Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement.(2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with decaborane all handlers should be trained on its proper handling and storage. Decaborane must be stored to avoid contact with oxidizers, such as permanganates, nitrates, peroxides, chlorates, and perchlorates; or halogenated compounds, since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area away from heat and water. Heat can cause an explosion. Contact with water can slowly produce flammable hydrogen gas. Detached storage is preferable. Sources of ignition, such as smoking and open flames are prohibited where decaborane is handled, used or stored.

Shipping: UN1868 Decaborane, Hazard Class: 4.1; Labels: 4.1-Flammable solid, 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. For small quantities, sweep into paper or other suitable material, place in appropriate container and burn in safe place (such as fume hood). Large quantities may be reclaimed. If reclamation is not practical, dissolve in flammable solvent (such as alcohol) and atomize in suitable combustion chamber.

Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Cover with water, sand or earth; shovel into metal container and keep material under water. *Large spills*: Dike for later disposal and cover with wet sand or water. Clean up only under supervision of an expert. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. The solid can self-ignite in oxygen, and mixtures with oxidizing materials can be explosive. Thermal decomposition products may include flammable hydrogen and boron fumes. Use dry chemical or CO_2 extinguishers. Avoid halogenated extinguishing agents, as they can react violently. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with aqueous scrubbing of exhaust gases to remove B_2O_3 particulates.

Hazardous to aquatic life or environment, with possible long lasting effects.[195]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, N, Xi, Xn; risk phrases: R11; R20/21; R38; R51/53; R65; R67; safety phrases: S29/35; S36/37; S45; S60; S61; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: DBDPO is a white to off-white powder. *A polybrominated biphenyl.* Molecular weight = 959.22; specific gravity (H_2O:1) = 3 v@ 20°C; freezing/melting point = 298.4°C−302.5°C; vapor pressure = < 1 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = < 1 mgm/mL @ 20°C.

Potential Exposure: It is used as a fire retardant for thermoplastics and man-made fibers.

Incompatibilities: Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Ethers have a tendency to form unstable and explosive peroxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation and skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. DBDPO irritates the eyes, skin, and respiratory tract.

Long-Term Exposure: This chemical can accumulate in the body and may cause liver damage. Thyroid enlargement (goiter) may occur. There is limited evidence that this chemical causes cancer in animals; it may cause liver cancer[193]. Some closely related polybrominated biphenyl compounds have been shown to damage the developing fetus.

Points of Attack: Liver, thyroid, liver, and kidney.

Medical Surveillance: Liver, kidney, and thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DPDPO all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from strong oxidizers. Where possible, automatically transfer this chemical from drums or other storage containers to process containers. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3152 Polyhalogenated biphenyls, solid or Polyhalogenated terphenyls, solid, Hazard class: 9; Labels: 9-Miscellaneous hazardous material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Do not dry sweep. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include hydrogen bromide and oxides of carbon. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 206-376-4

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R36/37/38, R53; R62; safety phrases: S26; S29/35; S36/37/39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: White crystalline solid or needles. Unpleasant, rancid odor. Molecular weight = 172.26; specific gravity (H_2O:1) = 0.8858 @ 40°C; boiling point = 268°C–270°C; freezing/melting point = 31.5°C; vapor pressure = 1 mm @ 125°C; flash point = 112.78°C (cc); Autoignition temperature = 375°C; Explosive limits: LEL = 5.5%; UEL = 0.8%. Hazard identification (based on NFPA-704M Rating System): Health Hazards (Blue): 2; Flammability (Red): 1; Reactivity (Yellow): 0. Practically insoluble in water; solubility = < 1 mg/mL @ 18°C; 140 mg/L.

Potential Exposure: Deconoic acid (fatty acids, saturated, linear, number of C-atoms > = 8 and < = 12, with terminating carboxyl group) is a carboxylic acid microbiocide used in cleaning, sanitizing and disinfecting applications for food processors and dairy farmers.

Incompatibilities: An organic carboxylic acid. Keep away from oxidizers, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, and epichlorohydrin. Corrosive solution; attacks most common metals. React violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Mixture with some silver compounds forms explosive salts of silver oxalate. Incompatible with silver compounds.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = \sim 4.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin and eye contact, and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Vapors cannot be tolerated even at low concentrations; can cause severe irritation of eyes and throat; may cause eye and lung injury. If inhaled, causes coughing or difficult breathing. Contact with liquid or solid causes second and third degree burns in a short time; very injurious to the eyes. If swallowed, causes nausea and vomiting. Toxicity by ingestion: Grade 3. LD_{50} (oral, rat) = > 10 g/kg.

Long-Term Exposure: May cause lung damage.

Medical Surveillance: Lung x-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink four to eight ounces of water. Do not induce vomiting. *Note to physician or authorized medical personnel*: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Carboxylic acids are generally weak acids, but can still be corrosive. Store in tightly closed containers in a cool, well-ventilated area. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat and incompatible materials. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Do not dry sweep. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products includes oxides of carbon. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recycle any unused portion of the material for its approved use or return it to the manufacturer or supplier. Ultimate disposal of the chemical must consider: the material's impact on air quality; potential migration in soil or water; effects on animal, aquatic, and plant life; and conformance with environmental and public health regulations[83].

RTECS Number: GZ1233000

UN/NA & ERG Number: UN2811 (toxic solids, organic, n.o.s.)/154; UN3349 (pyrethroid pesticide, solid, toxic)/151

EC Number: 258-256-6 [*Annex I Index No.:* 607-319-00-X]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC, Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3; EPA, Not Likely to be Carcinogenic to Humans

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Agricultural chemical, Environmental hazard.

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum

Clean water act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23/25; R50/53; R62; R63; safety phrases: S1/2; S24; S28; S29/35; S36/37/39; S38; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: Colorless, white, or off-white crystalline solid or powder. Odorless. Combustible. Molecular weight = 505.21; freezing/melting point = 98°C−100°C; boiling point decomposes on distillation; vapor pressure = 2×10^{-8} mmHg @ 25°C; 0.002 mmHg @ 25°C; specific gravity (H_2O:1) = 1.22 @ 25°C. Practically insoluble in water; solubility = ≤ 0.002 mg/L.

Potential Exposure: Deltamethrin is a synthetic pyrethroid insecticide that kills insects on contact and through digestion. It is used to control a variety of chewing and sucking insects that infest fruit, vegetables and field crops, including apples, pears and plums; peas, glasshouse cucumbers, tomatoes, peppers, potted plants, and ornamentals; hops, oats, cotton and other field crops. Deltamethrin is also used to control residential and commercial insect pests. Some formulations are RUPs)

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate.

Permissible Exposure Limits in Air:
ACGIH TLV[1]: (all pyrethrins) 5 milligram per cubic meter TWA

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum.

Determination in Water: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum. Octanol-water coefficient: Log $K_{ow} = >5$. Values above 3.0 are likely to bioaccumulate in marine organisms. Fish toxicity (threshold): Extra high—0.02258 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Inhalation, ingestion, and absorbed through the skin

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous. May be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause severe irritation and burns to skin and eyes. Pyrethrins can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness, rhinorrhea (discharge of thin nasal mucous). LD_{50} (oral), depending on carrier solvent = 30−2000 mg/kg; LD_{50} (dermal, rabbit) = > 2 g/kg.

Long-Term Exposure: High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny, or stuffy nose). Allergic “pneumonia” can also occur with cough, chest pain, breathing difficulty and abnormal chest x-ray. Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Dermal contact can cause rash with redness, blisters and intense itching. A severe generalized allergy can occur with weakness and collapse. May cause reproductive and fetal effects. May cause tumors. Human toxicity (long term)(101): Low—70.00 ppb, Health advisory.

Points of Attack: Respiratory system, skin, CNS, and brain. Reproductive cells.

Medical Surveillance: In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be indicated. Employees should be screened for history of certain medical conditions which might place the employee at increased risk from pyrethroid exposure. Chronic respiratory disease: In persons with chronic respiratory disease, especially asthma, the inhalation of pyrethroids might cause exacerbation of symptoms due to its sensitizing properties. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest x-ray if lung symptoms are present. Skin disease: Pyrethroids can cause dermatitis which may be allergic in nature. Persons with pre-existing skin disorders may be more susceptible to the effects of this agent. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Any employee developing the above-listed conditions should be referred for further medical examination[9].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: 50 milligram per cubic meter: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator).125 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). 250 milligram per cubic meter*:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or

SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 5000 milligram per cubic meter*:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location at temperature <35°C and away from alkaline materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.UN3349 Pyrethroid pesticide, solid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen bromide and oxides of nitrogen and carbon. *On a small fire:* Use dry chemical, CO_2 or water spray.On a large fire: Use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. (*O-*)

European/International Regulations (*O-; 298-03-3* & *mixture 8065-48-3*): Hazard symbol: T+, F, N; risk phrases: R10; R27/28; R29; R33; R50; R60, R61; R62; R63; safety phrases: S1/2; 28; S36/37; S41; S45; S60; S61; (*S-; 126-75-0*): Hazard symbol: T+, N; risk phrases: R27/28; R33; safety phrases: S1/2; S28; S36/37; S41; S45 (see Appendix 4).

Description: Demeton is a light brown liquid with an odor of sulfur compounds; freezing/melting point $\leq -13°C$. Molecular weight = 516.92; boiling point = 134°C @ 2 mmHg @ 20°C; flash point = 45°C; Explosive limits: LEL: 1%; UEL: 5.3%. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this systemic insecticide and acaricide.

Incompatibilities: May form explosive mixture with air. Strong oxidizers, strong bases, soluble mercury, other pesticides, and water.

Permissible Exposure Limits in Air

States which have set guidelines or standards for Demeton in ambient air[60] include North Dakota @ 1.0 μ/m^3 and Connecticut and Nevada @ 2.0 μ/m^3.

Determination in Air: Use NIOSH Analytical Method (IV) #5514.

Permissible Concentration in Water: A MAC of 0.01 mg/L in water bodies used for domestic purposes has been set in Russia[35],[43].

Routes of Entry: Inhalation, skin absorption, ingestion, and eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Demeton can be absorbed through the skin, thereby increasing exposure. Demeton may cause effects on the nervous system by cholinesterase inhibiting effect, causing convulsions, respiratory failure and possible death. High exposure (above OEL) may result in unconsciousness and death. Acute exposure to Demeton may produce the following symptoms of exposure: pinpoint pupils; pain; seizures, blurred vision; headache, dizziness, and muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. This material is a cholinesterase inhibitor. It is readily absorbed through the skin and is extremely toxic. Probable human lethal oral dose is 5−50 mg/kg or seven drops to one teaspoonful for 150 lb. person. Acute dose is believed to be 12−20 mg by oral route. The effects may be delayed. Medical observation is indicated.

Long-Term Exposure: May cause mutations. May damage the developing fetus. May damage the nervous system; causing sensation of “pins and needles” in the hands and feet. May cause depression, irritability and personality changes. Cumulative effect is possible. Demeton may affect cholinesterase, causing significant depression of blood cholinesterase.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count (CBC). Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 1 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator). 2.5 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 5 milligram per cubic meter: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 10 milligram per cubic meter: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with demeton all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong bases; water, soluble mercury; and other pesticides. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3278 Organophosphorus compound, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Hazard Technical Name Required, Potential Inhalation Hazard (Special Provision 5). UN3017 Organophosphorus pesticides, liquid, toxic, flammable, flash point not $<$ 23°C, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Organophosphorus Spill, Liquid

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.3/0.4

Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200

Then: Protect persons downwind (mi/km)

Day 1.4/2.3

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include sulfur oxides and carbon monoxide. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: The thiono-and thiolo-isomers of this mixture are 50% hydrolyzed in 75 minutes and 0.85 minute, respectively @ 20°C and pH 13. At pH 9 and 70°C, the half-life of Demeton is 1.25 hour, but an pH 1-5 it is over 11 hours. Sand and rushed limestone may be added together with a flammable solvent; the resultant mixture may be burned in a furnace with afterburner and alkaline scrubber[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Formula: $C_6H_{15}O_3PS_2$
Synonyms: Bay 15203; Bayer 21/116; Demethon-methyl; Duratox; ENT18,862; *S* (and *O*)-2-(Ethylthio)ethyl *O,O*-dimethyl phosphorothioate; Metasystox; Methyl demeton; Methyl mercaptophos; Methyl systox; Phosphorothioic acid, *O*-2-(ethylthio)ethyl *O,O*-dimethyl ester mixed with *S*-2-(ethylthio)ethyl *O,O*-dimethyl phosphorothioate
CAS Registry Number: 8022-00-2; 919-86-8 (Demeton-S-methyl)
HSDB Number: 6410
RTECS Number: TG1760000
UN/NA & ERG Number: (PIH) UN3018 (organophosphorus pesticides, liquid, toxic)/152; UN2810 (toxic liquid, organic, n.o.s.)/153
EC Number: 212-758-2 [*Annex I Index No.:* 015-031-00-5] (*S*-methyl); 212-758-1 [*Annex I Index No.:* 015-030-00-X] (*O*-methyl)
Regulatory Authority and Advisory Information
Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Combustible, Suspected of causing genetic defects.
Banned or Severely Restricted (Restricted in many countries) (UN)[35]
United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041.
Hazard symbols, risk, & safety statements: Hazard Symbol (*S*-methyl): T, N; risk phrases: R24/25; R28; R33; R51/53; R62; safety phrases: S1/2; S28; S36/37; S41; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]
Description: Demeton-methyl is a colorless to pale yellow oily liquid. Unpleasant odor. It is a mixture of Demeton-S and Demeton-O and may be formulated in a flammable organic solvent that may alter the physical properties shown here. Molecular weight = 230.30. Specific gravity (H_2O:1) = 1.2; boiling point = decomposes < 100°C. Hazard identification (based on NFPA-704M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 0.03%−0.3% @ 20°C.
Potential Exposure: An organophosphate insecticide. Those engaged in the manufacture, formulation and application of the insecticide and acaricide on agricultural and horticultural crops.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: 0.5 milligram per cubic meter TWA [skin]
ACGIH TLV[1]: 0.05 milligram per cubic meter TWA [skin] inhalable fraction and vapors (2006); BEI: methemoglobin in blood; 1.5% of hemoglobin, during or end-of-shift as methemoglobin inducers.
919-86-8, Demeton-S-methyl
PAC Ver. 29[138]
PAC-1: 0.45 milligram per cubic meter
PAC-2: 5 milligram per cubic meter
PAC-3: 22 milligram per cubic meter
DFG MAK: 0.5 ppm/4.8 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]
Australia: TWA 0.5 milligram per cubic meter, [skin], 1993; Austria: MAK 0.05 ppm (0.5 milligram per cubic meter), [skin], 1999; Belgium: TWA 0.5 milligram per cubic meter, [skin], 1993; France: VME 0.5 milligram per cubic meter, [skin], 1999; Russia: STEL 0.1 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 0.05 ppm (0.5 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 0.5 milligram per cubic meter [skin]
Determination in Air: None listed. Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.
Determination in Water: No criteria set. Octanol-water coefficient: Log $K_{ow} = 1.3$. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation; skin absorption.
Harmful Effects and Symptoms
Short-Term Exposure: Methyl demeton can be fatal by skin contact even if there is no feeling of irritation. Exposure can cause rapid, fatal organophosphate poisoning. Acute exposure to this chemical may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, and muscle spasms; profound weakness; vomiting, diarrhea, and abdominal pain; loss of coordination; seizures, coma, and death. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Eye contact may cause irritation.
Long-Term Exposure: May cause mutations. In animal studies this chemical causes a decrease in fertility and is toxic to the animal fetus. See also "Demeton" entry.
Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.
Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Note to Physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a. TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning. Contact local poison control center for additional guidance.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA > 0.45 milligram per cubic meter. None specifically listed by NIOSH for Methyl Demeton. *Herewith, for reference only, is the requirement for (8065-48-3) Demeton*: 1 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator). 2.5 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 5 milligram per cubic meter: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 10 milligram per cubic meter: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. See "Demeton" for guidance.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride and oxides of phosphorus, sulfur, nitrogen and carbon. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkaline hydrolysis or incineration[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EC Number: 237-198-5 [*Annex I Index No.:* 616-113-00-9]

Human toxicity (long term)(101): Very low—280.00 ppb, Health advisory

Regulatory Authority and Advisory Information

Carcinogenicity: EPA Group E, Evidence of noncarcinogenicity for humans.

Hazard Alert: Poison, Agricultural chemical.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R33; R50/53; safety phrases: S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Colorless, crystalline solid. Molecular weight = 300.34; boiling point = (decomposes); freezing/melting point = 120°C; vapor pressure = 2.9×10^{-9} mmHg @ 20°C. Low solubility in water.

Potential Exposure: A postemergence bis-carbamate herbicide used on sugarbeets to control annual weeds such as pigweed, wild mustard, lamb's quarters, nightshade, chickweed, buckwheat, goosefoot, ragweed, fiddleneck, and kochia.

Incompatibilities: Esters with acids to liberate heat along with alcohols and acids. Strong oxidizing acids may cause a vigorous reaction that is sufficiently exothermic to ignite the reaction products. Heat is also generated by the interaction of esters with caustic solutions. Flammable hydrogen is generated by mixing esters with alkali metals and hydrides. Carbamates are incompatible with reducing agents, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas. Forms Carbon monoxide and toxic nitrogen oxides when heated to decomposition.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 3.4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)(101): Low—225.68038 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Skin absorption, ingestion, inhalation

Harmful Effects and Symptoms

Short-Term Exposure: Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; agitation; tingling of the skin; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Carbamate insecticides inhibit the cholinesterase activity of enzymes, causing accumulation of acetylcholine at synapses and altering the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes. LD_{50} (oral, rat) = >4500 mg/kg.

Long-Term Exposure: A potent acetylcholinesterase (AChE) inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause dermatitis; liver damage.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC and chest x-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. *If conscious, alert, and able to swallow, rinse mouth and have victim drink four to eight ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUS OR HAVING CONVULSIONS*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of two tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at five to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. DuPont Tychem suit fabrics[88]. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable* *concentration:* SCBAF:Pd,Pp (APF = 10,000): (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (i.e., Sodium Hydroxide, Sodium Bicarbonate, etc.).

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: For solids, isolate spill or leak area in all directions for at least 25 m/75 ft. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Decomposes above 230°C releasing toxic carbons of nitrogen and carbon. *On small fire*, use dry chemical powder, carbon dioxide, water spray, or foam. *On large fire*, use water spray, fog or alcohol-resistant foam. Do not scatter material using straight water jet streams. Dike fire control water for later disposal; do not scatter the material. Move containers from fire area if you can do it without risk. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

HSDB Number: 2522 as sdium-2,4-dichlorophenoxyethyl sulfate

RTECS Number: KK4900000

UN/NA & ERG Number: UN3345/153

EC Number: 205-259-5 [*Annex I Index No.:* 016-025-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Primary irritant (w/o allergic reaction). Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R38; R41; safety phrases: S2; S26; S41 (see Appendix 4)

Description: Sesone or Crag pesticide is a colorless, odorless, and crystalline solid. It's a noncombustible solid, but commercial products may be formulated using flammable organic solvents, which can change the physical properties shown here. Molecular weight = 309.13; freezing/melting point = 245°C (decomposes); vapor pressure = 0.1 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water; solubility = 26% @ 25°C.

Potential Exposure: Used as corrosion inhibitor, pharmaceutical intermediate and emulsifier. A potential danger to those involved in manufacture, formulation and application of this herbicide as well as citizens in the area of application.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 milligram per cubic meter as Crag herbicide

OSHA PEL: 15 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction
NIOSH REL: 10 milligram per cubic meter TWA, total dust; 5 milligram per cubic meter TWA, respirable fraction
ACGIH TLV[1]: 10 milligram per cubic meter TWA; Not Suspected as a Human carcinogen, as Sesone
PAC not available
Russia: STEL 5 milligram per cubic meter [skin] 1993; United Kingdom: TWA 2 ppm (7.4 milligram per cubic meter); STEL 6 ppm (22 milligram per cubic meter), 2000; the Netherlands: MAC-TGG 7.4 milligram per cubic meter, 2003. Several states have set guidelines or standards for sesone in ambient air[60] ranging from 100 μ/m^3 (North Dakota) to 160 μ/m^3 (Virginia) to 200 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #S-356 (II-5).

Routes of Entry: Inhalation, ingestion skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin, and respiratory tract. High levels of exposure may cause CNS effects, convulsions. May affect the kidneys and liver.

Long-Term Exposure: May cause liver and kidney damage.

Points of Attack: Eyes, skin, CNS, liver, and kidneys.

Medical Surveillance: liver function. Kidney function. Tests of nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: 50 milligram per cubic meter: Qm (APF = 25) (any quarter-mask respirator (N, R, or P filters). 100 milligram per cubic meter: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). 250 milligram per cubic meter: PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or Sa:Cf (APF = 25) (any powered, air-purifying respirator with a dust and mist filter). 500 milligram per cubic meter: 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter*; or SaF (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode*; PaprTHie (APF = 50) (any SCBA with a full facepiece); or SaT: Cf (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode.) *Escape:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers and acids. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3345 Phenoxyacetic acid derivative pesticide, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sesone is hydrolyzed by alkali to $NaHSO_4$ and apparently dichlorophenoxyethanol. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Diacetone Alcohol D:0200

Formula: $C_6H_{12}O_2$: $(CH_3)_2C(OH)CH_2COCH_3$

Synonyms: Acetonyldimethylcarbinol; Diacetonalkohol (German); Diacetone-alcool (French); Diacetone, 4-hydroxy-4-methyl-2-pentatone, 2-methyl-2-pentanol-4-one; Diketone alcohol; Dimethylacetonylcarbinol; 4-Hydroxy-2-keto-4-methylpentane; 4-Hydroxyl-2-keto-4-methylpentane; 4-Hydroxy-4-methyl-pentan-2-on (German); 4-Hydroxy-4-methyl-2-pentanone; 4-Hydroxy-4-methylpentan-2-one; 4-Methyl-4-hydroxy-2-pentanone; 2-Methyl-2-pentanol-4-one; 2-Pentanone, 4-hydroxy-4-methyl-; tyranton

CAS Registry Number: 123-42-2

HSDB Number: 1152 as 4-hdroxy-4-methyl-2-pentanone

RTECS Number: SA9100000

UN/NA & ERG Number: UN1148/129

EC Number: 204-626-7 [*Annex I Index No.:* 603-016-00-1]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible/Flammable (technical), Primary irritant (w/o allergic reaction), Vapor may have a narcotic effect.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R10; R36/37/38; safety phrases: S2; S24/25; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Diacetone alcohol is a colorless liquid. Mild, mint odor. Molecular weight = 116.18; specific gravity (H_2O:1) = 0.93; boiling point = 164°C; freezing/melting point = −46.8°C; vapor pressure = 1.1 mmHg @ 20°C; flash point = 64°C; 58°C (acetone free); 64°C (commercial grade). Explosive limits: LEL: 1.8%; UEL: 6.9%. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: It is used as a solvent for pigments, cellulose esters; oils and fats. It is used in hydraulic brake fluids and in antifreeze formulations.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 1800 ppm [LEL]

Conversion factor: 1 ppm = 4.75 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 0.28 ppm.

OSHA PEL: 50 ppm/240 milligram per cubic meter TWA

NIOSH REL: 50 ppm/240 milligram per cubic meter TWA

ACGIH TLV[1]: 50 ppm/238 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 150 ppm

PAC-2: 350 ppm

PAC-3: 2100 ppm

DFG MAK: 20 ppm/96 milligram per cubic meter TWA; Peak Limitation Category I(2) [skin] Pregnancy Risk Group D

Australia: TWA 50 ppm (240 milligram per cubic meter), 1993; Austria: MAK 50 ppm (240 milligram per cubic meter), 1999; Belgium: TWA 50 ppm (238 milligram per cubic meter), 1993; Finland: TWA 50 ppm (240 milligram per cubic meter); STEL 75 ppm (360 milligram per cubic meter), 1999; France: VME 50 ppm (240 milligram per cubic meter), 1999; Norway: TWA 25 ppm (120 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 120 milligram per cubic meter, 2003; Russia: STEL 100 milligram per cubic meter, 1993; Sweden: NGV 25 ppm (120 milligram per cubic meter), KTV 20 ppm (240 milligram per cubic meter), 1999; Switzerland: MAK-W 50 ppm (240 milligram per cubic meter), 1999; Turkey: TWA 50 ppm (240 milligram per cubic meter), 1993; United Kingdom: TWA 50 ppm (241 milligram per cubic meter); STEL 75 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 50 ppm. Several states have set guidelines or standards for diacetone alcohol in ambient air[60] ranging from 0.03 milligram per cubic meter (Nevada) to 2.4−3.6 milligram per cubic meter (North Dakota) to 4.0 milligram per cubic meter (Virginia) to 4.8 milligram per cubic meter (Connecticut).

Determination in Air: Use NIOSH Analytical Method #1402, Method #1405, or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, and skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact can cause corneal tissue damage. Contact can irritate the skin, causing a burning sensation. It can cause you to become dizzy, lightheaded, and to pass out.

Long-Term Exposure: Repeated contact may lead to skin rash. Exposure may damage the liver, kidneys and the blood cells. Although there is no evidence involving this chemical, many similar solvents can cause nerve and brain damage.

Points of Attack: Eyes, skin, and respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. CBC. NIOSH lists: Expired Air; pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. 8 hours (more than 8 hours of resistance to breakthrough $> 0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, and boots; 4 hours (At least 4 but < 8 hours of resistance to breakthrough $> 0.1\ \mu g/cm^2/min$): Noeprene rubber gloves, suits, and boots; 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 1250 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. 1800 ppm: CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Diacetone alcohol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) or strong alkalis (such as sodium hydroxide or potassium hydroxide), since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where diacetone alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of diacetone alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Shipping: UN1148 Diacetone alcohol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Possibly fatal if swallowed, Suspected reprotoxic hazard, Environmental hazard, Agricultural chemical.

Banned or Severely Restricted (Malaysia, Germany)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant, as Dialifos

United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases R24; R28; R33; R50/53; R63; safety phrases: S1/2; S28; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Dialifor is a crystalline solid. The commercial product may also be available as a colorless oil. Molecular weight = 393.86; freezing/melting point (solid) = 68°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this insecticide.

Incompatibilities: Strong bases. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.45 milligram per cubic meter

PAC-2: 5 milligram per cubic meter

PAC-3: 39 milligram per cubic meter

Determination in Air: No method available.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption, and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: This material is highly toxic (the LD_{50} for rats is 5 mg/kg). Ingestion can be fatal. This material can cause serious symptoms, and in extreme cases, death by respiratory arrest. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and GI tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dialifor all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from strong bases.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Thermal decomposition products may include phosphorus, sulfur, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkaline hydrolysis or incineration. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Agricultural chemical, Environmental hazard.

Carcinogenicity: IARC: Animals Sufficient Evidence; Human No Adequate Data, Group 3, 1998

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U062

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: N, Xn; risk phrases: R20; R36/37/38; R51/53; safety phrases: S16; S26; S29/35; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Diallate is a brown liquid. Molecular weight = 270.21; boiling point = 150°C @ 9 mmHg; freezing/melting point = 25°C–30°C. Decomposes >200°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 14 mg/L @ 25°C.

Potential Exposure: A thiocarbamate herbicide. The slow release of poisonous gases from hydrolysis of many thio and dithiocarbamates requires the use of respirators during handling. Poisoning can also occur by ingestion and absorption through the skin. Diallate is potential danger to those involved in the manufacture, formulation and application of this re-emergence herbicide.

Incompatibilities: Thiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of thiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Many materials in this group slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of thiocarbamates with aldehydes, nitrides, and hydrides. Thiocarbamates are incompatible with acids, peroxides, and acid halides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: Russia[43] set a MAC of 0.03 mg/L in water used for domestic purposes[35],[43].

Routes of Entry: Ingestion, inhalation, absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact can irritate and possibly cause burns. Inhalation caused irritation of the respiratory tract with chest tightness and/or difficulty breathing. Higher levels can affect the nervous system. With nausea, vomiting, diarrhea, abdominal pain; reduced muscle coordination; blurred vision; muscle twitching; convulsions, coma and possible death.

Long-Term Exposure: High or repeated exposures can cause liver and kidney damage. There is limited evidence that diallate causes liver cancer in animals.

Points of Attack: Skin, eyes, and nervous system.

Medical Surveillance. Lung function tests. Kidney and liver function tests. Examination of the nervous system. Interview exposed person for brain effects, including memory, mood, concentration, headaches, malaise, and altered sleep patterns.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with diallate all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from alkalies. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2992 Carbamate pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include sulfur oxides, nitrogen oxides, and chlorides. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land burial is acceptable for small quantities. Larger quantities can be incinerated[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard Symbol (*includes sulfate*): T, N; risk phrases: R45; R22; R68; R50/53; R62; safety phrases: S29/35; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class) (*615-05-4*): 3-Severe hazard to water.

Description: 2,4-Diaminoanisole is a needle-like solid. Molecular weight = 138.19; freezing/melting point 67°C−68°C. The sulfate is an off-white to violet powder. Molecular weight = 236; boiling point = 150°C @ 5 mmHg; freezing/melting point 66°C−67°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. (includes sulfate). Soluble in water; solubility >1000 g/L @ 25°C.

Potential Exposure: The principal use of 2,4-diamino-anisole (and its salts such as the sulfate) as a component of oxidation (permanent) hair and fur dye formulations. Human exposure to 2,4-diaminoanisole sulfate may possibly occur through skin absorption at chemical and dye production facilities, as well as through dermal contact in persons using hair dyes containing the chemical.

Incompatibilities: Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. The sulfate may react violently with aluminum and magnesium.

Permissible Exposure Limits in Air

NIOSH (*2,4-Diaminoanisole and its salts*): Potential human carcinogen; Reduce exposure to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: [skin] Carcinogen Category 2

This chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Determination in Water: Octanol-water coefficient: Log K_{ow} = >4. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Contact may cause irritation and possible eye damage. High exposures to the sulfate can cause poisoning with trembling, diarrhea, trouble breathing and even death.

Long-Term Exposure: The sulfate can cause both skin and lung allergies to develop. There is sufficient evidence for the carcinogenicity of 2,4-diaminoanisole sulfate in experimental animals. In rats, dietary administration of the technical grade 2,4-diaminoanisole sulfate increased the incidence of cancers of the skin and the associated glands; and of thyroid cancers in each sex. In mice, dietary administration of 2,4-diaminoanisole sulfate induced thyroid tumors in each sex. Female rats exposed to technical-grade 2,4-diamonoanisole sulfate in the feed developed tumors of the thyroid, mammary, clitoral, and pituitary glands.

Points of Attack: Skin, eyes, and lungs.

Medical Surveillance: Evaluation by a qualified allergist. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Gloves are usually worn by hairdressers when applying hair dyes. Beyond that, NIOSH recommends minimization of exposure. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 2,4-DAA sulfate all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well ventilated area away from aluminum and magnesium.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. The sulfite decomposition products may include oxides of nitrogen, sulfur and carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

RTECS Number: BY5425000

UN/NA & ERG Number: UN2651/153

EC Number: 202-974-4 [*Annex I Index No.:* 612-051-00-1]

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen [4,4′-Methylenedianiline (101-77-9) and its Dihydrochloride (13552-44-8)]; IARC: Human No Adequate Data, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1998; OSHA/NIOSH: Potential human carcinogen.

California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: Poison, Polymerization hazard, Possible risk of forming tumors, Suspected of causing genetic defects, Sensitization hazard, Primary irritant (w/o allergic reaction), Environmental hazard; *dihydrochloride salt*: Reproductive hazard. Listed for Tier 1 screening as an endocrine disruptor[88].

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1050)

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*101-77-9*): Hazard symbol: T, N, Xi; risk phrases: R45; R19; R36/37/38; R39/23/24/25; R43; R48/20/21/22; R68; R50/53; R62; safety phrases: S53; S29/35; S45; S61; S41 (see Appendix 4)

Hazard symbols, risk, & safety statements: not listed in Annex I (*dichloride salt*).

WGK[100] (German Aquatic Hazard Class) (*101-77-9*): 3-Severe hazard to water.

Description: 4,4'-Diaminodiphenylmethane is a pale yellow crystalline solid (turns light brown on contact with air) with a faint amine-like odor. Molecular weight = 198.26; specific gravity (H_2O:1) = 1.07 @ 103°C; boiling point = 398°C; freezing/melting point = 92.5°C; vapor pressure = 2×10^{-7} mmHg @ 25°C; flash point = 221°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as an intermediate and as a curing agent. Approximately 99% of the DDM produced is consumed in its crude form (occasionally containing not more than 50% DDM and ply-DDM) at its production site by reaction with phosgene in the preparation of isocyanates and polyisocyanates. These isocyanates and polyisocyanates are employed in the manufacture of rigid polyurethane foams which find application as thermal insulation. Polyisocyanates are also used in the preparation of the semiflexible polyurethane foams used for automotive safety cushioning. DDM is also used as: an epoxy hardening agent; a raw material in the production of polyurethane elastomers; in the rubber industry as a curative for Neoprene and as an antifrosting agent (antioxidant) in footwear; a raw material in the production of Quana nylon; and a raw material in the preparation of poly (amide-imide) resins (used in magnet wire enamels).

Incompatibilities: Dust forms and explosive mixture with air. May polymerize in temperatures >125°C. A weak base. Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids. Flammable gaseous hydrogen may be generated in combination with strong reducing agents, such as hydrides[101].

Permissible Exposure Limits in Air

OSHA PEL: 0.010 ppm TWA; 0.100 ppm STEL. Potential human carcinogen. See 29CFR1910.1050.

NIOSH REL: Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.1 ppm/0.81 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

101-77-9

PAC Ver. 29[138]

PAC-1: 0.1 ppm

PAC-2: 3.4 ppm

PAC-3: 20 ppm

DFG MAK: [skin]; danger of skin sensitization; Carcinogen Category 2; BLW information available.

Australia: TWA 0.1 ppm (0.8 milligram per cubic meter), [skin], 1993; Austria: carcinogen, 1999; Belgium: TWA 0.1 ppm (0.81 milligram per cubic meter), [skin], carcinogen, 1993; Denmark: TWA 0.1 ppm (0.8 milligram per cubic meter), 1999; Japan: 0.4 milligram per cubic meter, [skin], 2B carcinogen, 1999; Norway: TWA 0.1 ppm (0.8 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.2 milligram per cubic meter, [skin], 2003; United Kingdom: LTEL 0.1 ppm (0.8 milligram per cubic meter); STEL 0.5 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for MDA in ambient air[60] ranging from zero (North Dakota) to 0.4 μ/m^3 (Kansas) to 0.8 μ/m^3 (Virginia) to 2.67 μ/m^3 (New York) to 4.0 μ/m^3 (South Carolina) to 8.0 μ/m^3 (Connecticut) to 19.0 μ/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method #ID-57; or, special filter; potassium hydroxide/methanol; high-pressure liquid chromatography/ultraviolet/electrochemical detection; NIOSH Analytical Method (IV) #5029.

Determination in Water: No criteria set. Octanol-water coefficient: Octanol-water coefficient: Log $K_{ow} = 1.6$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes. A single large exposure or repeated smaller exposures can cause serious liver disease (toxic hepatitis) with symptoms of fever, upper abdominal pain; jaundice, dark urine; fatigue, and loss of appetite.

Long-Term Exposure: 4,4'-Methylene dianiline can cause liver damage and may damage the kidneys. Repeated or prolonged contact with skin may cause skin sensitization and dermatitis. Causes thyroid and bladder cancer in animals; a possible carcinogen in humans.

Points of Attack: Liver, kidneys, and skin. In animals: bladder cancer.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: liver function tests. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 4,4′-Methylenedianiline (1910.1050 & 1926.60) < or = 10 × PEL: Half-mask respirator with high-efficiency* cartridge**. < or = 50 × PEL: Full-facepiece respirator with high-efficiency* cartridge or canister**. < or = 1000 × PEL: Full-facepiece powered air-purifying respirator with high-efficiency* cartridge**. >1000 × PEL or unknown concentration: (1) SCBA with full facepiece in positive-pressure mode; or (2) Full-facepiece positive-pressure demand supplied-air respirator with auxiliary self-contained air supply. *Escape*: (1) Any full-facepiece air-purifying respirator with high-efficiency* cartridges**; or (2) Any positive-pressure or continuous-flow-SCBA with full facepiece or hood. Firefighting full-facepiece SCBA in positive-pressure demand mode.

* A high-efficiency filter means a filter that is at least 99.97% efficient against mono-dispersed particles of 0.3 μm (micrometers) in diameter or higher.

** Combination High-Efficiency/Organic Vapor Cartridges shall be used whenever Methylenedianiline is in liquid form or a process requiring heat is used.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2651 4,4′-Diaminodiphenyl methane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

EC Number: 231-545-4 (silicon dioxide)

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1997; NIOSH (*Silica, amorphous silica, fused*): Potential occupational carcinogen.

Hazard Alert: Possible risk of forming tumors,.

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Diatomaceous earth is a transparent to gray, odorless amorphous powder. Molecular weight = 60.78; specific gravity (H_2O:1) = 2.20; boiling point = 2230°C; freezing/melting point = 1710°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Diatomaceous earth is used as a filtering agent and as a filler in construction materials, pesticides, paints, and varnishes. The calcined version (which has been heat treated) is the most dangerous and contains crystallized silica, and should be handled as silica. See also other entries on silica.

Incompatibilities: High temperatures causes the formation of crystalline silica. Incompatible with fluorine, oxygen difluoride, chlorine difluoride.

Permissible Exposure Limits in Air

diatomaceous earth, uncalcined & Silica, amorphous precipitated and gel

OSHA PEL: ***either one of the methods:*** 20 mppcf [millions of particles per cubic foot of air, based on impinger samples counted by light-field techniques] **or** 80 milligram per cubic meter divided by the value "%SiO2," TWA

NIOSH REL: 6 milligram per cubic meter TWA

ACGIH TLV[1]: withdrawn for the following: *silica amorphous, precipitated and gel; silica fume; silica fused; diatomaceous earth, calcined.*

NIOSH IDLH = 3000 milligram per cubic meter

PAC Ver. 27; No values found in Ver. 29[138]

Diatomaceous earth (flux calcinated)

PAC-1: 0.9 milligram per cubic meter

PAC-2: 9.9 milligram per cubic meter

PAC-3: 59 milligram per cubic meter

Diatomaceous earth (uncalcined)

PAC-1: 18 milligram per cubic meter

PAC-2: 200 milligram per cubic meter

PAC-3: 1200 milligram per cubic meter

DFG MAK (*diatomaceous earth, uncalcined)*: 4 milligram per cubic meter, inhalable fraction; Pregnancy Risk Group C. Austria: MAK 4 milligram per cubic meter, 1999; Norway: TWA 1.5 milligram per cubic meter (respirable dust), 1999; Switzerland: MAK-W 4 milligram per cubic meter, 1999; Thailand: TWA 80 milligram per cubic meter, 1993;

United Kingdom: TWA 6 milligram per cubic meter, total dust, 2000; United Kingdom: TWA 1.2 milligram per cubic meter, (respirable dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 3 milligram per cubic meter (respirable fraction, for particulate matter containing no asbestos and < 1% crystalline silica). Russia[43] set a MAC of 2 milligram per cubic meter in work-place air.

Determination in Air: Filter; Low-temperature ashing; X-ray diffraction spectrometry; NIOSH Analytical Method (IV) #7501[58]

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Unknown at this time.

Long-Term Exposure: Exposure can cause permanent scarring of the lungs, especially if diatomaceous earth has been calcined (heat treated). Symptoms include shortness of breath and cough. This can begin anywhere from months to years after exposure. The name of this disease is silicosis. With heavy exposure, individuals may become respiratory cripples. This can be fatal.

Points of Attack: Lungs.

Medical Surveillance: Before first exposure to calcined diatomaceous earth and at regular times after, the following are recommended: Medical exam of the lungs. Lung function tests. Chest X-ray (every 2−5 years).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: 30 milligram per cubic meter: Qm (APF = 25) (any quarter-mask respirator). 60 milligram per cubic meter: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). 150 milligram per cubic meter: Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). 300 milligram per cubic meter*:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 3000 milligram per cubic meter: SaF: Pd, Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Green: General storage may be used. Store in tightly closed containers in a cool well-ventilated area.

Shipping: This material is not singled out by DOT[19] in its Performance-Oriented Packaging Standards.

Spill Handling: Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use any extinguishing agent suitable for surrounding fire. Thermal decomposition products may include oxides of silicon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1987.

California Proposition 65 Developmental/Reproductive toxin 1/1/1992.

Hazard Alert: Poison, May be combustible, Reproductive toxin: possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Drug.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn; risk phrases: R21/22; R23/24/25; R36/37/38; R39; R51; R62; R63; safety phrases: S7; S16; S26; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Diazepam is a yellow crystalline powder. Molecular weight = 284.75; freezing/melting point = 125°C−126°C. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, packaging or consumption of this widely used tranquilizing drug.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Symptoms of exposure to this compound may include drowsiness, ataxia, skin rash, dysarthria, nausea, diplopia, anxiety, depression, constipation, changes in salivation, blurred vision, urinary retention, incontinence, tremor, headache, confusion, slurred speech, vertigo, changes in libido, and jaundice. Other symptoms of exposure include fatigue, dizziness, respiratory depression, nystagmus, incoordination of the upper extremities, cardiac arrest, hyporeflexia, muscular weakness, agitation, insomnia, grand mal seizures, organic brain syndrome, paradoxical excitement, delirium, coma, hallucinations, vomiting, lethargy, and respiratory failure or arrest. It can cause tinnitus, excitability, rage reaction, phlebitis, and lactic acidosis. It can also cause central nervous depression, brown discoloration of the lenses, lightheadedness, amnesia, mental depression, blood disorders, dysphoria, slight wheezing, cyanosis, increased respiratory rate, abnormal blood gases, convulsions, increase in chromosomal aberrations, aplastic anemia, leukopenia, leukocytosis, encephalopathy, bilateral gynecomastia, allergic conjunctivitis, angle closure glaucoma, reduction of cardiac output and stroke volume, increase in heart rate and peripheral resistance, cholestasis, disorganization of thought, depressed pupillary response, inhibited performance recall, improved recall of information, reduced reaction time, apprehension, vascular disease, bronchopneumonia, bullous and vesicular skin eruptions, eccrine sweat gland and sweat duct necrosis, skin pallor and death. Exposure can cause decreased blood pressure, increase in hostility and irritability, and vivid or disturbing dreams. Exposure can also lead to hypotension, increased muscle spasticity, sleep disturbances, stimulation, neutropenia, hypoactivity, syncope, bradycardia, urticaria, cardiovascular collapse and hiccups. Damage to the eyes, CNS, and pulmonary tract may occur. It may also cause dryness of the mouth, aggressive behavior, blood dyscrasias and hepatic dysfunction. If exposure occurs during pregnancy, it may cause lethargy and hypotonia in the offspring. The neonate may also experience apneic attacks. Symptoms may include hypertonia, hyperreflexis, difficulty in sucking, hypothermia and midline cleft deformities of the lip and palate. Depressed CNS function may also occur in the neonate[101].

Short-Term Exposure: When used as a medical drug, diazepam can cause drowsiness and difficulty with coordination, concentration, and balance. It may also cause irritability, anxiety, weakness, headaches, upset stomach, and joint pains. Less common side effects include jaundice, skin rashes; or a drop in the white blood cell count. These effects might also occur from work-place exposure due to breathing in dust during packaging or manufacture. LD_{50} = (oral-rat) 352 mg/kg (moderately toxic).

Long-Term Exposure: Diazepam is a probable teratogen and may be a mutagen. Handle with extreme caution. Sudden discontinuing the exposure following high exposure for at least 3 months may cause shakiness, irritability, and possible convulsions.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for diazepam level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to diazepam, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator (PAPR). *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in the pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with diazepam all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. If you are required to work in a sterile environment, you require specific training.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extinguishing agents suitable for surrounding fire. Thermal decomposition products may include hydrogen chloride, chlorine and oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant

Canada, Drinking Water Quality, 0.02 mg/L MAC.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard Symb Do not allow release to the environment unless proper permits are obtained from the federal government. ols, Risk & Safety statements: Hazard symbol: Xn, N; risk phrases: R22; R50/53; R62; R63; safety phrases: S2; S24/25; S29; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Diazinon is a combustible, colorless, oily liquid. Faint amine odor. Technical grade is pale to dark brown. Commercial formulations may use carrier solvents which can change the physical properties listed here. Molecular weight = 304.38; boiling point = decomposes below BP @ 120°C; 83°C−84°C @ 0.002 mm; flash point = 82°C; ∼100°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.004%.

Potential Exposure: Producers, formulators and applicators of this nonsystemic pesticide and acaricide. Diazinon is used in the United States on a wide variety of agricultural crops, ornamentals, domestic animals; lawns and gardens; and household pests.

Incompatibilities: Reaction with nitrosating agents (e.g., nitrites, nitrous gases, nitrous acid) capable of releasing carcinogenic nitrosamines. Hydrolyzes slowly in water and dilute acid. Reacts with strong acids and alkalis with possible formation of highly toxic tetraethyl thiopyrophosphates. Incompatible with copper-containing compounds. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides; may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.1 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.01 milligram per cubic meter TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; TLV-BEIA issued (2000), Acetylcholinesterase inhibiting pesticides.

No PAC available

DFG MAK: 0.1 milligram per cubic meter (measured as the, inhalable fraction); Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C

Australia: TWA 0.1 milligram per cubic meter, [skin], 1993; Austria: MAK 0.1 milligram per cubic meter, [skin], 1999; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Finland: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, [skin], 1999; Hungary: STEL 0.1 milligram per cubic meter, [skin], 1993; India: TWA 0.1 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Norway: TWA 0.1 milligram per cubic meter, 1999; Russia: STEL 0.2 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 0.1 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 0.1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for diazinon in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides. See also OSHA Analytical Method 62[58].

Permissible Concentration in Water: Canada set a MAC of 0.02 mg/L. Russia set a MAC in water bodies for domestic purposes of 0.3 mg/L. The United States Environmental Protection Agency has determined a NOAEL of 0.05 mg/kg/day which gives a long-term Health advisory: of 0.0175 mg/L and a lifetime Health advisory: of 0.00063 mg/L. Several states have set guidelines for Diazinon in drinking water[61] ranging from 4 μg/L (Maine) to 14 μg/L (California and Kansas).

Determination in Water: By Methylene Chloride extraction followed by gas chromatography. Octanol-water coefficient: Octanol-water coefficient: Log $K_{ow} = >3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Diazinon can affect you when breathed in and quickly enters the body by passing through the skin. May cause skin and eye irritation. Exposure can cause organophosphate poisoning with headache, sweating, nausea, and vomiting, diarrhea, muscle twitching and possible death. It is a moderately toxic organophosphate chemical. LD_{50} = (oral-rat) 66 mg/kg (moderately toxic).

Long-Term Exposure: Diazinon may damage the developing fetus. Exposure can cause severe organophosphate poisoning with headache, sweating, nausea and vomiting; diarrhea, loss of coordination; and death. Diazinon may affect the liver.

Points of Attack: Eyes, respiratory system; CNS, cardiovascular system, and blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Liver function tests. Exam of the nervous system. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for Exposures over 0.1 milligram per cubic meter use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator with a pesticide cartridge. The prefilter should be a high efficiency particulate filter. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a PAPR.

Where there is potential for high exposures exists, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in the pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool well-ventilated area away from water, and oxidizers, such as (peroxides, nitrates, permanganates, chlorates, and perchlorates).

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large Spills (from a large package or from many small packages)
First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Diazinon decomposes on heating above 120°C; decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. products include oxides of phosphorus, nitrogen and carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Diazinon is hydrolyzed in acid media about 12 times as rapidly as parathion, and at about the same rate as parathion in alkaline media. In excess water this compound yields diethylthiophosphoric acid and 2-isopropyl-4-methyl-6-hydroxypyrimidine. With insufficient water, highly toxic tetraethyl monothiopyrophosphate is formed. Therefore, incineration would be a preferable ultimate disposal method with caustic scrubbing of the incinerator effluent[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Diazomethane is a flammable, yellow gas or a liquid under pressure. Musty odor. Molecular weight = 42.04; specific gravity (H_2O:1) = 1.45; boiling point = −22.7°C; freezing/melting point = −145°C; Autoignition temperature = 100°C (explodes). Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3 ₩. Decomposes in water; reaction.

Potential Exposure: Diazomethane is a powerful methylating agent for acidic compounds, such as carboxylic acids, phenols and enols. It is used in pesticide manufacture and pharmaceutical manufacture.

Incompatibilities: Heat (at about or above 100°C), shock, friction, concussion, sunlight, or other intense illuminations may cause explosions. Contact with alkali metals; drying agents such as calcium sulfate, or rough edges (such as ground glass) may cause explosions. Diazo compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides. This chemical is sensitive to prolonged exposure to heat. This chemical is incompatible with strong oxidizing agents[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 2 ppm

Conversion factor: 1 ppm = 1.72 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.2 ppm/0.4 milligram per cubic meter TWA

ACGIH TLV[1]: 0.2 ppm/0.34 milligram per cubic meter TWA; Suspected Human Carcinogen

PAC Ver. 29[138]

PAC-1: 0.6 ppm

PAC-2: 6.6 ppm

PAC-3: 40 ppm

DFG MAK: Carcinogen Category 2

Australia: TWA 0.2 ppm (0.4 milligram per cubic meter), carcinogen, 1993; Austria: carcinogen, 1999; Finland: TWA 0.2 ppm (0.4 milligram per cubic meter), 1999; France: VME 0.2 ppm (0.4 milligram per cubic meter), 1993; Hungary carcinogen, 1993; India: STEL 0.4 milligram per cubic meter [skin] 1993; Norway: TWA 0.2 ppm (0.4 milligram per cubic meter), 1999; Russia: TWA 0.2 ppm (0.4 milligram per cubic meter), 1993; Switzerland: MAK-W 0.2 ppm (0.35 milligram per cubic meter), carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: Suspected Human Carcinogen. Several states have set guidelines or standards for diazomethane in ambient air[60] ranging from 1.3 μ/m^3 (New York) to 2.0 μ/m^3 (South Carolina) to 4.0 μ/m^3 (Florida and North Dakota) to 7.0 μ/m^3 (Virginia) to 8.0 μ/m^3 (Connecticut) to 10.0 μ/m^3 (Nevada).

Determination in Air: See NIOSH Analytical Method (IV) #2515[18].

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 5.5 μg/L, based on health effects.

Routes of Entry: Inhalation, ingestion, and skin and eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: Cough and shortness of breath; headaches; flushed skin; fever, chest pain; pulmonary edema; pneumonitis, asthma, and eye irritation. It is extremely toxic. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause severe lung damage with symptoms of coughing, chest pain; shortness of breath; fever and fatigue. Exposure to the gas or liquid can cause severe skin burns and eye damage. Contact with the liquid can cause frostbite.

Long-Term Exposure: Repeated exposures, even at low levels, may cause an asthma-like lung allergy. This chemical is a possible human carcinogen.

Points of Attack: Respiratory system, lungs, eyes, and skin.

Medical Surveillance: This chemical is a suspected human carcinogen[1]. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. These may be normal at first if the person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy.

Consider chest X-ray after acute overexposure. NIOSH lists the following tests: blood gas analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity (FVC), forced expiratory volume (1 s); white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Frostbite: Wear appropriate safety gloves (for cold) and personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Up to 2 ppm: Sa (APF = 10) (any supplied-air respirator); *or SCBA (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type SCBA).

*Substance causes eye irritation or damage; eye protection needed

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Should not be stored but prepared as needed. Color code-Blue: Health Hazard/Poison: This gas is highly toxic. Even slight exposure to this gas can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on non-wooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Diazomethane must be stored to avoid contact with alkali metals such as lithium, sodium, or potassium; or drying agents such as calcium sulfate, since violent reactions occur. Safety barriers or shields should be used to protect workers from accidental explosions. Sources of ignition, such as smoking and open flames are prohibited where diazomethane is handled, used, or stored. Metal containers used in the transfer of five gallons or more diazomethane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of diazomethane. Wherever diazomethane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1953 Compressed gas, toxic, flammable, n.o.s. ***Inhalation Hazard Zone A, B, C, or D***, Hazard Class: 2.3; Labels: 2.3-Poison Gas, 2.1-Flammable gas, Technical Name Required.

You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) Zone **A** 300/90: Zone **B**, C or D:100/30

Then: Protect persons downwind (mi/km)

Day Zone **A**: 0.3/0.5; Zone **B**, C & D: 0.1/0.2

Night Zone **A**: 1.4/2.3; Zone **B**, C & D: 0.2/0.3

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) Zone A: 2000/600; Zone B: 1000/300; Zones C or D: 600/180
Then: Protect persons downwind (mi/km)
Day Zone **A**: 1.7/2.8; Zone **B**: 0.8/1.2; Zone C: 0.7/1.1; Zone D: 0.5/0.8
Night Zone **A**: 5.4/8.7 Zone **B**: 2.2/3.5; Zone C: 2.0/3.2; Zone D: 1.3/2.0
If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. If in liquid form, allow to vaporize or absorb the spilled chemical by using a sponge and water. Decompose chemically with a 10% ceric ammonium nitrate solution. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable and explosive gas. Thermal decomposition products may include oxides of nitrogen and carbon. This gas is under pressure; containers may rupture and explode when heated. Use dry chemical or sand to extinguish fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Decompose chemically with ceric ammonium nitrate under constant agitation and cooling[24].

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R50/53; R63; safety phrases: S29; S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Dibenz(a,h)anthracene is a colorless, crystalline solid. PAHs are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Molecular weight = 278.35; specific gravity (H_2O:1) = 1.38; boiling point = 524°C; freezing/melting point = 267°C−270°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Dibenz(a,h)anthracene is a chemical substance formed during the incomplete burning of fossil fuel, garbage, or any organic matter and is found in smoke in general; it condenses on dust particles and is distributed into water and soil and on crops. DB(a,h)A is a PAH and is also a component of coal tar pitch, which is used in industry as a binder for electrodes, and creosote is used to preserve wood. PAHs are also found in limited amounts in bituminous materials and asphalt used in industry and for paving.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

Dibenz(a,h)anthracene falls in the category of coal tar pitch volatiles

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen

PAC Ver. 29[138]

PAC-1: 0.093 milligram per cubic meter

PAC-2: 1 milligram per cubic meter

PAC-3: 2.9 milligram per cubic meter

DFG MAK: [skin] Carcinogenic Category 2; Germ Cell Mutation Category 3A

France: carcinogen, 1993; Norway: TWA 0.04 milligram per cubic meter, 1999; Poland: TWA 0.004 milligram per cubic meter, 1999

Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; NIOSH Analytical Method #5515, PAHs by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms, therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0 *n*g/l, 2.8 *n*g/l, and 0.28 *n*g/l, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0 *n*g/l, 31.1 *n*g/l, and 3.11 *n*g/l, respectively.

Determination in Water: Extraction with methylene chloride may be followed by measurement by gas chromatography coupled with mass spectrometry.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Long-Term Exposure: DB(a,h)A is a toxic chemical and is a probable carcinogen in humans. It has caused cancer in laboratory animals when it is ingested or applied to their skin. Because DB(a,h)A causes cancer in animals, it is likely that humans exposed in the same manner would develop cancer as well. DB(a,h)A may affect the skin, resulting in photosensitization.

Points of Attack: Respiratory system, skin, bladder, and kidneys.

Medical Surveillance: NIOSH lists: CBC; chest X-ray; pulmonary function tests: FVC; Forced Expiratory Volume (1 s); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. See the entry on "Coal Tar Pitch Volatiles." A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: See the entry on Coal Tar Pitch Volatiles. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, CEPA Toxic Substances.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, N, Xn, Xi; risk phrases: R11; R20/21/22; R36/37/38; R43; R40; R48/20; R50/53; R59; safety phrases: S1; S7/9; S16; S20/21/22; S23/S24/25; S29/35; S36/37/38; S39; S40; S43; S45; S53; S61; S63; S67; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Dibenzofuran is a white crystalline powder. Molecular weight = 168.20; boiling point = 285°C288°C; freezing/melting point = 85°C−87°C; vapor pressure = 4.4×10^{-3} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Very slightly soluble in water.

Potential Exposure: This material is used as an insecticide and in organic synthesis to make other chemicals. It is derived from coal tar creosote.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Dibenzofuran can be absorbed through the skin, thereby increasing exposure. Exposure irritates the eyes, skin, and respiratory tract. Poisonous if ingested. See also entry for "Coal Tar."

Long-Term Exposure: Repeated contact may cause skin growths, rashes, and changes in skin color. Exposure to sunlight may make rash worse.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: *Skin Contact:* [52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Dibenzyldichlorosilane D:0320

Formula: $C_{14}H_{14}Cl_2Si$; $(C_6H_5CH_2)_2SiCl_2$

Synonyms: Dichlorobis(phenylmethyl)silane

CAS Registry Number: 18414-36-3

HSDB Number: 7802

RTECS Number: VV2977000

UN/NA & ERG Number: UN2434/156

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Corrosive, Water reactive.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%., *based on other chlorosilanes listed.*

Description: A colorless, corrosive liquid. Hazard Vapor pressure = < 1. identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2₩. Reacts with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: This material is used as an intermediate in the production of silicone polymers.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

based on other dichlorosilanes with identical PACs (for reference only)

PAC-1: $\mathbf{0.9}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{11}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{50}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: The health effects are not well known at this time. However, closely related chemicals cause irritation of the eyes, nose, throat and lungs. Dibenzyl dichlorosilane is a corrosive chemical and can cause severe eye and skin burns. This substance can give of corrosive hydrogen chloride gas on contact with water, steam, or moisture. It is possible that higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Although it is not known if this chemical causes lung problems, similar corrosive or highly irritating substances may affect the lungs.

Points of Attack: Skin and lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to Dibenzyl dichlorosilane, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from combustible materials and any form of moisture. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2434 Dibenzyldichlorosilane, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Dibenzyldichlorosilane, When Spilled in Water

Initial Isolation and Protective Action Distances as Chlorosilanes, corrosive, n.o.s.

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

When Spilled in Water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.4/0.6

Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dibenzyl dichlorosilane may burn, but does not readily ignite. Thermal decomposition products may include hydrogen chloride and oxides of metal and carbon. *Do not use wate or hydrous agents. FOR CHLOROSILANES, DO NOT USE WATER. USE AFFF ALCOHOL-RESISTANT, MEDIUM EXPANSION FOAM.* *Small fire*: Use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: Use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F+, Xn; risk phrases: R5; R12; R21; R23/24/25; R26; R36/37/38; R39; R61; safety phrases: S1; S1; S9; S16; S28; S33; S36/37/39; S38; S41; S45 (see Appendix 4)

Description: Diborane is a compressed, colorless, and flammable gas. It has a nauseating, sickly sweet odor. Molecular weight = 27.67; specific gravity (air = 1) = 0.96; boiling point = −92.5°C; freezing/melting point = −165.5°C; vapor pressure = 39.5 atm @ 17°C; Relative vapor density (air = 1) = 0.97; flash point = −90°C (flammable gas); Autoignition temperature = 40°C−50°C. Explosive limits: LEL: 0.8%; UEL: 88%. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 3. Reacts with water, forming hydrogen gas and boric acid.

Potential Exposure: Diborane is used as the source of boron in the semiconductor industry; as a catalyst for olefin polymerization; a rubber vulcanizer; a reducing agent; a flame-speed accelerator; a chemical intermediate for other boron hydrides; as a doping agent; in rocket propellants, and in the conversion of olefins to trialkyl boranes and primary alcohols.

Incompatibilities: A strong reducing agent. Unstable above 8°C. The presence of contaminants may lower the autoignition temperature; ignition may take place at, or below, room temperature. Diborane can polymerize, forming liquid pentaborane (See P:0190). It ignites spontaneously in moist air; and on contact with water, hydrolyzes exothermically forming hydrogen and boric acid. Contact with halogenated compounds (including fire extinguishers) may cause fire and explosion. Contact with aluminum, lithium and other active metals form hydrides which may ignite spontaneously. Incompatible with aluminum, carbon tetrachloride; nitric acid; nitrogen trifluoride and many other chemicals. Reacts with oxidized surfaces. Attacks some plastics, rubber or coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 15 ppm

Conversion factor: 1 ppm = 1.13 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 2.5 ppm.

OSHA PEL: 0.1 ppm/0.1 milligram per cubic meter TWA

NIOSH REL: 0.1 ppm/0.1 milligram per cubic meter TWA

ACGIH TLV[1]: 0.1 ppm/0.11 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: 0.3 ppm

PAC-2: $\mathbf{1.0_A}$ ppm

PAC-3: $\mathbf{3.7_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 0.1 ppm (0.1 milligram per cubic meter), 1993; Austria: MAK 0.1 ppm (0.1 milligram per cubic meter), 1999; Belgium: TWA 0.1 ppm (0.11 milligram per cubic meter), 1993; Finland: TWA 0.1 ppm (0.1 milligram per cubic meter); STEL 0.3 ppm (0.3 milligram per cubic meter), 1999; France: VME 0.1 ppm (0.1 milligram per cubic meter), 1999; Japan: 0.01 ppm (0.012 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; the Philippines: TWA 0.1 ppm (0.1 milligram per cubic meter), 1993; Russia: STEL 0.1 milligram per cubic meter, 1993; Switzerland: MAK-W 0.1 ppm (0.1 milligram per cubic meter), KZG-W 0.2 ppm, 1999; Turkey: TWA 0.1 ppm (0.1 milligram per cubic meter), 1993; United Kingdom: TWA 0.1 ppm (0.12 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 0.1 ppm. Several states have set guidelines or standards for diborane in ambient air[60] ranging from 30 μ/m^3 (North Dakota) to 50 μ/m^3 (Virginia) to 60 μ/m^3 (Connecticut) to 71 μ/m^3 (Nevada).

Determination in Air: NIOSH Analytical Method (IV) #6006.

Permissible Concentration in Water: No criteria set. (Diborane reacts on contact with water as noted above.)

Routes of Entry: Inhalation, skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Diborane is the least toxic of the boron hydrides. Can be fatal if inhaled. In acute poisoning, the symptoms are similar to "metal fume fever": tightness, heaviness, and burning in chest; coughing, shortness of breath; chills, fever, and pericardial pain; nausea, shivering, and drowsiness. Signs appear soon after exposure or after a latent period of up to 24 hours and persist for 1−3 days or more. Pneumonia may develop later. Reversible liver and kidney changes were seen in rats exposed to very high gas levels. This has not been noted in humans. Subacute poisoning is characterized by pulmonary irritation symptoms, and if this is prolonged, CNS symptoms, such as headaches, dizziness, vertigo, chills, fatigue, muscular weakness; and only infrequent transient tremors, appear. Convulsions do not occur. NIOSH lists symptoms as; chest tightness, precordial pain, shortness of breath; nonproductive cough; nausea, headache, lightheadedness, vertigo (an illusion of movement), chills, fever, fatigue, weakness, tremor, muscle fasiculation. In animals: liver, kidney damage; pulmonary edema; hemorrhage. LD_{50} (rat, inhalation) = 80 ppm.

Long-Term Exposure: Prolonged exposure may cause lung damage. Chronic exposure leads to wheezing, dyspnea, tightness, dry cough; rales; and hyperventilation which persist for several years.

Points of Attack: Respiratory system, CNS, liver, and kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure has occurred, the following may be useful: liver and kidney function tests. Examination of the nervous system. NIOSH lists the following tests: chest X-ray; pulmonary function tests: FVC, forced expiratory volume (1 s).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Up to 1 ppm: Sa (APF = 10) (any supplied-air respirator). Up to 2.5 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). Up to 5 ppm: SCBAF (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SaF (APF = 50) (any SCBA with a full facepiece); or SaT: Cf (APF = 50) (any supplied-air respirator with a full facepiece). Up to 15 ppm: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type SCBA).

Storage: PIH; check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and away from radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. (3) Color code-Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Diborane must be stored to avoid contact with: air, active metals, such as aluminum and lithium; halogenated compounds, such as chlorine; and oxidizing agents such as permanganates, nitrates, peroxides, chlorates, and perchlorates, since violent reactions occur. Containers should be dry, clean, and free of oxygen. Store in tightly closed containers in a cool well-ventilated area away from heat and moisture. Containers are usually stored in "dry ice" or are refrigerated in some other way. Diborane can ignite spontaneously in moist air at room temperature. Use dry nitrogen purge in any transfer. Sources of ignition, such as smoking and open flames are prohibited where diborane is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of diborane. Wherever diborane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1911 Diborane, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Diborane and diborane, compressed

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/180
Then: Protect persons downwind (mi/km)
Day 0.8/1.2
Night 2.5/4.1

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If possible, dilute the leak with an inert gas and exhaust through a fume hood. If source is a cylinder and the leak cannot be stopped in place, specially trained personnel may be able to remove the leaking cylinder to a safe place in the open air; repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. This chemical is a highly flammable and reactive gas; it will ignite without warning in moist air at room temperature. Thermal decomposition products may include boron and hydrogen at high heat; and hydrogen and boron hydrides at lower temperatures. This gas is under pressure; containers may rupture and explode when heated. Approach fire with extreme caution; consider letting it burn. Do not extinguish fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Stop the flow of gas and use water spray to protect personnel during the shut-off. Use water from an unmanned source to keep fire-exposed containers cool. Diborane may react violently with halogenated extinguishing agents. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration with aqueous scrubbing of exhaust gases to remove B_2O_3 particulates.

Dibromobenzene D:0340

Formula: $C_6H_4Br_2$

Synonyms: Benzene dibromide; Benzene, dibromo-; Bromobenzene; *o*-Dibromobenzene

CAS Registry Number: 106-37-6 (1,4-isomer); 26249-12-7

HSDB Number: 2734

RTECS Number: CZ1780000

UN/NA & ERG Number: UN2514/130; UN1993 (flammable liquids, n.o.s.)/128

EC Number: 204-390-2 (1,4-); 247-544-7

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid, Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N: risk phrases: R10; R36/37/38; R50/53; safety phrases: S29/35; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Dibromobenzene is a heavy colorless liquid. Pleasant aromatic odor. Molecular weight = 235.91; specific gravity = 1.84; boiling point = 219−225.5°C; freezing/melting point = 86°C−89°C; flash point = 47°C−49°C. Insoluble in water.

Potential Exposure: Dibromobenzene is used as a solvent for oils and in organic synthesis.

Incompatibilities: Extremely flammable. May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices. Russia[43] set a MAC value for ambient air in residential areas of 0.2 milligram per cubic meter on a momentary basis.

Determination in Water: Log $K_{ow} = \sim 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the eyes, nose and throat. High levels can cause you to feel dizzy, lightheaded and to pass out. Contact can irritate the eyes and skin.

Long-Term Exposure: Similar chemicals can cause liver damage.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to dibromobenzene, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149

(Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with dibromobenzene all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where dibromobenzene is used, handled, or stored, in a manner that could create a potential fire or explosion hazard.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required. UN2514 Bromobenzene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen bromide and oxides of carbon. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with flue gas scrubbing.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

Description: Dibromochloromethane is a clear colorless liquid. Molecular weight = 208.28; specific gravity (H_2O:1) = 2.45 @ 20°C; boiling point = 119°C−120°C; freezing/melting point = −20°C; vapor pressure = 5.54 mmHg @ 25°C. Also reported as ≤20°C.

Potential Exposure: Dibromochloromethane is used as a chemical intermediate in the manufacture of fire extinguishing agents; aerosol propellants; refrigerants, and pesticides. Dibromochloromethane has been detected in drinking water in the United States. It is believed to be formed by the haloform reaction that may occur during water chlorination. Dibromochloromethane can be removed from drinking water via treatment with activated carbon. There is a potential for dibromochloromethane to accumulate in the aquatic environment because of its resistance to degradation. Volatilization is likely to be an important means of environmental transport.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and magnesium.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.1 milligram per cubic meter

PAC-2: 12 milligram per cubic meter

PAC-3: 73 milligram per cubic meter

Permissible Concentration in Water: The Maximum Contaminant Level (MCL) for total trihalomethanes (including dibromochloromethane) in drinking water has been set by the United States Environmental Protection Agency at 0.10 mg/L (44 RF 68624). Illinois has set a guideline for CDBN in drinking water[61] of 1.0 μg/L.

Routes of Entry: Ingestion, inhalation, passing through the unbroken skin

Harmful Effects and Symptoms

Symptoms of exposure to dibromochloromethane may include irritation of the skin, eyes, mucous membranes and upper respiratory tract. It may also cause fatigue and may be imitating to the lung and cornea. Other symptoms may include CNS effects, lung and cornea irritation and liver and kidney damage. Prolonged exposure can cause nausea, dizziness, headache, and narcosis.

Short-Term Exposure: Very little toxicity information is available. It is, however, an irritant and narcotic. Symptoms include dizziness, headache, liver and kidney damage.

Long-Term Exposure: May cause liver and kidney damage. Dibromochloromethane gave positive results in mutagenicity tests with salmonella typhimurium TA 100. LD_{50} = (oral-rat) 848 mg/kg (slightly toxic).

Points of Attack: Liver, kidneys, and skin.

Medical Surveillance: Liver and kidney function tests.

First Aid: *Skin Contact:* [52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves (nitrile gloves may provide protection[52]) and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers under an inert atmosphere, away from light, in a refrigerator. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810, Toxic liquids, organic, n.o.s.

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency

Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen bromide, hydrogen chloride and oxides of carbon. It may also emit toxic fumes of chloride ion and bromide ion. It also decomposes to phosgene analogs. It may cause narcosis[101]. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be destroyed by high-temperature incinerator equipped with an HCl scrubber.

EC Number: 262-281-0

Regulatory Authority and Advisory Information

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

WGK[100] (German Aquatic Hazard Class):No value assigned.

Description: Light yellow crystalline solid or powder. Commercial products may be soluble concentrate (liquid or solid); pellets/tablets. Mild, acrid, sweet odor. Molecular weight = 265.93; specific gravity (H_2O:1) = 0.970 @ 20°C; freezing/melting point = 52°C; vapor pressure = 5.03×10^{-5} @25°C. Henry's Law constant = 3.9×10^{-10} atm-m^3/mol @ 25°C (est)[83]. Slightly soluble in water; solubility 0.212 g/100 mL.

Potential Exposure: Nitrile microbiocide used as a preservative in food grade adhesives and as a slimicide in the manufacture of food grade paper and paperboard; used to control slime-forming bacteria and fungi in recirculating water cooling system; oil recovery drilling mud systems; paper mill and pulp mill water systems and similar industrial processing and chemical systems.

Incompatibilities: Corrosive. Strong oxidizers and reducing agents, strong acids and bases. Reacts with acids, steam, warm water producing toxic and flammable hydrogen cyanide fumes. Hydrogen cyanide is produced when propionitrile is heated to decomposition. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact

Harmful Effects and Symptoms

Short-Term Exposure: Contact may cause burns to skin and eyes. May affect the iron metabolism, causing asphyxia. It is highly toxic. Forms cyanide in the body. Exposure results in headache, dizziness, rapid pulse, deep-rapid breathing, nausea, vomiting, unconsciousness, convulsions, and sometimes death. May cause cyanosis (blue coloration of skin and lips caused by lack of oxygen). LD_{50} (oral, rat) = 0.77 g/kg[83].

Long-Term Exposure: Chronic exposure over long periods may cause fatigue and weakness. Can cause same general symptoms as hydrogen cyanide but onset of symptoms is likely to be slower. May cause liver and kidney damage. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: In animals: liver, and kidney damage.

Medical Surveillance: Liver and kidney function tests

First Aid Move victim to fresh air. Call 911 or emergency medical service. Administer oxygen if breathing is difficult. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. DuPont Tychem Suit Fabrics is recommended by one government source[88]. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Spill Handling: For *liquids*, isolate spill or leak area in all directions for at least 50 m/150 ft. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers. For *solids*, isolate spill or leak area in all directions for at least 25 m/75 ft. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Shipping: UN3261 Corrosive solid, acidic, organic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3439 Nitriles, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Nitriles spill

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information

from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2
Large Spills (from a large package or from many small packages)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8
Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include Thermal decomposition products may include oxides of nitrogen and carbon and hydrogen bromide gas. *Fire involving storage or vehicular tanks: Isolate* for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire:* Dry chemical, carbon dioxide or water spray. *Large fire:* Dry chemical, carbon dioxide, alcohol-resistant foam, or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/trailer loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recycle any unused portion of the material for its approved use or return it to the manufacturer or supplier. Ultimate disposal of the chemical must consider: the material's impact on air quality; potential migration in soil or water; effects on animal, aquatic, and plant life; and conformance with environmental and public health regulations[83].

Regulatory Authority and Advisory Information
Carcinogenicty: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen
California Proposition 65 Chemical[102]: Cancer, October 1, 1994
Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.
Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R20/22; R24; R36/37/38; R50/53; R62; R63; safety phrases: S29/35; S41; S45; S53; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 2,3-Dibromo-1-propanol is a clear, colorless to slightly yellow thick liquid. Molecular weight = 217.9; specific gravity (H_2O:1) = 2.12 @ 20°C; boiling Point = 219°C @ 760.0 mmHg; freezing/melting point = °C; vapor Pressure = 1 mm Hg @ 57°C; 5 mm Hg @ 84.5°C; 10 mm Hg @ 98°C; flash point = > 113°C; Slightly soluble in water; solubility = < 100 mg/mL @ 20°C.

Potential Exposure: Chemical intermediate used to produce insecticides, pharmaceuticals, and flame retardants.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices

Routes of Entry: Inhalation, ingestion, or skin absorption

Harmful Effects and Symptoms

Short-Term Exposure: 2,3-Dibromo-1-propanol is an irritant of the skin, eyes, mucous membranes and upper respiratory tract. LD_{50} = (oral-rat) ~650 mg/kg.

Long-Term Exposure: May produce tumors. A suspected human carcinogen.

Points of Attack: Skin, digestive tract, intestines, nasal mucosa, liver, and clitoral gland (in animal studies of rats and mice).

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves (nitrile gloves may provide protection[52]) and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: This chemical react s with cellulose-based absorbents. *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Fire: If tank, rail car, or tank truck is involved in fire, isolate for at least 800 m (½ mi) in all directions; also, consider initial evacuation for 800 m (½ mi) in all directions.

Initial Isolation and Protective Action Distances:

Fire Extinguishing: This chemical has a flash point and is combustible. Thermal decomposition products may include hydrogen bromide and oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Positive: In vitro SCE-nonhuman; Positive/dose response: In vitro cytogenetics-nonhuman.

Hazard Alert: Flammable liquid, Corrosive, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, T, Xn; risk phrases: R10; R20/21/22; R23; R34; R35; R36/37/38; R62; safety phrases: S23; S26; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Dibutylamine is a colorless liquid with an odor of ammonia. Molecular weight = 129.28; specific gravity (H_2O:1) = 0.76; boiling point = 159°C−161°C; freezing/melting point = −61.9 to −59°C; flash point = 42°C−47°C; Autoignition temperature = 260°C. Explosive Limits: LEL: 1.1%; UEL-unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as a corrosion inhibitor; and intermediate for emulsifiers, rubber products, dyes; and insecticides.

Incompatibilities: May form explosive mixture with air. Aqueous solution is a strong base. Incompatible with acids, acid chlorides; acid anhydrides; halogens, isocyanates, vinyl acetate; acrylates, substituted allyls; alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution; strong oxidizers; reactive organic compounds. Attacks copper alloys, zinc, tin, tin alloys; galvanized steel. Also, carbon dioxide is listed as incompatible by the state of New Jersey.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.45 ppm

PAC-2: 5 ppm

PAC-3: 21 ppm

Routes of Entry: Inhalation, through the skin; ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical is corrosive. This chemical can be absorbed through the skin, thereby increasing exposure. Skin or eye contact can cause severe irritation and burns. Inhalation can cause irritation of the respiratory tract and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause lung irritation; bronchitis may develop with coughing, phlegm and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray following acute over exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with dibutylamine all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2248 Di-*n*-butylamine, Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include nitrogen oxides, hydrocarbons, amines, and carbon monoxide. Use dry chemical, water spray; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Dibutylaminoethanol D:0380

Formula: $C_{10}H_{23}NO$; $(C_4H_9)_2NCH_2CH_2OH$

Synonyms: DBAE; β-Di-*N*-butylaminoethanol; 2-Di-*N*-butylaminoethanol; 2-Dibutylaminoethanol; Dibutylamino ethanol; 2-Di-*N*-butylaminoethyl alcohol; *N*,*N*-Dibutyl ethanolamine; *N*,*N*-Dibutyl-*N*-(2-hydroxyethyl)amine

CAS Registry Number: 102-81-8

RTECS Number: KK3850000

UN/NA & ERG Number: UN2735 (amines, liquid, corrosive, n.o.s.)/153

EC Number: 203-057-1

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Corrosive

Hazard symbols, risk, & safety statements: Hazard symbol: C, F; risk phrases: R10; R21/22; R34; safety phrases: S26; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 2-Di-*n*-butylaminoethanol is a colorless to yellowish liquid. Faint amine-like odor. Molecular weight = 173.33; boiling point = 224°C−232°C; freezing/melting point = < -69°C; flash point = 96°C; Autoignition temperature = 240°C. Explosive Limits: LEL: 0.9%; UEL = 5.5%. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Solubility in water = 11.6 g/L @ 25°C.

Potential Exposure: This material is used in organic synthesis.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 2 ppm/14 milligram per cubic meter TWA [skin]

ACGIH: 0.5 ppm/3.5 milligram per cubic meter TWA [skin]; TLV-BEIA issued; Acetylcholinesterase inhibiting pesticides.

PAC not available

Australia: STEL of 4 ppm (28 milligram per cubic meter). Several states have set guidelines or standards for dibutylaminoethanol in ambient air[60] ranging from 0.14 milligram per cubic meter (North Dakota) to 0.23 milligram per cubic meter (Virginia) to 0.28 milligram per cubic meter (Connecticut) to 0.333 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2007, aminoethanol Compounds.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive, Contact may burn the eyes and irritate the skin. The vapor can irritate the nose, throat and bronchial tubes. LD_{50} = (oral-rat) 1070 mg/kg (slightly toxic).

Long-Term Exposure: High or repeated exposure may damage the liver and kidneys. Related chemicals can cause lung allergy (asthma) or skin allergy, with rash. They can also cause a fluid build-up in the lungs with high exposures, a medical emergency. Its not known whether 2-n-dibutylaminoethanol has these effects.

Points of Attack: Eyes, skin, and respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. These may be normal if the person is not having an attack at the time of the test. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 2 ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in the pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with DBAE all handlers should be trained on its proper handling and storage. 2-*N*-Dibutylamineothanol must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions may occur. Sources of ignition, such as smoking and open flames are prohibited where 2-n-dibutylaminoethanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2735 Amines, liquid, corrosive, n.o.s, or Polyamines, liquid, corrosive, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 204-881-4

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Limited Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Bioassay (feed); no evidence: mouse, rat. United States Environmental Protection Agency Gene-Tox Program, Positive: *D. melanogaster*-whole sex chromosome loss; Negative: Histidine reversion-Ames test; Mouse specific locus; Negative: *D. melanogaster* sex-linked lethal; Inconclusive: *D. melanogaster*-reciprocal translocation; Inconclusive: Mammalian micronucleus; Sperm morphology-mouse

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. (D2B, D2A); listed on Canada's DSL List.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22 Harmful if swallowed; R22; R 36; R37; R38; R62; R63; safety phrases: S24; S25; S26; S36; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: BHT is a white to pale yellow crystalline solid or powder. Molecular weight = 220.39; boiling point = 265°C; specific gravity (H_2O:1) = 1.05 @ 20°C; freezing/melting point = 68°C; vapor pressure = .01 mmHg @ 20°C; flash point = 127°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water; solubility = 0.00004%.

Potential Exposure: DBPC is used as a food and feed additive, flavor, and packaging material; as an antioxidant in human foods and animal feeds. It is also used as an antioxidant to stabilize petroleum fuels, rubber and vinyl plastics.

Incompatibilities: Contact with oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 10 milligram per cubic meter TWA

ACGIH TLV[1]: 2 milligram per cubic meter TWA (intermittent, vapor and aerosol); Not Classifiable as a Human carcinogen, as butylated hydroxytoluene (BHT) (2001).

128-37-0

PAC Ver. 28, no values found in Ver. 29[138]

PAC-1: 6 milligram per cubic meter

PAC-2: 29 milligram per cubic meter

PAC-3: 180 milligram per cubic meter
DFG MAK: 20 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(2); Carcinogen Category 4; Pregnancy Risk Group C
Australia: TWA 10 milligram per cubic meter, 1993; Austria: MAK 10 milligram per cubic meter, 1999; Belgium: TWA 10 milligram per cubic meter, 1993; Finland: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, [skin], 1999; France: VME 10 milligram per cubic meter, 1999; Switzerland: MAK-W 10 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Determination in Air: Use NIOSH II-1,[1] P&CAM Method #226 and OSHA Analytical Method PV-2108

Determination in Water: No tests listed. Octanol-water coefficient: Log $K_{ow} = 5.1$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. This compound has an acute oral LD_{50} for rats of 890 mg/kg which is classified as slightly toxic.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. BHT may cause liver damage. BHT may damage the developing fetus. Repeated exposure to high levels may affect the liver. BHT may cause changes in behavior and learning ability; and reduce the blood's ability to clot, but this is not known for sure at this time. In animals: decreased growth rate, increased liver weight.

Points of Attack: Eyes, skin, and liver.

Medical Surveillance: Liver function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with DBPC all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool well-ventilated area away from oxidizing agents (such as peroxides, permanganates, chlorates, perchlorates, and nitrates).

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: DBPC is a combustible solid, but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Water or foam may cause frothing. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Corrosive, Irritant.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C, Xi; risk phrases: R34; R37/38; R40; R41; safety phrases: S25; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Dibutyl phosphate is a pale amber to brown, odorless liquid. Molecular weight = 210.24; specific gravity (H_2O:1) = 1.06; boiling point = (decomposes) 135°C−138°C; freezing/melting point = −13°C; vapor pressure ≈1 mmHg @ 20°C; flash point = 188°C (oc); Autoignition temperature = 420°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Practically insoluble in water.

Potential Exposure: This material is used as a catalyst in organic synthesis.

Incompatibilities: Dibutyl phosphate is a medium strong acid. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Attacks many metals forming flammable and explosive hydrogen gas. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 30 ppm

OSHA PEL: 1 ppm/5 milligram per cubic meter TWA

NIOSH REL: 1 ppm/5 milligram per cubic meter TWA; 2 ppm/10 milligram per cubic meter STEL

ACGIH TLV[1]: 1 ppm TWA inhalable fraction and vapor; 2 ppm STEL inhalable fraction and vapor. [skin]

PAC Ver. 29[138]

PAC-1: 2 ppm

PAC-2: 21 ppm

PAC-3: 125 ppm

DFG MAK: Germ Cell Mutation Category 3A

Australia: TWA 1 ppm (5 milligram per cubic meter); STEL 2 ppm, 1993; Belgium: TWA 1 ppm (8.8 milligram per cubic meter); STEL 2 ppm (17 milligram per cubic meter), 1993; Finland: TWA 1 ppm (8 milligram per cubic meter); STEL 3 ppm (24 milligram per cubic meter), [skin], 1999; France: VME 1 ppm (5 milligram per cubic meter), 1999; Norway: TWA 1 ppm (5 milligram per cubic meter), 1999; the Philippines: TWA 1 ppm (5 milligram per cubic meter), 1993; Switzerland: MAK-W 1 ppm (8.5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 2 ppm. Some states have set guidelines or standards for dibutyl phosphate in ambient air[60] ranging from 50−100 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5017.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 1.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate and burn the eyes. Inhalation can irritate the respiratory tract causing coughing, wheezing, and shortness of breath. Skin contact irritates the skin causing rash or burning sensation.

Long-Term Exposure: Can cause drying and cracking of skin. Can cause lung irritation.

Points of Attack: Respiratory system, skin, and eyes.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. NIOSH lists the following tests: whole blood (chemical/metabolite); breath; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. 8 hours (more than 8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, and boots; nitrile rubber gloves, suits, and boots; polyvinyl alcohol gloves; Viton gloves, suits. 4 hours (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Up to 10 ppm: Sa (APF = 10) (any supplied-air respirator). Up to 25 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode. Up to 30 ppm: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Dibutyl phosphate must be stored to avoid contact with strong oxidizers, such as chlorine, chlorine dioxide, and bromine, since violent reactions occur.

Shipping: UN1760 Corrosive liquids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3261 Corrosive solid, acidic, organic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dibutyl phosphate is a combustible liquid. Thermal decomposition products may include oxides of phosphorus, carbon monoxide; phosphine, and phosphoric acid. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List, CEPA Priority Substance List, National Priority Release Inventory.

Hazardous to aquatic life or environment, with possible long lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R101; R23/24/25; R39; R51; R61; R62; R63; safety phrases: S16; S29/35; S36/37; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Dibutyl phthalate is a colorless oily liquid with a very weak aromatic odor. Molecular weight = 278.34; specific gravity (H_2O:1) = 1.05 @ 20°C; boiling point = 340°C; freezing/melting point = −35°C; vapor pressure = 0.00007 mmHg @ 20°C; flash point = 157°C; Autoignition temperature = 402°C; Explosive limits: LEL: 0.5% @ 235°C; UEL: ≈ 2.5%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Corrosive. Practically insoluble in water; solubility = 0.001% @ 25°C.

Potential Exposure: Use in making vinyl compounds; in plasticizing vinyl acetate emulsion systems and in plasticizing cellulose esters. Also used as a lacquer solvent (nail polish remover) and insect repellent.

Incompatibilities: DBP is a medium strong acid. Reacts with strong oxidizers, strong alkalis; strong acids; nitrates. Attacks many metals forming flammable and explosive hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 4000 milligram per cubic meter

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 15 milligram per cubic meter

PAC-2: 1600 milligram per cubic meter

PAC-3: 9300 milligram per cubic meter

DFG MAK: 0.05 ppm/0.58 milligram per cubic meter; Peak Limitation Category I(1) Pregnancy Risk Group: C

Australia: TWA 5 milligram per cubic meter, 1993; Austria: MAK 5 milligram per cubic meter, 1999; Belgium: TWA 5 milligram per cubic meter, 1993; France: VME 5 milligram per cubic meter, 1999; Hungary: TWA 2 milligram per cubic meter; STEL 4 milligram per cubic meter [skin] 1993; India: TWA 5 milligram per cubic meter, 1993; Japan: 5 milligram per cubic meter, 1999; Norway: TWA 3 milligram per cubic meter, 1999; the Philippines: TWA 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 5 milligram per cubic meter, MAC (STEL) 10 milligram per cubic meter, 1999; Russia: STEL 0.5 milligram per cubic meter, 1993; Sweden: NGV 3 milligram per cubic meter, KTV 5 milligram per cubic meter, 1999; Switzerland: MAK-W 5 milligram per cubic meter, 1999; United Kingdom: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 5 milligram per cubic meter. Russia has set a limit for ambient air of 0.1 milligram per cubic meter on a once daily basis; the Czech Republic[35] has set ambient air limits at 0.8 milligram per cubic meter on a daily average basis and 2.4 milligram per cubic meter on a half-hour exposure basis.

Determination in Air: Use NIOSH Analytical Method (IV) #5020.

Permissible Concentration in Water: State Drinking Water Guidelines: Florida 700 μg/L; Maine 700 μg/L; Minnesota 700 μg/L; New Hampshire 800 μg/L; Wisconsin 100 μg/L.

Determination in Water: Gas chromatography (EPA Method 606) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log $K_{ow} = > 4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly corrosive. The substance irritates the eyes, skin, nasal passages, and upper respiratory system. May cause skin allergy; stomach irritation; light sensitivity.

Long-Term Exposure: Unknown at this time. However this chemical may cause lung problems. Di-*n*-butyl phthalate may also damage the developing fetus and may also damage the testes (male reproductive glands).

Points of Attack: Eyes, respiratory system, and GI system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends butyl rubber; Neoprene, nitrile rubber, and viton as good to excellent protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 50 milligram per cubic meter: Any air-purifying full facepiece respirator equipped with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100. 125 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). 250 milligram per cubic meter: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 4000 milligram per cubic meter: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code-Blue: Health Hazard/Toxics/Poisons. Store in tightly closed containers in a cool well-ventilated area away from heat. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Di-*n*-butyl phthalate must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, or chlorine dioxide); strong alkalis (such as sodium hydroxide, potassium hydroxide and lithium hydroxide); and strong acids (such as sulfuric acid, hydrochloric acid, and nitric acid), since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where di-*n*-butyl phthalate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phthalic anhydride and oxides of carbon. Use dry chemicals or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be absorbed on vermiculite, sand or earth and disposed of in a sanitary landfill. Alternatively, it may be incinerated[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Dicamba is a white or brown nonflammable, colorless, odorless solid. May be dissolved in a flammable liquid carrier. Molecular weight = 221.04; specific gravity (H_2O:1) = 1.57; boiling point = 195°C (decomposes below B.P.); freezing/melting point = 114°C−116°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Highly soluble in water.

Potential Exposure: A potential danger to those involved in manufacture, formulation and application of this post-emergence herbicide. Used to control allual and perennial broad leaf weeds in corn, sorghum, small grain pastures; and noncroplands.

Incompatibilities: Incompatible with sulfuric acid, bases, ammonia, aliphatic amines; alkanolamines, isocyanates, alkylene oxides; epichlorohydrin. Dicamba decomposes in heat, producing toxic and corrosive fumes including hydrogen chloride.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices. Although no United States exposure limits have been established, this chemical can be absorbed through the skin, thereby increasing exposure

Russia: STEL 1 milligram per cubic meter, [skin], 1993.

Permissible Concentration in Water: A no-adverse-effect-level in drinking water has been calculated by NSA/NRC[46] at 0.009 mg/L. States which have set guidelines for dicamba in drinking water[61] include Maine @ 9.0 μg/L and Wisconsin @ 12.5 μg/L. Canada's MAC in drinking water is 0.12 mg/L.

Determination in Water: A detection limit of 1 ppb for dicamba by electron-capture gas chromatography has been reported by NAS/NRC[46]. Octanol-water coefficient: Log K_{ow} = 2.2.Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion, inhalation, and skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Dicamba irritates the eyes, skin, and respiratory tract. Exposure can cause nausea, vomiting, loss of appetite and weight; muscle weakness; and exhaustion. The acute toxicity of dicamba is relatively low. Dicamba produced no adverse effect when fed to rats at up to 19.3 mg/kg/day and 25 mg/kg/day in subchronic and chronic studies. The no-adverse-effect dose in dogs was 1.25 mg/kg/day in a 2-year feeding study. Based on these data, an ADI was calculated at 0.0012 mg/kg/day. LD_{50} = (oral-rat) 1037 mg/kg (slightly toxic).

Long-Term Exposure: May affect the liver.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dicamba all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from incompatible materials listed above, heat and water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.; UN2770 Benzoic derivative pesticides, liquid, flammable, toxic, Labels: 3-Flammable liquid, 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Thermal decomposition products may include chlorine and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land disposal or incineration are disposal options[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA)

EPCRA Section 304 RQ: CERCLA, 100 lb (45.4 kg)

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R21; R50/R53; safety phrases: S2; S36/37; S61; S41 (see Appendix 4)

Description: White solid. Molecular weight = 172.01; boiling point = 269°C; boiling point = decomposes @ 120°C before boiling; freezing/melting point = 143°C−146°C; vapor pressure = 1×10^{-3} mmHg @ 25. Practically insoluble in water; solubility = 18 ppm @ 20°C.

Potential Exposure: Dichlobenil is a substituted benzene/benzonitrile herbicide used on cranberry bogs, dichondra, ornamentals, blackberry, raspberry, and blueberry fields, apple, pear, filbert and cherry orchards, vineyards, hybrid poplar-cottonwood plantations, and rights-of-way to control weeds; and sewers to remove roots. It acts on dandelion, prickly oxtongue (pre-emergence), and tree roots.

Incompatibilities: Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

Permissible Exposure Limits in Air:

NIOSH REL: *Nitriles:* 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period. See NIOSH Criteria Document 212 *Nitriles*.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)]. Determination in Air[18].

Permissible Concentration in Water: Federal Drinking Water Guidelines: 9 ppb[14].

Determination in Water: Octanol-water coefficient: Log K_{ow} = 2.6−2.7. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)(101): Very low—973.64357 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Inhalation, absorbed through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the skin and eyes. Inhalation may irritate the nose and throat. High exposure can cause headache, dizziness, a drop in blood pressure, rapid pulse, loss of appetite, seizures, coma and death. Repeated high exposure may result in a loss of smell, acne-like rash. LD_{50} (oral, rat) = > 2500 mg/kg. Moderately toxic.

Long-Term Exposure: May cause cancer. Human toxicity (long term)(101): High—9.10 ppb, Health advisory

Points of Attack: Eyes, skin, liver, and kidneys

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring. Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with dichlobenil, all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from incompatible materials listed above, heat and water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3439 Nitriles, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Nitriles spill

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Thermal decomposition products may include oxides of nitrogen, hydrogen cyanide, hydrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land disposal or incineration are disposal options. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Dichloran D:0427

Formula: $C_6H_4Cl_2N_2O_2$; $Cl_2C_6H_2(NO_2)NH_2$

Synonyms: AI-50; AI3-08870; AL-50; Allisan; Aniline, 2,6-dichloro-4-nitro-; Benzenamine, 2,6-dichloro-4-nitro-; Bortran; Botran; Caswell No. 311; CDNA; CNA; DCNA; Dicloran; 2,6-Dichloro-4-nitrobenzenamine; 2,6-Dichloro-4-nitroaniline; Ditranil; Fumite dicloran smoke acaricide; 4-Nitro-2,6-dichloroaniline; 4-Nitroaniline, 2,6-dichloro-; RD-6584; Resisan; U-2069

CAS Registry Number: 99-30-9

HSDB Number: 1570

RTECS Number: BX2975000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 202-746-4

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Suspected reprotoxic hazard, Developmental toxin (TRI)

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

EPCRA Section 313 Form R *de minimus* concentration reporting level: 1.0%

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R36/R37/38; safety phrases: S26; S27/39 (see Appendix 4)

Description: Dicloran is a yellow crystalline solid or power. Odorless. Molecular weight = 207.01; boiling point = (decomposes); freezing/melting point = 193°C−195°C. Hazard identification (based on NFPA-704M Rating System): Health 2, Flammability 0, Reactivity 0. Low solubility in water; solubility = 1 g/L @ 60°C.

Potential Exposure: Dichloran is a substituted benzene/chlorophenyl fungicide Used to control fungi on a variety of crops. The top crop usages in California are on celery, head lettuce, and grapes (table, wine and raisin).

Incompatibilities: Keep away from strong oxidizing agents, strong acids; acid anhydrides; acid chlorides; acetic anhydride; and carbon dioxide.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 2.8$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin: may be fatal if absorbed through skin; may cause skin irritation. Inhalation should be avoided; may cause respiratory tract irritation. May be harmful and possibly fatal, if swallowed. LD_{50} (oral, rat) = > 2000 mg/kg.

Routes of Entry: Inhalation, ingestion, and skin absorption.

Long-Term Exposure: May cause tumors, reproductive and fetal effects.

Points of Attack: Eyes, liver, blood, CNS, spleen, and liver. Reproductive cells.

Medical Surveillance: In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and LH may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.*

Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Increase, in the downwind direction, as necessary, the isolation distance shown above. Eliminate all ignition sources (no smoking, flares, sparks or flames in immediate area). Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not get water inside containers. Soil Adsorption Index (K_{oc}) = 5000 (estimate).

Fire Extinguishing: Decomposes above 350°C emitting oxides of nitrogen and carbon and hydrogen chloride gas. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire:* Dry chemical, carbon dioxide or water spray. *Large fire:* Dry chemical, carbon dioxide, alcohol-resistant foam or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/trailer loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with a licensed waste disposal service or environmental regulatory agencies for guidance on acceptable disposal practices. Dissolve or mix material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

Dichloroacetic Acid D:0430

Formula: $C_2H_2Cl_2O_2$

Synonyms: Acetic acid, bichloro-; Acetic acid, dichloro-; Bichloroacetic acid; DCA; Dichlorethanoic acid

CAS Registry Number: 79-43-6

HSDB Number: 6894

RTECS Number: AG6125000

UN/NA & ERG Number: UN1764/153

EC Number: 201-207-0 [*Annex I Index No.:* 607-066-00-5]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Limited Evidence; Human Inadequate Data, *not classifiable as carcinogenic to humans*, Group 2B, 1995; EPA: Likely to produce cancer in humans.

California Proposition 65 Chemical[102]: Cancer 5/1/1996; male 8/7/2009.

Hazard Alert: Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

United States National Primary Drinking Water Regulations: zero mg/L; MCL = 0.060 mg/L, dichloroacetic acid, as a haloacetic acid.

Hazard symbols, risk, & safety statements: Hazard symbol: T, C, N, Xi, Xn; risk phrases: R20; R23/24/25; R35; R36/37/38; R39; R40; R51; R62; R63; safety phrases: S16; S26; S36/37; S39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: DCA is a corrosive, combustible, colorless liquid with a pungent odor. Molecular weight = 128.94; specific gravity (H_2O:1) = 1.56; boiling point = 193.8°C; freezing/melting point = 9.7−13.5°C; vapor pressure = 1 mmHg @ 44°C; flash point = 110°C. Autoignition temperature = 190°C; Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Highly corrosive. Soluble in water.

Potential Exposure: This haloacetic acid can be a byproduct of drinking water disinfection and may increase the risk of cancer. This chemical is used as starting material for the production of glyoxylic; dialkyloxy acids; and sulfonamides. It is also used as a fungicide, a medication; and a chemical intermediate in pharmaceuticals.

Incompatibilities: DCA is a medium strong acid; incompatible with nonoxidizing mineral acids; organic acids; bases, acrylates, aldehydes, alcohols, alkylene oxides; ammonia, aliphatic amines; alkanolamines, aromatic amines; amides, furfuryl alcohol (explosion hazard), glycols, isocyanates, ketones. Attacks metals generating flammable hydrogen gas. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 0.5 ppm/2.64 milligram per cubic meter [skin]; confirmed animal carcinogen with unknown relevance to humans

PAC Ver. 29[138]

PAC-1: 1.5 ppm

PAC-2: 8.9 ppm

PAC-3: 140 ppm

DFG MAK: Germ Cell Mutation Category 3A

Russia: STEL 4 milligram per cubic meter, 1993

Permissible Exposure Limits in Water: Safe Drinking Water Act (47FR 9352): zero mg/L; MCL = 0.060 mg/L, dichloroacetic acid, as a haloacetic acid.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 1.0$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Destructive to the eyes, skin, and tissues of the respiratory tract; causes severe irritation and burns. Eye contact may cause permanent damage. Higher exposures can cause chemical pneumonitis and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Symptoms can include burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea, and vomiting.

Long-Term Exposure: Increased risk of cancer. May cause damage to the developing fetus. May affect the liver and kidneys. May damage the nervous system causing numbness, "pins and needles," and/or weakness in the hands and feet. Repeated exposure may cause lung irritation, bronchitis. There is limited evidence that DCA causes liver cancer in animals.

Points of Attack: Lungs, liver, kidneys, and nervous system.

Medical Surveillance: This chemical may increase the risk of cancer. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Lung function tests, kidney function tests. Examination of the nervous system. Liver and kidney function tests. Lung function tests. Examination of the nervous system. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA > 1.5 ppm. *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with DCA all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1764 Dichloricacetic acid, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid, but does not readily ignite. Thermal decomposition products may include phosgene, hydrogen chloride, carbon monoxide. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Dichloroacetylene D:0440

Formula: C_2Cl_2; ClC≡CCl

Synonyms: DCA; Dichlorlethyne; Ethyne, dichloro-

CAS Registry Number: 7572-29-4

HSDB Number: 7200

RTECS Number: AP1080000

UN/NA & ERG Number: FORBIDDEN, Not produced commercially.

EC Number: [*Annex I Index No.:* 602-069-00-8]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Limited Evidence; Human Inadequate Data*, not classifiable as carcinogenic to humans*, Group 3, 1999.

Hazard Alert: Unstable explosive, Highly toxic gas, Possible risk of forming tumors, Suspected reprotoxic hazard.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 250 lb (114 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: A, E, Xn; risk phrases: R20; R40; R45; R48/20; safety phrases: S2; S36/37.

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: DCA is a volatile, pyrophoric oil. It has an unpleasant, sweetish odor. A gas above 32°C/90°F. Molecular weight = 94.92; specific gravity (H_2O:1) = 1.26 @ 20; boiling point = (explodes) 33°C; freezing/melting point = −50 to −66°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: DCA, dichloroacetylene, is not produced commercially and is a possible decomposition product of trichloroethylene or trichloroethane. Reported to be a by-product of vinylidene chloride (see V:0220). Also, a closed circuit anesthesia with trichloroethylene, heat and moisture produced by soda-lime absorption of CO_2 may produce dichloroacetylene (DCA) along with phosgene and carbon monoxide (CO).

Incompatibilities: An unstable explosive; heat or shock may cause explosion. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids (forms poisonous gases of phosgene and hydrogen chloride), strong bases.

Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: 0.1 ppm/0.4 milligram per cubic meter Ceiling Concentration; Potential occupational carcinogen; limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV[1]: 0.1 ppm/0.39 milligram per cubic meter Ceiling Concentration; confirmed animal carcinogen with unknown relevance to humans.
PAC Ver. 29[138]
PAC-1: 0.0091 ppm
PAC-2: 0.1 ppm
PAC-3: 3.4 ppm
DFG MAK: Carcinogen Category 2
Australia: TWA 0.1 ppm (0.4 milligram per cubic meter), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: STEL 0.1 ppm (0.39 milligram per cubic meter), 1993; Finland: TWA 0.1 ppm (0.4 milligram per cubic meter); STEL 0.3 ppm (1.2 milligram per cubic meter), 1993; Norway: TWA 0.1 ppm (0.4 milligram per cubic meter), 1999; the Netherlands: MAC-continuous 0.4 milligram per cubic meter, 2003; United Kingdom: STEL 0.1 ppm (0.39 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea: New Zealand, Singapore, and Vietnam: ACGIH TLV: Ceiling Concentration 0.1 ppm. Several states have set guidelines or standards for dichloroacetylene in ambient air[60] ranging from 3.2 μ/m^3 (Virginia) to 4.0 μ/m^3 (North Dakota) to 8.0 μ/m^3 (Connecticut) to 10.0 μ/m^3 (Nevada).

Determination in Air: The NIOSH pocket guide lists no methods. However, see NIOSH Analytical Method 1003, hydrocarbons, halogenated

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact can cause irritation. Inhalation can irritate the respiratory tract with coughing, wheezing, and/or shortness of breath. Exposure can cause headache, loss of appetite; extreme nausea; vomiting; involvement of the trigeminal nerve and facial muscles causing paralysis of the face; and the development of facial herpes. Higher exposure may cause a build-up of fluid in the lungs (pulmonary edema). This can cause death. LD_{50} (mouse, inhalation) = $<$ 20 ppm.

Long-Term Exposure: There is limited evidence that DCA causes kidney cancer in animals. Dichloroacetylene can cause nervous system damage leading to weakness and behavioral changes; and may affect the kidneys. May cause lung irritation and the development of bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: CNS, lungs, and kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Exam of the nervous system. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Avoid skin contact. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work.

Eye Protection: Wear splash-proof chemical goggles when working with liquid, unless full facepiece respiratory protection is worn. Wear gas-proof goggles, unless full facepiece respiratory protection is worn.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DCA all handlers should be trained on its proper handling and storage. Dichloroacetylene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Keep dichloroacetylene away from strong acids (such as hydrochloric, sulfuric, and nitric); because poisonous gases may be given off, including phosgene and hydrogen chloride. Store in tightly closed containers in a cool, well-ventilated area away from heat, potassium, sodium and aluminum powders. Sources of ignition, such as smoking and open flames are prohibited where dichloroacetylene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of dichloroacetylene. Wherever dichloroacetylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Explosive! Dichloroacetylene is cited by DOT[19] as "FORBIDDEN."

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dichloroacetylene is a combustible liquid; becomes a gas above 32°C/90°F. It will explode before it reaches a temperature that is hot enough to burn. Poisonous gas is produced in fire including phosgene, hydrogen chloride, chloroform, chlorine, dioxin. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: Dichloroacetylene*, Trenton, NJ (March 2004)

Dichlorobenzalkoniumb Chloride D:0450

Formula: C_8H_{17} to $C_{18}H_{37}$; $C_9H_{11}Cl_2N \cdot Cl$

Synonyms: Alkyl(C_6H_{18})dimethyl-3,4-dichlorobenzylammonium chloride; Alkyl(C_8H_{17} to $C_{18}H_{37}$) dimethyl-3,4-dichlorobenzyl ammonium chloride; Dichlorobenzalkonium chloride; Tetrosan

CAS Registry Number: 8023-53-8

HSDB Number: 6440

RTECS Number: BO3200000

Regulatory Authority and Advisory Information

Hazard Alert: Deadly poison[193], Combustible, Primary irritant (w/o allergic reaction).

Superfund/EPCRA 302, Extremely Hazardous Substances: *Dropped from listing in 1988.*

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R36/37/38; safety phrases: S16; S26; S36/37; S45 (see Appendix 4)

Description: Dichlorobenzalkonium chloride is a colorless, crystalline solid. Specific gravity (H_2O:1) = 0.89; freezing/melting point = 33°C−34°C. Hazard identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: This material is used as an antiseptic, germicide, algicide, sterilizer, and deodorant.

Incompatibilities: Chlorides may be incompatible with acids, acid fumes. Esters may be incompatible with moisture and nitrates. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact can cause vomiting, diarrhea, and abdominal pain. Ingestion causes burning pain in the mouth, throat and abdomen with spitting of blood; drooling, vomiting; burns and ulcers in the mouth, throat, pharynx, and esophagus; shock, restlessness, confusion, weakness, apprehension; muscle weakness; difficulty in breathing; depression; bluing of the skin; and death from shock or asphyxiation. Ten percent (10%) concentrated aqueous solutions are irritating to the skin and concentrations as low as 0.1–0.5% are irritating to the eyes and mucous membranes. Concentrations ranging from 2% to 17.5% have caused dermal necrosis. Ingestion can cause corrosion of upper intestinal tract. Swelling of throat and lungs with fluid (edema) also can occur. Death can occur due to paralysis of respiratory muscles or circulatory collapse. The oral LD_{50} (oral-rat) = 730 mg/kg (slightly toxic).

Long-Term Exposure: May cause liver and kidney damage. Prolonged or repeated contact may cause allergic contact dermatitis to skin and allergic reaction in the lungs.

Points of Attack: Liver, kidneys, lungs, and skin.

Medical Surveillance: Liver and kidney function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If concentrated (10% or greater) solution is ingested, patient should swallow a large quantity of milk, egg whites or gelatin solution. If breathing is difficult, give oxygen.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from acids, acid fumes; moisture and nitrates.

Shipping:

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, or foam extinguishers. Thermal decomposition products may include nitrogen oxides, ammonia, and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*all isomers*)

Description: There are three isomeric forms of dichlorobenzene (DCB):

m-DCB is a flammable liquid and vapor. Molecular weight = 147.00; specific gravity (H_2O:1) = 1.29 @ 20°C; boiling point = 173°C; freezing/melting point = −24.8°C; vapor pressure = 0.75 mmHg @ 8°C; flash point = 63°C. Explosive limits: LEL: 119,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

o-DCB is a colorless to pale yellow liquid with a pleasant, aromatic odor. Molecular weight = 147.00; specific gravity (H_2O:1) = 1.31 @ 20°C; boiling point = 180°; freezing/melting point = −17°C; vapor pressure = 0.75 mmHg @ 16.3°C; flash point = 60°C; 66°C (cc); Autoignition temperature: 648°C. Explosive limits: LEL: 2.2%; UEL: 9.2%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

p-DCB is a colorless or white solid with a mothball-like odor. Molecular weight = 147.00; specific gravity (H_2O:1) = 1.25 @ 55°C; boiling point = 174°C; freezing/melting point = 53.1°C; vapor pressure = 0.75 mmHg @ 8°C; 13 mmHg @ 20°C; flash point = 66°C. Insoluble in water. Explosive limits: LEL: 2.5%; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: The major uses of *o*-DCB are as a process solvent in the manufacturing of toluene diisocyanate and as an intermediate in the synthesis of dyestuffs, herbicides, and degreasers. *p*-Dichlorbenzene is used primarily as a moth repellant, a mildew control agent; space deodorant; and in insecticides, which accounts for 90% of the total production of this isomer. Information is not available concerning the production and use of *m*-DCB. However, it may occur as a contaminant of *o*-or *p*-DCB formulations. Both *o*-and *p*-isomers are produced almost entirely as by-products during the production of monochlorobenzene.

Incompatibilities: For *o*-DCB and *m*-DCB: acid fumes, chlorides, strong oxidizers; hot aluminum, or aluminum alloys. For *p*-DCB: Strong oxidizers; although, incompatibilities for this chemical may also include other materials listed for *o*-DCB.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm ***(m-isomer); 150 ppm (p-isomer)***

OSHA PEL: 50 ppm/300 milligram per cubic meter Ceiling Concentration

NIOSH REL: 50 ppm/300 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 25 ppm TWA; 50 ppm STEL, not classifiable as a human carcinogen

541-73-1, m-DCB

NIOSH IDLH = 200 ppm

PAC Ver. 29[138]

PAC-1: 6 ppm

PAC-2: 66 ppm

PAC-3: 400 ppm

DFG MAK: 2 ppm/12 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C

95-50-1, o-DCB

Odor threshold = 0.30 ppm.

OSHA PEL: 50 ppm/300 milligram per cubic meter Ceiling Concentration

NIOSH REL: 50 ppm/300 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 25 ppm/150 milligram per cubic meter TWA; 50 ppm/301 milligram per cubic meter Ceiling Concentration

DFG MAK: [skin]; Pregnancy Risk Group C

PAC-2: 170 ppm

PAC-3: 1000 ppm

DFG MAK: 10 ppm/61 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C; BAT information available

Australia: TWA 50 ppm (300 milligram per cubic meter), 1993; Austria: MAK 50 ppm (300 milligram per cubic meter), [skin], 1999; Belgium: STEL 50 ppm (301 milligram per cubic meter), [skin], 1993; Finland: TWA 50 ppm (300 milligram per cubic meter); STEL 75 ppm (450 milligram per cubic meter), [skin], 1999; France: VLE 50 ppm (300 milligram per cubic meter), 1999; Hungary: TWA 50 milligram per cubic meter; STEL 100 milligram per cubic meter, [skin], 1993; Japan: STEL 25 ppm (150 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 122 milligram per cubic meter, 2003; Norway: TWA 25 ppm (150 milligram per cubic meter), 1999; the Philippines: TWA 50 ppm (300 milligram per cubic meter), 1993; Poland: MAC (TWA) 20 milligram per cubic meter, MAC (ceiling) 300 milligram per cubic meter, 1999; Russia: STEL 50 milligram per cubic meter, 1993; Sweden: ceiling 50 ppm (300 milligram per cubic meter), 1999; Switzerland: MAK-W 50 ppm (300 milligram per cubic meter), KZG-W 100 ppm (600 milligram per cubic meter), 1999; Thailand: TWA 50 ppm (300 milligram per cubic meter), 1993; Turkey: TWA 50 ppm (300 milligram per cubic meter), 1993; United Kingdom: STEL 50 ppm (306 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 50 ppm

106-46-7, p-DCB

NIOSH IDLH = 150 ppm, potential human carcinogen

Odor threshold = 0.18 ppm.

OSHA PEL: 75 ppm/450 milligram per cubic meter TWA

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 10 ppm/60 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 30 ppm

PAC-2: 170 ppm

PAC-3: 1000 ppm

DFG MAK: [skin] Carcinogen Category 2; Pregnancy Risk Group 3B; BAT suspended 2003

Australia: TWA 75 ppm (450 milligram per cubic meter); STEL 110 ppm, 1993; Austria: carcinogen, 1999; Belgium: TWA 75 ppm (451 milligram per cubic meter); STEL 110 ppm (661 milligram per cubic meter), 1993; Finland: TWA 75 ppm (450 milligram per cubic meter); STEL 115 ppm (690 milligram per cubic meter), [skin], 1999; France: VME 75 ppm (450 milligram per cubic meter), VLE 110 ppm (675 milligram per cubic meter), 1999; Japan: 50 ppm (300 milligram per cubic meter), 2B carcinogen, 1999; the Netherlands: MAC-TGG 150 milligram per cubic meter, 2003; the Philippines: TWA 75 ppm (450 milligram per cubic meter), 1993; Poland: MAC (TWA) 20 milligram per cubic meter, 1999; Russia: TWA 50 ppm, 1993; Sweden: NGV 75 ppm (450 milligram per cubic meter), KTV 110 ppm (700 milligram per cubic meter), 1999; Switzerland: MAK-W 50 ppm (300 milligram per cubic meter), KZG-W 100 ppm (600 milligram per cubic meter), 1999; Turkey: TWA 75 ppm (450 milligram per cubic meter), 1993; United Kingdom: TWA 25 ppm (153 milligram per cubic meter); STEL 50 ppm (306 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia[43 gives a MAC for ambient air in residential areas of 0.035 milligram per cubic meter on a once daily basis for *p*-DCB[35].

Determination in Air: Use NIOSH Analytical Method 1003 or OSHA Analytical Method 7.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.6 mg/L; MCLG, 0.6 mg/L. ***(m-DCB)*** Federal Drinking Water Standards: EPA 600 μg/L; Federal Drinking Water Guidelines: EPA 600 μg/L; State Drinking Water Standards: New Jersey 600 μg/L; State Drinking Water Guidelines: Arizona 620 μg/L; Connecticut 210 μg/L; Maine 60 μg/L; Wisconsin 1250 μg/L. (***o-DCB***) Federal Drinking Water Guidelines: EPA 600 μg/L; State Drinking Water Standards: New Jersey 600 μg/L; State Drinking Water Guidelines: Arizona 620 μg/L; Maine 63 μg/L; Minnesota 600 μg/L. (***p-DCB***) Federal Drinking Water Standards: EPA 75 μg/L; Federal Drinking Water Guidelines: EPA 75 μg/L; State Drinking Water Standards: California 5 μg/L; Massachusetts 5 μg/L; State Drinking Water Guidelines: Arizona 75 μg/L; Maine 21 μg/L; Minnesota 10 μg/L.

Determination in Water: Gas chromatography (EPA Methods 601, 602, 612) or gas chromatography plus mass spectrometry (EPA Method 625). Gas-chromatographic methods have been developed for *p*-PDB with a sensitivity of 380 pg/cm peak high, and *p*-PDB concentrations as low as 1.0 ppb in water have been analyzed according to NAS/NRC. Octanol-water coefficient: Log K_{ow} (*p*-) = 3.37. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: *o*-DCB: inhalation, skin absorption, ingestion, and skin and/or eye contact. *p*-DCB: Inhalation, ingestion, and eye and skin contact.

Harmful Effects and Symptoms

Human exposure to dichlorobenzene is reported to cause hemolytic anemia and liver necrosis, and 1,4-dichlorobenzene has been found in human adipose tissue. In addition, the dichlorobenzenes are toxic to nonhuman mammals, birds, and aquatic organisms and impart an offensive taste and odor to water. The dichlorobenzenes are metabolized by mammals, including humans, to various dichlorophenols; some are as toxic as the dichlorobenzenes.

Exposure can damage blood cells. Contact can cause irritation of the skin and eyes. Prolonged contact can cause severe burns. It may damage the liver, kidneys and lungs. Exposure can cause headache, dizziness; swelling of the eyes, hands and feet; and nausea. Higher levels can cause severe liver damage and death. Persons with preexisting pathology (hepatic, renal, CNS; blood) or metabolic disorders; who are taking certain drugs (hormones or otherwise metabolically active), or who are otherwise exposed to DCBs or related (chemically or biologically) chemicals by such means as occupation, or domestic use or abuse, e.g., pica or "sniffing") of DCB products, might well be considered at increased risk from exposure to DCBs.

Short-Term Exposure: *o-DCB:* Can be absorbed through the skin, thereby increasing exposure. Irritates the eyes, skin, and respiratory tract. Prolonged skin contact may cause blisters. May affect the CNS. Exposure can cause headache and nausea. Higher exposure can cause dizziness, lightheadedness, and unconsciousness.

m-DCB: Can be absorbed through the skin, thereby increasing exposure. Symptoms are similar to *o*-DCB and *m*-DCB may damage the red blood cells leading to low blood count.

p-DCB: Can be absorbed through the skin, thereby increasing exposure. Exposure can cause headache, dizziness, nausea, swelling of the hands and feet. Contact with the dust can irritate and burn the eyes and skin. Skin allergy may develop.

Long-Term Exposure: *o-DCB:* Liver, kidney, or circulatory system problems. Repeated or prolonged contact may cause skin sensitization and allergy. Long term exposure may cause damage to the blood cells, liver, kidneys, and lungs.

m-DCB: Repeated or prolonged contact may cause skin sensitization and allergy. May affect the liver and kidneys.

p-DCB: Anemia; liver, kidney, or spleen damage; changes in blood. May be carcinogenic to humans; it causes kidney and liver cancer in animals. There is a suggested association between this chemical and leukemia. There is evidence that *p*-DCB can damage the developing animal fetus. Repeated exposure can damage the nervous system; skin allergy and damage the lungs, liver, and kidneys. *p*-DCG may affect the blood and cause hemolytic anemia.

Points of Attack: *o*-DCB and *m*-DCB: liver, kidneys, skin, and eyes. *p*-DCB: liver, respiratory system, eyes, kidneys, and skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: Liver and kidney function tests. Lung function tests. CBC. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. NIOSH lists the following tests: (*o*-isomer) urine (chemical/metabolite); (*p*-isomer) Expired Air, liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. 4 hours (At least 4 but $<$8 hours of resistance to breakthrough $>$ 0.1 μg/cm^2/min): Viton gloves, suits; 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof (*o*-DCB or *m*-DCB) or dust-proof (*p*-DCB) chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: For o-DCB: 2000 ppm: CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

p-DCB: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Red (*o*-DCB): Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color code-Blue (*m*-DCB): Health Hazard/Poison: Store in a secure poison location. Prior to working with any DCB all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Dichlorobenzene must be stored to avoid contact with strong oxidizers, such as permanganates, nitrates, peroxides, chlorates, and perchlorates, hot aluminum or aluminum alloys, since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area away from heat and direct light. Sources of ignition, such as smoking and open flames are prohibited where dichlorobenzene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where *p*-DCB is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: *m*-DCB: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. United States DOT Regulated Marine Pollutant. UN3077 Environmentally hazardous substances, solis, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

UN2810 Toxic liquids, organic, n.o.s.

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *p-DCB:* This chemical is a combustible solid. Use dry chemical, carbon dioxide, or foam extinguishers. Thermal decomposition products may include hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. *o-DCB and m-DCB:* These chemicals are combustible liquids. Thermal decomposition products may include hydrogen chloride and chlorine. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: 3,3’-Dichlorobenzidine is a gray or purple crystalline solid. Molecular weight = 253.13; boiling point = 368°C; 402°C[138]; freezing/melting point = 132.5°C; Autoignition temperature = ~350°C. Hazard identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.07% @ 15°C.

Potential Exposure: A halide-and amine-substituted aromatic compound used in the dye industry, curing agent for isocyanate terminated resins. The major uses of dichlorobenzidine are in the manufacture of pigments for printing ink, textiles, plastics, and crayons and as a curing agent for solid urethane plastics. There are no substitutes for many of its uses. Additional groups that may be at risk include workers in the printing or graphic arts professions handling the 3,3’-DCB-based azo pigments. 3,3’-DCB may be present as an impurity in the pigments, and there is some evidence that 3,3’-DCB may be metabolically liberated from the azo pigment.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Achemical base: neutralize acids to form salts plus water with an exothermic reaction. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen is generated by amines in combination with strong reducing agents such as hydrides, nitrides, alkali metals, and sulfides.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and personal protective equipment (PPE), including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements. See Appendix B of the *NIOSH Pocket Guide*.

NIOSH REL (*3,3'-Dichlorobenzidine and its salts*): A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A *Note:* OSHA and NIOSH concluded that benzidine and benzidine-based dyes were potential occupational carcinogens and recommended that worker exposure be reduced to the lowest feasible level. OSHA and NIOSH further concluded that *o*-tolidine and *o*-dianisidine (and dyes based on them) may present a cancer risk to workers and should be handled with caution and exposure minimized.

ACGIH TLV[1]: [skin] confirmed animal carcinogen with unknown relevance to humans; exposure to carcinogens must be kept to a minimum.

PAC Ver. 29[138]

91-94-1

PAC-1: 2.1 ppm

PAC-2: 23 ppm

PAC-3: 140 ppm

DFG MAK: [skin] Carcinogen Category 2

Australia [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, [skin], Carcinogen 1993; Switzerland 0.1 milligram per cubic meter, carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for dichlorobenzidine in ambient air[60] ranging from zero (North Dakota, Pennsylvania, Virginia) to 0.002 μ/m^3 (Rhode Island) to 0.10 μ/m^3 (New York) to 0.15 μ/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method #5509,[18] OSHA Analytical Method ID-65.

Permissible Concentration in Water: To protect freshwater and saltwater aquatic life: no criteria developed due to insufficient data. *To protect human health:* preferably zero. An additional life-time cancer risk of 1 in 100,000 results at a level of 0.103 μg/L[6]. States which have set guidelines for dichlorobenzidine in drinking water[61] include Kansas and Minnesota: both at 0.21 μg/L.

Determination in Water: Chloroform extraction followed by concentration and high performance liquid chromatography (EPA Method 605) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Skin allergic sensitization, dermatitis, headache, dizziness, caustic burns; frequent urination; dysuria, hematuria (blood in the urine); GI upset; upper respiratory infection.

Long-Term Exposure: 3,3'-Dichlorobenzidine was shown to be a potent carcinogen in rats and mice in feeding and injection experiments, but no bladder tumors were produced. LD_{50} = (oral-rat) 5250 mg/kg (insignificantly toxic).

Points of Attack: Bladder, liver, lung, skin, and GI tract.

Medical Surveillance: Preplacement and periodic examinations should include history of exposure to other carcinogens, smoking, alcohol, medication, and family history. The skin, lung, kidney, bladder, and liver should be evaluated; sputum or urinary cytology may be helpful. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Full body protective clothing and gloves should be used by those employed in handling operations. Full-face supplied air respirators of continuous flow or pressure demand type should also be used. On exit from a regulated area, employees should shower and change into street clothes, leaving their protective clothing and equipment at the point of exit to be placed in impervious containers at the end of the work shift for decontamination or disposal. Effective methods should be used to clean and decontaminate gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 second for primary combustion; 1204°C, 1.0 second for secondary combustion). The formation of elemental chlorine can be prevented through injection of steam or methane into the combustion process. nitrogen oxides may be abated through the use of thermal or catalytic devices[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
European/International Regulations (*cis-*): Hazard symbol: T+, N; risk phrases: R45; R10; R24/25; R26; R34; R50/53; safety phrases: S41; S45; S53; S60; S61. European/International Regulations (*trans-*): not listed in Annex 1.
WGK[100] (German Aquatic Hazard Class) (*cis-*): 3-Severe hazard to water.

Description: The 1,4-dichloro-2-butenes are colorless liquids. Some have a distinct odor. (*cis*-isomer): Molecular weight = 125; specific gravity (H_2O:1) = 1.18 @ 25°C; boiling point = 158°C; freezing/melting point = 3.5°C; vapor pressure = 3 mmHg @ 25°C. Explosive limits: LEL: 1.5%; UEL: 4.0%. Reacts slowly with water. (*trans*-isomer): This material has a sweet, pungent odor. Molecular weight = 125; specific gravity (H_2O:1) = 1.18 @ 25°C; boiling point = 155.5°C; freezing/melting point = 1°C–3°C; vapor pressure = 6 mmHg @ 25°C; flash point = 53°C. The explosive limits for the *trans*-isomer are LEL: 1.5%; UEL: 4%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water. The *trans-isomer*, only, appears on the EHS list.

Potential Exposure: DC occurs as a by-product in chloroprene manufacture and may be used as a chemical intermediate.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. (*cis*-isomer): Reacts slowly with water forming hydrogen chloride. Attacks metals and may form other, more dangerous materials; attacks some plastics.

Permissible Exposure Limits in Air
764-41-0, cis-isomer
ACGIH TLV[1]: 0.005 ppm/0.025 milligram per cubic meter TWA [skin] Suspected Human Carcinogen
PAC Ver. 29[138]
PAC-1: 0.015 ppm
PAC-2: 1.9 ppm
PAC-3: 12 ppm
DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutagen Category 3A
Russia[43] set a MAC in work-place air of 1.0 milligram per cubic meter for 1,3-dichloro-2-butene but set no value for 1,4-dichloro-2-butene.
110-57-6, trans-isomer
PAC-1: 0.078 ppm
PAC-2: 0.86 ppm
PAC-3: 3.8 ppm

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.05 mg/L for 1,3-dichloro-2-butene but has no value for 1,4-dichloro-2-butene.

Routes of Entry: Inhalation, dermal-absorbed through the skin, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure include respiratory distress and burns to skin and eyes. Inhalation of vapor irritates nose and throat. Contact with eyes causes intense irritation and tears. Contact of liquid with skin causes severe blistering. Ingestion causes severe irritation of mouth and stomach and may be fatal. Liquid and vapors from the material are highly corrosive and may damage skin, eyes, lungs, and internal organs.

Long-Term Exposure: The material is a carcinogen according to DFG[3] and ACGIH. Corrosive substances may affect the lungs.

Points of Attack: Lungs and skin.

Medical Surveillance. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and Saranex are among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: PIH; check oxygen content prior to entering storage area. (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Red (*cis*-isomer): Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3384 Toxic by inhalation liquid, flammable, n.o.s. with an $LC_{50} \leq 1000\ \text{ml/m}^3$ and saturated vapor concentration $\geq$ to 10 LC_{50}, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid, Technical Name Required, Inhalation Hazard Zone B. UN2920 Corrosive liquids, flammable, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid. The code "D" identifies proper shipping names [Dichlorobutene] which are appropriate for describing materials for domestic transportation but may be inappropriate for international transportation under the provisions of international regulations, e.g., IMO, ICAO). An alternate proper shipping name may be selected when either domestic or international transportation is involved.

Spill Handling:

Poisonous by inhalation liquid, flammable, n.o.s. (Inhalation Hazard Zone B)

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Wear fully encapsulating, vapor protective clothing. Stop the release if it can be done safely from a distance. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. *Small spill*: Absorb with earth, sand, or other noncombustible material and transfer to containers with clean, nonsparking tools for later disposal. *Large spill*: Dike far ahead of liquid spill for later disposal. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Ventilate confined area if it can be done without placing personnel at risk Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: The material will burn, though it may require some effort to ignite. Thermal decomposition products may include toxic fumes of chlorine-containing compounds. For small fires, use dry chemical, carbon dioxide, spray or foam. For large fires, use water spray, fog, or foam. Wear positive pressure breathing apparatus and full protective clothing. Move containers from fire area if you can do so without risk. Spray containers with cooling water until well after fire is out. Isolate for one-half mile in all directions if tank car or truck is involved in a fire.

Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration with hydrochloric acid scrubbing. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Dichlorodifluoroethylene D:0490

Formula: $C_2Cl_2F_2$; CFCl = CFCl

Synonyms: Dichlorodifluoroethene; Ethene, dichlorofluoro-; Diclorodifluoroetileno (Spanish) to index

CAS Registry Number: 27156-03-2

RTECS Number: KV9460000

UN/NA & ERG Number: UN2810 (toxic liquid, organic, n.o.s.)/153

Regulatory Authority and Advisory Information

Description: Dichlorodifluoro-ethylene is a colorless gas or liquid. Molecular weight = 132.93; boiling point = 21.1°C. ₩ Reacts with water.

Potential Exposure: A potential danger to those involved in the manufacture of this compound or its use in the synthesis of fluorochemicals. Used for chemical research and development purposes.

Incompatibilities: Reacts with moisture, water, steam, forming corrosive and toxic fumes. Incompatible strong reducing agents, active metals; with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

No standards or PAC available.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Dichlorodifluoro-ethylene can affect you when breathed in. Exposure can irritate the eyes, nose and throat. High levels can cause you to become dizzy, light-headed and pass out. Similar compounds can cause the heart to beat irregularly, or stop, which can cause death.

Long-Term Exposure: May cause liver and kidney damage.

Points of Attack: Liver and kidneys.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following tests may be useful: liver function tests. Kidney function tests. Holter monitor (a special 24 hour EKG to look for irregular heart beat).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Dichlorodifluoro-ethylene exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. On contact with water or steam, dichlorodifluoro-ethylene produces highly toxic and corrosive fumes. Store in tightly closed containers in a cool, dry area.

Shipping: UN2810 Toxic, liquids, organic, n.o.s., Hazard class 6.1; Labels: 6.1-Poisonous materials Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. If dichlorodifluoro-ethylene gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air; repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dichlorodifluoroethylene may burn, but does not readily ignite. Thermal decomposition products may include highly toxic fumes of fluorides and chlorides. Containers may explode in fire. Use dry chemical or CO_2 extinguishers. Use water spray to keep fire-exposed containers cool. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 200-893-9

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Environmental hazard (atmospheric).

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential (ODP) = 1.0

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U075

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.23; Nonwastewater (mg/kg), 7.2

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8010 (10); 8240 (5)

Safe Drinking Water Act (47FR 9352): Priority List (55 FR 1470) (Removed January 1981)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Harms public health and the environment by destroying ozone in the upper atmosphere.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, N, Xi, Xn; risk phrases: R5; R11; R12; R20; R21; R22; R23/24/25; R39; R58/59; safety phrases: S7; S9; S16; S23; S24/25; S26; S33; S36/37; S38; S41; S45; S57; S59; S61; S41 (see Appendix 4)

Description: Dichlorodifluoromethane is a colorless, nonflammable gas. Ethereal odor at >20% by volume. Shipped as a compressed gas. Molecular weight = 120.91; specific gravity (H_2O:1) = 1.49 @ −29.8°C; boiling point = −30°C; freezing/melting point = −157°C; vapor pressure = 750 mmHg @ −30°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water; solubility = 0.03% @ 25°C.

Potential Exposure: Dichlorodifluoromethane is used as an aerosol propellant, refrigerant and foaming agent.

Incompatibilities: Chemically active metals: sodium, potassium, calcium; powdered aluminum; zinc, magnesium. Attacks magnesium and its alloys.

Permissible Exposure Limits in Air

NIOSH IDLH = 15,000 ppm

OSHA PEL: 1000 ppm/4950 milligram per cubic meter TWA

NIOSH REL: 1000 ppm/4950 milligram per cubic meter TWA

ACGIH TLV[1]: 1000 ppm/4950 milligram per cubic meter TWA; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 3000 ppm

PAC-2: 10,000 ppm [> = 10% LEL, lower explosive limit but < 50% LEL]

PAC-3: 50,000 ppm (> LEL, lower explosive limit)

DFG MAK: 1000 ppm/5000 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Australia: TWA 1000 ppm (4950 milligram per cubic meter), 1993; Austria: MAK 1000 ppm (5000 milligram per cubic meter), 1999; Belgium: TWA 1000 ppm (4950 milligram per cubic meter), 1993; Finland: TWA 1000 ppm (4950 milligram per cubic meter); STEL 1250 ppm (6200 milligram per cubic meter), 1999; France: VME 1000 ppm (4950 milligram per cubic meter), 1999; Hungary: TWA 100 milligram per cubic meter; STEL 200 milligram per cubic meter, 1993; Japan: 500 ppm (2500 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 5040 milligram per cubic meter, 2003; Norway: TWA 500 ppm (2475 milligram per cubic meter), 1999; the Philippines: TWA 1000 ppm (4950 milligram per cubic meter), 1993; Poland: MAC (TWA) 4000 milligram per cubic meter, MAC (STEL) 6200 milligram per cubic meter, 1999; Russia: TWA 500 ppm; STEL 3000 milligram per cubic meter, 1993; Switzerland: MAK-W 1000 ppm (5000 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (4950 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (5030 milligram per cubic meter); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for R-12 in ambient air[60] ranging from 49.5 milligram per cubic meter (North Dakota) to 82.5 milligram per cubic meter (Virginia) to 99.0 milligram per cubic meter (Connecticut) to 118.0 milligram per cubic meter (Nevada) to 247.0 milligram per cubic meter (North Carolina). Those values may well be modified in the future because of concern over the effect of chlorofluorocarbons on the depletion of the ozone layer in the atmosphere.

Determination in Air: Use NIOSH Analytical Method (IV) #1018.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg[F]/L.

Determination in Water: Use EPA Method 601.

Routes of Entry: Inhalation, eye and/or skin contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can cause you to become dizzy and lightheaded, and to have trouble concentrating. Exposure can cause the heart to beat irregularly (cardiac arrythmia) or cause heart arrest. This can cause death. Contact with the liquid can cause severe eye and skin burns from frostbite. Breathing the gas can irritate the mouth, nose and throat. High levels can cause asphyxiation.

Points of Attack: Cardiovascular system and peripheral nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24 h EKG (Holter monitor) to look for irregular heartbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Where cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends Neoprene rubber as a good to excellent protective material. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 10,000 ppm: Sa (APF = 10) (any supplied-air respirator). 15,000 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA).

Storage: Check oxygen content prior to entering storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area away from heat. Dichlorodifluoromethane must be stored to avoid contact with chemically active metals (such as sodium, potassium, calcium, powdered aluminum; zinc, and magnesium), since violent reactions occur. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1028 Dichlorodifluoromethane or Refrigerant gas R-12, Hazard class: 2.2; Labels: 2.2-Nonflammable compressed gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. The material itself does not burn. Thermal decomposition products may include hydrogen chloride. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Because of potential ozone decomposition in the stratosphere, R-12 should be released to the atmosphere only as a last resort[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 204-258-7
Regulatory Authority and Advisory Information
Hazard Alert: Combustible, Strong oxidizer, Dangerously water reactive, Corrosive, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).
Hazard symbols, risk, & safety statements: Hazard symbol: C, O, N, Xn; risk phrases: R8; R20/21/R22; R23/24/25; R31; R34; R36/37/38; R51; R62; safety phrases: S17; S26; S36/37/39; S41; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: DCDMH is a combustible, white powder. Chlorine-like odor. Molecular weight = 197.03; freezing/melting point = 130°C; flash point = 175°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0 Oxidizer, ₩. Slightly soluble in water; solubility = 0.2%. Reacts with water releasing hydrogen chloride gas.
Potential Exposure: It is used as a chlorinating agent, disinfectant, biocide, and laundry bleach. It is also used as a polymerization catalyst in making vinyl chloride; and in drug and pesticide synthesis.
Incompatibilities: A strong oxidizer. Contact with water forms poisonous and corrosive gases. Mixtures with xylene may explode. Not compatible with moisture (especially hot water, steam), strong acids; easily oxidized materials (such as ammonia salts; sulfides, etc.); reducing agents; strong bases; ammonium salts; sulfides. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).
Permissible Exposure Limits in Air
NIOSH IDLH = 5 milligram per cubic meter
OSHA PEL: 0.2 milligram per cubic meter TWA
NIOSH REL: 0.2 milligram per cubic meter TWA; 0.4 milligram per cubic meter STEL
ACGIH TLV[1]: 0.2 milligram per cubic meter TWA; 0.4 milligram per cubic meter STEL
PAC not available
Australia: TWA 0.2 milligram per cubic meter; STEL 0.4 milligram per cubic meter, 1993; Belgium: TWA 0.2 milligram per cubic meter; STEL 0.4 milligram per cubic meter, 1993; Finland: TWA 0.2 milligram per cubic meter; STEL 0.6 milligram per cubic meter, 1999; France: VME 0.2 milligram per cubic meter, 1999; the Philippines: TWA 0.2 milligram per cubic meter, 1993; Switzerland: MAK-W 0.2 milligram per cubic meter, 1999; United Kingdom: TWA 0.2 milligram per cubic meter; STEL 0.4 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 0.2 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 0.4 milligram per cubic meter. Several states have set guidelines or standards for this material in ambient air[60] ranging from 2.0−4.0 μ/m^3 (North Dakota) to 3.2 μ/m^3 (Virginia) to 4.0 μ/m^3 (Connecticut) to 5.0 μ/m^3 (Nevada).
Determination in Air: No method established.
Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: Irritation of skin, eyes, mucous membrane and respiratory system. LD_{50} = (oral-rat) 542 mg/kg (slightly toxic). Higher levels can irritate the lungs, causing a build-up of fluid (pulmonary edema). This can cause death.
Long-Term Exposure: Can irritate the lungs, causing bronchitis with coughing, phlegm, and/or shortness of breath.
Points of Attack: Eyes and respiratory system.
Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce

vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Up to 2 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator). Up to 5 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1 h hour fire wall from flammable or reactive materials. *Note:* Store corrosives in this group in chemical resistant secondary containers and/or in corrosion proof cabinets. Prior to working with this chemical, personnel should be trained on its proper handling and storage. 1,3-Dichloro-5,5-dimethyl hydantoin must be stored to avoid contact with strong acids (such as sulfuric acid, nitric acid, or hydrochloric acid) and easily oxidized materials (such as ammonium salts and sulfides), since violent reactions occur and poisonous gases can be produced. Store in tightly closed containers in a cool well-ventilated area away from water or steam. 1,3-Dichloro-5,5-dimethylhydantoin decomposes with formation of poisonous gases @ 201°C−210°C. If 1,3-dichloro-5,5-dimethylhydantoin contacts water or steam, it decomposes at lower temperatures and produces Thermal decomposition products may include chlorine. Sources of ignition, such as smoking and open flames are prohibited where 1,3-dichloro-5,5-dimethylhydantoin is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1479 Oxidizing solid, n.o.s., Hazard Class: 5.1; Labels: 5.1-Oxidizer, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Conflagrates at 212°C (turns brown). Thermal decomposition products may include hydrogen chloride, phosgene, and oxides of nitrogen and carbon. Chlorine gas evolves at temperatures >210°C[101]. Use dry chemical or carbon dioxide. *Do not use water.* If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (815.5°C/816°C, 0.5 second for primary combustion; 104.4°C/220°F, 1.0 second for secondary combustion). The formation of elemental chlorine can be prevented by injection of steam or methane into the combustion process. Any nitrogen oxides may be abated by the use of thermal or catalytic devices.

PAC-3: 4000 ppm [> 50% LEL but < 100% LEL = 8000]
DFG MAK: 100 ppm/410 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C
Australia: TWA 200 ppm (810 milligram per cubic meter); STEL 250 ppm, 1993; Austria: MAK 100 ppm (400 milligram per cubic meter), 1999; Belgium: TWA 200 ppm (810 milligram per cubic meter); STEL 250 ppm (1010 milligram per cubic meter), 1993; Finland: TWA 100 ppm (400 milligram per cubic meter); STEL 250 ppm (1000 milligram per cubic meter), 1999; France: VME 200 ppm (810 milligram per cubic meter), 1999; Japan: 100 ppm (400 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 400 milligram per cubic meter, 2003; the Philippines: TWA 100 ppm (400 milligram per cubic meter), 1993; Poland: TWA 50 milligram per cubic meter,

1999; Russia: TWA 100 ppm, 1993; Switzerland: MAK-W 100 ppm (400 milligram per cubic meter), KZG-W 200 ppm (800 milligram per cubic meter), 1999; Thailand: TWA 50 ppm; STEL 100 ppm, 1993; Turkey: TWA 100 ppm (400 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (823 milligram per cubic meter); STEL 400 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for ethylidene chloride in ambient air[60] ranging from 8.0 milligram per cubic meter (Connecticut) to 8.1−10.1 milligram per cubic meter (North Dakota) to 13.5 milligram per cubic meter (Virginia) to 19.3 milligram per cubic meter (Nevada).

Determination in Air: Charcoal tube; CS 2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV)#1003, Halogenated hydrocarbons or OSHA Analytical Method 7.

Permissible Concentration in Water: No criteria set for aquatic life or human health due to insufficient data[6]. Several states have set guidelines or standards for ethylidene chloride in drinking water[61] ranging from 1.0 μg/L (Illinois) to 20.0 μg/L (California) to 25 μg/L (New Mexico) to 70.0 μg/L (Vermont) to 850 μg/L (Wisconsin).

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol-water coefficient: Log $K_{ow} = 1.8$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, and eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical may affect the CNS. Exposure can cause drowsiness, unconsciousness, and death. High exposures may damage the liver or kidneys. Contact can cause eye and skin irritation with eye burns. Long-term exposure can cause thickening and cracking of skin. 1,1-Dichloroethane is a highly flammable liquid and a dangerous fire hazard. Never use near combustion sources. Do not use 1,1-dichlorethane where welding is being done because deadly phosgene gas can be formed.

Long-Term Exposure: It may damage the developing fetus. The liquid destroys the skin's natural oils. May affect the kidneys and liver. A chloroethane, this chemical may be a potential occupational carcinogen. Prolonged skin contact can cause thickening and cracking of the skin and mild burns. Although not adequately evaluated, similar petroleum-based chemicals can cause brain or other nerve damage.

Points of Attack: Skin, liver, kidneys, lungs, and CNS.

Medical Surveillance: If overexposure or illness is suspected, consider: liver and kidney function tests. Interview for brain effects, including recent memory, mood, concentration, headaches, malaise, and altered sleep patterns. Consider autonomic and peripheral nervous system evaluation. Positive and borderline cases should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear solvent-resistant protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. NIOSH recommends: 8 hours (more than 8 hours of resistance to breakthrough >0.1 μg/cm^2/min): Tychem 10000 suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon is among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 1000 ppm: Sa (APF = 10) (any supplied-air respirator). 2500 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 3000 ppm: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,1-Dichloroethane must be stored to avoid contact with strong oxidizers, such as chlorine, bromine and fluorine, since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where 1,1-dichlorethane is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers used in the transfer of five gallons or more of 1,1-dichloroethane should be grounded and bonded. Drums must be quipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of 1,1-dichloroethane. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72].

Shipping: UN2362 1,1-Dichloroethane, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Harmful to aquatic life with long lasting effects. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Dichloroethyl Acetate D:0530

Formula: $C_4H_6Cl_2O_2$: $CH_3COOCHClC\ H_2Cl$

Synonyms: Aceto de 1,2-dicloroetilo (Spanish); 1,2-Dichloroethanol acetate; 1,2-Dichloroethyl acetate; Ethanol, 1,2-dichloro-, acetate

CAS Registry Number: 10140-87-1

HSDB Number: 6442

RTECS Number: KK4200000

UN/NA & ERG Number: UN1993 (flammable liquids, n.o.s.)/128

EC Number: 233-398-1

Regulatory Authority and Advisory Information

Hazard Alert: Combustible.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg).

Description: Dichloroethyl acetate is a water-white liquid. Molecular weight = 155.32; specific gravity (H_2O:1) = 1.3 @ 20°C; boiling point = 58°C−65°C @ 13 mmHg; flash point = 157°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: This material is used in organic synthesis.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Contact with strong oxidizing acids may cause an exothermic reaction strong enough to ignite reaction products. May explode on contact with nitrates and heat. Reacts with caustic solutions.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 0.15 ppm
PAC-2: 1.7 ppm
PAC-3: 10 ppm

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: EPA states that the material is toxic by inhalation.

Long-Term Exposure: Prolonged or repeated contact may cause organ damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers and nitrates. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: Take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Ventilate area of spill or leak. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phosgene and chlorine. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

Description: 1,2-Dichloroethylene exists in three isomers, *sym-*, *cis*-60% and *trans*-40%. There are variations in toxicity between these two forms. At room temperature, these chemicals are colorless liquids with a slightly acrid, ethereal odor. The Odor Threshold in air is 17 ppm.

sym-isomer: Molecular weight = 96.95; specific gravity (H_2O:1) = 1.27 @ 25°C; boiling point = 48°C55°C; freezing/melting point = −50°C; flash point = 2°C (cc). Autoignition temperature = 460°C. Explosive Limits: LEL: 9.7%; UEL: 12.8%. Poor solubility in water; solubility = 0.4%.

cis-isomer*:* Molecular weight = 96.94; specific gravity (H_2O:1) = 1.28 @ 20°C; boiling point = 60.3°C; freezing/melting point = −82°C; flash point = 6°C. Explosive limits: LEL: 27,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2.

trans-isomer*:* Molecular weight = 96.94; specific gravity (H_2O:1) = 1.26 @ 20°C; boiling point = 47.5°C; freezing/melting point = −49.8°C; vapor pressure = 750 mmHg @ 47.3°C; flash point = 2-4°C. The explosive limits are: LEL: 5.6% or 9.7%;[52] UEL: 12.8%. Slightly soluble in water. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2.

Potential Exposure: Primary irritant (w/o allergic reaction). 1,2-Dichloroethylene is used as a solvent for waxes, resins, and acetylcellulose. It is also used in the extraction of rubber, as a refrigerant; in the manufacture of pharmaceuticals and artificial pearls; and in the extraction of oils and fats from fish and meat.

Incompatibilities: May form explosive mixture with air. Attacks some plastics, rubber, and coatings. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Gradual decomposition results in hydrochloric acid formation in the presence of ultraviolet light or upon contact with hot metal or other hot surfaces. Reacts with strong bases; potassium hydroxide; difluoromethylene, dihypofluoride, nitrogen tetroxide (explosive); or copper (and its alloys) producing toxic chloroacetylene which is spontaneously flammable on contact with air. Attacks some plastics and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm (1,2-dichloroethylene)

Conversion factor: 1 ppm = 3.97 milligram per cubic meter (*sym*-dichloroethylene)@ 25°C & 1 atm

OSHA PEL: 200 ppm/790 milligram per cubic meter TWA

NIOSH REL: 200 ppm/790 milligram per cubic meter TWA

ACGIH TLV[1]: 200 ppm/793 milligram per cubic meter TWA, all isomers

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 200 ppm/800 milligram per cubic meter; Peal Limitation Category II(2) (*sym*-)

Australia: TWA 200 ppm (790 milligram per cubic meter), 1993; Austria: MAK 200 ppm (790 milligram per cubic meter), 1999; Belgium: TWA 200 ppm (793 milligram per cubic meter), 1993; Denmark: TWA 200 ppm (790 milligram per cubic meter), 1999; Finland: TWA 200 ppm (790 milligram per cubic meter); STEL 250 ppm (990 milligram per cubic meter), 1999; Hungary: TWA 80 milligram per cubic meter; STEL 160 milligram per cubic meter, 1993; Japan: 150 ppm (590 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 790 milligram per cubic meter, 2003; Norway: TWA 100 ppm (395 milligram per cubic meter), 1999; the Philippines: TWA 200 ppm (790 milligram per cubic meter), 1993; Poland: MAC (TWA) 50 milligram per cubic meter, 1999; Russia: TWA 150 ppm, 1993; Switzerland: MAK-W 200 ppm (790 milligram per cubic meter), KZG-W 400 ppm (1580 milligram per cubic meter), 1999; Turkey: TWA 200 ppm (790 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (806 milligram per cubic meter); STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 200 ppm. Several States have set guidelines or standards for *sym*-dichloroethylene in ambient air[60] ranging from 0.110 milligram per cubic meter (Massachusetts) to 13.0 milligram per cubic meter (Virginia) to 15.8 milligram per cubic meter (Connecticut) to 18.8 milligram per cubic meter (Nevada).

Determination in Air: Charcoal absorption workup with CS2, analysis by gas chromatography. Use NIOSH Analytical Method #1003 for hydrocarbons, halogenated or OSHA Analytical Method 7.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): (***trans-1,2-dichloroethylene***) MCL, 0.1 mg/L; MCLG, 0.1 mg/L: (***cis-1,2-dichloroethylene***)): MCL, 0.07 mg/L; MCLG, 0.07 mg/L. (***1,2-dichloroethylene***) State Drinking Water Standards: Florida 70 μg/L; State Drinking Water Guidelines: Arizona 70 μg/L. (***cis-1,2-dichloroethylene***) State Drinking Water Standards: California 6 μg/L; State Drinking Water Guidelines: Maine 70 μg/L; Minnesota 50 μg/L. (***trans-1,2-dichloroethylene***) State Drinking Water Standards: California 10 μg/L; State Drinking Water Guidelines: Arizona 70 μg/L; Maine 140 μg/L; Minnesota 100 μg/L.

Determination in Water: *trans*-1,2-dichloroethylene may be determined by inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol-water coefficient: Log $K_{\mathrm{ow}} = 2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of the vapor, ingestion, and skin and eye contact.

Short-Term Exposure: This liquid can act as a Primary irritant (w/o allergic reaction) producing dermatitis and irritation of mucous membranes. 1,2-DCE irritates the eyes, skin, and respiratory tract. Skin contact can cause a burning sensation and rash. 1,2-Dichloroethylene acts principally as a narcotic, causing CNS depression. Symptoms of acute exposure include dizziness, nausea, frequent vomiting; and CNS intoxication, similar to that caused by alcohol. High levels can cause unconsciousness. LD_{50} = (oral-rat) 770 mg/kg (slightly toxic).

Long-Term Exposure: Destroys skin's natural oils. Repeated exposure to the *cis*-or *trans*-isomers may damage the liver and kidneys. Renal effects, when they do occur, are transient.

Points of Attack: Respiratory system, eyes, and CNS.

Medical Surveillance: Consider possible irritant effects on skin or respiratory tract as well as liver and renal function is preplacement or periodic examinations. Expired air analysis may be useful in detecting exposure. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. NIOSH recommends: 8 hours (more than 8 hours of resistance to breakthrough $> 0.1\ \mu g/cm^2/min$): Teflon gloves, suits, and boots; Viton gloves, suits; 4H and Silver Shield gloves; Barricade coated suits; CPF3 suits; Responder suits; Trychem 10000 suits. 4 hours (At least 4 but <8 hours of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton is among the recommended protective materials for the *cis*-and *trans*-isomers. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 1000 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with 1,2-DCE all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,2-Dichloroethylene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where 1,2-dichloroethylene is used, handled, or stored. Metal containers involving the transfer of five gallons or more of 1,2-dichloroethylene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of 1,2-dichloroethylene. Wherever 1,2-dichloroethylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1150 Dichloroethylene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 1,2-DCE is a flammable liquid. Thermal decomposition products may include phosgene and hydrogen chloride. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Dichloroethyl ether is a clear, colorless liquid. Pungent, fruity odor. It is also described as having a chlorinated solvent-like odor. Molecular weight = 143.02;

boiling point = 176°C−178°C; flash point = 55°C; [17]; Autoignition temperature = 369°C; Explosive limits: LEL: 2.7%; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Insoluble in water.

Potential Exposure: Dichloroethyl ether is used as a soil fumigant, an insecticide, and an acaricide; in the manufacture of paint, varnish, lacquer, soap, and finish removers. It is also used as a solvent for cellulose esters, naphthalenes, oils, fats, waxes, greases, pectin, tar, and gum; in dry cleaning and in textile scouring.

Incompatibilities: Contact with moisture caused decomposition producing hydrochloric acid. Can form peroxides. May form explosive mixture with air. Contact with strong oxidizers may cause fire and explosion hazard. Attacks some plastics, rubber, and coatings. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 5.85 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 15 ppm/90 milligram per cubic meter Ceiling Concentration [skin]

NIOSH REL: 5 ppm/30 milligram per cubic meter TWA; 10 ppm/60 milligram per cubic meter STEL [skin]; See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 5 ppm/29 milligram per cubic meter TWA; 10 ppm/58 milligram per cubic meter STEL [skin], not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 10 ppm

PAC-2: 25 ppm

PAC-3: 250 ppm

DFG MAK: 10 ppm/59 milligram per cubic meter TWA; Peak Limitation Category I(1) [skin]

Australia: TWA 5 ppm (30 milligram per cubic meter); STEL 10 ppm, [skin], 1993; Austria: MAK 5 ppm (30 milligram per cubic meter), [skin], 1999; Belgium: TWA 5 ppm (29 milligram per cubic meter); STEL 10 ppm (58 milligram per cubic meter), [skin], 1993; Finland: TWA 5 ppm (30 milligram per cubic meter); STEL 10 ppm (60 milligram per cubic meter), [skin], 1999; France: VME 5 ppm (30 milligram per cubic meter), [skin], 1999; Japan: 15 ppm (88 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 30 milligram per cubic meter, 2003; the Philippines: TWA 15 ppm (90 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 10 milligram per cubic meter, MAC (STEL) 60 milligram per cubic meter, 1999; Russia: STEL 0.6 milligram per cubic meter, [skin]; TWA 15 ppm; STEL 2 milligram per cubic meter, [skin], 1993; Sweden: carcinogen, 1999; Switzerland: MAK-W 5 ppm (30 milligram per cubic meter), KZG-W 25 ppm (50 milligram per cubic meter), [skin], 1999; Thailand: TWA 15 ppm (90 milligram per cubic meter), 1993; Turkey: TWA 15 ppm (90 milligram per cubic meter), [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 10 ppm [skin]. Several states have set guidelines have set guidelines or standards for BCEE in ambient air[60] ranging from 0.0714 milligram per cubic meter (Kansas) to 0.3−0.6 milligram per cubic meter (North Dakota) to 0.5 milligram per cubic meter (Virginia) to 0.6 milligram per cubic meter (Connecticut) to 0.714 milligram per cubic meter (Nevada) to 0.72 milligram per cubic meter (Pennsylvania).

Determination in Air: Charcoal tube; CS2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1004 or OSHA Analytical Method 7.

Permissible Concentration in Water: State Drinking Water Guidelines: Arizona 0.030 μg/L; Florida 1.5 μg/L; Maine 0.3 μg/L; Minnesota 0.3 μg/L; New Hampshire 0.03 μg/L.

Determination in Water: CH_2Cl_2 extraction followed by gas chromatography with halogen; specific detector (EPA Method 611) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log K_{ow} = 1.3. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: BCEE can be absorbed through the skin, thereby increasing exposure. Exposure irritates the eyes, skin, and respiratory tract. Skin and eye contact may cause burns. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. At concentrations above 500 ppm, coughing, retching, and vomiting may occur; as well as profuse tearing. There can be irritation at lower concentrations. This material is very toxic; the probable oral lethal dose is 50−500 mg/kg, or between one teaspoon and one ounce for a 150 pound person. It can be a CNS depressant in high concentrations. It is extremely irritating to the eyes, nose, and respiratory passages. It can penetrate the skin to cause serious and even fatal poisoning. Poisonous; may be fatal if inhaled, swallowed or absorbed through skin.

Long-Term Exposure: BCEE may damage the liver and kidneys. Can irritate the lungs; repeated exposures may cause bronchitis.

Points of Attack: Respiratory system, skin, eyes, liver, and kidneys. This chemical causes liver cancer in animals and may be a potential human carcinogen.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may also be useful: Liver and kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. NIOSH recommends: 8 hours (more than 8 hours of resistance to breakthrough > 0.1 $\mu g/cm^2/min$): Tychem 10000 suits; 4 hours (At least 4 but < 8 hours of resistance to breakthrough > 0.1 $\mu g/cm^2/min$): Teflon gloves, suits, and boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon and chlorinated polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with BCEE all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Bis (2-chloroethyl) ether must be stored to avoid contact with strong oxidizers, such as chlorine, bromine, and chlorine dioxide, since violent reactions occur, and moisture. Store in tightly closed containers in a cool, dry, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where bis (2-chloroethyl) ether is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1916 2,2′-Dichlorodiethyl ether, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb spills in vermiculite, dry sand, earth, or similar material. Keep material out of water sources and sewers. Build dikes to contain flow as necessary. Use water spray to knock down vapors. *Spill or leak:* Shut off ignition sources; no flares, smoking or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep unnecessary people away; isolate hazard area and deny entry. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phosgene, hydrogen chloride, chlorine fumes and explosive hydrogen gas. Use dry chemical, carbon dioxide, or foam extinguishers. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to

cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: A potential candidate for liquid injection incineration at a temperature range of 650 to 1600°C and a residence time 0.1 to 2 seconds. Also, a potential candidate for rotary kiln incineration at a temperature range of 820 to 1600°C and residence times of seconds for liquids and gases, and hours for solids. Also, a potential candidate for fluidized bed incineration at a temperature range of 450 to 980°C and residence times of seconds for liquids and gases, and longer for solids[72]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazard symbols, risk, & safety statements: Hazard symbol: O, Xn, N; risk phrases: R8; R22; R31; R36/37; R50/53; safety phrases: S2; S8; S26; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: White, crystalline solid, powder, or granules. Chlorine odor. Molecular weight = 197.97; freezing/melting point = 227°C (decomposes); vapor pressure = 2.0×10^{-9} mmHg @25°C. Moderately soluble in water; reaction may be violent, forming hypochlorous acid and releasing chlorine gas. ₩

Potential Exposure: This triazinetrione biocide, and water treatment chemical used in disinfectants and cleaning solution in domestic products and in food processing plants.

Incompatibilities: A strong oxidizer and chlorinating compound. Violent reaction with organic and flammable materials. Contact with materials containing nitrogen, such as ammonia, ammonium salts, or urea, may be violent and form highly explosive nitrogen trichloride. Contact with water forms hypochlorous acid and evolves extremely dense and noxious fumes of chlorides; chlorine gas. Triazine compounds are incompatible with oxidizers, acids, acid chlorides, acid halides, isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, and anhydrides. Contact with strong reducing agents such as hydrides may generate explosive a flammable gas.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg[CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid). Octanol-water coefficient: Log $K_{ow} = 1.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, passing through the skin, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: May cause skin and severe eye irritation. Moderately poisonous if ingested or inhaled. LD_{50} (oral, rat) = 150 mg/kg *as chlorinated isocyanurates*[83].; 1170 mg/kg[lit]

Long-Term Exposure: May cause lung irritation and damage. May cause skin allergy. Contact with some triazine compounds may increase risks for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects on the hypothalamic pituitary gonadal axis. Repeated exposure may cause weight loss and reduced red blood cell count. A mutagen

Points of Attack: Liver, lungs, and skin. May cause reproductive and fetal effects.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung function tests. Consider chest x-ray following acute overexposure. Evaluation by a qualified allergist. Examination of the nervous system

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: NIOSH (*as cyanides*): 25 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 m or a 1 hour fire wall from flammable or reactive materials. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2465 Dichloroisocyanuric acid, dry, or Dichloroisocyanuric acid salts., Hazard Class: 5.1; Labels: 5.1-Oxidizer. It is a marine pollutant and environmentally hazardous substance.

Spill Handling: For solids, *small spill*, isolate spill or leak area in all directions for at least 25 m/75 ft. Increase, in the downwind direction, as necessary. For a *large spill*, evacuate downwind at least 100 m/330 ft. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Do not allow water to get inside containers. *Small dry spill*: With clean shovel place material into clean, dry container and cover loosely; move containers from spill area. *Large spill*: Dike far ahead of liquid spill for later disposal. Following product recovery, flush area with water. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers.

Fire Extinguishing: Thermal decomposition products may include extremely dense and noxious fumes of chlorides, carbon monoxide, and other toxic gases. Move containers from fire area if you can do it without risk. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: Use water. Do not use dry chemicals or foams. carbon dioxide or Halon may provide limited control. *On a large fire,* Flood fire area with water from a distance. Do not move cargo or vehicle if cargo has been exposed to heat. *Fire involving tanks or car/trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank.

Disposal Method Suggested: Recycle any unused portion of the material for its approved use or return it to the manufacturer or supplier. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Ultimate disposal of the chemical must consider: the material's impact on air quality; potential migration in soil or water; effects on animal, aquatic, and plant life; and conformance with environmental and public health regulations.

Dichloromethylphenylsilane D:0560

Formula: $C_7H_8Cl_2Si$; $C_6H_5SiCl_2CH_3$

Synonyms: Dichloromethylphenylsilane; Methylphenyldichlorosilane; Phenylmethyldichlorosilane; Silane, dichloromethylphenyl-

CAS Registry Number: 149-74-6

HSDB Number: 5650

RTECS Number: VV3530000

UN/NA & ERG Number: UN2437/156

EC Number: 205-746-2

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Poison, Highly flammable liquid, Corrosive, Violently water reactive

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F, C, Xn; risk phrases: R11; R14; R34; R36/37/38; R34; R40; R45; R51; safety phrases: S1; S21; S22; S26; S36/37/39; S45; S53; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Dichloromethylphenylsilane is a flammable, colorless liquid. Molecular weight = 191.14; specific gravity (H_2O:1) = 1.18 @ 20°C; boiling point = 205°C; freezing/melting point: −52.7°C; flash point = 82°C. Explosive limits: LEL: 14,190 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩. Reacts violently with water, rapidly releasing corrosive hydrogen chloride fumes.

Potential Exposure: Used in the manufacture of silicones; and as a chemical intermediate for silicone fluids, resins, and elastomers.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Contact with ammonia may form a self-igniting material. Attacks some metals in the presence of moisture.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.9 milligram per cubic meter

PAC-2: 11 milligram per cubic meter

PAC-3: 50 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: The chemical is toxic and a corrosive irritant. Contact with the skin or eyes causes burns and permanent damage. Inhalation may cause irritation. Higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated exposure may cause lung irritation and bronchitis.

Points of Attack: Lungs.

Medical Surveillance. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with methylphenyldichlorosilane all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from moisture, oxidizers, and ammonia. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2437 Methylphenyldichlorosilane, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

When Spilled in Water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.4/0.6

Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dichloromethylphenylsilane is a combustible liquid. Thermal decomposition products may include silicon oxides, hydrogen chloride and oxides of carbon. *Do not use water. FOR CHLOROSILANES, DO NOT USE WATER. USE AFFF ALCOHOL-RESISTANT, MEDIUM EXPANSION FOAM. Small fire*: Use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: Use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

EC Number: 200-869-8

Regulatory Authority and Advisory Information

Hazard Alert: Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Suspected of causing genetic defects, Environmental hazard (atmospheric).

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential (ODP) =

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Harms public health and the environment by destroying ozone in the upper atmosphere.

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R5; R21; R58/59; R62; safety phrases: S9; S33; S38; S57; S59; S61 (see Appendix 4)

Description: Dichlorofluoromethane is a heavy, colorless gas or liquid (below 9°C) with a slight ethereal odor. Molecular weight = 102.92; specific gravity (H_2O:1) = 1.4 1 @ 9°C; boiling point = 8.9°C; freezing/melting point = −130.4°C; Relative vapor density (air = 1) = 3.57; vapor pressure = 750 mmHg @ 8.6°C; Autoignition temperature = 522°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Poor solubility in water; solubility = 0.7% @ 30°C.

Potential Exposure: This material is used as a refrigerant and a propellant gas.

Incompatibilities: Reacts violently with chemically active metals: sodium, potassium, calcium, powdered aluminum; zinc, magnesium, alkali, alkaline earth. Reacts with acids or acid fumes producing highly toxic chlorine and fluorine fumes. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 5000 ppm

OSHA PEL: 1000 ppm/4200 milligram per cubic meter TWA

NIOSH REL: 10 ppm/40 milligram per cubic meter TWA

ACGIH TLV[1]: 10 ppm/42 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 30 ppm

PAC-2: 8300 ppm

PAC-3: 50,000 ppm

DFG MAK: 10 ppm/43 milligram per cubic meter TWA; Peak Limitation Category II(2)

Australia: TWA 10 ppm (40 milligram per cubic meter), 1993; Austria: MAK 10 ppm (45 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (42 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (40 milligram per cubic meter), 1999; Finland: TWA 10 ppm (40 milligram per cubic meter); STEL 20 ppm (80 milligram per cubic meter), 1999; France: VME 10 ppm (40 milligram per cubic meter), 1999; Hungary: STEL 40 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 43 milligram per cubic meter, 2003; Norway: TWA 10 ppm (42 milligram per cubic meter), 1999; the Philippines:

TWA 1000 ppm (4200 milligram per cubic meter), 1993; Poland: MAC (TWA) 40 milligram per cubic meter, MAC (STEL) 200 milligram per cubic meter, 1999; Switzerland: MAK-W 10 ppm (40 milligram per cubic meter), KZG-W 20 ppm (80 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (4200 milligram per cubic meter), 1993; United Kingdom: TWA 10 ppm (43 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 10 ppm. Several states have set guidelines or standards for R-21 in ambient air[60] ranging from 0.4 milligram per cubic meter (North Dakota) to 0.5 milligram per cubic meter (North Carolina) to 0.65 milligram per cubic meter (Virginia) to 0.8 milligram per cubic meter (Connecticut) to 0.952 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2516.

Determination in Water: No tests listed. Octanol-water coefficient: Log $K_{ow} = 1.55$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, and eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with the liquid may cause frostbite. This chemical affects the CNS at high concentrations. High exposure could cause asphyxia and/or cardiac arrhythmia (irregular heartbeat). This might lead to cardiac arrest.

Long-Term Exposure: May damage the developing fetus. May damage the liver. May cause irregular heartbeat.

Points of Attack: Respiratory system, lungs, and cardiovascular system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. EKG, liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 100 ppm: Sa (APF = 10) (any supplied-air respirator). 250 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 500 ppm: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 5000 ppm: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA).

Storage: Check oxygen content prior to entering storage area. Prior to working with dichlorofluoromethane all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from chemically active metals; acids, acid fumes; alkali, alkaline earth; since violent reaction occur. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1029 Dichlorofluoromethane or Refrigerant gas R-21 Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include chlorine, fluorine. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Because of recent discovery of potential ozone decomposition in the stratosphere, this material should be released to the atmosphere only as a last resort.

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 2 ppm (10 milligram per cubic meter), 1993; Austria: MAK 2 ppm (12 milligram per cubic meter), 1999; Belgium: TWA 2 ppm (12 milligram per cubic meter), 1993; Finland: TWA 10 ppm (60 milligram per cubic meter), STEL 20 ppm (120 milligram per cubic meter), 1999; France: VME 2 ppm (10 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; the Philippines: TWA 10 ppm (60 milligram per cubic meter), 1993; Poland: MAC (TWA) 30 milligram per cubic meter, MAC (STEL) 60 milligram per cubic meter, 1999; Switzerland: MAK-W 2 ppm (12 milligram per cubic meter), 1999; Thailand: TWA 10 ppm (60 milligram per cubic meter), 1993; Turkey: TWA 10 ppm (60 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 2 ppm. Several states have set guidelines or standards for dichloronitroehtane in ambient air[60] ranging from 100 μ/m^3

(North Dakota) to 160 μ/m^3 (Virginia) to 200 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1601 or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: In animals: lung, skin, eye irritation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. LD_{50} = (oral-rat) 410 mg/kg (moderately toxic).

Long-Term Exposure: This chemical causes liver, heart, kidney, and blood vessel damage in animals.

Points of Attack: Lungs.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: Up to 20 ppm: Sa (APF = 10) (any supplied-air respirator). Up to 25 ppm: Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece). SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator away from oxidizers and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2650 1,1-Dichloro-1-nitroethane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Water may be used to blanket fire since liquid is heavier than water (sp gr = 1.4). Apply water gently to the surface of the liquid[17]. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 second for primary combustion; 1204°C, 1.0 second for secondary combustion). The formation of elemental chlorine can be prevented through injection of steam or methane into the combustion process. nitrogen oxides may be abated through the use of thermal or catalytic devices.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R22; R24; R34; R50/53; R62; R63; safety phrases: S1/2; S26; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 2,4-DCP is a colorless crystalline solid with a characteristic odor. Molecular weight = 163.00; boiling point = 210°C; freezing/melting point = 45.0°C; vapor pressure = 0.09 mmHg @ 25°C; flash point = 113°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: 2,4-Dichlorophenol is a commercially produced substituted phenol used in the manufacture of industrial and agricultural products; in synthesis of pharmaceuticals. As an intermediate in the chemical industry, 2,4-DCP is utilized as the feedstock for the manufacture of 2,4-dichlorophenoxyacetic acid (2,4-D), and 2,4-D derivatives (germicides, soil sterilants, etc.); certain methyl compounds used in mothproofing, antiseptics and seed disinfectants. 2,4-DCP is also reacted with benzene sulfonyl chloride to produce miticides or further chlorinated to pentachlorophenol, a wood preservative. It is thus a widely used pesticide intermediate. The only group expected to be at risk for high exposure to 2,4-DCP is industrial workers involved in the manufacturing or handling of 2,4-DCP and 2,4-D.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Contact with acids or acid fumes causes decomposition releasing poisonous chlorine gas. Incompatible with caustics, acid anhydrides; acid chlorides. Quickly corrodes aluminum; slowly corrodes zinc, tin, brass, bronze, copper and its alloys. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: $\mathbf{0.2}_{\mathbf{E}}$ ppm

PAC-2: $\mathbf{2}_{\mathbf{E}}$ ppm

PAC-3: $\mathbf{20}_{\mathbf{E}}$ ppm

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

Michigan[60] has set a guideline for 2,4-dichlorophenol in ambient air of 77.0 μ/m^3.

Permissible Concentration in Water: Federal Drinking Water Guidelines: 20 μg/L; State Drinking Water Guidelines:

Arizona 21 μg/L; Florida 4 μg/L; Maine 21 μg/L; Minnesota 20 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, ingestion, and through the skin.

Harmful Effects and Symptoms

Although a paucity of aquatic toxicity data exists, 2,4-DCP appears to be less toxic than the higher chlorinated phenols. 2,4-DCP's toxicity to certain microorganisms and plant life has been demonstrated and its tumor promoting potential in mice has been reported. In addition, it has been demonstrated that 2,4-DCP can produce objectionable odors when present in water at extremely low levels. These findings, in conjunction with potential 2,4-DCP pollution by waste sources from commercial processes or the inadvertent production of 2,4-DCP due to chlorination of waters containing phenol, lead to the conclusion that 2,4-DCP represents a potential threat to aquatic and terrestrial life, including humans. 2,4-DCP can irritate tissue and mucous membranes. LD_{50} = (oral-rat) 580 mg/kg (slightly toxic).

Short-Term Exposure: 2,4-DCP can be absorbed through the skin, thereby increasing exposure. Skin or eye contact can cause irritation and burns. Inhalation can cause respiratory irritation, coughing and wheezing. A suspected carcinogen.

Long-Term Exposure: May cause liver and kidney damage. May affect the nervous system causing headache, dizziness, nausea, vomiting, weakness, and possible coma. Several other chlorophenols are carcinogenic, although 2,4-DCP has not been identified specifically as a carcinogen.

Points of Attack: Nervous system, liver, and kidneys.

Medical Surveillance: Examination of the nervous system. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 2,4-DCP all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator away from oxidizers, acid, acid fumes; acid chlorides; acid anhydrides; caustics. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2020 Chlorophenols, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Dry chemical or CO_2 are preferred extinguishers. Water or foam may cause frothing. Thermal decomposition products may include corrosive hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a combustible solvent and incinerate in a furnace equipped with afterburner and scrubber[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: 2,6-Dichlorophenol is a white crystalline solid having a strong odor similar to *o*-chlorophenol. Molecular weight = 163.00; specific gravity (H_2O:1) = 1.65 @ 20°C; boiling point = 219.5°C; freezing/melting point = 68.5°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: 2,6-Dichlorophenol is produced as a by-product from the direct chlorination of phenol. It is used primarily as a starting material for the manufacture of trichlorophenols, tetrachlorophenols, and pentachlorophenols. It also acts as a sex pheromone for the Lone Star tick.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid fumes, acid anhyrides and acid chlorides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 8.8 milligram per cubic meter
PAC-2: 97 milligram per cubic meter
PAC-3: 580 milligram per cubic meter

Permissible Concentration in Water: State Drinking Water Guidelines: Florida 0.4 μg/L.

Routes of Entry: Inhalation, and through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: 2,6 DCP can be absorbed through the skin, thereby increasing exposure. Severe local irritation of eyes, skin, and mucous membranes; causes burns. Other symptoms are tremors, convulsions and respiratory inhibition. LD_{50} = (oral-rat) 2940 mg/kg (slightly toxic).

Long-Term Exposure: May cause liver and kidney damage. May affect the nervous system causing headache, dizziness, nausea, vomiting, weakness, and possible coma. Several other chlorophenols are carcinogenic, although 2,6-DCP has not been identified specifically as a carcinogen.
Points of Attack: Nervous system, liver, and kidneys.
Medical Surveillance: Examination of the nervous system. Liver and kidney function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%. (carcinogens), all isomers.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R23/24/25; R36/37/38; R42; R51; safety phrases: S22; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (CAS: 102-36-3)

Description: The dichlorophenyl isocyanates are combustible, crystalline (sugar or sand-like) solids. In general, they are white to yellow in color, but the 1,4-dichloro-2-phenyl isomer is white to light green. Their flash points are generally >113°C but that of the 1,3-dichloro-2-phenyl isomer is reported as 77°C. These chemicals are insoluble in water, and some may be reactive. *1,2-dichloro-4-isomer* (CAS 102-36-3) is the isomer of regulatory focus: Molecular weight = 188.01; boiling point = 240°C; freezing/melting point = 42°C; vapor pressure = 0.02 mmHg @ 25°C. Explosive limits: LEL: 20,000 ppm; UEL: unknown. Reacts with water; decomposition.

Potential Exposure: Those materials used as chemical intermediates.

Incompatibilities: May form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, and ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acylchlorides may cause explosive polymerization. Contact with metals may evolve flammable hydrogen gas. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

102-36-3

PAC-1: 1.3 milligram per cubic meter

PAC-2: 14 milligram per cubic meter

PAC-3: 120 milligram per cubic meter

Determination in Air: Impinger; Reagent; High-pressure liquid chromatography/Fluorescence/Electrochemical detection; NIOSH Analytical Method (IV) #5522, Isocyanates. See also Method #5521.

Permissible Concentration in Water: Hazardous to the aquatic environment. Reacts with water, forming carbon dioxide.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the eyes, nose, throat, air passages and lungs, causing coughing, shortness of breath and tightness in the chest. LD_{50} = (oral-rat) 91 mg/kg[NTIS]

Long-Term Exposure: Dichlorophenyl isocyanates may cause an asthma-like allergy. Future exposures can cause asthma attacks with shortness of breath; wheezing, cough, and/or chest tightness.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to dichlorophenyl isocyanates exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with these chemicals all handlers should be trained on its proper handling and storage. Store to avoid contact with alcohols, strong bases (such as potassium hydroxide and sodium hydroxide), carboxylic acids; amines, and metals, since violent reactions occur. Store in tightly closed containers in a dry, cool, well-ventilated area away from moisture and temperatures above 40°C.

Shipping: UN2250 Dichlorophenyl isocyanates, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals are combustible. Thermal decomposition products may include hydrogen cyanide, oxides of nitrogen and hydrogen chloride gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Combustion in an incinerator equipped with afterburner and fume scrubber.

Dichlorophenyl Trichlorosilane D:0630

Formula: $C_6H_3Cl_5Si$; $Cl_2C_6H_3SiCl_3$

Synonyms: Silane, trichloro(dichlorophenyl)-; Trichloro (dichlorophenyl)silane

CAS Registry Number: 27137-85-5

HSDB Number: 6348

RTECS Number: VV3540000

UN/NA & ERG Number: UN2987/156

EC Number: 248-254-3

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Corrosive, Violently water reactive

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C, T; risk phrases: R34; safety phrases: S26; S36/37/38/39; S41; S45 (see Appendix 4).

Description: Dichlorophenyl trichlorosilane is a straw-colored liquid. Molecular weight = 280.43; boiling point = 258.6°C; vapor pressure = < 1 mmHg @ 18°C; flash point = 141°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2. Decomposes in water; rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: This material is used in silicone polymer manufacture.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.60}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{7.3}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{33}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values. Russia[43] set a MAC in work-place air of 1.0 milligram per cubic meter.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema). This can cause death. This substance is a corrosive chemical and contact can cause severe skin and eye burns. Exposure can irritate the eyes, nose and throat.

Long-Term Exposure: Repeated exposure may affect the lungs.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to dichlorophenyl Trichlorosilane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure demand or other positive-pressure mode.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Dichlorophenyl trichlorosilane should be stored to avoid contact with moisture or with combustible materials, such as wood, paper and oil.

Shipping: UN2987 Chlorosilanes, corrosive, n.o.s, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase

with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

When Spilled in Water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 1.0/1.5

Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dichlorophenyl trichlorosilane may burn, but does not readily ignite. Poisonous gas is produced in fire. *FOR CHLOROSILANES, DO NOT USE WATER. USE AFFF ALCOHOL-RESISTANT, MEDIUM EXPANSION FOAM. Small fire*: Use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: Use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Carcinogenicity: IARC: Human Limited Evidence, animal Inadequate Evidence, possibly carcinogenic to humans, *possibly carcinogenic to humans*, Group 2B, 1987.

California Proposition 65 Developmental/Reproductive toxin delisted 1/25/2002

Hazard Alert: Poison, Environmental hazard, Agricultural chemical.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn; risk phrases: R40; R21/22; R38; R41; R51/53; safety phrases: S2; S26; 36/37; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: 2,4-DP is a combustible, colorless to yellowish to tan crystalline solid with a faint phenolic odor; Molecular weight = 235.07; freezing/melting point = 117°C−118°C. Soluble in water; solubility = 350 mg/L @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. May be applied as a liquid formulated with a flammable carrier, which can alter the physical properties listed here.

Potential Exposure: A phenoxy herbicide.

Incompatibilities: Dust may form explosive mixture with air. Contact with oxidizers may cause a fire and explosion hazard. The aqueous solution is a weak acid. Attacks many metals in presence of moisture. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: No method listed. Octanol-water coefficient: Log $K_{ow} = > 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation and passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause headache, fatigue, muscle twitching, fever, nausea, vomiting, diarrhea, stomach pain, poor appetite, and convulsions.

Long-Term Exposure: There is limited evidence that related phenoxy herbicide compounds cause cancer. May cause liver damage.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 2,4-DP all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from strong oxidizers and bases. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically transfer material from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3345 Phenoxyacetic acid derivative pesticide, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: *Solid material:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid formulations containing organic solvents: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include phosgene, hydrogen chloride and oxides of carbon. *Solid material:* This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include phosgene, hydrogen chloride and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. *Liquid formulations containing organic solvents:* This chemical is a combustible liquid. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%., National Pollution Release Inventory (NPRI).

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11, R20/22; R50/53; R62; R63; safety phrases: S2; S16; S21; S24; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Dichloropropane is a colorless stable liquid. Sweet, chloroform-like odor. The odor threshold in air is 0.25 ppm. Molecular weight = 112.99; specific gravity (H_2O:1) = 1.16; boiling point = 96°C; freezing/melting point = −100°C; vapor pressure = 40 mmHg @ 20°C; flash point = 16°C (cc); Autoignition temperature = 557°C. Explosive limits: LEL: 3.4%; UEL: 14.5%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Very slightly soluble in water; solubility = 0.3% @ 20°C.

Potential Exposure: Dichloropropane is used as a chemical intermediate in perchloroethylene and carbon tetrachloride synthesis, and as a lead scavenger for antiknock fluids. It is also used as a solvent for fats, oils, waxes, gums and resins; and in solvent mixtures for cellulose esters and ethers. Other applications include the use of dichloropropane; as a fumigant, alone and in combination with dichloropropane, as a scouring compound; and a metal degreasing agent. It is also used as an insecticidal fumigant.

Incompatibilities: May form explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Contact with strong oxidizers, powdered aluminum may cause fire and explosion hazard. Strong acids can cause decomposition and the formation of hydrogen chloride vapors. Reacts with strong bases; *o*-dichlorobenzene, 1,2-dichloroethane. Corrosive to aluminum and its alloys. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.62 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 75 ppm/350 milligram per cubic meter TWA

NIOSH REL: Potential occupational carcinogen; limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 10 ppm/46 milligram per cubic meter TWA, sensitizer, not classifiable as a human carcinogen

78-87-5

NIOSH IDLH = 400 ppm, potential human carcinogen

PAC Ver. 29[138]

78-87-5

PAC-1: 30 ppm

PAC-2: 220 ppm

PAC-3: 2000 ppm

DFG MAK: Carcinogen Category 3B

Australia: TWA 75 ppm (350 milligram per cubic meter); STEL 110 ppm, 1993; Austria: MAK 75 ppm (350 milligram per cubic meter), 1999; Belgium: TWA 75 ppm (347 milligram per cubic meter); STEL 110 ppm (509 milligram per cubic meter), 1993; Denmark: TWA 75 ppm (350 milligram per cubic meter), 1999; Finland: TWA 75 ppm (350 milligram per cubic meter); STEL 115 ppm (530 milligram per cubic meter), 1999; France: VME 75 ppm (350 milligram per cubic meter), 1999; Hungary: TWA 50 milligram per cubic meter; STEL 100 milligram per cubic meter [skin] 1993; the Netherlands: MAC-TGG 350 milligram per cubic meter, 2003; Norway: TWA 40 ppm (185 milligram per cubic meter), 1999; the Philippines: TWA 75 ppm (350 milligram per cubic meter), 1993; Poland: MAC (TWA) 50 milligram per cubic meter, MAC (STEL) 400 milligram per cubic meter, 1999; Russia: STEL 10 milligram per cubic meter, 1993; Switzerland: MAK-W 75 ppm (350 milligram per cubic meter), KZG-W 375 ppm (1750 milligram per cubic meter), 1999; Turkey: TWA 74 ppm (350 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 110 ppm. Russia[35],[43] set a MAC in ambient air in residential areas of 0.18 milligram per cubic meter on a daily average basis. Sever1 from 5.1 μ/m^3 (Massachusetts) to 13.89 μ/m^3 (Kansas) to 3500−5100 μ/m^3 (North Dakota) to 5800 μ/m^3 (Virginia) to 7000 μ/m^3 (Connecticut) to 8330 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1013 or OSHA Analytical Method 7.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.005 mg/L; MCLG, zero; Priority List (55 FR 1470). Federal Drinking Water Standards: EPA 5 μg/L; State Drinking Water Standards: California 5 μg/L; State Drinking Water Guidelines: Arizona 0.56 μg/L; Connecticut 5 μg/L; Minnesota 5 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol-water coefficient: Log K_{ow} = about 2.

Routes of Entry: Inhalation of vapor, ingestion, and eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: 1,2-Dichloropropane irritates the eyes, skin, and respiratory tract. It may affect the nervous system. High concentration exposure can result in lightheadedness, dizziness, and unconsciousness. Propylene dichloride may cause dermatitis and defatting of the skin. More severe irritation may occur if it is confined against the skin by clothing. Undiluted, it is moderately irritating to the eyes, but does not cause permanent injury. The vapor can irritate the nose, throat, eyes and air passages. Repeated or prolonged skin contact can cause rash.

Long-Term Exposure: Repeated exposure can cause skin drying and dermatitis. There is limited evidence that this chemical causes cancer in animals. It may cause liver cancer. In animal experiments, acute exposure to propylene dichloride produced CNS narcosis, fatty degeneration of the liver and kidneys. High or repeated exposure can damage the liver, kidneys and brain, Early symptoms include headaches, nausea, personality changes. Based on animal tests this chemical may affect reproduction and may cause malformations in the human fetus.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, and CNS. *Cancer site:* (in animals) liver and mammary gland tumors.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system. Evaluate the skin condition.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon is among the recommended protective materials for all dichloropropane isomers. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: At *any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with 1,2-dichlropropane all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,2-dichlropropane must be stored to avoid contact with aluminum, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine and fluorine); strong acids (such as hydrochloric, sulfuric and nitric); *o*-dichlorobenzene and 1,2-dichlroethane. Sources of ignition, such as smoking and open flames, are prohibited where 1,2-dichlropropane, is handled, used, or stored. Metal containers involving the transfer of five gallons or more of 1,2-dichlropropane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of 1,2-dichloropropane. Wherever 1,2-dichloropropane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1279 1,2-Dichloropropane, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include chlorine. Use dry chemical, CO_2, or foam extinguishers. Water may be ineffective, except to blanket fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: There are 4 isomers of dichloropropanols 1,3-dichloro-2-propanol (96-23-1) and "dichloropropanols" (26545-73-3) are citations in environmental regulations: $C_3H_6OCl_2$ is a colorless viscous liquid with a chloroform-like odor. Slightly soluble in water. *1,3-Dichloro-2-propanol*: Molecular weight = 128.99; specific gravity (H_2O:1) = 1.37 @ 20°C; boiling point = 174°C; vapor pressure = 1 mmHg @ 28°C; flash point = 74°C; freezing/melting point = −4°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water. *2,3-Dichloro-1-propanol*: Boiling point = 182°C. *3,3-Dichloro-1-propanol*: Boiling point = 82-83°C. *1,1-Dichloro-2-propanol*: Boiling point = 146-148°C.

Potential Exposure: It is used as a solvent for hard resins and nitrocellulose; in the manufacture of photographic chemicals and lacquer; as a cement for celluloid; and as a binder of water colors. It occurs in effluents from glycerol and halohydrin production plants.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, acid anhydrides, strong bases.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

96-23-1, *dichloro-2-propanol, 1,3-*

PAC-1: 0.33 ppm

PAC-2: 3.6 ppm

PAC-3: 5.4 ppm

DFG MAK: [skin] Carcinogen Category 2

Harmful Effects and Symptoms

Short-Term Exposure: *2,3-dichloro-1-propanol:*[52] Irritation of the eyes, skin, and mucous membranes; dyspnea, coughing, nausea, vomiting, diarrhea, abdominal pain; GI hemorrhage; toxic hepatitis; jaundice, hemolytic anemia; decreased urinary output from nephritis and renal failure; somnolence, cerebral hemorrhage; CNS depression and coma. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *1,3-dichloro-2-propanol:*[52] Irritation of skin, eyes, and respiratory system; inhalation may cause headache, vertigo, nausea, vomiting; may also cause coma and liver damage.

Long-Term Exposure: Causes cancer in animals; may be a potential human carcinogen. May cause liver, kidney, and/or lung damage.

Points of Attack: CNS, liver, kidneys, and lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Kidney function tests. Liver function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 1,3-dichloro-2-propanol all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a refrigerator under inert atmosphere away from oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2750 1,3-Dichloropropanol-2, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak

until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride, phosgene, and oxides of carbon. Use alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations (*Z; 10061-01-5*): Hazard symbol: T, N, Xi; risk phrases: R11; R20; R24/25; R36/37/38; R43; R65; R50/53; safety phrases: S1/2; S21; S36/37; S41; S45; S60; S61.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: 1,3-Dichloropropene is a colorless to straw-colored liquid. Sharp, sweet, irritating, chloroform-like odor. Molecular weight = 110.97; specific gravity (H_2O:1) = 1.21; boiling point = 107.7°C; 103°C−110°C (mixed *cis*-and *trans*-isomers); freezing/melting point = −83.8°C; vapor pressure = 29 mmHg @ 20°C; flash point = 35°C. The explosive limits are: LEL: 5.3%; UEL: 14.5%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Practically insoluble in water; solubility = 0.2%.

Potential Exposure: Used as a soil fumigant prior to planting crops, such as cotton, sugar beet, potatoes; used in combinations with dichloropropanes as a soil fumigant. Workers engaged in manufacture, formulation and application of this soil fumigant and nematocide.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. May accumulate static electrical charges, and may cause ignition of its vapors. Incompatible with strong acids; oxidizers, aluminum or magnesium compounds; aliphatic amines; alkanolamines, alkaline materials; halogens, or corrosives. *Note:* Epichlorohydrin may be added as a stabilizer.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 1 ppm/5 milligram per cubic meter TWA [skin]; Potential occupational carcinogen; limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 1 ppm/4.5 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans (2003)

PAC Ver. 29[138]

542-75-6

PAC-1: 3 ppm

PAC-2: 19 ppm

PAC-3: 120 ppm

78-88-6

PAC-1: 0.33 ppm

PAC-2: 3.6 ppm

PAC-3: 21 ppm

DFG MAK (*cis-and trans-isomers*): [skin] danger of skin sensitization; Carcinogen Carcinogen Category 2

Australia: TWA 1 ppm (5 milligram per cubic meter), [skin], carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 1 ppm (4.5 milligram per cubic meter), [skin], 1993; Denmark: TWA 1 ppm (5 milligram per cubic meter), [skin], 1999; Norway: TWA 1 ppm (5 milligram per cubic meter), 1999; Russia: STEL 5 milligram per cubic meter, 1993; Switzerland: 1 ppm (5 milligram per cubic meter), [skin], carcinogen, 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for 1,3-dichloropropene in ambient air[60] ranging from 50 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: No method listed.

Permissible Concentration in Water: (*CAS: 26952-23-8*) State Drinking Water Guidelines: Arizona 87 μg/L. (***542-75-6, 1,3-isomer***) State Drinking Water Standards: California 0.5 μg/L; State Drinking Water Guidelines: Florida 0.4 μg/L; Massachusetts 0.4 μg/L; Maine 4 μg/L; Minnesota 2 μg/L; New Hampshire 0.4 μg/L; Wisconsin 0.2 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Fish Tox = 137.01437000 ppb MATC (LOW)

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Exposure can cause headaches, chest pain; and dizziness. High levels can cause you to pass out. Contact can severely burn the eyes and skin, with permanent damage. High exposures can damage the kidneys, liver, and lungs.

Long-Term Exposure: There is evidence that 1,3-dichloropropene causes cancer in animals and humans. May damage the kidneys, liver and lungs. May cause chronic headache, and personality changes. Human Tox = 2.86885 ppb CHCL (Chronic Human Carcinogen Level) (HIGH).

Points of Attack: Eyes, skin, respiratory system, CNS, liver, and kidneys. *Cancer site:* (in animals) cancer of the bladder, liver, lung, and stomach.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: liver function tests; lung function tests, and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. NIOSH recommends: 8 hours (more than 8 hours of resistance to breakthrough $> 0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves; Viton gloves, suits; Responder suits; 4 hours (At least 4 but $<$ 8 hours of resistance to breakthrough $> 0.1\ \mu g/cm^2/min$): Teflon gloves, suits, and boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with 1,3-dichloropropene all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,3-dichloropropene must be stored to avoid contact with aluminum or magnesium compounds; substances containing fluorine, chlorine, bromine, or iodine; and alkaline or corrosive materials, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Separate outside storage is preferred. Sources of ignition, such as smoking and open flames are prohibited where 1,3-dichloropropene is handled, used, or stored. Metal containers involving the transfer of five gallons or more of 1,3-dichloropropene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers or 1,3-dichloropropene. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2047 Dichloropropene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Cancer Classification: likely to be carcinogenic to humans; IARC. Group 2b, possibly carcinogenic to humans.

California Proposition 65 Chemical, Cancer 4/6/2010

Hazard Alert: Poison, Combustible solid, Environmental hazard, Sensitization hazard (skin).

EPA Acceptable Daily Intake (ADI): 0.002 mg/kg.

Hazard Alert: Combustible, Suspected reprotoxic hazard (TRI), Possible endocrine disruptor.

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N, Xi; risk phrases: R22; R43; R50/53; safety phrases: S2; S24; S29/35; S37; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: A white crystalline solid. Odorless. Can also be commercially available as a clear to dark brown liquid with a typical solvent odor. Molecular weight = 341.19; specific gravity (H_2O:1) = 1.4; boiling point = 173−175; freezing/melting point = 39−43.8°C; vapor pressure = 2.5×10^{-2} mmHg @ 25°C; flash point = ~150°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water (forms an emulsion); solubility = 3 mg/L. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Diclofop-methyl is a chlorophenoxy; aryloxyphenoxypropionate acid selective postemergence herbicide used to control wild oats and annual grassy weeds in grain and vegetable crops: alfalfa, carrots, celery, box, field and French beans, barley, wheat, brassicas, parsnips, peas, potatoes, rapeseed (canola), soy beans, oilseed rape, onions, sugar beets and lettuce. Some uses are classified RUP.

Incompatibilities: Incompatible with oxidizers, chlorates nitrates, peroxides, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, and epichlorohydrin.

Permissible Concentration in Water: EU Drinking Water MAC: 0.006 μg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)(101): Intermedia—10.60669 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Inhalation, ingestion, and absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin, and respiratory tract, with burning sensation, pain, redness, and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse persperation, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, and risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years. May cause pulmonary edema or bronchopneumonia; symptoms may be delayed. LD_{50} (oral, rat) = >500 mg/kg.

Long-Term Exposure: Workers exposed to chlorophenoxy compounds over a 5 to 10 year period at levels above 10 milligram per cubic meter complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure, and slowed heartbeat were also found. Based on animal tests, may affects human reproduction. Human toxicity (long-term)(101): High—1.40 ppb, Health advisory

Points of Attack: Eyes, skin, lungs and respiratory system, CNS, cardiovascular system, liver, and kidney. Liver and kidney toxin; skin sensitizer.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Exam of the nervous system. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with 2,4-DP all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from strong oxidizers and bases. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically transfer material from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3345 Phenoxyacetic acid derivative pesticide, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3348 Phenoxyacetic acid derivative pesticide, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. *Note*: Commercial product may also be a liquid in a flammable carrier.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Solid material:* First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid formulations containing organic solvents: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers.

Fire Extinguishing: *Solid material: A* combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* Use dry chemical, CO_2, water spray or regular *foam. On a large fire:* Use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (CAS: 76-14-2)

Description: CFC 114 is a colorless gas with a faint, ethereal odor at high concentrations. A liquid below 3.3°C/38°F. Shipped as a liquefied compressed gas. Molecular weight = 170.92; specific gravity (H_2O:1) = 1.46 @ 20°C; boiling point = 3.8°C; freezing/melting point = −93.9°C; vapor pressure = 2014 mmHg @ 25°C; 1.9 atm. @ 70°F[77]. Explosive limits: LEL: 26,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 0.1%.

Potential Exposure: This material is used as a refrigerant and also as a propellant gas.

Incompatibilities: Keep away from welding and hot metals; decomposes, forming hydrogen chloride and hydrogen fluoride. Reacts with acids and acid fumes forming highly toxic chloride gases. Keep away from chemically active metals: sodium, potassium, calcium, powdered aluminum; zinc, and magnesium. Attacks some plastics and coatings.

Permissible Exposure Limits in Air

PAC-3: 50,000 ppm (> LEL, lower explosive limit)

DFG MAK: 1000 ppm/7100 milligram per cubic meter TWA; Peak Limitation Category II(8); Pregnancy Risk Group D

Australia: TWA 1000 ppm (7000 milligram per cubic meter), 1993; Austria: MAK 1000 ppm (7000 milligram per cubic meter), 1999; Belgium: TWA 1000 ppm (6990 milligram per cubic meter), 1993; Denmark: TWA 500 ppm (3500 milligram per cubic meter), 1999; Finland: TWA 1000 ppm (7000 milligram per cubic meter); STEL 1250 ppm (8750 milligram per cubic meter), 1999; France: VME 1000 ppm (7000 milligram per cubic meter), 1999; Hungary: TWA 100 milligram per cubic meter; STEL 200 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 7130 milligram per cubic meter, 2003; Norway: TWA 500 ppm (3500 milligram per cubic meter), 1999; the Philippines: TWA 1000 ppm (7000 milligram per cubic meter), 1993; Poland: MAC (TWA) 5000 milligram per cubic meter, MAC (STEL) 8750 milligram per cubic meter, 1999; Russia: STEL 3000 milligram per cubic meter, 1993; Switzerland: MAK-W 1000 ppm (7000 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (7000 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (7110 milligram per cubic meter); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for R-114 in ambient air[60] ranging from 70 milligram per cubic meter (North Dakota) to 115 milligram per cubic meter (Virginia) to 140 milligram per cubic meter (Connecticut) to 167 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1018.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: No method cited. Octanol-water coefficient: Log K_{ow} = 2.8. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin, and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: Dichlorotetrafluoroethane can affect you when breathed in. Irritates the eyes and upper respiratory tract. Inhalation of vapors can cause you to become dizzy and lightheaded, drowsy, and pass out. It can cause the heart to beat irregularly or stop, which can cause death. Contact with the liquid can cause frostbite, burning the eyes and skin.

Long-Term Exposure: Can irritate the lungs and cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Respiratory system and cardiovascular system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: Holter monitor (a special 24 hour EKG to look for irregular heart rhythms).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with the liquid, wear gas-proof goggles and face shield when working with the gas unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 10,000 ppm: Sa (APF = 10) (any supplied-air respirator). 15,000 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type SCBA).

Storage: Check oxygen content prior to entering storage area. Prior to working with CFC 114 all handlers should be trained on its proper handling and storage. Dichlorotetrafluoroethane must be stored to avoid contact with acids, acid fumes; chemically active metals, such as sodium, potassium, calcium, powdered aluminum; zinc and magnesium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1958. 1,2-Dichloro-1,1,2,2-tetrafluoroethane or Refrigerant gas R-114, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dichlorotetrafluoroethane is a nonflammable liquid or gas. Thermal decomposition products may include hydrogen chloride, phosgene and hydrogen fluoride. Extinguish fire using an agent suitable for type of surrounding fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any

signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration after mixing with combustible fuel. Use flue gas scrubber[22].

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xi; risk phrases: R 24/25; R26; R33; R43; R50; R62; R63; safety phrases: S1/2; S28; S29/35; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Dichlorvos is a colorless to amber liquid with a mild aromatic odor. Molecular weight = 220.98; boiling point = 140°C under 20 mmHg @ 20°C; flash point ≥ 79°C. Hazard identification (based on NFPA-704 M

Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 0.5%.

Potential Exposure: A potential danger to those involved in manufacture, formulation and application of this fumigant insecticide in household, public health and agricultural uses. Used as an insecticide and as an anthelminthic for swine and dogs.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101] Corrosive to iron, mild steel, some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 milligram per cubic meter

Conversion factor: 1 ppm = 9.04 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 milligram per cubic meter TWA [skin]

NIOSH REL: 1 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.9 milligram per cubic meter TWA measured as inhalable fraction and vapor; [skin, sensitization]; not classifiable as a human carcinogen; BEIA issued; Acetylcholinesterase inhibiting pesticides.

PAC Ver. 29[138]

62-73-7

PAC-1: 1.8 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

DFG MAK: 0.11 ppm/1 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin], Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 0.1 ppm (1 milligram per cubic meter), 1993; Australia: TWA 0.1 ppm (1 milligram per cubic meter), [skin], 1993; Austria: MAK 0.1 ppm (1 milligram per cubic meter), [skin], 1999; Belgium: TWA 01 ppm (0.9 milligram per cubic meter), [skin], 1993; Denmark: TWA 0.1 ppm (1 milligram per cubic meter), [skin], 1999; Finland: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, [skin], 1999; France: VME 0.1 ppm (1 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, [skin], 2003; India: TWA 0.1 ppm (1 milligram per cubic meter), [skin], 1993; Norway: TWA 0.1 ppm (1 milligram per cubic meter), 1999; the Philippines: TWA 1 milligram per cubic meter, [skin], 1993; Poland: MAC (TWA) 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1999; Russia: STEL 0.2 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 0.1 ppm (1 milligram per cubic meter), [skin], 1999; United Kingdom: TWA 0.1 ppm (0.92 milligram per cubic meter); STEL 0.3 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. milligram per cubic meter.

Determination in Air: Use NIOSH P&CAM Method #295 (II-5) or OSHA Analytical Method 62.

Permissible Concentration in Water: Russia set a MAC in water bodies used for domestic purposes of 1.0 mg/L and in water for fishing of zero.

Determination in Water: No tests listed. Octanol-water coefficient: Log $K_{ow} = 1.47$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Symptoms of exposure include sweating, twitching, contracted pupils; respiratory distress (tightness in the chest and wheezing); salivation (drooling); lacrimation (tearing); nausea, vomiting, abdominal cramps; diarrhea, involuntary defecation and urination; slurred speech; coma, apnea (cessation of breathing); and death. Dichlorvos is a very toxic compound with a probable lethal oral dose in humans between 50 and 500 mg/kg, or between one teaspoon and 1 oz. for a 70 kg (150 lb.) person. However, brief exposure (30−60 minutes) to vapor concentrations as high as 6.9 mg/Liter did not result in clinical signs or depressed serum cholinesterase levels. Toxic changes are typical of organophosphate insecticide poisoning with progression to respiratory distress, respiratory paralysis; and death if there is no clinical intervention[72].

Short-Term Exposure: Dichlorvos irritates the eyes and skin. Symptoms include miosis, aching eyes; rhinorrhea (discharge of thin nasal mucous); headache, chest tightness; wheezing, laryngeal spasm; salivation, cyanosis, anorexia, nausea, vomiting, diarrhea, sweating, muscle fasiculation; paralysis, giddiness, ataxia, convulsions; low blood pressure; cardiac irregular/irregularities. The substance may cause effects on the CNS. Cholinesterase inhibitor. High levels of exposure may result in death.

Long-Term Exposure: Repeated or prolonged contact with skin may cause skin sensitization and dermatitis. Cholinesterase inhibitor; cumulative effect is possible: see "Short-Term Exposure." This substance may be carcinogenic to humans; it has been shown to cause cancer of the pancreas in animals. There is limited evidence that Dichlorvos is a teratogen in animals, and may cause birth defects or damage the fetus in humans.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, CNS, and blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. NIOSH lists the following tests: blood serum; cholinesterase: whole blood (chemical/metabolite); cholinesterase: blood plasma, red blood cells/count; cholinesterase: blood serum, red blood cells/count; urine (chemical/metabolite)

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours following overexposure.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 10 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator). 25 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 50 milligram per cubic meter: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 100 milligram per cubic meter: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dichlorvos all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids; strong alkalis. Dichlorvos will attack some forms of mild iron, plastics, rubber, and coatings.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Organophosphorus compounds

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be

necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include chloride and phosgene fumes and oxides of phosphorus, nitrogen and carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Use SCBA with a full facepiece operated on pressure-demand or other positive-pressure mode. Prevent skin contact with protective clothing. Isolate area and deny entry. Fight fire from maximum distance. Dike fire control water for future disposal. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: 50% hydrolysis is obtained in pure water in 25 minutes @ 70°C and in 61.5 days @ 20°C. A buffered solution yields 50% hydrolysis (37.5°C) in 301 minutes at pH 8, 462 minutes at pH 7, 620 minutes at pH 5.4. Hydrolysis yields no toxic residues. Incineration in a furnace equipped with an afterburner and alkaline scrubber is recommended as is alkaline hydrolysis followed by soil burial[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Dicofol D:0700

Formula: $C_{14}H_9Cl_5$
Synonyms: Acarin; Benzenemethanol, 4-chloro-a(-4-chlorophenyl)-α-(trichloromethyl)-; Benzhydrol, 4,4′-dichloro-α-(trichloromethyl)-; 1,1-Bis(*p*-chlorophenyl)-2,2,2-trichloroethanol; 1,1-Bis(4-chlorophenyl)-2,2,2-trichloroethanol; 4-Chloro-α-(4-chlorophenyl)-α-(trichloromethyl) benzene methanol; CPCA; Decofol; Dichlorokelthane; Di(*p*-chlorophenyl) trichloromethyl carbinol; 4,4′-Dichloro-α-(trichloromethyl)benzhydrol; DTMC; ENT 23,648; Ethanol, 2,2,2-trichloro-1,1-bis(4-chlorophenyl)-; Fumite dicofol; FW 293; Keltane; *p,p*'-Kelthane; Kelthane; Kelthane A; Kelthanethanol; Milbol; Mitigan; NCI-C00486; 2,2,2-Trichloro-1,1-bis(*p*-chlorophenyl)ethanol; 2,2,2-Trichloro-1,1-bis(4-chlorophenyl)ethanol; 2,2,2-Trichloro-1,1-di(4-chlorophenyl)ethanol
CAS Registry Number: 115-32-2
HSDB Number: 631
RTECS Number: DC8400000
UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171
EC Number: 204-082-0 [*Annex I Index No.:* 603-044-00-4]
Regulatory Authority and Advisory Information
Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse; no evidence: rat; IARC: Human, No Adequate Data, 1983; Animal, Limited Evidence, 1983*, not classifiable as carcinogenic to humans*, Group 3, 1987.
Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Sensitization hazard, Environmental hazard.
United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Supported
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N, Xi; risk phrases: R21/22; R38; R43; R50/53; R62; R63; safety phrases: S2; S29/35; S36/37; 60; S41; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Dicofol is a white or brown waxy solid. Molecular weight = 370.48; flash point = 120°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: A potential danger to those involved in manufacture, formulation and application of this organochlorine pesticide. Used as acaricide (miticide) in agricultural and nonagricultural applications. Similar in structure to DDT.

Incompatibilities: Incompatible with alkaline pesticides, strong acids; acid fumes; aliphatic amines; isocyanates. Halogenated aliphatic compounds are moderately or very reactive. Halogenated organics generally become less reactive as more of their hydrogen atoms are replaced with halogen atoms. Halogenated aliphatics are incompatible with strong oxidizing and reducing agents. Also, they are incompatible with many amines, nitrides, azo/diazo compounds, alkali metals, and epoxides. Dicofol hydrolyzes in alkali. It is slightly corrosive to metals. Contact with steel at elevated temperatures causes formation of toxic gases[101].

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, skin absorption, and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Dicofol can be absorbed through the skin, thereby increasing exposure. It irritates the skin and the respiratory tract. Exposure can cause headache, nausea, vomiting and poor appetite. Dicofol may affect the CNS causing numbness and weakness in the hands and feet; muscle twitching; seizures, unconsciousness and death. LD_{50} = (oral-rat) ~600 mg/kg.

Long-Term Exposure: May affect the liver and kidneys. May cause personality changes with depression, anxiety, and irritability. May decrease fertility in females. Prolonged or repeated skin contact may cause dermatitis. There is limited evidence that Dicofol causes liver cancer in animals.

Points of Attack: Skin, nervous system, liver, and kidneys.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system. Dermatological examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. For liquid solutions containing Dicofol wear indirect-vent, impact and splash-resistant goggles. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dicofol all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from alkaline pesticides, strong acids; acid fumes, and steel. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2996 Organochlorine pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of carbon. If dicofol is dissolved in xylene the fumes may cause flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

UN/NA & ERG Number: (PIH) UN3018 (organophosphorus pesticides, liquid, toxic)/152

EC Number: 205-494-3 [*Annex I Index No.:* 015-073-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard. Listed for Tier 1 screening as an endocrine disruptor[88].

United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Supported

Banned or Severely Restricted (Germany and Malaysia) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R24; R28; R33; R50/53; R62; R63; safety phrases: S1/2; S28; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Dicrotophos is an amber liquid with a mild ester odor. Molecular weight = 237.22; boiling point = 400°C (Decomposes below boiling point @ 75°C after storage for 31 days); flash point ≥ 94°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this organophosphate. Used to control the coffee borer and certain economically important pests of cotton.

Incompatibilities: Attacks some metals: Corrosive to cast iron, mild steel; brass, and stainless steel l304. Decomposes after prolonged storage, but is stable when stored in glass or polyethylene containers with temperatures to 40°C. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 9.70 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.25 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.05 milligram per cubic meter TWA measured as inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI: methemoglobin in blood; 1.5% of hemoglobin, during or end-of-shift as methemoglobin inducers.

PAC Ver. 29[138]

141-66-2

PAC-1: 0.15 milligram per cubic meter
PAC-2: 0.9 milligram per cubic meter
PAC-3: 17 milligram per cubic meter

Australia: TWA 0.25 milligram per cubic meter, [skin], 1993; Belgium: TWA 0.25 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.25 milligram per cubic meter, [skin], 1999; Finland: TWA 0.25 milligram per cubic meter, 1999; France: VME 0.25 milligram per cubic meter, [skin], 1999; Switzerland: MAK-W 0.25 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.25 milligram per cubic meter, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for dicrotophos in ambient air[60] ranging from 2.5 μ/m^3 (North Dakota) to 4.0 μ/m^3 (Virginia) to 5.0 μ/m^3 (Connecticut) to 6.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Dicrotophos may affect the nervous system; causing convulsions, respiratory failure. Dicrotophos is a cholinesterase inhibitor which can penetrate the skin. Effects may be cumulative. It is extremely toxic. Probable human oral lethal dose is 5−50 mg/kg, seven drops to one teaspoonful for a 70 kg (150 lb.) person. Closely related in toxicity to azodrin. Acute exposure to dicrotophos may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, and muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath); respiratory depression; and respiratory paralysis. Psychosis may occur. The effects may be delayed.

Long-Term Exposure: Dicrotophos is a cholinesterase inhibitor; cumulative effect is possible. May damage the nervous system causing numbness, “pins and needles,” sensation and/or weakness of the hands and feet. Repeated exposure may cause personality changes of depression, anxiety or irritability.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended; effect may be delayed.

Note to Physician: 1,1′-Trimethylenebis(4-formylpyridinium bromide) dioxime (a.k.a. TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from strong oxidizers, metals, strong bases and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.3/0.4

Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200

Then: Protect persons downwind (mi/km)

Day 1.4/2.3

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. Thermal decomposition products may include oxides of phosphorus, nitrogen and carbon. Fire and runoff from fire control water may produce irritating or poisonous gases. Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dicrotophos decomposes after 7 days @ 90°C and 31 days @ 75°C. Hydrolysis is 50% complete in aqueous solutions @ 38°C after 50 days at pH 9.1 (100 days are required at pH 1.1). Alkaline hydrolysis (NaOH) yields (CH3)2NH. Incineration is also recommended as a disposal method[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EC Number: 202-980-7 [*Annex I Index No.:* 612-066-00-3]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human, No Adequate Data, 1980; Animal, Limited Evidence, 1980, *not classifiable as carcinogenic to humans*, Group 3, 1987.

Hazard Alert: Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: C, N; risk phrases: R22; R34; R50/53; R62; safety phrases: S1/2; S26; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Dicyclohexylamine is a combustible, colorless liquid with a faint amine odor. Molecular weight = 181.36; boiling point = 256°C; flash point ≥ 99°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Dicyclohexylamine salts of fatty acids and sulfuric acid have soap and detergent properties useful to the printing and textile industries. Metal complexes of DI-CHA are used as catalysts in the paint, varnish, the ink industries. Several vapor-phase corrosion inhibitors are solid DI-CHA derivatives. These compounds are slightly volatile at normal temperatures and are used to protect packaged or stored ferrous metals from atmospheric corrosion. Dicyclohexylamine is also used for a number of other purposes: plasticizers, insecticidal formulations; antioxidant in lubricating oils, fuels, and rubber; and as an extractant.

Incompatibilities: Contact with strong oxidizers can cause fire and explosion hazard.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: [skin] No numerical value established.

Russia: STEL1 milligram per cubic meter, [skin], 1993. Russia[43] set a MAC for ambient air in residential areas of 0.008 milligram per cubic meter on a momentary basis.

Permissible Concentration in Water: Russia[43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the skin and eyes; may cause burns and permanent damage. Dicyclohexylamine is somewhat more toxic that cyclohexylamine. Poisoning symptoms and death appear earlier in rabbits injected with 0.5 g/kg DI-CHA (as opposed to CHA). Doses of 0.25 g/kg are just sublethal, causing convulsions and reversible paralysis. Dicyclohexylamine is a skin irritant. LD_{50} = (oral-rat) 373 mg/kg (moderately toxic). Symptoms of exposure include severe irritation of the eyes, skin and mucous membranes. Also nausea, vomiting, weakness and irritation of the GI tract.

First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at lest 20−30 minutes. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DI-CHA all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Protection from air is recommended for long term storage.

Shipping: UN2565 Dicyclohexylamine, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are

required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

Dicyclohexylamine Nitrite D:0730

Formula: $C_{12}H_{24}N_2O_2$: C_6H_{11}-NH-$C_6H_{11}HNO_2$

Synonyms: Dechan; Diana; Dichan; Di-Chan; Dicynit; Dicyclohexylaminonitrite; Dicyclohexylammonium nitrite; Dodecahydrophenylamine nitrite; Leukorrosin C

CAS Registry Number: 3129-91-7

HSDB Number: 4018

RTECS Number: HY4200000

UN/NA & ERG Number: UN2687/133

EC Number: 221-515-9 [*Annex I Index No.:* 007-009-00-9]

Regulatory Authority and Advisory Information

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases R20/22; safety phrases: S2; S15; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Dicyclohexylamine nitrite is a flammable white powder which has some volatility at room temperature and higher. Molecular weight = 228.38; freezing/melting point = 181°C; flash point = 185°C. Partly soluble in water.

Potential Exposure: It is used as a vapor-phase corrosion inhibitor whereby it vaporizes either from the solid state or from solution, and offers protection against atmospheric rusting. Wrapping paper, plastic wraps; and other materials may be impregnated with dichan to protect metal parts during packaging and storage.

Incompatibilities: Highly flammable and a strong oxidizer. Contact with reducing materials (nitrides, hydrides, sulfides, etc.) or easily oxidized materials may cause fire and explosion hazard.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: No numerical value established. Data may be available.

Russia[43] set a MAC of 0.5 milligram per cubic meter in work-place air and a MAC in ambient air in residential areas of 0.02 milligram per cubic meter.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.01 mg/L.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: LD_{50} = (oral-rat) 284 mg/kg (moderately toxic). It decreases blood pressure.

Long-Term Exposure: Prolonged exposure to dicyclohexylamine nitrite vapor is reported to lead to changes in the CNS, erythrocytes, and methemoglobinemia; and to disturb the functional state of the liver and kidneys of human workers.

Points of Attack: Blood, liver, and kidneys.

Medical Surveillance: Blood pressure. CBC. Liver and kidney function tests.

First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode.

Storage: Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage Store in a refrigerator under an inert atmosphere for long-term storage.

Shipping: UN2687 Dicyclohexylammonium nitrite, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with water to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Thermal decomposition products may include nitrogen oxides and nitrous acid. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Poison, Sensitization hazard, Corrosive (tissue), Water reactive.

Canada: WHMIS Classification D1A; D2B; on DSL list.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, Xi; risk phrases: R22; R24; R34; R41; R43; safety phrases: S1/2; S24; S26; S37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *N,N′*-Dicyclohexylcarbodiimide (DCC) is a white crystalline solid. Odor is sweet and heavy. Molecular Weight = 206.37; boiling Point = 122°C−124°C@ 6.0 mmHg; freezing/melting Point = 34°C−35°C; flash Point = 112.8°C; Hazard identification (based on NFPA-704 M Rating System): Health 3; Flammability 1; Reactivity 1₩. Insoluble in water; water reactive.

Potential Exposure: Laboratory reagent.

Incompatibilities: Dust may for explosive mixture with air. Reacts with steam and water. *N,N′*-Dicyclohexylcarbodiimide is an amine/imide: contact with strong oxidizers may cause fire and explosions. Incompatible with acids, strong bases, strong reducing agents (may form flammable gasses); azo and diazo compounds (may form toxic gases); chlorinated hydrocarbons; nitro compounds. Contact with mixture of acetic acid + dinitrogen trioxide may cause explosion. The combustion of amide compounds generate nitrogen oxides (NOx). In the presence of moisture, may attack metals and plastics.

Permissible Exposure Limits in Air:

PAC Ver. 29[138]

PAC-1: 0.12 milligram per cubic meter

PAC-2: 1.3 milligram per cubic meter

PAC-3: 8 milligram per cubic meter

Determination in Air: No NIOSH or OSHA method available.

Permissible Concentration in Water: No data available.

Determination in Water: Data not available.

Routes of Entry: Ingestion, inhalation, or absorbed through the skin. Causes burns by all exposure routes.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Highly toxic by inhalation. Severe overexposure can result in death. Harmful if inhaled, swallowed, or absorbed through skin. May cause allergic skin reaction and allergic reaction to the respiratory tract. Depending on the intensity and duration of exposure, this chemical can cause severe destruction of tissues of the mucous membranes and upper respiratory tract. Causes burns to any internal or external area of contact. Symptoms of exposure to this compound may include severe skin and eye irritation, irritation of the mucous membranes and upper respiratory tract; burning feeling, laryngitis; coughing and wheezing, shortness of breath, headache, nausea, and vomiting. Inhalation of this chemical can be fatal, resulting from inflammation, bronchial pneumonia, edema of the larynx, bronchi, and pulmonary tract. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. LD_{50} = (oral-rat) 400 mg/kg.

Long-Term Exposure: The chronic properties of this material have not been fully investigated. May cause skin and respiratory allergies. Repeated exposure to a highly toxic material may result in general deterioration of health and possible organ damage.

Points of Attack: Skin and respiratory tract.

Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin or respiratory tract allergy.

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Maintain eye wash fountain and quick-drench facilities in work area. Unless full facepiece respiratory protection is worn, wear splash-proof protective eyeglasses or chemical safety goggles as described in OSHA regulations 29CFR1910.133 or European Standard EN166. Wear Tyvek-type disposable protective clothing or other impervious protective clothing, gloves, lab coat, apron or coveralls, as appropriate, to prevent skin contact. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow the regulations in OSHA 29CFR1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149-approved respirator; or an approved half face respirrator equipped with an organic vapor/acid gas cartridge (specific for organic vapors, HCl, acid gas and SO2) with a dust/mist filter. Splash proof safety goggles should be worn while handling this chemical. Alternatively, a full face respirator, equipped as above, may be used to provide simultaneous eye and respiratory protection. For emergencies or instances where the exposure levels are not known, use a full-face positive-pressure, air-supplied respirator. WARNING: Air-purifying respirators do not protect workers in oxygen-deficient atmospheres.

Storage: (1) Color code-Blue: Health Hazard/Toxics/ Poisons: Store in a secure poison location. (2) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Keep DCC in a tightly closed container in a cool, dry, ventilated area away from sources of incompatible materials, heat, direct sunlight, moisture, or ignition; best stored under an inert atmosphere at refrigerated temperatures. Containers of DCC may be hazardous when empty since they retain product residues (dust, solids); observe all warnings and precautions listed for the product. Shelf life when stored under ideal conditions: >4 years.

Shipping: UN2928 Toxic solids, corrosive, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Wear appropriate PPE. Remove all sources of ignition. Ventilate area of leak or spill. *Small spills and leakage*: Should a spill occur while you are handling this chemical*, remove all sources of ignition*. Clean up spills in a manner that does not disperse dust into the air. Reduce airborne dust and prevent scattering by moisteningthe solid spill material with 60%−70% ethanol and using nonsparking tools and equipment, transfer the dampened material to a suitable container. Use absorbent paper dampened with 60%−70% ethanol to pick up any remaining material. Seal the absorbent paper, and any of your clothes, which may be contaminated, in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60%−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the Safety Officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. In the event of a fire, wear full protective clothing and use a NIOSH/MSHA or European Standard EN 149-approved SCBA with full facepiece operated in the pressure demand or other positive-pressure mode. Burning may produce carbon monoxide, carbon dioxide, nitrogen oxides. Fires involving this material can be controlled with a dry chemical, carbon dioxide or Halon extinguisher.

Disposal Method Suggested: Whatever cannot be saved for recovery or recycling should be managed in an appropriate and approved waste facility. Although not a listed RCRA hazardous waste, this material may exhibit one or more characteristics of a hazardous waste and require appropriate analysis to determine specific disposal requirements. Processing, use or contamination of this product may change the waste management options. State and local disposal regulations may differ from federal disposal regulations. Dispose of container and unused contents in accordance with federal, state and local requirements.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Cyclopentadiene is a crystalline solid or a liquid (above 32°C) with a disagreeable, camphor-like odor. The Odor Threshold is 0.011 (detectable); 0.020 ppm (recognizable). Molecular weight = 132.22; boiling point = (decomposes) 167−172.2°C; freezing/melting point = 33°C; vapor pressure = 1.4 mmHg @ 20°C; 10 mmHg @ 48°C; flash point = 32°C; Autoignition temperature = 503°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 1. Explosive limits: LEL: 0.8%; UEL: 6.3%. Practically insoluble in water; solubility = 0.02%.

Potential Exposure: This compound is used in the manufacture of cyclopentadiene as a pesticide intermediate; in the production of ferrocene compounds; in paints, varnishes, and resin manufacture; in production of elastomers, resin systems, and polymers.

Incompatibilities: Forms explosive mixture with air above flash point. Depolymerizes at boiling point and forms two molecules of cyclopentadiene; unless inhibited and maintained under inert atmosphere to prevent polymerization. Violent reaction with strong oxidizers; strong acids; strong bases. Can accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.41 milligram per cubic meter @ 25°C & 1 atm

The Odor Threshold is 0.011 (detectable); 0.020 ppm (recognizable).

OSHA PEL: None

NIOSH REL: 5 ppm/30 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/27 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.01}_{\mathbf{A}}$ ppm

PAC-2: **5_A** ppm
PAC-3: **75_A** ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
DFG MAK: 0.5 ppm/2.7 milligram per cubic meter TWA; Peak Limitation Category II(1); Pregnancy Risk Group D
Australia: TWA 5 ppm (30 milligram per cubic meter), 1993; Austria: MAK 0.5 ppm (3 milligram per cubic meter), 1999; Belgium: TWA 5 ppm (27 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (30 milligram per cubic meter), 1999; Finland: TWA 5 ppm (30 milligram per cubic meter); STEL 10 ppm (54 milligram per cubic meter) [skin] 1999; France: VME 5 ppm (30 milligram per cubic meter), 1999; Norway: TWA 5 ppm (30 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 3 milligram per cubic meter, 2003; Switzerland: MAK-W 0.5 ppm (3 milligram per cubic meter), KZG-W 1 ppm (6 milligram per cubic meter), 1999; United Kingdom: TWA 5 ppm (27 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 5 ppm. Several states have set guidelines or standards for dicyclopentadiene in ambient air[60] ranging from 0.3 milligram per cubic meter (North Dakota) to 0.5 milligram per cubic meter (Virginia) to 0.6 milligram per cubic meter (Connecticut) to 0.714 milligram per cubic meter (Nevada).

Determination in Air: See OSHA Analytical Method PV-2098.

Routes of Entry: Inhalation, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Dicyclopentadiene irritates the skin and eyes. Human subjects reported an Odor Threshold at 0.003 ppm, slight eye or throat irritation @ 1−5 ppm. May cause headache; loss of balance and coordination; and even convulsions. Increased urinary frequency have been reported in exposed workers.

Long-Term Exposure: May affect the liver, kidneys, nervous system; and gastro-intestinal tract. May cause lung irritation with possible cough and shortness of breath. Animal experiments produced leukocytosis and kidney lesions.

Points of Attack: Eyes, skin, respiratory system, CNS, and kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung and kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles when working with powders or dusts and splash-proof goggles when working with liquids unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 5 ppm; Use an NIOSH/MSHA or European Standard EN 149-approved respirator with a combination cartridge offering protection against organic vapors as well as against dust, fume, and mist. More protection is provided by a full facepiece respirator than by a half mask respirator, and even greater protection is provided by a PAPR. If while wearing a filter, cartridge or canister respirator, you can smell, taste, or otherwise detect dicyclopentadiene, or in the case of a full facepiece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing materials, strong acids; and strong bases. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN2048 Dicyclopentadiene must carry a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3.

Spill Handling: *Powders and dusts:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid:* Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Dieldrin D:0750

Formula: $C_{12}H_8Cl_6O$

Synonyms: Alvit; Compound 497; Dieldrex; Dieldrina (Spanish); Dieldrine (French); Dieldrite; 2,7: 3,6-Dimethanonaphtha(2,3b)oxirene,3,4,5,6,9,9-hexachloro-1a,2,2a,3,6,6a, 7,7a-octahydro-(1a a,2.b,2a.a,3b,6.b,6aa,7b,7aa); ENT 16,225; HEOD; 1,2,3,4,10,10-Hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-endo,exo-5,8-di-methanonaphthalene; Hexachloroepoxyoctahydro-endoexo-dimethanonaphthalene; 3,4,5,6,9,9-Hexachloro-1a,2,2a,3,6,6a,7, 7a-octahydro-2,7: 3,6-dimethano; 3,4,5,6,9,9-Hexachloro-1a, 2, 2a, 3, 6, 6a, 7, 7a-octahydro-2,7:3,6-dimethanonaphth (2,3-b)oxirene; (1r,4s,4as, 5r,6r,7s,8s,8ar)1,2,3,4,10,10-Hexachloro-1,4,4a,5,6,7,8,8a-octahydro-6,7-epoxy-1,4:5,8-dimethanonaphthalene; Illoxol; Killgerm dethlac insecticidal laquer; NCI-C00124; Octalox; Oxralox; Panoram; Panoram D-31; Quintox

CAS Registry Number: 60-57-1

HSDB Number: 322

RTECS Number: IO1750000

UN/NA & ERG Number: UN2761 (Organochlorine pesticides, solid toxic)/151

EC Number: 200-484-5 [*Annex I Index No.:* 602-049-00-9]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human, Inadequate Data, 1974; Animal, Limited Evidence, 1974, *not classifiable as carcinogenic to humans*, Group 3, 1987; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies; NCI: Carcinogenesis Bioassay (feed); equivocal evidence: mouse, no evidence: rat, 1978; NIOSH: Potential occupational carcinogen, See *NIOSH Pocket Guide*, Appendix A. United States Environmental Protection Agency Gene-Tox Program, Positive: V79 cell culture-gene mutation; Negative: Rodent dominant lethal; Host-mediated assay; Negative: Histidine reversion-Ames test; *S. cerevisiae-homozygosis*; Inconclusive: *D. melanogaster* sex-linked lethal.

California Proposition 65 Chemical[102]: Cancer 7/1/1988.

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Persistent Organic Pollutants (UN), Environmental hazard.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/1992); Toxic Pollutant (Section 401.15)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P037

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.017; Nonwastewater (mg/kg), 0.13

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8080 (0.05); 8270 (10)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Mexico, Drinking Water Criteria, 0.0000007 mg/L

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)]

List of Stockholm Convention POPs: Annex A (Elimination).

Regulations: Hazard symbol: T+, N; risk phrases: R25; R27; R40; R48/25; R50/53; R62; R63; safety phrases: S1/2; S21; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Dieldrin is a colorless to light tan solid with a mild chemical odor. The Odor Threshold in water is 0.04 mg/L. Molecular weight = 380.90; boiling point = (decomposes); freezing/melting point = 176.1°C; vapor pressure = 8×10^{-7} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.02%.

Potential Exposure: Aldrin belongs to the group of cyclodiene insecticides. They are a subgroup of the chlorinated cyclic hydrocarbon insecticides which include DDT, BHC, etc. They were manufactured in the United States by Shell Chemical Co. until the United States Environmental Protection Agency prohibited their manufacture in 1974 under the Federal Insecticide, Fungicide, and Rodenticide Act. The primary use of the chemicals in the past was for control of corn pests, although they were also used by the citrus industry.

Dieldrin's persistence in the environment is due to its extremely low volatility (i.e., a vapor pressure of 1.78×10^{-7} mmHg @ 20°C), and low solubility in water (186 μg/L @ 25°C−29°C). In addition, dieldrin is extremely apolar, resulting in a high affinity for fat which accounts for its retention in animal fats, plant waxes; and other such organic matter in the environment. The fat solubility of dieldrin results in the progressive accumulation in the food chain which may result in a concentration in an organism which would exceed the lethal limit for a consumer.

Incompatibilities: Incompatible with strong acids: concentrated mineral acids; acid catalysts; phenols, strong oxidizers, active metals; like sodium, potassium, magnesium, and zinc. Keep away from copper, iron, and their salts.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 milligram per cubic meter

OSHA PEL: 0.25 milligram per cubic meter TWA[skin]

NIOSH REL: 0.25 milligram per cubic meter TWA[skin]; Potential occupational carcinogen; limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.25 milligram per cubic meter TWA measured as inhalable fraction and vapor [skin]; confirmed animal carcinogen with unknown relevance to humans

PAC Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 6.8 milligram per cubic meter

PAC-3: 450 milligram per cubic meter

DFG MAK: 0.25 milligram per cubic meter, measured as the, inhalable fraction; [skin] Peak Limitation Category II (8)

Australia: TWA 0.25 milligram per cubic meter, [skin], 1993; Austria: MAK 0.25 milligram per cubic meter, [skin], 1999; Belgium: TWA 0.25 milligram per cubic meter, [skin], 1993; Denmark 0.25 milligram per cubic meter, [skin], 1999; Finland: TWA 0.25 milligram per cubic meter; STEL 0.75 milligram per cubic meter, [skin], carcinogen, 1999; France: VME 0.25 milligram per cubic meter, [skin], continuous carcinogen, 1999; India: TWA 0.25 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 0.25 milligram per cubic meter, [skin], 2003; Norway: TWA 0.25 milligram per cubic meter, 1999; the Philippines: TWA 0.25 milligram per cubic meter, [skin], 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, 1999; Russia: STEL 0.01 milligram per cubic meter, 1993; Switzerland: MAK-W 0.25 milligram per cubic meter, [skin], 1999; Thailand: TWA 0.25 milligram per cubic meter, 1993; Turkey: TWA 0.25 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.25 milligram per cubic meter; STEL 0.75 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for dieldrin in ambient air[60] ranging from 0.035 μ/m^3 (Pennsylvania) to 0.595 μ/m^3 (Kansas) to 2.5 μ/m^3 (North Dakota) to 4.0 μ/m^3 (Virginia) to 5.0 μ/m^3 (Connecticut) to 6.0 μ/m^3 (Nevada).

Determination in Air: Filter; Isooctane; Gas chromatography/Electrochemical detection; NIOSH II(3), Method #S283.

Permissible Concentration in Water: Federal Drinking Water Guidelines: 0.02 ppb[93]. State Drinking Water

Standards: Illinois 1 μg/L; State Drinking Water Guidelines: Arizona 0.001 μg/L State Drinking Water Guidelines: Arizona 0.63 μg/L; Florida 0.002 μg/L; California 0.002 μg/L; Connecticut 0.03 μg/L; Maine 0.02 μg/L; Minnesota 0.2 μg/L; New Hampshire 0.002 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625).

Permissible Concentration in Water: Octanol-water coefficient: Log $K_{ow} = > 6$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Routes of Entry: Inhalation, skin absorption, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

During the past decade, considerable information has been generated concerning the toxicity and potential carcinogenicity of the two organochlorine pesticides, aldrin and dieldrin. These two pesticides are usually considered together since Aldrin is readily epoxidized to dieldrin in the environment. Both are acutely toxic to most forms of life including arthropods, mollusks, invertebrates, amphibians, reptiles, fish, birds and mammals. Dieldrin is extremely persistent in the environment. By means of bioaccumulation it is concentrated many times as it moves up the food chain.

Short-Term Exposure: *Inhalation:* May cause nausea, drowsiness, loss of appetite; visual disturbances and insomnia. Sprays of 1%−2½% have caused giddiness, headache, muscle twitching; convulsions and loss of consciousness. *Skin:* Can be absorbed to cause or increase the severity of symptoms as listed under ingestion. Contact may cause skin rash. *Eyes:* May cause irritation, redness, and affect vision. *Ingestion:* Can cause headache, nausea, irritability, insomnia, high blood pressure; vision problems; loss of coordination; profuse sweating, dizziness, frothing at the mouth; convulsions and loss of consciousness. Death may occur from as little as 1/20 ounce (1.4 gram). Some symptoms may be delayed up to 12 hours. Exposure to dieldrin may affect the CNS; resulting in convulsions.

Long-Term Exposure: May cause liver damage. Dieldrin accumulates in the human body. Dieldrin has caused cancer in laboratory animals. It is considered a suspect occupational carcinogen. May damage the developing fetus. May reduce fertility in males and females. Dieldrin concentrates in breast milk, and therefore, may be transferred to breast feeding infants. Repeated higher exposure can cause tremors, muscle twitching and seizures (convulsions), and may lead to coma and death. Convulsions are somewhat delayed and may occur weeks or months following exposure. Repeated exposure may cause personality changes of depression, anxiety or irritability.

Points of Attack: CNS, liver, kidneys, and skin. *Cancer site* (in animals): lung, liver, thyroid, and adrenal gland tumors.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Blood dieldrin level. Examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. EEG. Blood dieldrin levels (Normal = less than 1 mg/100 ml; level should not exceed 15 mg/100 ml). Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 12 hours after overexposure.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: At *any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:

Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dieldrin all handlers should be trained on its proper handling and storage. Dieldrin must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); strong acids (such as hydrochloric, sulfuric and nitric); chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dieldrin is a noncombustible solid. Commercial solutions may contain flammable or combustible liquids. Use dry chemical, carbon dioxide, water spray, alcohol, or polymer foam extinguishers. Thermal decomposition products may include hydrogen chloride and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 second minimum for primary combustion; 1760°C, 1.0 second for secondary combustion) with adequate scrubbing and ash disposal facilities[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

CHEMISTRY/TOXICOLOGY

Sittig's Handbook of
Toxic and Hazardous Chemicals and Carcinogens
Volume 1: A – D
SEVENTH EDITION

The definitive reference on hazardous chemical substances.
Comprehensive and convenient, *Sittig's Handbook* focuses on the most important hazardous chemicals in commercial use.

- The chemicals are presented alphabetically and classified as a carcinogen, hazardous substance, hazardous waste, or toxic pollutant.
- Find the chemical you are looking for quickly and reliably: entries have a full range of synonyms for each chemical, including trade names and CAS index.
- Relevant data for the United States and EU included throughout, along with the essential chemical hazard information applicable worldwide.
- The seventh edition includes more than 100 new chemical records.
- The trusted source of reliable information depended on by first-line responders (emergency services), industry, logistics companies, scientists, and environmental protection organizations.

For over 30 years, *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* has proven to be a reliable, accessible must-have reference work on hazardous materials. This updated and revised 7th edition is the most quickly accessible and comprehensive listing of the hazardous chemicals that are commonly used, transported, and regulated for use in the environment and the workplace. Information is the most vital resource anyone can have when dealing with potential hazardous substance accidents, spillages, fires, or acts of terror. It is also essential for the safe day-to-day operation of chemical processes and environmental protection. Sittig's handbook provides extensive data for over 2200 chemicals in a uniform format, enabling fast and accurate decisions in almost any situation. This new edition contains expanded and reviewed information for each chemical listed (including chemicals classified as WMDs) and has been updated to keep pace with world events, standards, and regulations.

Richard P. Pohanish is the author or co-author of 25 books and database product in the fields of hazardous material, environmental health, chemical safety, and engineering. Active in the publishing and information business for more than half a century, Mr. Pohanish, now retired, formerly held various executive positions with Van Nostrand Reinhold, including President, Information Division. His numerous published works include *Sittig's Handbook of Pesticides and Agricultural Chemicals*, 2nd Edition.

NOTICE TO BE READ BY ALL USERS OF THIS PUBLICATION

Great care has been taken in the preparation of this work and, to the best knowledge of the Publisher and the Editors, the information contained herein is factual and accurate and the opinions expressed are those of qualified experts. The data are not to be taken as a warranty or representation for which the Publisher or Editors assumes legal responsibility. Furthermore, the Publisher does not assume any responsibility or liability for the accuracy or completeness of, or consequences from, such information. Data are offered in this work are solely for your consideration, investigation, and verification. Mention of trade names or commercial products in the work does not constitute endorsement or recommendation for use by the Publisher or Editors.

This reference work is intended to provide information about chemical hazards and guidelines for those trained in the use and storage of hazardous materials, as well as those trained to respond to spills, leaks, and accidents involving those materials. The work is not intended as a primary source of research information. As with any reference, it cannot include all information or discuss all situations that might occur. It cannot be assumed that all necessary warnings and precautionary measures are contained in this work; other, or additional, information or assessments may be required. Most of all, it cannot replace the expertise, and experience of trained professionals or qualified responders.

As information may not be available for some chemicals, an absence of data does not necessarily mean that a substance is not hazardous. For major incidents, it will be necessary to obtain additional detailed information from other resources as well as more expertise from those with extensive training. Neither the Publisher nor the Editors assume any liability or responsibility for completeness or accuracy of the information presented or any damages of any kind alleged to result in connection with, or arising from, the use of this work.

Final determination of the suitability of any information for use contemplated by any user of this work, and the manner of that use, is the sole responsibility of the user. Any use of these data and information must be determined by the user to be in accordance with applicable federal, state, territory, and local laws, and regulations. The Publisher and Editors recommend that anyone intending to use any toxic, hazardous chemical, and/or carcinogenic material mentioned in this work, should satisfy themselves as to such suitability, and that the user can meet all applicable safety and health standards. The Publisher and the Editors strongly encourage all readers, and users of chemicals, to adhere to and follow the manufacturers' or suppliers' current instructions, technical bulletins, and material safety data sheets for specific use, handling, protection (including the use of personal protective equipment and eye protection), and storage of all chemical materials. The Publisher and Editors also strongly recommend that users obtain expert advice before implementing procedures involving any hazardous chemicals, materials, or carcinogens.

Contents

Preface

For more than 35 years *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* has continued to serve an ever-widening audience of users. It has been proven to be among the most easy-to-use and essential reference works on hazardous materials. The 7th edition has been updated and expanded, once again, to keep pace with world events and to respond to the ever-expanding need for reliable information on chemicals used in the workplace and the tool shed.

Most users of this work understand the potential dangers of chemicals. Hazardous and toxic substances pose a wide range of health hazards, including irritation, sensitization, and carcinogenicity. Chemicals can possess physical properties of flammability, explosion and corrosion. Many chemicals can harm the environment by poisoning aquatic and plant life.

The chemical industry and its many component businesses are forced to strike a delicate balance because the same properties that make a chemical substance highly useful can also make it extremely harmful. We are told by some industrialists that toxic chemicals are present in nature and that industrial contributions are just the price we have to pay for progress. There is little argument about the chemical industry's critical place in the nation's economy. The United States is the number one chemical producer in the world, generating more than $550 billion a year and employing more than 5 million people. So, somewhere in between lies the truth—or at least an area in which we can function. Information is vital in a world where virtually every aspect of our lives is touched by chemical hazards.

Each year, in the United States, over 2 billion tons of hazardous and toxic chemicals are manufactured. Including imports, more than 3 billion tons are transported employing 800,000 shipments each day. It is estimated that 1.3 billion tons are moved by truck and hundreds of billions of pounds of these hazardous materials are transported through populated areas. The average American household generates approximately 15 pounds of hazardous waste per year. Nearly five million poisonings occur in the United States annually, resulting in thousands of deaths. Based on 2004 TRI data (publically released April 2006), over 4 billion pounds of toxic chemicals are released into the nation's environment each year, including 72 million pounds of recognized carcinogens from nearly 24,000 industrial facilities.

Chemical accidents and spills can range from small to large and can occur anywhere chemicals are manufactured, transported, stored or used. Today's media headlines constantly point out both the information gaps and the need for constantly updated information. On January 9, 2014, for example, an estimated 10,000 gallons[CDC,NTP] of chemicals used to process coal spilled from a damaged 45,000 gallon storage tank into the Elk River in the US state of West Virginia. As the news of the spill developed, it became clear to the public (and many experts) that federal and state officials had sparse data about the health risks of the two potentially toxic organic solvents involved in the spill: primarily crude 4-methylcyclohexanemethanol and a minor component of mixed glycol ethers consisting of glycol phenyl ether and dipropylene glycol phenyl ether. The latter mixture of chemicals was not reported by the manufacturer to the public until 12 days after the initial spill. The unfortunate truth is that the Elk River is a municipal water source that serves approximately 300,000 people in and around Charleston, the state capitol. For weeks following the spill, residents were instructed not to drink or bathe with local tap water.

The problem of toxic chemicals in the United States; and, indeed, in all the world frightens many people. Over the years, these fears are heightened by news stories such as the huge accidental plant fire in Saudi Arabia that killed at least 12 people and injured another dozen (April 2016); the huge explosion at a vinyl chloride plant in Coatzacoalcos, Mexico—A few days later (also April 2016) that killed 24 workers and injured 136; the worst environmental disaster in Vietnam history caused by a chemical spill of cyanide, phenols and iron hydroxide which poisoned tons of marine life and killed people along 120 miles of coastline and stretching some 20 nautical miles out to sea (June 2016); the chemical plant explosion and subsequent spill of highly flammable liquids in Guizhou Province, China (February 2012) that killed more than 20 people and forced the evacuation of almost 30,000. Whether the chemical involves an aluminum dust explosion (Huntington, IN, 2003), a fertilizer explosion in West Texas (April 2013) leads in the water supply (Flint, MI, 2016), the massive Deepwater Horizon oil spill (Gulf of Mexico, 2010), or older problems—Bhopal, India, Love Canal, New York, the disastrous Valley of the (100,000) Drums (Kentucky), the Valley of Death in Brazil, and the like−these incidents generate emotional responses, often from people uninformed about science or technology and confirm the charge of critics that chemicals are "accidents waiting to happen."

In 2001, the 4th Edition of *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* was published shortly before the tragic events of the morning of September 11. The decade that followed brought many changes to life in the civilized world. The United States government, for example, established the Department of Homeland Security and enacted laws such as the *Chemical Facilities Security Act of 2003.* These actions were prompted by concerns involving infrastructure protection and the anticipation of another attack, possibly on the nation's chemical and energy facilities or by using trucks

or tank cars that transport highly dangerous and possibly lethal chemicals. "These facilities are found around the country in industrial parks, in seaports, and near the major population centers. Dangerous chemicals routinely travel along our highways, inland waterways, and on railcars that pass through the heart of major cities including Washington, D.C., just a short distance from Capitol Hill. Terrorist attacks on the US chemical industry have the potential to kill tens of thousands of Americans and seriously injure many more. In many instances, these attacks hold the potential for having a cascading effect across other infrastructures, particularly in the energy and transportation sectors. This is both because of the damage that can be caused by the attack, and the enormous expense and effort associated with the clean-up to an affected area in its aftermath."[83] To put it more simply, using the same low tech/high concept approach that turned passenger planes into missiles, terrorists do not need to produce or amass chemical weapons or smuggle them into the United States in order to produce great damage.

"Commercial chemical incidents occur tens of thousands of times each year, often with devastating and exorbitantly expensive consequences. They are indiscriminate in their effects. Workers, companies, the public, emergency response organizations, and all levels of government pay the figurative and literal price. Yet, until now and with few exceptions, chemical incidents have been invisible. Perhaps it is due to their pervasiveness, or to the common tendency to overlook what is taken for granted."[84] This quote is from the highly publicized *600K Report* prepared by the Chemical Safety and Hazard Investigation Board (CSB), an independent, nonpartisan, quasi-legislative US government agency. The CSB described our nation's lack of definitive knowledge of the "big picture" surrounding chemical incidents as "... the industrial equivalent of two 737 airplanes "crashing" year after year, killing all passengers (256 people) without anyone seeming to notice."[84]

Almost 40 years ago, the United States Government Accounting Office (GAO) estimated that 62,000 chemicals were in commercial use. Today, that number has grown to beyond 82,000.

Given the reality of problems inherent to chemical hazards, including accidents and spills, the advent of new threats to our way of life, and the challenges of communicating complex data, it is the goal of this work to provide data so that responsible decisions can be made by all who may have contact with chemicals covered in this reference work. With this in mind the work can be used by those in the following chemical fields and related professions:

Applied research and product development
Attorneys
Campus safety and health
Certified chemical hygiene officer (CCHO)
Chemical engineering
Chemical health and safety
Chemical informatics and information management
Chemicals manufacturers and distributors
Chemical technology
Certified hazardous materials manager (CHMM)
Certified health physicist (CHP)
Certified industrial hygienist (CIH)
Certified safety professional (CSP)
Dyes, pigments and inks
Emergency response personnel
Environmental protection and management
Forensic chemistry
Formulation chemistry
Hazardous waste management
Industrial management
Laboratory management
Loss control management
Pesticide distributors
Process chemistry
Process safety
Project management
Public information and outreach
Public health
Quality control and assurance
Regulatory affairs
Researchers
Science policy
Technical communications
Technical support
Toxicology
Water chemistry

The chemicals chosen for inclusion are officially recognized substances, many identified as carcinogens, as belonging to some designated category of hazardous or toxic materials; with numerically defined safe limits in air in the workplace, ambient air, water; in waste effluents. For the most part these are materials of commerce that can be heavily used and may be transported in bulk.

The 7th edition contains more chemicals and data for each material. In keeping with the broad changes initiated with the fourth edition, contents of the 7th edition are focused on the concept of "regulated chemicals." The carcinogen potential of each chemical was compared to listings and reports from eminent authorities as the International Agency for Research on Cancer (IARC), the US National Toxicology Program (NTP) and the US Environmental Protection Agency.

The "Regulatory Authority and Advisory Bodies" section contains new items including, where available, EPA Gene-Tox Program findings, and many of the individual listings now contain useful advice sought after by the regulated community. As a result, the new volume should be even

more practical for those users of specific chemicals, and to those concerned with both adherence to, and enforcement of, regulations.

Data is furnished, to the extent currently available, in a uniform multisection uniform format to make it easy for users who must find information quickly and/or compare the data contained within records, in any or all of these important categories:

Chemical Name and Record Number
Chemical Formula
Synonyms (including trade names)
Code Numbers (including CAS Registry, HSDB, RTECS, UN/NA & ERG, EC)
Regulatory Authority and Advisory Information (summary)
Description (including physical properties, explosion and fire data and water reaction and solubility)
Potential Exposure
Incompatibilities
Permissible Exposure Limits in Air
Determination in Air
Permissible Concentration in Water
Determination in Water
Routes of Entry
Short-Term Exposure
Long-Term Exposure
Points of Attack
Medical Surveillance
First Aid
Decontamination (selected records)
Personal Protective Methods
Respirator Selection
Storage
Shipping
Spill Handling
Fire Extinguishing
Disposal Method Suggested
References

A Brief history of this work

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens was first published more than 35 years ago. This work continues to provide first responders and occupational and environmental health and safety professionals with an accessible and portable reference source. Based on a count of CAS numbers, the seventh edition of this handbook contains data on almost 2600 toxic and hazardous chemicals (up from nearly 600 in the first edition, nearly 800 in the second edition, nearly 1300 in the third edition, and nearly 1500 in the fourth edition, and 2200 in the sixth edition).

According to the United State Library of Congress, the history of the project is as follows: 1st edition published in 1981; 2nd edition published in 1985; 3rd edition published in 1991; 4th edition published in 2001; 5th edition November 2007; 6th edition 2012, 7th edition: 2017.

Acknowledgments

The compilation of this 7th edition could not have been realized without the contributions of many of the researchers, scientists, contract employees and institutions that developed the excellent documents and databases that provided so much of the essential data that appear in this work. A full list of these contributors is impossible to compile. Nevertheless, In no particular order, I wish to acknowledge the those associated with US Environmental Protection Agency (EPA); United States Department of Labor; Occupational Safety and Health Administration (OSHA); Department of Health and Human Services; National Institute for Occupational Safety and Health (NIOSH); US Department of Energy (DOE); Agency for Toxic Substances and Disease Registry (ATSDR); American Conference of Governmental Industrial Hygienists (ACGIH); Deutsche Forschungsgemeinschaft (DFG); Centers for Disease Control and Prevention (CDC); NOAA; United States National Library of Medicine (NLM) National Institutes of Health (NIH); Hazardous Substance Data Bank (HSDB) and (TOXNET); US Department of Health and Human Services, Public Health Service, National Toxicology Program (NTP); Federal Emergency Management Agency (FEMA); US Department of Transportation (DOT); US Coast Guard (USCG); National Fire Protection Association (NFPA); International Agency for Research on Cancer; (IARC); New Jersey Department of Health and Senior Services; Chemical Safety and Hazard Investigation Board (CSB); United Nations Environment Programme; the states of New York and New Jersey, and many other government organizations, organizations and companies. It is nearly impossible to express the extent of my gratitude to all of them for their contributions to my research.

Although every effort has been made to produce an accurate and highly useful handbook, the editors and Publisher appreciates the need-for constant improvement. Any comments, corrections, or advice from users of this book are welcomed by the author who asks that all correspondence be submitted in writing and mailed directly to the publisher who will maintain a file for reprints and future editions.

How to Use This Book

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens focuses on critical data for more than 2600 commercially important, regulated and hazardous, to one degree or another, substances. A large number of these chemicals are known or suspected potentially dangerous carcinogens. Many are found in the workplace and fewer are found in the medical and research fields. Some are found in home basements and worksheds. For the most part, importance is defined by inclusion in official, regulatory, and advisory listings. Much of this information, found in US government sources, has been supplemented by a careful search of many publications and databases.

This handbook is becoming more encyclopedic in nature. When one looks at many, if not most published works in this field, the user simply expects to find numerical data. Here, we have tried, wherever possible, to provide useful descriptive material and references which hopefully opens the door to additional of published materials.

Nevertheless, this is not a seminal research work and it is recommended that this book be used as a guide. This work is not meant to be a substitute for workplace hazard communication programs required by regulatory bodies such as OSHA, and/or any other United States or international government agencies. If data are required for legal purposes, the original source documents [such as Code of Federal Regulations (CFR)], appropriate Federal and State agencies, which are often referenced, should be consulted.

In the pages which follow, the following categories of information will be presented, for each chemical record, discussed with reference to scope, sources, nomenclature employed, and the like. Omission of a category generally indicates a lack of available information.

Chemical name: Each record is arranged alphabetically by a chemical name. These are names used by regulatory and advisory bodies. In very few cases the name may be a popularly-used product name or trade name. The chemical name section of each chemical record is backed-up with the "Synonyms" section and Appendix 5, "Synonym and Trade Name-Cross Index."

Formula: Generally, this has been limited to a commonly used one-line empirical or atomic formula. In the *Molecular Formula* field, the Hill system has been used showing number of carbons (if present), number of hydrogens (if present), followed by alphabetically listed element (s). Multiple carbon−carbon (double and triple) bonds have been displayed where appropriate.

Synonyms: This section contains scientific, product, trade, and other synonym names that are commonly used for each hazardous substance. Some of these names are registered trade names. Some are provided in other major languages other than English, including Spanish, French, and German. In some cases, "trivial" and nicknames (such as MEK for methyl ethyl ketone) have been included because they are commonly used in general communications, especially in the workplace. This section is important because the various "regulatory" lists published by federal, state, international agencies and advisory bodies do not always use the same name for a given hazardous substance. Every attempt has been made to ensure the accuracy of the synonyms and trade names found in this work, but errors of highly complex names are inevitable in compilations of this magnitude. Please note that this work may not include the names of all products currently found in commerce, particularly mixtures that may contain ingredients that are regulated chemicals.

The synonym index contains all synonym names listed in alphabetical order. It should be noted that organic chemical prefixes and interpolations such as (α-) alpha-, (β-) beta-, (γ-) gamma-, (δ-) delta-, (o-) ortho-, (m-) meta-; (p-) para-; sec- (secondary-), trans-, cis-, (n-) normal-, and numbers (1-; 1,2-), etc. are not used when searching for a chemical name. In other words, these prefixes are not treated as part of the chemical name for the purposes of alphabetization. Users should use the substance name without the prefix. For example, to locate *n*-butane, search for butane; to locate 3,3′-dichlorobenzidine; search for dichlorobenzidine; and to locate *α*-cyanotoluene or *alpha*-cyanotoluene, search for cyanotoluene. *Note*: All product names, company names, trademarks, and brands are the registered property of their respective owners. All company, product and service names used in this work are for identification purposes only. Use of these names, logos, and brands does not imply endorsement by the Author, Editors or the Publisher.

CAS Registry Number: The Chemical Abstracts Service (CAS) number is a unique identifier assigned to each chemical registered with the CAS of the American Chemical Society. This number is used to identify chemicals on the basis of their molecular structure. CAS numbers, in the format "nnn-nn-n" [two or more numeric characters (dash) two numeric characters (dash) followed by a single numeric check digit]. CAS numbers should always be used in conjunction with substance names to insure positive identification and to avoid confusion with like-sounding names, i.e., benzene (71-43-2) and benzine (8032-32-4). This 7th edition contains some alternate CAS numbers that may now be considered related, retired, obsolete and/or widely and incorrectly used in the literature. In this section, the first CAS number(s), before the abbreviation "alt." for the word "alternate," is considered (based on several sources) to be the correct CAS number(s). Ultimately, it is the responsibility of the user to find and use the correct number. *Note*: CAS Registry Number is a Registered Trademark of the American Chemical Society.

HSDB Number: HSDB is a toxicology data file on the National Library of Medicine's (NLM's) Toxicology Data Network (TOXNET). HSDB is organized into individual chemical records, and contains over 5000 such records. HSDB is a database focused primarily on the toxicology of potentially hazardous chemicals. The information in HSDB has been assessed by a Scientific Review Panel. Using your computer browser and entering a search such as "HSDB (followed by the Number)" should take you to the exact record you are seeking.

RTECS Number: RTECS (Registry of Toxic Effects of Chemical Substances) is a compendium of data extracted from the open scientific literature. The data are recorded in the format developed by the RTECS staff at NIOSH and arranged in alphabetical order by prime chemical name.[NIOSH] The RTECS numbers are unique identifiers assigned NIOSH. The RTECS number in the format "AAnnnnnnn" (two alphabetic characters followed by seven numeric characters) may be useful for online searching for additional toxicologic information on specific substances. It can, for example, be used to provide access to the MEDLARS computerized literature retrieval services of the NLM in Washington, DC. The RTECS number and the CAS number can serve to narrow down online searches. The RTECS Database is currently available from a growing list of "value-added" vendors that are listed on the Internet from NIOSH or CDC. In the US 1-800-232-4636; Outside the US 1-513-533-8328 or by Email: cdcinfo@cdc.gov.

UN/NA & ERG Number: United Nations-North America numbers are four-digit numbers that identify an individual chemical or group of hazardous substances, chemicals or articles (such as explosives, corrosive substances, pesticides, grenades, etc.) with similar characteristics. These four-digit numbers are normally preceded by UN or NA (e.g., UN1759-NA1759). UN/NA numbers are required to appear on shipping documents, and are often displayed on warning labels, the exterior of packages, and on specified containers such as truck or railway placards. These ID (identification) numbers may also be called NA (North American) numbers or DOT (Department of Transportation) numbers.[cameo] UN numbers are assigned by the United Nations Committee of Experts on the Transport of Dangerous Goods. Identification numbers containing a UN prefix (United Nations numbers) are authorized for use with all international shipments of hazardous materials. NA numbers are assigned by the United States DOT and usually correspond closely, but not always precisely, to the UN listing. The "NA" prefix is used for shipments between Canada and the United States *only*, and may *not* be used for other international shipments. Some chemicals without an assigned UN number may have an NA number. These latter NA numbers are usually in the format and range of NA8000−NA9999. Use of these ID numbers for hazardous materials will (1) serve to verify descriptions of chemicals; (2) provide for rapid identification of materials when it might be inappropriate or confusing to require the display of lengthy chemical names on vehicles; (3) aid in speeding communication of information on materials from accident scenes and in the receipt of more accurate emergency response information; and (4) provide a means for quick access to immediate emergency response information in the *North American Emergency Response Guidebook* (ERG) and also in the international publication, *Recommendations on the Transport of Dangerous Goods*, also known as the *Orange Book*.

EC Number: The European Commission number is a seven digit identification code used in countries of the European Union (EU) for commercially available chemical substances within the EU. This number is an identification number (ID) from *European Inventory of Existing Commercial Chemical Substances*, published by the European Environment Agency, Copenhagen, Denmark. The EC number supercedes the outmoded EINECS, ELINCS and NLP numbers. This section also includes "Annex I, Index Number" for the Export and Import of Dangerous Chemicals found in Annex I of Regulation (EC) No. 689/2008.

Regulatory Authority and Advisory Bodies:
This section contains a listing of major regulatory and advisories for the chemical of concern, including, but not limited to, Homeland Security, OSHA, US EPA, DFG (Germany), US DOT, ACGIH, IARC, NTP, WHMIS (Canada) and the EC, etc. Many law or regulatory references in this work have been abbreviated. For example, Title 40 of the CFR, Part 261, subpart 32 has been abbreviated as 40CFR261.32. The symbol "§" may be used as well to designate a "section" or "part."

- United States Department of Homeland Security. Includes "chemicals of interest" from The Chemical Facility Anti-Terrorism Standards (CFATS Act of 2014) program and the *Federal Register*, Appendix A, including all provisions of 6 CFR Part 27, including § 27.210(a)(1)(i). In developing the list, the DHS looked to existing expert sources of information including other federal regulations related to chemicals, including the following: chemicals covered under the United States Environmental Protection Agency's Risk Management Program. Chemicals included in the Chemical Weapons Convention. Hazardous materials, such as gases that are poisonous by inhalation. Explosives regulated by the DOT. The Department of Homeland Security has identified three security issues related to chemicals: *Release*—Toxic, flammable, or explosive chemicals or materials that, if released from a facility, have the potential for significant adverse consequences for human life or health. *Theft or Diversion*—Chemicals or materials that, if stolen or diverted, have the potential to be misused as weapons or easily converted into weapons using chemical

manipulation and techniques and related equipment with the intent of creating significant adverse consequences for human life or health. *Sabotage or Contamination*—Chemicals or materials that, if mixed with other and possibly readily available materials, have the potential to create significant adverse consequences for human life or health. Also considered were these security issues as well as to determine their potential future inclusion in the final version of Appendix A, and/or coverage under *Chemical Facility Anti-Terrorism Standards: Critical to Government Mission*—Chemicals or facilities the loss of which could create significant adverse consequences for national security or the ability of the government to deliver essential services, and *Critical to National Economy*—Chemicals or facilities the loss of which could create significant adverse consequences for the national or regional economy.

- Carcinogenicity: lists known and suspected human carcinogens, the agency making such a determination, the nature of the carcinogenicity. The following lists and agencies were consulted: *US Department of Health and Human Services 13th Report on Carcinogens (10/2/2014)*. United States Environmental Protection Agency: US EPA's general categories recognized by the 2005 guidelines are as follows: *Group A*: Carcinogenic to Humans: Agents with adequate human data to demonstrate the causal association of the agent with human cancer (typically epidemiologic data). *Group B*: Probably Carcinogenic to Humans: Agents with sufficient evidence (i.e., indicative of a causal relationship) from animal bioassay data, but either limited human evidence (i.e., indicative of a possible causal relationship, but not exclusive of alternative explanations; Group B1), or with little or no human data (Group B2). *Group C*: Possibly Carcinogenic to Humans: Agents with limited animal evidence and little or no human data. *Group D*: Not Classifiable as to Human Carcinogenicity: Agents without adequate data either to support or refute human carcinogenicity. *Group E*: Evidence of Noncarcinogenicity for Humans: Agents that show no evidence for carcinogenicity in at least two adequate animal tests in different species or in both adequate epidemiologic and animal studies.[USEPA] US Department of Health and Human Services *13th Report on Carcinogens (RoC)*, (2014), a science-based document prepared by the National Toxicology Program (NTP) that identifies chemical, biological, and physical agents that are considered cancer hazards for people living in the United States. IARC (International Agency for Research on Cancer),[12] are classified as to their carcinogenic risk to humans by IARC as follows: Group 1: Human Carcinogen; Group 2A: Probable Human Carcinogen; Group 2B: Possible Human Carcinogen.
- Chemicals on California's Proposition 65 List, revised as of September 30, 2016. Officially known as the Safe Drinking Water and Toxic Enforcement Act of 1986. The proposition requires that the Governor protect the state's drinking water sources from being contaminated with chemicals known to cause cancer, birth defects or other reproductive harm, and to revise and republish at least once per year a list of such chemicals. It also requires businesses to inform Californians about exposures to chemicals on the revised list[OEHHA].
- This 7th edition contains a brief summary labeled "Hazard Alert". The purpose of this section is to quickly notify users of specific dangers related to each chemicals of interest. Following is a *sample* of warnings appearing in this section: Asphyxiation hazard • Combustible liquid • Contains gas under pressure • may explode if heated • Endocrine disruptors (high/medium/low, where available) • Dangerous nerve agent • Extremely flammable gas • Flammable liquid • Frostbite/Cryogenic burn hazard • Poison inhalation hazard: exposure can be lethal • Polymerization hazard (high) • Polymerization hazard $>$ 30°C • Possible risk of forming tumors • Primary irritant (w/o allergic reaction) • Sensitization hazard (skin, respiratory) • Suspected of causing genetic defects • Suspected reprotoxic hazard • Environmental hazard, etc. *Warning*: This section is merely a guide and does not purport to be complete for every chemical covered in this work.
- A banned or severely restricted product as designated by the United Nations[13] or by the US EPA Office of Pesticide Programs under FIFRA (Federal Insecticide, Fungicide and Rodenticide Act).[14]
- A substance with an air pollutant standard set or recommended by OSHA and/or NIOSH,[58] ACGIH,[1] DFG.[3] The OSHA limits are the enforceable pre-1989 PELs. The transitional limits that were vacated by court order have not been included. However, the vacated limits are used and enforced by some states. Some airborne limits, for example, such as those from NIOSH and ACGIH are recommendations that do not carry the force of law.
- A substance whose allowable concentrations in workplace air are adopted or proposed by the American Conference of Government Industrial Hygienists

(ACGIH),[1] DFG [Deutsche Forschungsgemeinschaft (German Research Society)].[3] Substances whose allowable concentrations in air and other safety considerations have been considered by OSHA and NIOSH.[2] Substances which have limits set in workplace air, in residential air, in water for domestic purposes or in water for fishery purposes as set forth by the former USSRUNEP/IRPTC Project.[43]

- Substances that are specifically regulated by OSHA under 29CFR1910.1001 to 29CFR1910.1050
- Highly hazardous chemicals, toxics, and reactives regulated by OSHA's "*Process Safety Management of Highly Hazardous Chemicals*" under 29CFR1910.119, Appendix A. Substances that are Hazardous Air Pollutants (Title I, Part A, § 112) as amended under 42USC7412. This list provided for regulating at least 189 specific substances using technology-based standards that employ Maximum Achievable Control Technology (MACT) standards; and, possibly health-based standards if required at a later time. § 112 of the Clean Air Act (CAA) requires emission control by the EPA on a source-by-source basis. Therefore, the emission of substances on this list does not necessarily mean that a firm is subject to regulation.
- Regulated Toxic Substances and Threshold Quantities for Accidental Release Prevention. These appear as Accidental Release Prevention/Flammable Substances, Clean Air Act (CAA) §112(r), Table 3, TQ (threshold quantity) in pounds and kilograms under 40 CFR68.130. The accidental release prevention regulations applies to stationary sources that have present more than a threshold quantity of a CAA § 112(r) regulated substance.
- Clean Air Act (CAA) Public Law 101−549, Title VI, *Protection of Stratospheric Ozone*, Subpart A, Appendix A, class I and Appendix B, Class II, Controlled Substances, (CFCs) Ozone depleting substances under 40CFR82.
- Clean Water Act (CWA) Priority toxic water pollutants defined by the US Environmental Protection Agency for 65 pollutants and classes of pollutants which yielded 129 specific substances.[6]
- Chemicals designated by EPA as "Hazardous Substances"[4] under the Clean Water Act (CWA) 40CFR116.4, Table 116.4A.
- Clean Water Act (CWA) § 311 Hazardous Materials Discharge Reportable Quantities (RQs). This regulation establishes reportable quantities for substances designated as hazardous (see §116.4, above) and sets forth requirements for notification in the event of discharges into navigable waters. Source: 40 CFR117.3, amended at 60FR30937.
- Clean Water Act (CWA) § 307 List of Toxic Pollutants. Source: 40CFR401.15.
- Clean Water Act (CWA) § 307 Priority Pollutant List. This list was developed from the List of Toxic Pollutants classes discussed above and includes substances with known toxic effects on human and aquatic life, and those known to be, or suspected of being, carcinogens, mutagens, or teratogens. Source: 40CFR423, Appendix A.
- Clean Water Act, § 313 Water Priority Chemicals. Source: 57FR41331.
- RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic with Regulatory levels in mg/L. Source: 40CFR261.24.
- RCRA Hazardous Constituents. Source: 40CFR261, Appendix VIII. Substances listed have been shown, in scientific studies, to have carcinogenic, mutagenic, teratogenic or toxic effects on humans and other life forms. This list also contains RCRA waste codes. The words, "waste number not listed" appears when a RCRA number is NOT provided in Appendix VIII.

Characteristic Hazardous Wastes

Ignitability	A nonaqueous solution containing less than 24% alcohol by volume and having a closed cup flash point below 60°C/140°F using Pensky−Martens tester or equivalent An ignitable compressed gas A nonliquid capable of burning vigorously when ignited or causes fire by friction, moisture absorption, spontaneous chemical changes at standard pressure and temperature An oxidizer. See §261.21
Corrosivity	Liquids with a pH equal to or less than 2 or equal to or more than 12.5 or which corrode steel at a rate greater than 6.35 mm (0.25 in.) per year @ 55°C/130°F. See §261.22
Reactivity	Unstable substances that undergo violent changes without detonating Reacts violently with water or other substances to create toxic gases Forms potentially explosive mixtures with air. See §261.23
Toxicity	A waste that leaches specified amounts of metals, pesticides, or organic chemicals using Toxicity Characteristic Leaching Procedure (TCLP). See §261, Appendix II, and §268, Appendix I. **Listed Hazardous Wastes**

"F" wastes	Hazardous wastes from nonspecific sources §261.31
"K" Wastes	Hazardous wastes from specific sources §261.32
"U" Wastes	Hazardous wastes from discarded commercial products, off-specification species, container residues §261.34. Covers some 455 compounds and their salts and some isomers of these compounds
"P" Wastes	Acutely hazardous wastes from discarded commercial products, off-specification species, container residues §261.33. Covers some 203 compounds and their salts plus soluble cyanide salts

Note: If a waste is not found on any of these lists, it may be found on state hazardous waste lists.

RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic. Source: 40CFR261.24, Table I. These are listed with regulatory level in mg/L and "D" waste numbers representing the broad waste classes of ignitability, corrosivity, and reactivity.

EPA Hazardous Waste code(s), or RCRA number, appears in its own field. Acute hazardous wastes from commercial chemical products are identified with the prefix "P." Nonacutely hazardous wastes from commercial chemical products are identified with the prefix "U."

RCRA Universal Treatment Standards. Lists hazardous wastes that are banned from land disposal unless treated to meet standards established by the regulations. Treatment standard levels for wastewater (reported in mg/L) and nonwastewater [reported in mg/kg or mg/L TCLP (Toxicity Characteristic Leachability Procedure)] have been provided. Source: 40CFR268.48 and revision, 61FR15654.

RCRA Ground Water Monitoring List. Sets standards for owners and operators of hazardous waste treatment, storage, and disposal facilities, and contains test methods suggested by the EPA (see Report SW-846) followed by the Practical Quantitation Limit (PQL) shown in parentheses. The regulation applies only to the listed chemical; and, although both the test methods and PQL are provided, they are *advisory only*. Source: 40CFR264, Appendix IX.

Safe Drinking Water Act (SDWA) Maximum Contaminant Level Goals (MCLG) for Organic Contaminants. Source: 40CFR141 and 40CFR141.50, amended 57FR31776.

- Maximum Contaminant Levels (MCL) for Organic Contaminants. Source: 40CFR141.61.
- Maximum Contaminant Level Goals (MCLG) for Inorganic Contaminants. Source: 40CFR141.51.
- MCL for Inorganic Contaminants. Source: 40CFR141.62.
- MCL for Inorganic Chemicals. The MCL for arsenic applies only to community water systems. Compliance with the MCL for arsenic is calculated pursuant to §141.23. Source: 40CFR141.11.
- Secondary Maximum Contaminant Levels (SMCL). Federal advisory standards for the states concerning substances that effect physical characteristics (i.e., smell, taste, color, etc.) of public drinking water systems. Source: 40CFR143.3.
- CERCLA Hazardous Substances ("RQ" Chemicals). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*.
- Releases of CERCLA hazardous substances in quantities equal to or greater than their reportable quantity (RQ), are subject to reporting to the National response Center under CERCLA. Such releases are also subject to state and local reporting under §304 of SARA Title III (EPCRA). CERCLA hazardous substances, and their reportable quantities, are listed in 40CFR302, Table 302.4. RQs are shown in pounds and kilograms for chemicals that are CERCLA hazardous substances. For metals listed under CERCLA (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, thallium, and zinc), no reporting of releases of the solid is required if the diameter of the pieces of solid metal released is 100 μm (0.004 in.) or greater. The RQs shown apply to smaller particles.
- EPCRA §302 Extremely Hazardous Substances (EHS). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*. The presence of Extremely Hazardous Substances in quantities in excess of the Threshold Planning Quantity (TPQ), requires certain emergency planning activities to be conducted. The Extremely Hazardous Substances and their TPQs are listed in 40CFR355, Appendices A and B. For chemicals that are solids, there may be two TPQs given (e.g., 500/10,000). In these cases, the lower quantity applies for solids in powder form with particle size less than 100 μm; or, if the substance is in solution or in molten form. Otherwise, the higher quantity (10,000 pounds in the example) TPQ applies.
- EPCRA §304 Reportable Quantities (RQ). In the event of a release or spill exceeding the reportable quantity, facilities are required to notify State Emergency Response Commissions (SERCs) and Local Emergency Planning Committees (LEPCs). From Consolidated List of Chemicals Subject to the

Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*.

- EPCRA § 313 Toxic Chemicals. From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*. Chemicals on this list are reportable under §313 and §6607 of the Pollution Prevention Act. Some chemicals are reportable by category under §313. Category codes needed for reporting are provided for the EPCRA§313 categories. Information and Federal Register references have been provided where a chemical is subject to an administrative stay, and not reportable until further notice.
- From "*Toxic Chemical Release Inventory Reporting Form R and Instructions, Revised 2005 Version*," EPA document 260-B-06-001 was used for *de minimis* concentrations, toxic chemical categories.
- Chemicals which EPA has made the subject of Chemical Hazard Information Profiles or "CHIPS" review documents.
- Chemicals which NIOSH has made the subject of "Information Profile" review documents on "Current Intelligence Bulletins."
- Carcinogens identified by the National Toxicology Program of the US Department of Health and Human Services at Research Triangle Park, NC.[10]
- Substances regulated by EPA[7] under the major environmental laws: Clean Air Act, Clean Water Act, Safe Drinking Water Act, RCRA, CERCLA, EPCRA, etc. A more detailed list appears above. Substances with environmental standards set by some international bodies including those in Europe and Canada.[43]
- Hazard Symbols, Risk Phrases, and Safety Phrases. Explanation of these symbols and phrases can be found in Appendix 4. In the year 2018 it is expected that the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) will be phased in by many countries. Hazard statements are an essential element under the GHS, and will eventually replace the risk phrases (R-phrases) described earlier in the paragraph. In addition to hazard statements, containers and Material Safety Data Sheets (MSDS) will often contain, where necessary, one or multiple pictograms, a signal word such as "Warning" or "Danger," and precautionary statements. The precautionary statements will indicate proper handling procedures aimed at protecting the user and other people who might come in contact with the substance during an accident or in the environment. The container and MSDS will also contain the name of the supplier, manufacturer, or importer. Each hazard statement contains a four-digit code, starting with the letter H (in the format Hxxx). Statements appear under various headings grouped together by code number. The purpose of the four-digit code is for reference only; however, following the code is exact *phrase* as it should appear on labels and MSDS. The collection of Risk and Safety phrases in this work my go beyond those found in some, more generalized Material Safety Data Sheets. It is also possible that some of the warnings are based on animal rather than human studies. These statements are usually preceded by the word "suspected" or "potential".
- Water hazard classifications from the German Federal Water Management Act on Water Hazard Classification, *Verwaltungsvorschrift Wassergefährdende Stoffe* (VwVwS). This law requires all chemical substances be evaluated for their detrimental impact on the physical, chemical, or biological characteristics of water. Substances can be classified as nonhazardous to water (*nwg, nicht wassergefährdende*) or assigned to one of three numeric water hazard classes, WGK-1: low hazard to waters (low polluting to water), WGK-2: hazard to waters (water pollutant), or WGK: 3 severe hazard to waters (severe pollutant). The English acronym for WGK is WHC (water hazard class). This work uses the German initial-acronym "WGK" so there is no confusion as to its source. Material Safety Data Sheets (MSDS) that use these water hazards also use the German acronym. If a value was not assigned or not found in the German database, an estimated has been provided using the format, "*WGK (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]*." These estimates are based on other sources, for example, the US DOT *List of Marine Pollutants (§172.101—Appendix B). Warning*: These estimates are to be used only as a guide. In the case of limited information, it is the responsibility of the users of this work to recognize and address those limitations and to engage in additional research, including direct contact with chemical suppliers and all forms of supplier communications such as the legally required Material Safety Data Sheets (MSDSs), Technical Bulletins, etc.

Description: This section contains a quick summary of properties of the substance including physical state (solid, liquid or gas), color, odor description, molecular weight, density, boiling point, freezing/melting point, vapor

pressure, flash point, autoignition temperature, explosion limits in air, Hazard Identification (based on NFPA-704 M Rating System) in the format: Health (ranked 1 to 4), Flammability (ranked 1 to 4), Reactivity (ranked 1 to 4) (see also below for a detailed explanation of the System and Fire Diamond), and solubility or miscibility in water. This section may also contain special and relevant comments about the substance. Terms in this section are also defined in the glossary.

Odor threshold: This is the lowest concentration in air that most humans can detect by smell. Some value ranges are reported. The value cannot be relied on to prevent overexposure, because human sensitivity to odors varies over wide limits, some chemicals cannot be smelled at toxic concentrations, odors can be masked by other odors, and some compounds rapidly deaden the sense of smell.

Molecular weight: The MW as calculated from the molecular formula using standard elemental molecular weights (e.g. carbon = 12.1).

Boiling point at 1 atm: The value is the temperature of a liquid when its vapor pressure is 1 atm. For example, when water is heated to 100°C/212°F its vapor pressure rises to 1 atm and the liquid boils. The boiling point at 1 atm indicates whether a liquid will boil and become a gas at any particular temperature and sea-level atmospheric pressure.

Melting/Freezing point: The melting/freezing point is the temperature at which a solid changes to liquid or a liquid changes to a solid. For example, liquid water changes to solid ice at 0°C/32°F. Some liquids solidify very slowly even when cooled below their melting/freezing point. When liquids are not pure (e.g., salt water) their melting/freezing points are lowered slightly.

Flash point: This is defined as the lowest temperature at which vapors above a volatile combustible substance will ignite in air when exposed to a flame. Depending on the test method used, the values given may be either Tag Closed Cup (cc) (ASTM D56) or Cleveland Open Cup (oc) (ASTM D93). The values, along with those in *Flammable Limits in Air* and *Autoignition temperature* below, give an indication of the relative flammability of the chemical. In general, the open cup value is slightly higher (perhaps 10 to 15°F higher) than the closed cup value. The flash points of flammable gases are often far below 0° (F or C) and these values are of little practical value, so the term "flammable gas" is often used instead of the flash point value.

Autoignition Temperature: This is the minimum temperature at which the material will ignite without a spark or flame being present. Values given are only approximate and may change substantially with changes in geometry, gas, or vapor concentrations, presence of catalysts, or other factors.

Flammable Limits in Air: The percent concentration in air (by volume) is given for the LEL (lower explosive-flammable limit in air, % by volume) and UEL (upper explosive flammable limit in air, % by volume), at room temperature, unless other specified. The values, along with those in "Flash point" and "Autoignition temperature" give an indication of the relative flammability of the chemical.

NFPA Hazard Classifications: The NFPA 704 Hazard Ratings (Classifications) are based on those found in "*Fire Protection Guide to Hazardous Materials*," 2001 edition, National Fire Protection Association, Quincy, MA, ©1994. The classifications are defined in Table 1.

Table 1. *Explanation of NFPA Hazard Classifications*

Classification	*Definition*
HEALTH HAZARD (blue)	
4	Materials which on very short exposure could cause death or major residual injury (even though prompt medical treatment was given), including those that are too dangerous to be approached without specialized protective equipment
3	Materials which on short exposure could cause serious temporary or residual injury (even though prompt medical treatment was given), including those requiring protection from all bodily contact
2	Materials that, on intense or continued (but not chronic) exposure, could cause temporary incapacitation or possible residual injury, including those requiring the use of protective clothing that has an independent air supply
1	Materials which on exposure would cause irritation but only minor residual injury, including those requiring the use of an approved air-purifying respirator
0	Materials that, on exposure under fire conditions offer no hazard beyond that of ordinary combustible material
FLAMMABILITY (red)	
Classification number and Definition	
4	This degree includes flammable gases, pyrophoric liquids, and Class IA flammable liquids. Materials which will rapidly or completely vaporize at atmospheric pressure and normal ambient temperature, or which are readily dispersed in air and which will burn readily
3	Includes Class IB and IC flammable liquids and materials that can be easily ignited under almost all normal temperature conditions
2	Materials that must be moderately heated before ignition will occur and includes Class II and Class IIIA combustible liquids and solids and semisolids that readily give off ignitable vapors
1	Materials that must be preheated before ignition will occur, such as Class IIIB combustible liquids, and solids and semisolids whose flash point exceeds 200°F/93.4°C, as well as most ordinary combustible materials
0	Materials that will not burn

REACTIVITY (yellow)

4 Materials that, in themselves, are readily capable of detonation, explosive decomposition or explosive reaction at normal temperatures and pressures

3 Materials that, in themselves, are capable of detonation, or explosive reaction, but require a strong initiating source or heating under confinement. This includes materials that are sensitive to thermal and mechanical shock at elevated temperatures and pressures and materials that react explosively with water

2 Materials that are normally unstable and readily undergo violent chemical change, but are not capable of detonation. This includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures. This also includes materials that may react violently with water or that may form potentially explosive mixtures in water

1 Materials that are normally stable, but that may become unstable at elevated temperatures and pressures and materials that will react with water with some release of energy, but not violently

0 Materials that are normally stable, even under fire exposure conditions, and that do not react with water

OTHER (white)

₩ Materials which react so violently with water that a possible hazard results when they come in contact with water, as in a fire situation. Similar to Reactivity Classification 2. Oxy—Oxidizing material; any solid or liquid that readily yields oxygen or other oxidizing gas, or that readily reacts to oxidize combustible materials

It should be noted that OSHA and DOT have differing definitions for the term "flammable liquid" and "combustible liquid." DOT defines a flammable liquid as one which, under specified procedures, has a flash point of 140°F/60°C or less. A combustible liquid is defined as "having a flash point above 140°F/60°C and below 200°F/93°C." OSHA defines a combustible liquid as having a flash point above 100°F/37.7°C.

Detection: Only those materials having specific or specialized testing materials have this section. For example, the chemical Abrin or Ricin can be detected using BTA (BioThreat Alert) test strips.

History of the material: This section is reserved for those materials having a useful and interesting background. Some of these materials may be, for example, invasive botanicals that may be found in populated areas Dangerous to both people and pets, these invasive plants may have to be professionally removed to prevent both spreading and accidental poisonings.

Potential Exposure: A brief indication is given of the nature of exposure to each compound in the industrial environment. Where pertinent, some indications are given of background concentration and occurrence from other than industrial discharges such as water purification plants. Obviously in a work of this magnitude, this coverage must be very brief. It is of course recognized that nonoccupational exposures may be important as well.

Incompatibilities: Important, potentially hazardous incompatibilities of each substance are listed where available. Where a hazard with water exists, it is described. Reactivity with other materials are described including structural materials such as metal, wood, plastics, cement, and glass. The nature of the hazard, such as severe corrosion formation of a flammable gas, is described. This list is by no means complete or all inclusive. In some cases a very small quantity of material can act as a catalyst and produce violent reactions such as polymerization, disassociation and condensation. Some chemicals can undergo rapid polymerization to form sticky, resinous materials, with the liberation of much heat. The containers may explode. For these chemicals the conditions under which the reaction can occur are given.

Permissible Exposure Limits in Air: The permissible exposure limit (PEL), has been cited as the federal standard where one exists. Inasmuch as OSHA has made the decision to enforce only pre-1989 PELs, we decided to use these values rather than the transitional limits that were vacated by court order. Except where otherwise noted, the PELs are 8-hour work-shift time-weighted average (TWA) levels. Ceiling limits, Short-Term Exposure Limits (STEL), and TWAs that are averaged over other than full workshifts are noted.

The Short-Term Exposure Limit (STEL) values are derived from NIOSH,[58] ACGIH,[1] and HSE[33] publications. This value is the maximal concentration to which workers can be exposed for a period up to 15 minutes continuously without suffering from: irritation; chronic or irreversible tissue change; or narcosis of sufficient degree to increase accident proneness, impair self-rescue, or materially reduce work efficiency, provided that no more than four excursions per day are permitted, with at least 60 minutes between exposure periods, and provided that the daily TWA also is not exceeded. The "Immediately Dangerous to Life or Health" (IDLH) concentration represents a maximum level from which one could escape within 30 minutes without any impairing symptoms or any irreversible health effects. However, the 30-minute period is meant to represent a MARGIN OF SAFETY and is NOT meant to imply that any person should stay in the work environments any longer than necessary. In fact, every effort should be made to exit immediately. The concentrations are reported in either parts per million (ppm) or milligrams per cubic meter (mg/m^3).

Most US specifications on permissible exposure limits in air have come from ACGIH[1] or NIOSH.[2] In the In

Germany the DFG has established Maximum Concentrations in the workplace.[3] This section also contains numerical values for allowable limits of various materials in ambient air[60] as assembled by the US EPA. Where available, this field contains legally enforceable airborne Permissible Exposure Limits (PELs) from OSHA. It also contains recommended airborne exposure limits from NIOSH, ACGIH, and international sources and special warnings when a chemical substance is a Special Health Hazard Substance. Each are described below. TLVs have not been developed as legal standards and the ACGIH does not advocate their use as such. The TLV is defined as the time-weighted average (TWA) concentration for a normal 8-hour work-day and a 40-hour work-week, to which nearly all workers may be repeatedly exposed, day after day, without adverse effects. A ceiling value (TLV-C) is the concentration that should not be exceeded during any part of the working exposure. If instantaneous monitoring is not feasible, then the TLV-C can be assessed by sampling over a 15-minute period except for those substances that may cause immediate irritation when exposures are short. As some people become ill after exposure to concentrations lower than the exposure limits, this value cannot be used to define exactly what is a "safe" or "dangerous" concentration. ACGIH threshold limit values (TLVs) are reprinted with permission of the American Conference of Governmental Industrial Hygienists, Inc., from the booklet entitled, *Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices*. This booklet is revised on an annual basis. No entry appears when the chemical is a mixture; it is possible to calculate the TLV for a mixture only when the TLV for each component of the mixture is known and the composition of the mixture by weight is also known. According to ACGIH, "Documentation of the Threshold Limit Values and Biological Exposure Indices, 7th Edition" is necessary to fully interpret and implement the TLVs.

OSHA Permissible Exposure Limits (PELs), are found in Tables Z-1, Z-2, and Z-3 of OSHA, "General Industry Air Contaminants Standard (29CFR1910.1000)" that were effective on July 1, 2001 and which are currently enforced by OSHA.

Unless otherwise noted, PELs are the Time-Weighted Average (TWA) concentrations that must not be exceeded during any 8-hour shift of a 40-hour work-week. An OSHA ceiling concentration must not be exceeded during any part of the work-day; if instantaneous monitoring is not feasible, the ceiling must be assessed as a 15-minute TWA exposure. In addition there are a number of substances from Table Z-2 that have PEL ceiling values that must not be exceeded except for a maximum peak over a specified period (e.g., a 5- minute maximum peak in any 2 hours).

NIOSH Recommended Exposure Limits (RELs) are Time-Weighted Average (TWA) concentrations for up to a 10-hour work day during a 40-hour work week. A ceiling REL should not be exceeded at any time. Exposure limits are usually expressed in units of parts per million (ppm), i.e., the parts of vapor (gas) per million parts of contaminated air by volume at 25°C/77°F and one atmosphere pressure. For a chemical that forms a fine mist or dust, the concentration is given in milligrams per cubic meter (mg/m^3).

Protective Action Criteria (PAC) is emergency exposure limits developed by the US Department of Energy (DOE) for more than 3400 chemicals in revision 29, published May 2016. These exposure limits can be used to estimate the consequences of the uncontrolled release of hazardous materials and to plan for emergency response. These PACs have been added to the 7th edition of Sittig because other well established exposure limits in air are available for an only a limited number of chemicals from other governmental and advisory sources. PAC values are given in parts per million (ppm) for volatile liquids and gases; in milligrams per cubic meter (mg/m^3) for solids, particulates, solids, and nonvolatile liquids. Chemicals for which Acute Emergency Guideline Levels (AEGLs) and Emergency Response Planning Guidelines (ERPGs) have their values displayed in *bolded* font.

PAC Definitions[SCAPA]:

There are subtle difference in the definitions of AEGLs, ERPGs, and TEELs and major differences in how they are developed and issued. Differences in their definitions include:

AEGLs pertain to the "general population, including susceptible individuals," but ERPGs and TEELs pertain to "nearly all individuals."

AEGLs are defined as the level "above which" certain health effects are expected, while ERPGs and TEELs are defined as the level "below which" certain health effects are *not* expected.

Acute Emergency Guideline Levels (AEGLs) are defined as follows:

- *AEGL-1*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience notable discomfort, irritation, or certain asymptomatic, nonsensory effects. However, these effects are not disabling and are transient and reversible upon cessation of exposure.
- *AEGL-2*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience irreversible or other serious, long-lasting, adverse health effects or an impaired ability to escape.
- *AEGL-3*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience life-threatening adverse health effects or death.

Emergency Response Planning Guidelines (ERPGs) are defined as follows:

- *ERPG-1*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to one hour without experiencing other than mild transient adverse health effects or perceiving a clearly defined objectionable odor.
- *ERPG-2*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms that could impair their abilities to take protective action.
- *ERPG-3*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing life-threatening health effects.

Additional information on PAC values and links to other sources of information can be found on the webpage for the *Subcommittee for Consequence Assessment and Protective Action (SCAPA)*: http://orise.orau.gov/emi/scapa/teels.htm

The German MAK (DFG MAK) values are conceived and applied as 8-hour time-weighted average (TWA) values.[3]

Short-Term Exposure Limits (15-minute TWA): This field contains Short-Term Exposure Limits (STELs) from ACGIH, NIOSH and OSHA. The parts of vapor (gas per million parts of contaminated air) by volume at 25°C/77°F and one atmosphere pressure is given. The limits are given in milligrams per cubic meter (mg/m^3) for chemicals that can form a fine mist or dust. Unless otherwise specified, the STEL is a 15-minute TWA exposure that should not be exceeded at any time during the work-day.

Determination in Air: The citations to analytical methods are drawn from various sources, such as the *NIOSH Manual of Analytical Methods*.[18] In addition, methods have been cited in the latest US Department of Health and Human Services publications including the *"NIOSH Pocket Guide to Chemical Hazards"* August, 2006.

Permissible Concentrations in Water: The permissible concentrations in water are drawn from various sources also, including: The National Academy of Sciences/ National Research Council, Safe Drinking Water Committee Board on Toxicology and Environmental Health Hazards, *Drinking Water and Health*, 1980.[16]

The priority toxic pollutant criteria published by US EPA 1980.[6]

The multimedia environmental goals for environmental assessment study conducted by EPA.[32] Values are cited from this source when not available from other sources.

The US EPA has come forth with a variety of allowable concentration levels:

For allowable concentrations in "California List" wastes.[38] The California List consists of liquid hazardous wastes containing certain metals, free cyanides, polychlorinated biphenyls (PCBs), corrosives with a pH of less than or equal to 2.0, and liquid and nonliquid hazardous wastes containing halogenated organic compounds (HOCs).

For regulatory levels in leachates from landfills.[37]

For concentrations of various materials in effluents from the organic chemicals and plastics and synthetic fiber industries.[51]

For contaminants in drinking water.[36]

For National Primary and Secondary Drinking Water Regulations.[62]

In the form of health advisories for 16 pesticides,[47] 25 organics,[48] and 7 inorganics.[49]

For primary drinking water standards starting with a priority list of 8 Volatile Organic Chemicals.[40]

State drinking water standards and guidelines [61] as assembled by the US EPA.

Determination in Water: The sources of information in this field have been primarily US EPA publications including the test procedures for priority pollutant analysis[25] and later modifications.[42]

Routes of Entry: The toxicologically important routes of entry of each substance are listed. In other words, the way in which the people or experimental animals were exposed to the chemical is listed, e.g. eye contact, skin contact, inhalation, intraperitoneal, intravenous. Many of these are taken from the *NIOSH Pocket Guide*,[2] but are drawn from other sources as well.

Harmful Effects and Symptoms: These are primarily drawn from NIOSH, EPA publications, and New Jersey and New York State fact sheets on individual chemicals, and are supplemented from information from the draft criteria documents for priority toxic pollutants[26] and from other sources. The other sources include the following:

EPA Chemical Hazard Information Profiles (CHIPS) cited under individual entries.

NIOSH Information Profiles cited under individual entries.

EPA Health and Environmental Effect Profiles cited under individual entries.

Particular attention has been paid to cancer as a "harmful effect" and special effort has been expended to include the latest data on carcinogenicity. See also "Regulatory Authority and Advisory Bodies" section.

Short-Term Exposure: These are brief descriptions of the effects observed in humans when the vapor (gas) is inhaled, when the liquid or solid is ingested (swallowed), and when the liquid or solid comes in contact with the eyes or skin. The term LD50 signifies that about 50% of the animals given the specified dose by mouth will die. Thus, for a Grade 4 chemical (below 50 mg/kg) the toxic dose for 50% of animals weighing 70 kg (150 lb) is $70 \times 50 = 3500$ mg = 3.5 g, or less than 1 teaspoonful; it might be as little as a few drops. For a Grade 1 chemical (5−15 g/kg), the LD50 would be between a pint and a quart for a 150-lb man. All LD50 values have been obtained using small laboratory animals such as rodents,

cats, and dogs. The substantial risks taken in using these values for estimating human toxicity are the same as those taken when new drugs are administered to humans for the first time.

Long-Term Exposure: Where there is evidence that the chemical can cause cancer, mutagenic effects, teratogenic effects, or a delayed injury to vital organs such as the liver or kidney, a description of the effect is given.

Points of Attack: This category is based, in part, on the "Target Organs" in the *NIOSH Pocket Guide*[2] but the title has been changed as many of the points of attack are not organs (blood, for example). This is human data unless otherwise noted.

Medical Surveillance: For each chemical, this information is drawn from many and various government publications and sources including, for example, CDC, NIOSH publications,[27] *New Jersey* or *New york State Fact Sheets*,[70] HSDB/Toxnet, etc. In many cases, statements may refer to known and suspected carcinogen, known or suspected mutagens, reproductive affecters, skin and/or respiratory sensitizers, etc.

First Aid: Guides and guidance to first aid found in this work should not be construed as authorization to emergency personnel to perform the procedures or activities indicated or implied. Care of persons exposed to toxic chemicals must be directed by a physician or other recognized professional or authority. Simple first aid procedures are listed for response to eye contact, skin contact, inhalation, and ingestion of the toxic substance as drawn to a large extent from the *NIOSH Pocket Guide*[2] but supplemented by information from recent commercially available volumes in the United States,[29] in the United Kingdom, and in Japan[24] as well as from state fact sheets. They deal with exposure to the vapor (gas), liquid, or solid and include inhalation, ingestion (swallowing) and contact with eyes or skin. The instruction "Do NOT induce vomiting" is given if an unusual hazard is associated with the chemical being sucked into the lungs (aspiration) while the patient is vomiting. "*Seek medical attention*" or "*Call a doctor*" is recommended in those cases where only competent medical personnel can treat the injury properly. In all cases of human exposure, seek medical assistance as soon as possible. In many cases, medical advice has been included for guidance only. Dosage information has been avoided because dosage recommendations constantly change. Emergency personnel are urged to check all manufacturers' information particularly before administering any drug with which they are not familiar or have not used for some period of time. Also, medications suggested to be administered by qualified medical personnel presume no immediate prior administration of the same, similar or complicating medications.

Personal Protective Methods: This information is drawn heavily from NIOSH publications[2][77] and supplemented by information from the United States,[29] the United Kingdom, and Japan.[24] There are indeed other "personal protective methods" which space limitations prohibit describing here in full. One of these involves limiting the quantities of carcinogens to which a worker is exposed in the laboratory. The items listed are those recommended by (1) NIOSH and/or OSHA, (2) manufacturers, either in technical bulletins or in material safety data sheets (MSDS), (3) the Chemical Manufacturers Association (CMA), or (4) the National Safety Council (NSC), for use by personnel while responding to fire or accidental discharge of the chemical. They are intended to protect the lungs, eyes, and skin.

Respirator Selection: The 7th edition, like its predecessors, presents respirator selection with a full text description. For each line a maximum use concentration (in ppm, mg/m^3, μg/m^3, fibers/m^3, or mppcf) condition (e.g., escape) followed by the NIOSH code and full text related to respirator recommendations. All recommended respirators of a given class, can be utilized at any concentration equal to or less than the class's listed maximum use concentration. Respirator selection should follow recommendations that provide the greatest degree of protection. Respirator codes found in the *NIOSH Pocket Guide* have been included to ease updating.

All respirators selected must be approved by NIOSH under the provisions of 42CFR84. The current listing of NIOSH/MSHA certified respirators can be found in the *NIOSH Certified Equipment List*, which is available on www.cdc.gov/niosh/npptl/topics/respirators/cel. This is the NIOSH Web site.

For firefighting, only self-contained breathing apparatuses with full facepieces operated in pressure-demand or other positive pressure modes are recommended for all chemicals in the *NIOSH Pocket Guide*. In the case of chemical warfare agents, use only SCBA Respirator certified by NIOSH For CBRN environments. CBRN stands for "Chemical, Biological, Radiological, and Nuclear."

Pesticides are not identified as such in the respirator selection tables. For those substances that are pesticides, the recommended air-purifying respirator must be specifically approved by NIOSH/MSHA. Specific information on choosing the appropriate respirator will be provided on pesticide labels. Approved respirators will carry a "TC" number prefix, which signifies they have been tested and certified for a specific level of protection. New respirators may carry a "TC-84A" prefix in compliance with 42 CFR 84 for testing and certifying nonpowered, air-purifying, particulate-filter respirators. The new Part 84 respirators have passed a more demanding certification test than the old respirators (e.g., dust and mist [DM], dust, fume and mist [DFM], spray paint, pesticide, etc.) certified under 30 CFR 11.

Additionally, a complete respirator protection program should be implemented including all requirements in 29CFR1910.134 and 42CFR84. At a minimum, a respirator protection program should include regular training, fit-testing, periodic environmental monitoring, maintenance inspection, and cleaning. The selection of the actual respirator to be used within the classes

of recommended respirators depends on the particular use situation, and should only be made by a knowledgeable person. Remember, air-purifying respirators will not protect from oxygen-deficient atmospheres. For firefighting, only self-contained breathing apparatuses with full facepieces operated in pressure-demand or other positive pressure modes are recommended for all chemicals in the *NIOSH Pocket Guide*.

Storage: The 7th edition now provides, as general guidance, a color-coded classification system similar to those often found in commerce and laboratories. It is the objective of any chemical storage classification system to prevent accidental combination of two or more incompatible materials that might be stored in the same space. To prevent an unwanted and possibly dangerous reaction, chemicals must be separated by space and/or physical barriers. Chemical storage areas should be appropriately labeled. Users must be careful to check the MSDS for both additional and specific information. Some chemical entries contain multiple storage codes because the chemical profile fits more than a single category.

Code	***Hazard***
Red	Flammables (Flash point $<100°F$)
Blue	Health hazards/toxics/poisons
Yellow	Reactives/oxidizers
White	Contact hazards
Green[a]	General storage

[a] *For general storage, the colors gray and orange may also be used by some companies.*

- Chemical containers that are not color coded should contain hazard information on the label.
- Check the MSDS to learn what personal protective equipment is required when using the substance
- *Red*: Flammability hazard: Store in a flammable (liquid or materials) storage area or approved cabinet away from ignition sources and corrosive and reactive materials.
- *Blue*: Health hazard/toxics/poisons: Store in a secure poison location.
- *Yellow*: Reactive hazard; store in a location separate from other materials, especially flammables and combustibles.
- *White*: Corrosive or contact hazard; store separately in a corrosion-resistant location.
- *Green (or gray or orange)*: General storage may be used. Generally, for flammability, health, and corrosivity with an NFPA rating of no higher than "2."
- Chemicals with labels that are colored and diagonally striped may react with other chemicals in the same hazard class. See MSDS for more information.
- *Red Stripe*: Flammability hazard: store separately from all other flammable materials. Example: sodium metal.
- *Yellow Stripe*: Reactivity hazard; store separately in an area isolated from flammables, combustibles, or other yellow coded materials. *Example*: reducing agents.
- *White stripe*: Contact hazard; not compatible with materials in solid white category. Store separately. *Example*: Bases.

Other data in this field is drawn from, or based on, various resources, including the NFPA,[17] from Japanese sources[24] and from publications such as the *Hazardous Substance Fact Sheets* published by the New Jersey Department of Health and Senior Services.[70]

Shipping: The shipping guidance offered herein does not replace the training requirements of the DOT and in no way guarantees that you will be in full compliance with the DOT Regulations. *Labeling*: This section refers to the type label or placard required by regulation on any container or packaging of the subject compound being shipped. In some cases a material may require more than one hazardous materials label. *Quantity limitation*: This section lists quantities of material that may be shipped on passenger aircraft, rail, and cargo aircraft. Materials in certain hazard classes may be shipped under the small quantities exception (see 49 CFR 173.4) with specific approval from the Associate Administrator for Hazardous Materials Safety, DOT. *Hazard class or division*: This number refers to the division number or hazard class that must appear on shipping papers. This information is drawn from DOT publications[19] as well as UN publications[20] and also NFPA publications.[17] The US DOT[19] has published listings of chemical substances which give a hazard classification and required labels. The US DOT listing now corresponds with the UN listing[20] and specifies first a hazard class of chemicals as defined in the following table, and then a packing group (I, II, or III) within each of the classes. These groups are variously defined depending on the hazard class but in general define materials presenting: I—a very severe risk (great danger); II—a serious risk (medium danger); and III—a relatively low risk (minor danger).

Hazard Classification System

The hazard class of dangerous goods is indicated either by its class (or division) number or name. For a placard corresponding to the primary hazard class of a material, the hazard class or division number must be displayed in the lower corner of the placard. However, no hazard class or division number may be displayed on a placard representing the subsidiary hazard of a material. For other than Class 7 or the OXYGEN placard, text indicating a hazard (for example, "CORROSIVE") is not required. Text is shown only in the United States. The hazard class or division number must appear on the shipping document after each shipping name.

Class 1—Explosives
Division 1.1: Explosives with a mass explosion hazard
Division 1.2: Explosives with a projection hazard
Division 1.3: Explosives with predominantly a fire hazard
Division 1.4: Explosives with no significant blast hazard
Division 1.5: Very insensitive explosives with a mass explosion hazard
Division 1.6: Extremely insensitive articles
Class 2—Gases
Division 2.1: Flammable gases
Division 2.2: Nonflammable, nontoxic* gases
Division 2.3: Toxic* gases
Class 3—Flammable liquids [and combustible liquids (United States)]
Class 4—Flammable solids; spontaneously combustible materials; and dangerous when wet materials/Water-reactive substances
Division 4.1: Flammable solids
Division 4.2: Spontaneously combustible materials
Division 4.3: Water-reactive substances/dangerous when wet materials
Class 5—Oxidizing substances and organic peroxides
Division 5.1: Oxidizing substances
Division 5.2: Organic peroxides
Class 6—Toxic* substances and infectious substances
Division 6.1: Toxic* substances
Division 6.2: Infectious substances
Class 7—Radioactive materials
Class 8—Corrosive substances
Class 9—Miscellaneous hazardous materials/Products, Substances or Organisms

**Note*: The words "poison" or "poisonous" are synonymous with the word "toxic."

Spill Handling: Spill or leak information provided is intended to be used only as a guide. The term *Issue warning* is used when the chemical is a poison, has a high flammability, is a water contaminant, is an air contaminant (so as to be hazardous to life), is an oxidizing material, or is corrosive. *Restrict access* is used for those chemicals that are unusually and immediately hazardous to personnel unless they are protected properly by appropriate protective clothing, eye protection, and respiratory protection equipment, etc. *Evacuate area* is used primarily for unusually poisonous chemicals or these that ignite easily. *Mechanical containment* is used for water-insoluble chemicals that float and do not evaporate readily. *Should be removed* is used for chemicals that cannot be allowed to disperse because of potentially harmful effects on humans or on the ecological system in general. The term is not used unless there is a reasonable chance of preventing dispersal, after a discharge or leak, by chemical and physical treatment. *Chemical and physical treatment* is recommended for chemicals that can be removed by skimming, pumping, dredging, burning, neutralization, absorption, coagulation, or precipitation. The corrective response may also include the use of dispersing agents, sinking agents, and biological treatment. *Disperse and flush* is used for chemicals that can be made nonhazardous to humans by simple dilution with water. In a few cases the response is indicated even when the compound reacts with water because, when proper care is taken, dilution is still the most effective way of removing the primary hazard. This material safety data sheet information is drawn from a variety of sources including New Jersey Department of Health and Senior Services *Hazardous Substance Fact Sheets*[70] and EPA *Profiles on Extremely Hazardous Substances.*[82]

Fire Extinguishing: Fire information provided is intended to be used only as a guide. Certain extinguishing agents should not to be used because the listed agents react with the chemical and have the potential to create an additional hazard. In some cases they are listed because they are ineffective in putting out the fire. Many chemicals decompose or burn to give off toxic and irritating gases. Such gases may also be given off by chemicals that vaporize in the heat of a fire without either decomposing or burning. If no entry appears, the combustion products are thought to be similar to those formed by the burning of oil, gasoline, or alcohol; they include carbon monoxide (poisonous), carbon dioxide, and water vapor. The specific combustion products are usually not well known over the wide variety of conditions existing in fires; some may be hazardous. This information is drawn from NFPA publications,[17] FEMA,[78] and other sources. Any characteristic behavior that might increase significantly the hazard involved in a fire is described. The formation of flammable vapor clouds or dense smoke, the possibility of polymerization, and explosions is stated in this section and/or the incompatibility section. Unusual difficulty in extinguishing the fire is noted.

Disposal Method Suggested: The disposal methods for various chemical substances have been drawn from various sources, including government documents and a UN publication.[22,79]

References: The general bibliography for this volume follows immediately. It includes both general reference sources and references dealing with analytical methods. The references at the end of individual chemical records are generally restricted to: references dealing only with that particular compound; and references which, in turn, contain bibliographies giving references to the original literature on toxicological and other behavior of the substance in question.

Key to Abbreviations and Acronyms

α	the Greek letter *alpha*; used as a prefix to denote the carbon atom in a straight chain compound to which the principal group is attached.
as-	prefix for asymmetric
ACGIH	American Conference of Governmental Industrial Hygienists
AEGL	Acute Emergency Guideline Level, developed by the EPA
AIHA	American Industrial Hygeine Association
approx	approximately
asym-	prefix for asymmetric
@	at
atm.	atmosphere
ATSDR	Agency for Toxic Substances and Disease Registry
β	the Greek letter *beta*
BEI	Biological Exposure Indices (ACGIH in the USA; South Africa; New Zealand)
BLV	Biological Limit Values
BP	boiling point.
°C	degrees Centigrade
CAA	Clean Air Act
CAAA	Clean Air Act Amendments of 1990
CAMEO	Computer-Aided Management of Emergency Operations (NOAA)
carc.	carcinogen
CAS	Chemical Abstract Service
cc	cubic centimeter
cc	closed cup (Flash point)
CDC	U.S. Center for Disease Control
CEPA	Canadian Environmental Protection Act
CERCLA	Comprehensive Environmental Response, Compensation, And Liability Act
CFCs	chlorofluorocarbons
CFR	*Code of Federal Regulations*
cis-	(Latin: on this side). Indicating one of two geometrical isomers in which certain atoms or groups are on the same side of a plane
CMA	Chemical Manufacturers Association
CPR	Cardiopulmonary Resuscitation
CWA	Clean Water Act
cyclo-	(Greek, circle). Cyclic, ring structure; as cyclohexane
Δ or δ	Greek letter *delta*
DFG	Deutsche Forschungs-gemeinschaft
DOE	U.S. Department of Energy
DOT	U.S. Department of Transportation
DOT ID	Department of Transportation Identification Numbers
EEC or EC	European Economic Community
EEGL	Emergency Exposure Guidance Level
EHS	Extremely Hazardous Substances
EINECS	European Inventory of Existing Commercial Chemical Substances
ε	Greek letter epsilon
EPA (US)	Environmental Protection Agency
EPCRA	Emergency Planning and Community Right-to-Know Act
ESLI	End of Service Life Indicator
est.	estimate
EU	European Union
°F	degrees Fahrenheit
FDA	Food and Drug Administration
FEMA	Federal Emergency Management Agency
FR	*Federal Register* (United States)
γ	Greek letter *gamma*
GHS	Globally Harmonized System of Classification and Labeling of Chemicals
h	hour(s)
HCFC	hydrochlorofluorocarbons
HCS	Hazard Communication Standard
HSDB	Hazardous Substances Data Bank
IARC	International Agency for Research on Cancer
IATA	International Air Transport Association
IDLH	Immediately Dangerous to Life or Health
ILO	International Labor Office
IRIS	Integrated Risk Information System (EPA)
iso-	(Greek, equal, alike). Usually denoting an isomer of a compound.
kg	kilogram(s)
l	liter(s)
lb	pound(s)
$\mathbf{LC_{50}}$	The concentration of a substance in air that kills 50% of the test population.
$\mathbf{LC_{Lo}}$	The lowest concentration of a substance in air that has been shown to cause death in a test population.
$\mathbf{LD_{50}}$	The dose of a substance administered by any route (other than inhalation) that causes death to 50% of the test population.
$\mathbf{LD_{LO}}$	The lowest dose of a substance administered by any route (other than inhalation)that has been shown to cause death in a test population.

LEL	Lower explosive (flammable) limit in air, % by volume at room temperature or other temperature as noted
LEPC	Local Emergency Planning Committees
LTEL	Long Term Exposure Limit (UK)
m-	an abbreviation for "*meta-*," a prefix used to distinguish between isomers or nearly related compounds
m^3	cubic meter
MACT	Maximum Achievable Control Technology (CAA)
MAK	airborne exposure limit "Maximale Arbeitsplatz-Konzentration" (maximum workplace concentration) from the Deutsche Forschungsgemeinschaft (DFG), German Research Foundation.
MCL	Maximum Contaminant Level (SDWA)
MCLG	Maximum Contaminant Level Goal (SDWA)
mg	milligram(s)
μ	micro
μg	microgram(s)
min	minute(s)
mmHg	millimeters of mercury (non-SI symbol for pressure) Also known as "torr."
mppcf	million particles per cubic foot
MSDS	Material Safety Data Sheets
n-	abbreviation for "normal," referring to the arrangement of carbon atoms in a chemical molecule prefix for normal
N-	Symbol used in some chemical names, indicating that the next section of the name refers to a chemical group attached to a nitrogen atom. The bond to the nitrogen atom
NCI	National Cancer Institute (USA)
NFPA	National Fire Protection Association (USA)
NIOSH	National Institute for Occupational Safety and Health (USA)
NLM	National Library of Medicine (USA)
NOAA	National Oceanic and Atmospheric Administration (USA)
NOAEL	No Observed Adverse Effect Level
NOS	not otherwise specified
NPRI	National Pollutant Release Inventory (Canada)
NTIS	National Technical Information Service (USA)
NTP	National Toxicology Program (USA)
o-	*ortho-*, a prefix used to distinguish between isomers or nearly related compounds.
OEL	Occupational Exposure Limit

ω	Greek letter *omega*
oc	open cup
OSHA	Occupational Safety and Health Administration (USA)
Oxy	Oxidizer or oxidizing agent
p-	an abbreviation for "*para-*," a prefix used to distinguish between isomers or nearly related compounds
PAC	Protective Action Criterion (U.S. DOE)
PBB	polybrominated biphenyl
PCB	polychlorinated biphenyl
PE	polyethylene
PEL	Permissible Exposure Limit (USA, Japan, Mexico)
PNOS	Particulates Not Otherwise Specified
POTW	Publicly Owned Treatments Works
PP	polypropylene
ppb	parts per billion
PPE	Personal Protective Equipment
ppm	parts per million
PQL	Practical Quantitation Limit (RCRA)
prim-	prefix for primary
REL	Recommended Exposure Limits (NIOSH)
RQ	Reportable Quantity
RTECS	Registry of Toxic Effects of Chemical Substances
RTK	Right-to-Know
SARA	Superfund Amendments and Reauthorization Act
s. carc	Suspected Carcinogen
SCAPA	Subcommittee on Consequence Assessment and Protective Actions (DOE)
SCBA	Self-Contained Breathing Apparatus
SDWA	Safe Drinking Water Act
sec-	prefix for secondary
SERC	State emergency response commissions
SMCL	Secondary Maximum Contaminant Levels (SDWA)
STEL	Short-Term Exposure Limit
sym-	abbreviation for "symmetrical," referring to a particular arrangement of elements within a chemical molecule
t-	prefix for tertiary
TC_{Lo}	The lowest concentration of a substance in air that has been shown to produce toxic effects in a test population.
TD_{Lo}	The lowest dose of a substance that has been shown to produce toxic effects in a test population
TEEL	Temporary Emergency Exposure Limit
TRK	Technical Guiding Concentrations (DFG) for workplace control of carcinogens

tert-	abbreviation for "tertiary," referring to a particular arrangement of elements within a chemical molecule
TLV	Threshold Limit Value (ACGIH)
TQ	Threshold Quantity
trans-	(Latin: across). Indicating that one of two geometrical isomers in which certain atoms or groups are on opposite sides of a plane
TRI	Toxic Release Inventory
TSCA	Toxic Substances Control Act
TWA	Time-Weighted Average. Often shown as TWA - 8h (8 hours)
UEL	Upper Explosive (flammable) Limit in air, % by volume at room temperature or other temperature as noted
UN	United Nations
unsym-	prefix for asymmetric
USDA	United States Department of Agriculture
USCG	United States Coast Guard
VOCs	Volatile Organic Compounds
WEEL	Workplace Environmental Exposure Level (AIHA)
WHMIS	Workplace Hazardous Materials Information System (Canada)
>	symbol for "greater than"
<	symbol for "less than"
≤	symbol for "less than or equal to"
≥	symbol for "greater than or equal to"
°	degrees of temperature
%	percent

E

Emetine dihydrochloride E:0050

Formula: $C_{29}H_{42}Cl_2N_2O_4$; $C_{29}H_{40}N_2O_4 \cdot 2HCl$
Synonyms: Amebicide; (-)Emetine, dihydrochloride; 1-Emetine, dihydrochloride; Emetine, hydrochloride; NSC-33669
CAS Registry Number: 316-42-7
RTECS Number: JY5250000
UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154: UN1544 (alkaloid, solid, n.o.s.)/151
EC Number: 206-259-8

Regulatory Authority and Advisory Information

Hazard Alert: Poison (highly toxic), Primary irritant (w/o allergic reaction).

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1/10,000 lb (0.454/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T+; Xi; risk phrases: R28; R36/37/38; R41; safety phrases: S25; S26; S28; S29; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Emetine dihydrochloride is a colorless, combustible powder which turns yellow on exposure to heat or light. Molecular weight = 553.63; boiling point = 600°C; freezing/melting point = 235°C−250°C (decomposes); flash point = >310°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Emetine dihydrochloride is an injectable form of emetine; an alkaloid and antiamebic; the active ingredient of Ipecac. Emetine dihydrochloride is used as chemical reagent, organic intermediate; in pharmaceutical R&D.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Turns yellow on contact with light or heat.

Permissible Exposure Limits in Air

PAC Ver. 28, no values found in Ver. 29[138]
PAC-1: 9.10E-04 milligram per cubic meter
PAC-2: 0.01 milligram per cubic meter
PAC-3: 0.06 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Symptoms include nausea, vomiting, diarrhea, muscle weakness, pain, tenderness, hypotension, precordial pain, and rapid heartbeat. This material is highly toxic orally. It is an eye irritant. Probable oral lethal dose for humans if 5−50 mg/kg, or between seven drops and one teaspoon for a 150-lb person. LD_{50} = (oral-rat) 0.012 mg/kg (12 μg/kg) (extremely toxic).

Short-Term Exposure: Irritates the eyes. Symptoms include nausea, vomiting, diarrhea, muscle weakness, pain, tenderness, hypotension, precordial pain, rapid heartbeat, diarrhea, dyspnea, hallucinations, nausea, or vomiting. This material is highly toxic orally. Probable oral lethal dose for humans if 5−50 mg/kg, or between seven drops and one teaspoon for a 150-lb person. LD_{50} = (oral-rat) 0.012 mg/kg (12 μg/kg) (extremely toxic). Eye irritant, moderate; Heart, cardiovascular system, acute effects; CNS, acute effects; Nervous system toxin, acute effects; Respiratory toxin, acute effects other than severe or moderate irritation; gastrointestinal (GI) tract, acute effects[138].

Points of Attack: Respiratory toxin-chronic; cardiovascular system, chronic effects[138].

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Emetine is an alkaloid. Procedures for alkaloid salts are as follows. Move victim to fresh air; call emergency medical care. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 minutes. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00005-3

be clean, available each day and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive pressure, pressure-demand, full facepiece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place and protect from light.

Shipping: UN1544 Alkaloids, solid, n.o.s. or Alkaloid salts, solid, n.o.s. poisonous, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. The following procedures should be used for alkaloid salts. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: Take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: With clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: Dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal and nitrogen oxides decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Extinguishing methods for alkaloid salts are as follows. *Small fires*: Dry chemical, carbon dioxide; water spray; or foam. *Large fires*: Water spray, fog, or foam. Procedures for alkaloid salts include the following. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (CAS: 115-29-7)

Description: Endosulfan is a chlorinated cyclodiene insecticide. The pure product is a colorless crystalline solid. The technical product is a light to dark brown waxy solid. It has a rotten egg or sulfur odor. Molecular weight = 406.90; freezing/melting point = 406.91; boiling point = decomposes; freezing/melting point = 70−100°C (technical); 106.1°C (pure); 106°C (a); 212°C (b); vapor pressure = 1.7×10^{-7} mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water; solubility = 0.00001%.

Potential Exposure: Those engaged in the manufacture, formulation, and application of this material.

Incompatibilities: Strong acids, strong bases. Hydrolyzed by acids. Contact with alkalis forms toxic sulfur dioxide fumes. Corrosive to iron in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.1 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.006 ppm/0.1 milligram per cubic meter TWA measured as inhalable fraction and vapor [skin]; not classifiable as a human carcinogen

115-29-7

PAC Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 0.8 milligram per cubic meter

PAC-3: 180 milligram per cubic meter

Australia: TWA 0.1 milligram per cubic meter, [skin], 1993; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter, [skin], 1999; Finland: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, [skin], 1999; India: TWA 0.1 milligram per cubic meter, [skin], 1993; Norway: TWA 0.1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; Switzerland: MAK-W 0.1 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 0.1 mg'm^3; STEL 0.3 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[35,43] set a MAC of 0.1 milligram per cubic meter in work-place air as well as a MAC in ambient air of residential areas of 0.005 milligram per cubic meter on a momentary basis and 0.001 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for endosulfan in ambient air[60] ranging from 0.238 μ/m^3 (Kansas) to 1.0 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada) to 2.4 μ/m^3 (Pennsylvania).

Determination in Air: Use OSHA Analytical Method PV-2023.

Permissible Concentration in Water: State Drinking Water Guidelines: Arizona 74 μg/L; Florida 42 μg/L; Maine 42 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log $K_{ow} = > 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish Tox = 0.00446000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact. Can be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Endosulfan may affect the central nervous system (CNS); blood, resulting in irritability, convulsions, and renal failure. High level exposure at may result in death. The effects may be delayed. Ingestion of endosulfan may result in nausea, vomiting, and diarrhea. Dizziness, agitation, nervousness, tremor, a lack of coordination, and convulsions may also occur. CNS depression may terminate in respiratory failure. Contact with endosulfan may irritate or burn the skin, eyes, and mucous membranes. Human Tox = 42.00000 ppb (INTERMEDIATE). The probable oral lethal dose is 50−500 mg/kg, or one teaspoonful and one ounce for a 150 lb person. LD_{50} = (oral-rat) 18 mg/kg (highly toxic). Death has occurred within 2 hours of heavy dust exposure during bagging operations.

Long-Term Exposure: Repeated exposure may cause brain damage, causing convulsions, loss of coordination, and memory loss. May cause liver and kidney damage. May damage the testes.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Liver and kidney function tests. Examination of the nervous system. EEG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Consult hospital or poison control center on use of antidotes. Transport to healthcare facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton or Neoprene materials are recommended. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. If used out of doors adequate emergency water should be available.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. A dust respirator approved for pesticide use may be worn. An organic vapor respirator may be necessary if exposure to the solvent is significant.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry, well-ventilated area; free of alkalis, acids, and acid fumes. Where possible, automatically pump liquid from drums or other storage containers to process containers. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72].

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. In case of spills, stay upwind;

stay out of low areas. Use water spray to reduce vapors. Do not dry sweep. Do not touch spilled material; stop leak if you can do it without risk. Small wet spills: Take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: With clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: Dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include hydrogen chloride and oxides of sulfur and carbon. Use any extinguishing agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: A recommended method for disposal is burial 18 in deep in noncropland, away from water supplies, but bags can be burned[22]. Large quantities should be incinerated at high temperature in a unit with effluent gas scrubbing. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Hazard Alert: Suspected reprotoxic hazard, Agricultural chemical. Listed for Tier 1 screening as an endocrine disruptor[88].

Banned or Severely Restricted (several countries) (UN)[13]

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P088

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

United States National Primary Drinking Water Regulations: MCLG = 0.1 mg/L; MCL = 0.1 mg/L

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg).

European/International Regulations (*145-73-3; 129-67-9*): Hazard Symbol: T; Risk phrases: R21; R25; R36/37/38; R51; R63; Safety phrases: S1/2; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Endothall, when pure, is a white crystalline solid. The technical grade is a light brown liquid. Molecular weight = 186.18; boiling point = (decomposes); freezing/melting point = 144°C with conversion to the anhydride. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water; solubility = 100% @ 20°C.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).
Potential Exposure: Endothall is dicarboxylic acid defoliant and herbicide used on both terrestrial and aquatic weeds.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
129-67-9, disodium salt
PAC-1: 0.15 milligram per cubic meter
PAC-2: 1.7 milligram per cubic meter
PAC-3: 10 milligram per cubic meter
Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.1 mg/L; MCLG, 0.1 mg/L.
Determination in Water: Fish Tox = 240.32545000 ppb. Low).
Routes of Entry: Inhalation, ingestion (possibly fatal), and eye and/or skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: Endothall can be fatal if swallowed. May cause serious eye, skin and respiratory irritation. Poisonous: approximate lethal dose (human) is about 2.5 teaspoonful. Little information was found in the available literature on the health effects of endothall in humans except for one case history of a young male suicide victim who ingested an estimated 7−8 g of disodium endothall in solution (approximately 100 mg endothall ion/kg) Repeated vomiting was evident. Autopsy revealed focal hemorrhages and edema in the lungs and gross hemorrhage of the GI tract. LD_{50} = (oral-rat) 18 mg/kg.
Long-Term Exposure: Endothall can cause stomach and intestinal problems. May be mutagenic.
First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.
Personal Protective Methods: Wear rubber gloves for all handling. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear hats, protective suits, and boots for all handling.
Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.
Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with endothall all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area.
Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.
Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not dry sweep. Use industrial vacuum. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen, sulfur, phosphorus, carbon and other corrosive and/or toxic gases. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any

signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small quantities may be disposed of by burial in soil which is rich in organic matter. Large quantities are best disposed of by incineration[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (= 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041.

Harmful to aquatic life in very low concentrations[136] as DSA

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R24/25; R26/27/28; R33; safety phrases: S1/2; S29/35; S36/37; S41; S45; S61 (see Appendix 4).

Description: Endothion is a white crystalline solid with a slight odor. Molecular weight = 280.25; freezing/melting point = 96°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: This material is a systemic insecticide. It is not sold in the United States or Canada.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides; may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 17 milligram per cubic meter

PAC-3: 100 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, and skin contact.

Short-Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and GI tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma; loss of reflexes and loss of sphincter control. Exposure may cause psychotic behavior, loss of coordination; unconsciousness, and rarely, convulsions. This material is poisonous to humans. Its toxic effects are most likely related to action on the nervous system; LD_{50} = (oral-rat) 23 mg/kg (highly toxic).

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Endothion may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from strong oxidizers.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but does not ignite readily. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. *For small fires*, use dry chemical, carbon dioxide; water spray; or foam. *For large fires*, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

California Proposition 65 Chemical[102]: Cancer 2/27/1987; Developmental/Reproductive toxin (male, female) 1/1/1989.

Hazard Alert: Poison, Neurotoxin (cumulative), Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard.

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U058

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R62; R63;?; safety phrases: (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Endoxan is a white crystalline powder (monohydrate). It may be used or shipped in solution. Darkens on exposure to light. Odorless. Molecular weight = 261.11; freezing/melting point = 41°C−45°C; flash point = 112°C. Soluble in water; solubility = 4%.

Potential Exposure: Exodan is used as an immunosuppressive agent in nonmalignant diseases; treatment of malignant lymphoma, multiple meyloma; leukemias, and other malignant diseases. Exodan has been tested as an insect chemosterilant and for use in the chemical shearing of sheep. Exodan is not produced in the United States.; manufactured in Germany and imported into the United States since1959. The FDA estimates that 200,000−300,000 patients per year are treated with exodan. It is administered orally and through injection. The adult dosage is usually 1−5 mg/kg of body weight daily or 10−15 mg/kg administered intravenous every 7−10 days[193].

Incompatibilities: Should be protected from exposure to temperatures above 30°C/86°F.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation and passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Exodan irritates the eyes, skin, and respiratory tract. Eye contact can cause severe damage with possible loss of vision. This chemical can be absorbed through the skin, thereby increasing exposure. Exodan may affect the blood, bladder, CNS, and heart. Symptoms of exodan exposure include GI disturbance, leukopenia, nausea, dizziness, liver dysfunction, and hair loss. When used as a medical drug it can cause nausea, vomiting, and may interfere with the body's manufacture of blood cells (anemia). It is not known if this also occurs in work-place exposures. Contact may cause eye damage.

Long-Term Exposure: Exodan is a carcinogen and probable teratogen in humans. It causes bladder and skin cancer. There is limited evidence that this chemical causes sterility in males and females. Repeated exposure may interfere with the body's ability to produce blood cells (anemia). May cause liver damage. The substance may have effects on the blood, bladder, lungs, and bone marrow resulting in leucopenia, cystitis, and pulmonary fibrosis. There is sufficient evidence for the carcinogenicity of exodan both in humans and in experimental animals. Exodan was carcinogenic in rats following administration in drinking water and intravenous injection; and in mice following subcutaneous injection. Dosages were comparable to those used in clinical practice. The chemical produced benign and malignant tumors at various sites including bladder tumors in the rats. Epidemiological studies are available in which persons treated with Exodan for a variety of medical conditions were compared with similarly affected controls. These studies consistently demonstrate an excess of various neoplasms and leukemias in the treated groups; although the number in all five studies was small. LD_{50} = (oral-mouse) 137 mg/kg (Moderately Toxic).

Points of Attack: Blood, lungs, bladder, skin, and liver.

Medical Surveillance: Complete blood count. Lung function tests. Kidney function tests. GI tests. Tests for blood in urine.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. If you are required to work in a "sterile" environment you require special training.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100 F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and

storage. Store in tightly closed containers in a cool, well ventilated area. Store at below 25°C. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3464 Organophosphorus compound, solid, toxic, n.o.s, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN1851 Medicine, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen, phosphorus and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases R24; R28; R50/53; R62; R63; safety phrases: S1/2; S21; S22; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Endrin is the common name of one member of the cyclodiene group of pesticides. It is a cyclic hydrocarbon having a chlorine-substituted, methano-bridge structure. Endrin is a white, crystalline solid. Molecular weight = 380.90; boiling point = (decomposes) below 245°C; freezing/melting point = (decomposes) 200°C/392°F; vapor pressure = 2×10^{-7} mmHg @ 20°C. *Mixture in xylene:* Flash point = 27°C. Explosive limits: LEL: 1.1%; UEL: 7.0%. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in manufacture, formulation and field application of this insecticide, avicide, and rodenticide. Pesticide not in use; TRI and/or IUR indicates importers or manufacturers are unlikely[88].

Incompatibilities: Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids (forms explosive vapors), oxoacids, epoxides, and parathion. Slightly corrosive to metal.

Permissible Exposure Limits in Air

NIOSH IDLH = 2 milligram per cubic meter

OSHA PEL: 0.1 milligram per cubic meter TWA[skin]

NIOSH REL: 0.1 milligram per cubic meter TWA[skin]

ACGIH TLV [1]: 0.1 milligram per cubic meter TWA [skin]; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 1.8 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

DFG MAK: 0.1 milligram per cubic meter, measured as the, inhalable fraction TWA; Peak Limitation Category II (8); [skin]; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 0.1 milligram per cubic meter, [skin], 1993; Australia: TWA 0.1 milligram per cubic meter, [skin], 1993; Austria: MAK 0.1 milligram per cubic meter, [skin], 1999; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter, [skin], 1999; Finland: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; Norway: TWA 0.1 milligram per cubic meter, 1999; Poland: MAC (TWA) 0.5 milligram per cubic meter, MAC (STEL) 1.5 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, [skin], 1999; Thailand: TWA 0.1 milligram per cubic meter, 1993; Turkey: TWA 0.1 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for Endrin in ambient air[60] ranging from 0.07 μ/m^3 (Pennsylvania) to 0.238 μ/m^3 (Kansas) to 1.0 μg/L (North Dakota) to 1.6 μg/L (Virginia) to 2.0 μg/L (Connecticut and Nevada).

Determination in Air: Use NIOSH (IV), Method #5519.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.002 mg/L; MCLG, 0.002 mg/L. Federal Drinking Water Standards: EPA 2 μg/L; Federal Drinking Water Guidelines: EPA 2 μg/L; State Drinking Water Guidelines: Arizona 0.32 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log K_{ow} = 5.3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish Tox = 0.00440000 pbb (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact. Quickly passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the skin and eyes and may affect vision. Inhalation can cause irritation of the respiratory tract. Exposure can cause headache, nausea, vomiting, diarrhea, loss of appetite; sweating and weakness; lightheadedness, dizziness, convulsions, and unconciousness. Lower exposure can affect concentration, memory and muscle coordination. Endrin can cause death by respiratory arrest. Symptoms include headache, nausea, vomiting, dizziness, tremors, convulsions, loss of consciousness; rise in blood pressure; fever, frothing of the mouth, deafness, coma, and death. This material is extremely toxic. It is rapidly absorbed through the skin. Symptoms appear between 20 minutes and 12 hours after exposure. Doses of 1 mg/kg can cause symptoms. Also, it is a CNS depressant and hepatotoxin. Inhalation may cause irritation to nose and throat; and sudden convulsions, which may occur from 30 minutes to 10 hours after exposure. Recovery is usually rapid, but headache, dizziness, lethargy, weakness, and weight loss may persist to 2–4 weeks. Prolonged breathing or ingestion can result in an onset of symptoms in 3 hours at a dose of 1 mg per kg of body weight. Ingestion of 12 grams has caused death. Pregnant women are considered to be at special risk. A rebuttable presumption notice against pesticide registration was issued on July 27, 1976 by EPA on the basis of oncogenicity, teratogenicity, and reductions in endangered species and nontarget species. Human Tox = 2.00000 ppb MCL (High).

Long-Term Exposure: High or repeated exposure may cause liver damage. May damage the developing fetus. May damage the nervous system causing numbness and weakness in the extremities. Repeated exposure may cause personality changes of depression, anxiety and/or irritability. May cause anorexia.

Points of Attack: Liver, respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Examination of the nervous system. Electroencephalogram (a test for abnormal seizure activity). Blood endrin level. Liver and kidney function tests. NIOSH lists the following tests: whole blood (chemical/metabolite), end-of-shift; blood plasma, blood serum; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 1 milligram per cubic meter: Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator); 2 milligram per cubic meter: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter); or CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into* *unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with endrin all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. Store in tightly closed containers in a cool, well ventilated area away from oxidizers and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: For leaks or spills, use water spray to disperse vapor and to flush spills. Liquid containing this material should be absorbed in vermiculite, dry sand, and earth. Do not touch spilled material; stop leak if you can do it without risk. Establish forced ventilation to keep levels below explosive limit. *Small dry spills*: Collect powdered material in the most convenient and safe manner and deposit in sealed containers; move containers from spill area. *Large spills*: Dike far ahead of spill for later disposal. Keep unnecessary people away; isolate hazard area and deny entry. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Endrin itself does not burn but it may be dissolved in a flammable liquid. Thermal decomposition products may include phosgene and hydrogen chloride. Use dry chemical, foam, carbon dioxide; water spray for solution. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Use water to keep fire-exposed containers cool. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind: keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: A disposal procedure recommended by the manufacturer consists of absorption, if necessary, and burial at least 18 in deep; preferably in sandy soil in a flat or depressed location away from wells, livestock, children, wildlife, etc. Incineration is the recommended method[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Enflurane E:0150

Formula: $C_3H_2ClF_5O$; CHF_2OCF_2CHFCl
Synonyms: 2-Chloro-1-(difluoromethoxy)-1,1,2-trifluoroethane; 2-Chloro-1,1,2-trifluoroethyl difluoromethyl ether; Ethrane; Ethrane methylflurether
CAS Registry Number: 13838-16-9; *(alt.)* 22194-21-4; *(alt.)* 22194-22-5
HSDB Number: 7909
RTECS Number: KN6800000
UN/NA & ERG Number: UN1851 (Medicine, liquid, toxic, n.o.s.)/151
EC Number: 237-553-4
Regulatory Authority and Advisory Information
Carcinogenicity: IARC: Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987. United States Environmental Protection Agency Gene-Tox Program, Negative: V79 cell culture-gene mutation; Inconclusive: Histidine reversion-Ames test; Sperm morphology-mouse.
Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.
Hazard symbols, risk, & safety statements: Hazard symbol: T, F: risk phrases: R5; R11, R21; R23; R26; R36; R62; R63; safety phrases: S9; S23; S26; S33; S36/37/39; S38; S45(see Appendix 4)
Description: Enflurane is a clear, colorless liquid that easily turns into a nonflammable gas. Mild, sweet odor. Molecular weight = 184.50; specific gravity (H_2O:1) = 1.52; boiling point = 56.7°C; vapor pressure = 175 mmHg; relative vapor density (air = 1) = 1.92. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Very slightly soluble in water.
Potential Exposure: FDA-proprietary drug, used as an anesthetic (gas). Axphyxiant.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Decomposes on heating, forming toxic and corrosive fumes of hydrogen chloride, hydrogen fluoride, and phosgene. Decomposes in strong sunlight.
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL*: 2 ppm/15.1 milligram per cubic meter [60 minute] Ceiling Concentration [**Note*: REL for exposure to waste anesthetic gas.]
ACGIH TLV [1]: 75 ppm; not classifiable as a human carcinogen
PAC not available
DFG MAK: 20 ppm/150 milligram per cubic meter TWA; Peak Limitation Category II(8); Pregnancy Risk Group C
Australia: TWA 0.5 ppm (3.8 milligram per cubic meter), 1993; Belgium: TWA 75 ppm (566 milligram per cubic meter), 1993; Denmark: TWA 2 ppm (15 milligram per cubic meter), 1999; Norway: TWA 2 ppm (15 milligram per cubic meter), 1999; Sweden: NGV 10 ppm (80 milligram per cubic meter), KTV 20 ppm (150 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (80 milligram per cubic meter, KZG-W 20 ppm (160 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 153 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen
Determination in Air: Use OSHA Analytical Methods 29 and 103.
Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg [Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.
Determination in Water: Octanol-water coefficient: Log K_{ow} = Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation of vapors.
Harmful Effects and Symptoms
Short-Term Exposure: Enflurane can cause skin, eye and respiratory irritation. There is an association between exposure to anesthetic vapors and increased cancers, miscarriages, and birth defects. Enflurane's role in these increased risks in unclear. Medical patients receiving enflurane as surgical anesthesia have had rare cases of seizures (fits) and liver damage. It is not known whether this happens with work-place exposures. Exposure can cause you to become dizzy, lightheaded and to pass out. LD_{50} = (oral-rat) 5450 mg/kg (insignificantly toxic).
Long-Term Exposure: There is limited evidence that enflurane causes lung and liver cancer in animals. It may damage the developing fetus. Exposure to high levels may cause seizures and affect the liver.
Points of Attack: Eyes, CNS, and liver.
Medical Surveillance: Liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 2 ppm; Use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Non-combustible gas in cylinders under compressed pressure. Prior to working with enflurane all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. Check oxygen content before entering confined spaces. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1851 Medicine, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. If the gas is leaking from a vaporizer or other equipment Stop the flow of gas if it can be done safely. Ventilate area of spill or leak to disperse gas. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid or gas. Thermal decomposition products may include hydrogen chloride, hydrogen fluoride, and phosgene. Use any extinguisher suitable for surrounding fires. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Epichlorohydrin is a colorless liquid with a slightly irritating, chloroform-like odor. Molecular weight = 92.53; specific gravity (H_2O:1) = 1.18 @ 25°C; boiling point = 117.9°C; freezing/melting point = −25.6°C; vapor pressure = 13 mmHg @ 20°C; 16.4 mmHg @ 25°C; flash point = 31°C; autoignition temperature = 411°C. Explosive limits: LEL: 3.8%; UEL: 21.0%. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 2. Soluble in water; solubility = 7%.

Potential Exposure: Epichlorohydrin, an organochlorine, is used in the manufacture of many glycerol and glycidol derivatives and epoxy resins; as a stabilizer in chlorine-containing materials; as an intermediate in the preparation of cellulose esters and ethers, paints, varnishes, nail enamels, and lacquers; as a cement for celluloid. It is used as an intermediate in the manufacture of various drugs. Increased cancer risk.

Incompatibilities: May form explosive mixture with air. Slowly decomposes on contact with water. Heat or strong acids; alkalies, metallic halides, or contaminants can cause explosive polymerization. Violent reaction with strong oxidizers, aliphatic amines; alkanolamines, amines (especially aniline), alkaline earths; chemically active metals (chlorides of aluminum, iron zinc); powdered metals (aluminum, zinc); alcohols, phenols, organic acids; causing fire and explosion hazard. Will pit steel in the presence of water. Thermal decomposition forms highly toxic phosgene gas. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 75 ppm

OSHA PEL: 5 ppm/19 milligram per cubic meter TWA [skin]

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV [1]: 0.5 ppm TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC* Ver. 29[138]

PAC-1: $\mathbf{1.7_A}$ ppm

PAC-2: $\mathbf{24_A}$ ppm

PAC-3: $\mathbf{72_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2; Germ Cell Mutagen Group: 3B

Arab Republic of Egypt: TWA 2 ppm (10 milligram per cubic meter), [skin], 1993; Australia: TWA 2 ppm (10 milligram per cubic meter), [skin], 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 2 ppm (7.6 milligram per cubic meter), [skin], 1993; Finland: TWA 0.5 ppm (1.9 milligram per cubic meter), [skin], carcinogen, 1999; France: VLE 2 ppm (10 milligram per cubic meter), carcinogen, 1999; Hungary: STEL 1 milligram per cubic meter, [skin], carcinogen, 1999; the Netherlands: MAC-TGG 1.9 milligram per cubic meter, 2003; Norway: TWA 0.5 ppm (1.9 milligram per cubic meter), 1999; the Philippines: TWA 5 ppm (19 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 1 milligram per cubic meter; STEL 8 milligram per cubic meter, 1999; Sweden: NGV 0.5 ppm (1.9 milligram per cubic meter), KTV 1 ppm (4 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 2 ppm (8 milligram per cubic meter), [skin], carcinogen, 1999; Turkey: TWA 5 ppm (19 milligram per cubic meter), [skin], 1993; United Kingdom: TWA 0.5 ppm (1.9 milligram per cubic meter); STEL 1.5 ppm, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans.

Russia set a MAC values in the ambient air in residential areas [35,43] of 0.2 milligram per cubic meter (200 μ/m^3) on either a momentary or a daily average basis. Several states have set guidelines or standards for epichlorohydrin in ambient air[60] ranging from 2.7 μ/m^3 (Massachusetts) to 8.3 μ/m^3 (North Carolina) to 12.0 μ/m^3 (Pennsylvania) to 20.0 μ/m^3 (Connecticut) to 33.3 μ/m^3 (New York) to 50.0 μ/m^3 (Indiana, South Carolina) to 0–100.0 μ/m^3 (North Dakota) to 0.8–200.0 μ/m^3 (Rhode Island) to 160.0 μ/m^3 (Virginia) to 238.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH (IV), Method #1010 or OSHA Analytical Method 7.

Permissible Concentration in Water: EPA has suggested a permissible ambient goal of 276 μg/L based on health effects. The EPA more recently calculated[48] a no-observed-adverse-effects-level (NOAEL) of 2 mg/kg/day on the basis of which they have calculated a lifetime Health advisory: of 70 μg/L. United States National Primary Drinking Water Regulations: MCLG = zero mg/L; MCL = TT: Each water system must certify annually, in writing, to the state (using third-party or manufacturers certification) that when it uses epichlorohydrin to treat water, the combination of dose and monomer level does not exceed the levels specified, as follows: 0.01 percent dosed at 20 mg/L (or equivalent). State Drinking Water Guidelines: Arizona 3.5 μg/L; Maine 35 μg/L; Florida 3.0 μg/L.

Determination in Water: A purge-and-trap gas chromatographic (GC)/mass spectrometric procedure for the determination of volatile organic compounds may be used for epichlorohydrin according to EPA[48].

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Epichlorohydrin is corrosive to the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the nervous system. Exposure may result in unconsciousness. Acute exposure to epichlorohydrin may result in nausea, vomiting, and abdominal pain. Liver and kidney effects may be observed. The respiratory tract may become irritated; dyspnea (shortness of breath) may occur; and in acute cases, respiratory paralysis has been observed. CNS and respiratory depression have been noted. *Inhalation:* Levels below 0.05 ppm have not caused adverse effects. Levels above 20 ppm may cause fatigue, stomach pains, nausea, vomiting, slowed breathing; loss of muscle strength and Blue coloration of the skin. *Skin:* May cause severe blistering, burns, and severe pain which may be delayed. Skin absorption may cause or increase the severity of symptoms listed above. *Eyes:* Levels above 5 ppm may cause severe irritation or burns. Direct contact of the liquid may cause clouding of the cornea and tissue death. *Ingestion:* May cause nausea and stomach pain. Animal studies indicate that the probable lethal dose for an adult is 14 grams (1/2 ounce).

Long-Term Exposure: Increased cancer risk. Stomach problems. Repeated or prolonged contact to epichlorohydrin may cause skin allergy to develop. Repeated or prolonged inhalation exposure may cause asthma. May decrease fertility in males. Repeated overexposure may cause changes in the eyes and lungs; kidney and liver damage and chronic asthmatic bronchitis. Epichlorohydrin causes cancer and changes in the genetic material of laboratory animals; and has been linked to cancers and change in the genetic material of occupationally exposed humans. There is some evidence of lung cancer in humans.

Points of Attack: Eyes, skin, respiratory system, stomach, kidneys, liver, and reproductive system. *Cancer site* (in animals): nasal cancer.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Epichlorohydrin slowly penetrates rubber, so all contaminated clothing should be thoroughly washed. 8 hours: Barricade coated suits, Trellchem HPS suits; Trychem 1000 suits; 4 hours: 4 H and Silver Shield gloves, Responder suits. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOvAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor and acid gas canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Epichlorohydrin must be stored to avoid contact with strong oxidizers (such as chlorine, bromine and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), and chemically active metals (such as aluminum, caustics, chlorides of iron and aluminum and zinc), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where epichlorohydrin is handled, used, or stored. Metal containers involving the transfer of five gallons or more of epichlorohydrin should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Where possible, automatically pump liquid from drums or other storage containers to process containers. Use only nonsparking tools and equipment, especially when opening and closing containers of epichlorohydrin. Wherever epichlorohydrin is used, handled, manufactured, or stored, use explosion proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2023 Epichlorhydrin, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Establish forced ventilation to keep levels below explosive limit. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Use water spray, dry chemical, foam or carbon dioxide. Water spray may be used to dilute spills to nonflammable mixtures. If leak or spill has not ignited, use water spray to disperse the vapors. Evacuate for a radius of 1500 ft. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Epichlorohydrin may react violently with water. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Neurotoxin (cumulative), Combustible, Drug; Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Banned or Severely Restricted (several countries) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R27/28; R33; R50/53; R62; safety phrases: S1/2; S22; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: EPN is a light yellow crystalline solid with an aromatic odor (as a pesticide) or a brown liquid above 36°C. Molecular weight = 323.32; freezing/melting point = 36°C; vapor pressure = 3.4×10^{-7} mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: EPN is used in preparation of emulsifiable, granular or wettable powder insecticides for cotton. A potential danger to those involved in the manufacture, formulation and application of this material.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides; may cause the formation of flammable and toxic phosphine gas. Contact with alkalies causes decomposition (hydrolysis) producing *p*-nitrophenol.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 milligram per cubic meter

OSHA PEL: 0.5 milligram per cubic meter TWA [skin]

NIOSH REL: 0.5 milligram per cubic meter TWA [skin]

ACGIH TLV [1]: 0.1 milligram per cubic meter TWA inhalable fraction [skin]; not classifiable as a human carcinogen (2000); BEIA issued as Acetylcholinesterase inhibiting pesticides.

PAC Ver. 29[138]

PAC-1: 0.45 milligram per cubic meter

PAC-2: 5 milligram per cubic meter

PAC-3: 50 milligram per cubic meter

DFG MAK: 0.5 milligram per cubic meter measured as the, inhalable fraction TWA; Peak Limitation Category II(2) [skin].

Australia: TWA 0.5 milligram per cubic meter, [skin], 1993; Austria: MAK 0.5 milligram per cubic meter, [skin], 1999; Belgium: TWA 0.5 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.5 milligram per cubic meter, [skin], 1999; France: VME 0.5 milligram per cubic meter, [skin], 1999; the Philippines: TWA 0.5 milligram per cubic meter, [skin], 1993; Norway: TWA 0.5 milligram per cubic meter, 1999; Switzerland: MAK-W 0.5 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for EPN in ambient air[60] ranging from 5.0 μ/m^3 (North Dakota) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH (IV), Method #5012.

Permissible Concentration in Water: Japan[35] has set a effluent maximum of 1 mg/L and an environmental water quality standard of zero.

Determination in Water: Fish Tox = 1.51635000 ppb MATC (HIGH). Octanol-water coefficient: Log $K_{ow} = > 5.0$.

Determination in Soil: Soil Adsorption Index (Koc) = 4000 (Estimate).

Routes of Entry: Inhalation, ingestion, skin absorption, and skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: A cholinesterase inhibitor. EPN can affect the nervous system; causing convulsions and possible respiratory failure. Exposure may result in unconsciousness or death. The effects may be delayed. Medical observation is indicated. This material may be fatal if swallowed. It is poisonous if inhaled and extremely hazardous by skin contact. Repeated exposure may, without symptoms, be increasingly hazardous. The estimated fatal oral dose is 0.3 grams for a 150 lb (70 kg) person. Acute exposure to EPN may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression and respiratory paralysis. Giddiness, slurred speech; confusion, and psychosis may also be observed. A rebuttable presumption against pesticide registration was issued for EPN on September 19, 1979 by EPA on the basis of neurotoxicity. Human Tox = 0.07000 ppb (EXTRA HIGH).

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. EPN may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, cardiovascular system, CNS, eyes, skin, and blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. NIOSH lists the following tests: Cholinesterase: blood serum, red blood cells/count; cholinesterase: red blood cells/count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Up to 5 milligram per cubic meter Sa (APF = 10) (any supplied-air respirator); or SCBA (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with EPN all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. For small fires, use dry chemicals, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Fight fire from maximum distance. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: EPN plant wastes are treated by preaeration, activated sludge treatment; recycle, chlorination and final polishing where additional natural biological stabilization occurs. EPN is also relatively rapidly hydrolyzed in alkaline solution to benzene thiophosphoric acid; alcohol and *p*-nitrophenol and soil burial with alkali may be used. For large quantities, however, incineration is recommended[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Epoxy ethyloxy propane E:0180

Formula: $C_5H_{10}O_2$

Synonyms: 1,2-Epoxy-3-ethoxy-propane (DOT); (Ethoxymethyl)oxirane; Ethyl glycidyl ether; Oxirane, (ethoxymethyl); Ppropane, 1,2-epoxy-3-ethoxy-

CAS Registry Number: 4016-11-9

HSDB Number: 6080
RTECS Number: TZ3200000
UN/NA & ERG Number: UN2752/127
EC Number: 223-671-3

Regulatory Authority and Advisory Information

Hazard Alert: Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn, N; risk phrases: R10; R22; R36/37/38; R51/53; safety phrases: S16; S26; 37/39; S61; S41 (see Appendix 4). WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Epoxy ethyloxy propane is a colorless, highly flammable, polymerizable liquid. Molecular weight = 102.15. Flash point = (approx.) 37°C. Mixes with water; may partially decompose.

Potential Exposure: It has limited commercial use in organic synthesis.

Incompatibilities: Polymerizable. Keep away from strong oxidizers, heat, flames.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Epoxy ethyloxy propane can affect you when breathed in and by passing through your skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate or burn the eyes and skin with possible permanent damage. Exposure can irritate the eyes, nose and throat. Higher levels can irritate the lungs, causing coughing and/or shortness of breath. Very high levels could cause you to feel dizzy, lightheaded, and pass out. Pulmonary edema may develop.

Long-Term Exposure: Epoxy ethyloxy propane can cause a skin allergy to develop. Similar very irritating substances can affect the lungs.

Points of Attack: Skin, and lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to epoxy ethyloxy propane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where epoxy ethyloxy propane is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2752 1,2-Epoxy-3-ethoxypropane, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep 1,2-epoxy-3-ethoxypropane out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Light yellow liquid or yellow granular material. Commercial products may be in the form of dusts, sprays, solutions, wettable powder suspensions or emulsions. Molecular weight = 189.35; specific gravity (H_2O:1) = 0.995 @ 20°C; boiling point = 127.22°C at 20 mmHg[88]; vapor pressure = 0.034 mmHg @ 35°C[88]; 2.4×10^{-2} mmHg @ 25°C[83,161]; flash point = 115°C. ₩ Low solubility in water; solubility = < 1 mg/mL@ 22.5°C[88]; 370 ppm. Slow decomposition in water, releasing carbon disulfide and propyl amine. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: EPTC is a pre-emergence and early postemergence thiocarbamate herbicide used to control the growth of germinating annual weeds, including broadleaves, grasses, and sedges. It is used in every region of the United States in the production of a wide variety of food crops. The heaviest usage is in the Corn Belt, Northeastern and Mid-Atlantic states, Coastal and Northern Great Plains and in the Pacific Northwest on corn, potatoes, sweet potatoes, dry beans, peas, alfalfa, and snap beans. EPTC is also used on home-grown vegetables and ornamentals. Some formulations are Restricted Group Pesticides (RUP)

Incompatibilities: Thiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Thermal decomposition of thiocarbamate compounds include carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of thiocarbamates with aldehydes, nitrides, and hydrides. Thiocarbamates are incompatible with acids, peroxides, and acid halides.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >3.0$. Values at or above 3.0 are likely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low−1848.27939 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Inhalation, ingestion, and dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Unlike carbamates the thiocarbamates are not cholinesterase inhibitors, but some of them may react with recently ingested alcohol or alcohol-containing products including wine, medications, and cold remedies such as cough-sirups. Low toxicity. Concentrated solutions are slightly corrosive to eyes and mucous membranes. Dust inhalation can cause irritation of the respiratory system with sneezing. Eye contact can cause irritation, watering, pain, and inflammation of the eyelids. Dermal contact can cause irritation and minor ulceration. Ingestion can cause nausea, vomiting, fever, muscle twitching, seizure, rapid respiration, slow heartbeat. Severe exposure may result in death. LD_{50} (oral, rat) = 900−1000 mg/kg; LD_{50} (dermal, rat) = > 3000 mg/kg.

Long-Term Exposure: A cholinesterase inhibitor. A neurotoxin. Human toxicity (long term)[101]: Very low−175.00 ppb, Health advisory.

Points of Attack: Respiratory system, CNS, cardiovascular system, skin, and eyes.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Comprehensive physical examination with emphasis on the genito-urinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be carried out if, in the opinion of a physician, they are indicated. Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count (CBC) and chest x-ray following acute overexposure

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink four to eight ounces of water. Do not induce vomiting. *Note to physician or authorized medical personnel*: Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Personal Protective Methods: Reacts with the following absorbent materials: Cellulose-Based; Mineral-and Clay-Based; Dirt/Earth[88]. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with diallate all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from alkalies. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2902 Pesticides, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: A combustible liquid. Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. *On a small fire:* Use dry chemical, CO_2 or water spray. On a large fire: Use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. A pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land burial is acceptable for small quantities. Larger quantities can be incinerated. (EPTC is combustible and could be incinerated. Recommendable method: Incineration. Peer-review: Incineration in a unit with effluent gas scrubbing is recommendable for large amount. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Ergocalciferol E:0190

Formula: $C_{28}H_{44}O$

Synonyms: Activated ergosterol; D-Arthin; Calciferol; Calciferon; Candacaps; Condocaps; Condol; Crtron; Crystallina; Dacitin; Daral; Davitamon D; Decaps; Dee-Osterol; Dee-Ron; Dee-Ronal; Dee-Roual; Deltalin; Deratol; Detalup; Diactol; Ergorone; Ergosterol; Ergosterol, activated; Ertron; 1,2-Ethylidene dichloride; Fortodyl; Geltabs; Hi-Deratol; Infron; Irradiated; Irradiated ergosta-5,7,22,-trien-3-β-ol; Metadee; Mulsiferol; Mykostin; Oleovitamin D; Ostelin; Radiostol; Radsterin; 9,10, Secoergosta-5,7,10(19), 22-tetraen-3-β-ol; Shock-Ferol; Sterogly; Vigantol; Viosterol; Vitamin D2; Vitavel-D

CAS Registry Number: 50-14-6

HSDB Number: 819

RTECS Number: KE1050000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3249 (Medicines, toxic, solid, n.o.s.)/151

EC Number: 200-014-9 [*Annex I Index No.:* 603-179-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Natural Product (Ergosterol); Suspected of causing genetic defects. DOT regulated (see 49CFR173.4); small quantity provisions apply.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R24/25; R26; R48/25; R51; safety phrases: S1/2; S28; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)].

Description: Ergocalciferol is an odorless white crystalline solid. Molecular weight = 396.72; freezing/melting point = 116°C. Practically insoluble in water.

Potential Exposure: Used as a nutrient and/or dietary supplement food additive.

Incompatibilities: Dust may be combustible and may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

PAC Ver. 27, no values found in Ver. 29[138]

PAC-1: 3.6 milligram per cubic meter

PAC-2: 40 milligram per cubic meter

PAC-3: 40 milligram per cubic meter

Routes of Entry: Inhalation and skin or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic. Ergocalciferol in a single acute ingestion presents no toxic hazard. Daily ingestion in excess of 5000 units/day in children or 7500 units/day in adults will produce toxic symptoms associated with hypervitaminosis D. Initial symptoms of ergocalciferol poisoning include anorexia, nausea and vomiting. It often mimics hyperparathyroidism with thirst, muscular weakness, nervousness, kidney impairment, hypertension, and excessive urination. LD_{50} = (oral-rat) 10 mg/kg.

Long-Term Exposure: Ergocalciferol poisoning disturbs calcium metabolism and causes kidney damage.

Medical Surveillance: Kidney and other organ function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed. It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

EC Number: 206-835-9

Regulatory Authority and Advisory Information

California Proposition 65 Developmental/Reproductive toxin 4/1/90 Hazard Alert: Poison, Combustible, Reproductive toxin,

List 1, DEA Chemical Code 8676 (Title 21 CFR1310.02), Ergotamine and its salts

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

Description: Ergotamine tartrate is a crystalline solid. Molecular weight = 1313.56; freezing/melting point = (decomposes) 203°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = < 1 mg/mL @ 20°C.

Potential Exposure: (Toxicity evaluation)[77]; Suspected reprotoxic hazard, Suspected of causing genetic defects. The major uses of the ergot alkaloids fall into two categories: applications in obstetrics and treatment of migraine headaches. May be used in the production of “street” drugs.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, light, and heat.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.91 milligram per cubic meter

PAC-2: 10 milligram per cubic meter

PAC-3: 32 milligram per cubic meter

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Has high oral toxicity and acts as a convulsant in humans. People with liver damage are at a greater risk. Nausea and vomiting occur in some patients after oral administration. Weakness in the legs is common and muscle pains in the extremities may occur. Numbness and tingling of the fingers and toes may also occur.

Long-Term Exposure: May cause liver damage.

Points of Attack: Liver, nervous system, and cardiovascular system.

Medical Surveillance: Liver function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do so without risk. Use water vapor to reduce vapors. Absorb spills with sand or other noncombustible absorbent material. *Small dry spills*: With clean shovel place material into clean, dry container and cover; move containers from spill area. For *large spills*, dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN3352 (liquid)/151; UN3349 (pyrethroid pesticide, solid, toxic)/151

EC Number: [*Annex I Index No.:* 608-058-00-4]

Regulatory Authority and Advisory Information

Carcinogenicty: EPA Group E, Evidence of noncarcinogenicity for humans.

Hazard Alert: Poison, Environmental hazard, Sensitization hazard, Possible endocrine disruptor.

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum

Clean water act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, N; risk phrases: R23/25; R43; R50/53; safety phrases: S1/2; S24; S29/35; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Viscous yellow or amber liquid or white or amber crystalline solid. Molecular weight = 419.9; specific gravity (H 2 O:1) = 1.175 @ 25°C; boiling point = 160°C; freezing/melting point = 59.7°C; vapor pressure = 1.1×10^{-8} mmHg @ 20°C; 0.037 mmHg @ 25°C. Soluble in water; solubility = < 1 ppm @ 20°C.

Potential Exposure: Esfenvalerate is a synthetic pyrethroid Insecticide used to control wide range of pests such as moths, flies, beetles, and other insects. It is used on vegetable crops (soya beans, sugar cane), tree fruit, cotton, maize, sorghum and nut crops, and noncrop lands. It also is used on a wide variety of household pests. It is usually mixed with a wide variety of other types of pesticides such as carbamate compounds or organophosphates and has the naturally occurring compound fenvalerate for use in the United States Esfenvalerate is almost identical to fenvalerate. Much of the data for fenvalerate is applicable to the pesticide esfenvalerate (E:0207) because the two compounds contain the same components. The only differences in the two products are the relative proportions of the four separate constituents (isomers). Esfenvalerate has become the preferred compound because it requires lower applications rates than fenvalerate, is less chronically toxic, and is a more powerful insecticide. A United States Environmental Protection Agency Restricted Use Pesticide (RUP).

Incompatibilities: Oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); strong acids. Moisture may cause hydrolysis/decomposition.

Permissible Exposure Limits in Air:
NIOSH[2] IDLH = 5000 ppm
OSHA PEL: 5 milligram per cubic meter TWA
NIOSH REL: 5 milligram per cubic meter TWA
ACGIH TLV[1]: 5 milligram per cubic meter TWA
STEL set by HSE[33] = 10 milligram per cubic meter.

Determination in Air: Filter; none; Gravimetric; NIOSH IV[18] [Particulates NOR; #0500 (total), #0600 (respirable)]. Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum.

Permissible Concentration in Water: Acceptable Daily Intake (ADI) = 0.02 mg/kg as pyrethroid

Determination in Water: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, #5008[18], pyrethrum. Octanol-water coefficient: Log $K_{ow} = > 6.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation and absorbed through the skin

Harmful Effects and Symptoms

Short-Term Exposure: Pyrethroids can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness, rhinorrhea (discharge of thin nasal mucous). Highly toxic. May cause nausea, vomiting and abdominal pain if ingested. LD_{50} (oral, rat) = 90−450 mg/kg; LD_{50} (dermal, rat) = > 5 g/kg.

Long-Term Exposure: High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic "pneumonia" can also occur with cough, chest pain, breathing difficulty and abnormal chest x-ray. Repeated attacks may lead to permanent scarring. Skin sensitizer; allergy may also develop with rash and itching, even with lower exposures. Dermal contact can cause rash with redness, blisters and intense itching. A severe generalized allergy can occur with weakness and collapse. May cause endocrine effects. May cause tumors.

Points of Attack: Respiratory system, skin (sensitizer), and CNS.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Employees should be screened for history of certain medical conditions which might place the employee at increased risk from pyrethroid exposure. Chronic respiratory disease: In persons with chronic respiratory disease, especially asthma, the inhalation of pyrethroids might cause exacerbation of symptoms due to its sensitizing properties. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest x-ray if lung symptoms are present. Skin disease: Pyrethroids can cause dermatitis which may be allergic in nature. Persons with pre-existing skin disorders may be more susceptible to the effects of this agent. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Any employee developing the above-listed conditions should be referred for further medical examination[9].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4−6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: 50 milligram per cubic meter: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). 125 milligram per cubic meter*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter).250 milligram per cubic meter*:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 5000 milligram per cubic meter: SaF:Pd, Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location at temperature <35°C and away from alkaline materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3349 Pyrethroid pesticide, solid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material. UN3352 Pyrethroid pesticide, liquid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor.

Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of sulfur and carbon. *On a small fire:* Use dry chemical, CO_2 or water spray. On a large fire: Use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Estradiol 17b E:0210

Formula: $C_{18}H_{24}O_2$

Synonyms: Altrad; Bardiol; Dihydroxyestrin; Dihydroxy follicular hormone; Oestra-1,3,5(10)triene-3,17-β-diol; Syndiol

CAS Registry Number: 50-28-2; 57-63-6 (Estradiol, 17-ethynyl-)
HSDB Number: 3589
RTECS Number: KG2975000
UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151
EC Number: 200-023-8; 200-342-2 (Estradiol, 17-ethynyl-)

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Limited Evidence (Equigyne), *carcinogenic to humans*, Group 1, 1998; NTP 13th Report on Carcinogens[10]
California Proposition 65 Chemical[102]: Cancer 1/1/1988.
Hazard Alert: Poison, Combustible.

Description: Estradiol, 17-β-is an odorless white to yellow crystalline substance. Molecular weight = 272.42; boiling point = (decomposes); freezing/melting point = 173°C−179°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: The working environment may be contaminated during sex hormone manufacture, especially during the extraction and purification of natural steroid hormones; grinding of raw materials; handling of powdered products and recrystallization. Airborne particles of sex hormones may be absorbed through the skin, ingested or inhaled. Enteric absorption results in quick inactivation of sex hormones in the liver. The rate of inactivation is decreased for the oral, alkylated steroid hormones (methyl testosterone, anabolic steroids, etc.). Sex hormones may accumulate and reach relatively high levels even if their absorption is intermittent. Consequently, repeated absorption of small amounts may be detrimental to health. Intoxication by sex hormones may occur in almost all the exposed workers if preventive measures are not taken. The effect in the industrial sector is more successful than the agricultural one (chemical caponizing of cockerels by stilbestrol implants and incorporation of estrogens in feed for body weight gain promotion in beef cattle), where measures taken are summary and the number of cases of intoxication is consequently bigger.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices. *Note:* An industrial guideline of 0.05 μg airborne (estrogen dust)/m^3 TWA (8 h work-day) was adopted at one manufacturing company.

Routes of Entry: Ingestion and inhalation.

Harmful Effects and Symptoms

Adverse Effects of Estrogens in Men: Anorrhexia, nausea, vomiting, edema; a feminization syndrome characterized by gynecomastia (uni-or bi-lateral); increased pigmentation of the areollae; tenderness of the nipples, with or without secretion, slight loss of libido with difficulty in erection, with or without involution of the secondary sex organs; and sterility (by inhibition of spermatogenesis), may occur. Urinary estrogens are increased. A differential diagnosis of breast tumors in men occupationally exposed to estrogen is needed. Gynecomastia may occur in cases of functional insufficiency of organs involved in the metabolism of estrogens (chronic liver or kidney diseases); or of increased endogenous estrogen synthesis by neoplastic growths, such as pituitary, adrenal and testicular tumors or ectopic secretion of gonadotropins or prolactin by lung tumors. Endocrinopathies may be accompanied by gynecomastia. The conversion of androgen into estrogen may explain the occurrence of gynecomastia in the case of gonadotropin or androgen excess in men. Some drugs (spironolactone, digitalis, etc.) may induce gynecomastia. Physiological gynecomastia at birth, puberty and old age; as well as the possibility of the occurrence of breast cancer in men, should be also considered.

Adverse Effects of Estrogen in Women: Prolonged estrogen therapy has caused malignant endometrial changes in predisposed persons. Endometrial hyperplasia and endometrial carcinoma occurred also, after exposure to diethylstilbestrol. Clear cell adenocarcinoma of the vagina and cervix uteri occurred in young women exposed prenatally to diethylstilbestrol or other nonsteroidal estrogens. Women treated with estrogen may complain of menstrual disorders; nausea, headaches, etc. Similar effects were observed during occupational exposure to natural or synthetic estrogens and oral contraceptives. Menstrual disorders were frequent. Menorrhagia occurred in women workers with endometrial hyperplasia. In menopausal women, diethylstilbestrol may produce abnormal uterine bleeding, which often leads to suspicion of cancer of the uterine body. Manifestations like metrorrhagia, nausea and headache usually disappear after discontinuance of exposure. Excess of progesterone may be responsible for weight gain, acne, mastalgia, breast enlargement and recurrent monilial virginities. Toxicity may also include headache, nausea, chloasma, breakthrough bleeding; weight gain; loss of libido; cholestatic liver damage; sterility may also occur.

Medical Surveillance: Persons directly involved in the hazardous sectors of manufacture should be examined every 2 weeks. Persons engaged in the pharmaceutical stage of manufacture should be examined monthly. The frequency of the physical examination of the employees should increase with the age of the worker. Feminization in men, masculinization or menstrual disorders in women; changes in certain metabolic parameters and other symptoms detrimental to health, are indications for changing the workplace. Before admission of a new employee a very careful health examination will serve to exclude persons at risk, namely women of childbearing age, epileptics (steroid hormones may increase the frequency of seizures by changes in fluid retention) and persons with hepatic insufficiency, for example.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Adequate preventive measures, taken in the pharmaceutical industry, have succeeded in eliminating the occurrence of intoxications almost completely. The airpolluting processes are isolated in areas having adequate exhaust facilities and hermetically sealed machines. The isolated areas are entered only by workers wearing special clothing including underwear, stockings; long-sleeved overalls (with no pockets) buttoned to the neck and with ties at the bottom of the trousers for tying over the boots, rubber gloves, head cover and dust respirators. Air-supplied vinyl suits may be used by the groups at highest risk. When workers leave the polluted area they should undress, take a shower; wash their hair; clean their nails and put on their own clothes if the working day is over. Workers indirectly exposed to hormonal dust (i.e., mechanics who change the filters in the ventilation system) must also be provided with adequate protective equipment. The contaminated work clothing should be thoroughly cleaned. Disposable paper garments can be burned. Gloves should be rinsed with acetone or methanol, then washed and dried. Respiratory protection equipment should also be cleaned before reuse. Workrooms must be kept very clean. An alkaline detergent has been found to be most suitable for washing clothes and wiping surfaces. Mixers, stirring rods, spatulas, glassware, dishes, etc., should be rinsed after use with acetone or methanol in a hood or near a vacuum; and then washed in the conventional manner. Methanol should be used on plastic items. It is important to inform workers of the risk represented by the work-place and to win their cooperation in lowering of occupational exposure; for example, not putting on rubber gloves after having worked barehanded; not rubbing the face or nose with contaminated gloves; not contaminating the inside of respirators by leaving them exposed to processing dust; not using outside the work area items which have been inside it (cigarettes, pipes, and handkerchiefs); and being alert to detect deficiencies in preventive measures. In some pharmaceutical companies, the workers alternate 1 week in the polluted areas with 2 weeks in another place of work. In other companies rotation is carried out only when signs of intoxication occur. If women are employed, the alternating work environment should respect their cyclic hormonal pattern. Workers who develop symptoms of chronic intoxication in the presence of a low concentration of hormones in the air must be FORBIDDEN to return to the polluted area. The effectiveness of preventive measures should be checked by analyses of the amount of hormonal compounds in the air of the working environment, and in the plasma of the employees; and by clinical examinations. The fact that cases of chronic intoxication may occur in spite of considerable efforts to minimize occupational exposure to sex hormones suggests the need for a closed system of the entire production process.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS Number: XU6200000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 259-564-3

Regulatory Authority and Advisory Information

Carcinogenicity: EPA. Group C, possible human carcinogen

Hazard Alert: Combustible, Possible sensitization hazard (skin), Possible environmental hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xi; risk phrases: R45; R29/35; R43; R50/53; R61; safety phrases: S29/35; S60; S61 (see Appendix 4) R43

Description: Yellow-orange crystalline solid. Mild amine odor. Commercial products and mixtures may contain flammable carriers (such as xylene); these may be red-orange liquids with a mild aromatic odor. Molecular weight = 333.26; specific gravity (H_2O:1) = 1.15; boiling point = [decomposes; may be dangerous above 200°C (solid); 70°C (liquid)]; freezing/melting point = 55°C−58°C; vapor pressure = 9×10^{-8} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Very slightly soluble in water; solubility = 0.35 ppm. @ 25°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Ethalfluralin is a 2,6-fluorodinitrotoluidine selective herbicide used for the pre-emergence control of annual grasses and broadleaf weeds in certain food and feed crops. Ethalfluralin may be used in growing a variety of grain, seed, and cucurbit crops. The greatest amounts of ethalfluralin are used in growing soybeans, dry beans, and sunflower seeds. Ethalfluralin is used only outdoors, in agriculture; no residential uses were registered. Not used in EU countries.

Incompatibilities: Sensitive to heat. Dintroanilines can be explosive and are strong oxidizers. Contact with reducing agents, other strong oxidizers or, nitrosylsulfuric acid may cause fire or explosion.

Permissible Exposure Limits in Air: No standards or PAC available.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Absorbed through the skin, inhalation, and ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Eye or dermal contact may cause severe irritation and serious damage. May be absorbed through the skin. Inhalation of vapor or mists should be avoided. Harmful if swallowed. May cause nausea and vomiting. May cause shortness of breath (dyspnea). LD_{50} (oral, rat) = 3000 to >5000[83] mg/kg; LD_{50} (dermal, rabbit) = > 2 g/kg.

Long-Term Exposure: May cause loss of appetite and anorexia nervosa. Ethalfluralin has caused birth defects in laboratory animals as well as liver, thyroid, kidney and blood effects

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

Contact physician if poisoning is suspected or if redness, itching, or a burning sensation develops in the eyes or skin. May cause sensitization.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

Personal Protective Methods: Dinitroanilines react with cellulose-based and expanded polymeric absorbents[88]. Prevent any reasonable probability of dermal and/or eye contact. Wear protective eye wear/goggles or face shield and protective clothing such as coveralls over long-sleeved shirt and full length pants; impermeable, chemical-resistant gloves when handling this product[83]. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material (such as DuPont Viton gloves and Tychem suit fabrics) for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code-Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. (2) Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong acids; strong bases and other incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Storage: Color code-Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9- Miscellaneous hazardous material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: For dinitroaniline solids, isolate spill or leak area in all directions for at least 50 m/150 ft. Increase, in the downwind direction, as necessary. *If tank, rail car, or tank truck is involved in spill*, isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: This chemical is a combustible solid but does not readily ignite. Liquid formulations may be combustible or flammable. Thermal decomposition products may include hydrogen chloride, hydrogen fluoride and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* Use dry chemical, CO_2, water spray, or regular *foam. On a large fire:* Use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Contact a licensed disposal facility about surplus and non-recyclable solutions. Burn in a chemical incinerator equipped with an afterburner and scrubber. Extra care must be exercised as the material in an organic solvent is highly flammable. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Do not reuse container.

Ethane E:0230

Formula: C_2H_6

Synonyms: Bimethyl; Dimethyl; Etano (Spanish); Ethyl hydride; Methylmethane

CAS Registry Number: 74-84-0

HSDB Number: 941

RTECS Number: KH3800000

UN/NA & ERG Number: UN1035 (compressed gas)/115; UN1961 (refrigerated liquid)/115

EC Number: 200-814-8 [*Annex I Index No.:* 601-002-00-X]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Extremely flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: F+ ; risk phrases: R5; R12; R16; R18; R21; safety phrases: S1; S2; S9; S16; S33; S38; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Ethane is a compressed, liquefied, colorless gas. Mild, gasoline-like odor. Odorless when pure. Molecular weight = 30.08; specific gravity (H_2O:1) = 0.45 @ 20°C (liquid); boiling point = −89°C; freezing/melting point = −172°C; flash point = flammable gas; autoignition temperature = 472°C. Explosive limits: LEL: 3.0%; UEL: 12.5%. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water. An aliphatic hydrocarbon gas (C1−C4).

Potential Exposure: Ethane is used as a fuel, in making chemicals or as a freezing agent. The health effects caused by ethane exposure are much less serious than the fire and explosion risk posed by this chemical.

Incompatibilities: Flammable gas; forms explosive mixture with air. Strong oxidizers may cause fire and explosions. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Odor threshold = 899 ppm.

OSHA PEL: Simple asphyxiant (Shipyards, Construction)

ACGIH TLV[1]: 1000 ppm TWA *as aliphatic hydrocarbon gas (C1−C4)*

PAC Ver. 29[138]

PAC-1: 65,000 ppm

PAC-2: 2.30E + 05 ppm

PAC-3: 4.00E + 05 ppm

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: MAK-W 10000 ppm (12500 milligram per cubic meter), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: Simple asphyxiant

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can cause headache, dizziness and make you feel lightheaded. Very high levels can cause suffocation from lack of oxygen. Contact with liquid ethane can cause frostbite. Ethane is highly flammable. It is a dangerous fire hazard.

Long-Term Exposure: Chronic health effects are unknown at this time.

First Aid: Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Wear gas-proof goggles, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Chemical cartridge respirators should not be used where ethane exposure occurs. For high exposures use air-supplied respirators. Exposure to ethane is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in the positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where ethane is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of ethane. Wherever ethane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1035 (compressed gas); UN1961 (refrigerated liquid): Ethane, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place, and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ethane is a flammable gas. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R11; R62;?; safety phrases: S1; (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethanolamines can be detected by odor as low as 2−3 ppm. *Monoethanolamine* is a colorless, viscous liquid or solid (below 111°C) with an unpleasant, ammonia-like odor. Molecular weight = 61.08; specific gravity (H_2O:1) = 1.02 @ 20°C; boiling point = 170.6°C; freezing/melting point = 10.5°C; vapor pressure = 0.4 mmHg @ 20°C; 0.75 mmHg @ 35°C; flash point = 85°C (cc); autoignition temperature = 410°C. Explosive limits: LEL: 3.0% (@140°C); UEL: 23.5%. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water. *Triethanolamine* has only a faint nonammonia odor. Molecular weight = 149.22; boiling point = 343°C; freezing/melting point = 21°C; flash point = 179°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Soluble in water. All three compounds are water soluble liquids.

Potential Exposure: Monoethanolamine is widely used in industry for scrubbing acid gases and in production of detergents and alkanolamide surfactants; to remove carbon dioxide and hydrogen from natural gas, to remove hydrogen sulfide and carbonyl sulfide; as an alkaline conditioning agent; as an intermediate for soaps, detergents, dyes, and textile agents. *Diethanolamine* is an absorbent for gases; a solubilizer for 2,4- dichlorophenoxyacetic acid (2,4-D); and a softener and emulsifier intermediate for detergents. It also finds use in the dye and textile industry. *Triethanolamine* is used as plasticizers, neutralizer for alkaline dispersions; lubricant additive; corrosion inhibitor; and in the manufacture of soaps, detergents, shampoos, shaving preparations; face and hand creams; cements, cutting oils, insecticides, surface active agents; waxes, polishes, and herbicides.

Incompatibilities: *Monoethanolamine:* This chemical is a medium-strong base. Reacts violently with strong oxidizers, acetic acid; acetic anhydride; acrolein, acrylic acid; acrylonitrile, cellulose nitrate; chlorosulfonic acid; epichlorohydrin, hydrochloric acid; hydrogen fluoride; mesityl oxide; nitric acid; oleum, sulfuric acid; β-propiolactone; and vinyl acetate. Reacts with iron. May attack copper, aluminum, and their alloys, and rubber. *Di-isomer*: Oxidizers, strong acids; acid anhydrides; halides. Reacts with CO_2 in the air. Hygroscopic (i.e., absorbs moisture from the air). Corrosive to copper, zinc, and galvanized iron (di-). The aqueous solution is a medium strong base. Attacks copper, zinc, aluminum, and their alloys.

Permissible Exposure Limits in Air

PAC-3: 130 milligram per cubic meter

Several states have set guidelines or standards for diethanolamine in ambient air[60] ranging from 150 μ/m^3 (North Dakota) to 250 μ/m^3 (Virginia) to 300 μ/m^3 (Connecticut) to 357 μ/m^3 (Nevada). A large number of states have set guidelines or standards for monoethanolamine in ambient air[60] ranging from 19.048 μ/m^3 (Kansas) to 26.7 μ/m^3 (New York) to 80.0 μ/m^3 (Florida) to 80.0–150.0 μ/m^3 (North Dakota) to 120 μ/m^3 (Connecticut) to 130.0 μ/m^3 (Virginia) to 190.0 μ/m^3 (Nevada) to 200.0 μ/m^3 (South Carolina).

Determination in Air: *Monoethanolamine*: Use NIOSH Analytical Method: Aminoethanol compounds I: 2007; or OSHA Analytical Method PV-2111

Permissible Concentration in Water: EPA[32] has suggested permissible ambient limits of 83 μg/L. Russia[43] has set MAC values in water bodies used for domestic purposes of 0.8 mg/L for diethanolamine and 1.4 mg/L for triethanolamine but no MAC for monoethanolamine.

Determination in Water: No tests listed. Octanol-water coefficient: Log $K_{ow} = -1.3$.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

The LD$_{50}$ oral-rat for the isomers is as follows: *mono*-2050 mg/kg (slightly toxic); *di* −710 mg/kg (slightly toxic); *tri*-8000 mg/kg (insignificantly toxic). All three compounds cause irritation to nose, throat and lungs upon inhalation. Skin contact causes irritation, stinging and burns. Eye contact can cause severe irritation. Ingestion can cause nausea and intestinal irritation. Fatal doses are estimated by NY State to be 6 g of monethanolamine for a 150-pound man.

Short-Term Exposure: *Monoisomer:* Corrosive to the eyes and irritates the skin and respiratory tract. Inhalation may cause asthmatic reactions. May affect CNS and may cause unconsciousness. *Di-isomer:* Corrosive to the eyes. Irritates the eyes, skin, and respiratory tract.

Long-Term Exposure: *Monoisomer:* Repeated or prolonged contact with skin may cause dermatitis and ulceration and lungs may be affected. May affect the CNS; kidneys, liver, and blood, causing asthenia, hematological changes, and tissue lesions. *Di-isomer:* May affect the kidneys and liver.

Points of Attack: Eyes, skin, respiratory system, and CNS

Medical Surveillance: With monoethanolamine, if symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

With diethanolamine: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended. Lung function tests. If symptoms develop or overexposure is suspected the following may be useful: Skin testing with dilute diethanolamine may help diagnose allergy if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. 8 hours: Neoprene rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; Viton gloves, suits; 4 H and Silver Shield gloves, Tychem 1000 suits; 4 hours: polyvinyl chloride gloves, suits, and boots. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Monoethanolamine:* Up to 30 ppm: CcrS * (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator); * or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethanolamine must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) and strong acids, (such as hydrochloric, sulfuric and nitric acids), because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where ethanolamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2491 Ethanolamine or Ethanolamine solutions, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

EC Number: 240-718-3 [*Annex I Index No.:* 015-514-00-4]

Regulatory Authority and Advisory Information: Carcinogenicity[83]: EPA Group D, Not classifiable as a human carcinogen

Hazard Alert: Poison, Neurotoxin (cumulative), Corrosive (resp.), Environmental hazard, Agricultural chemical.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, C, H, N; risk phrases: R20/21; R34; R52/53; safety phrases: S1/2; S26; S28; S29/35; S36/37/39; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ethephon is a white to tan powder. Commercial product is a white, waxy solid. Commercial products may be available as aqueous solutions or soluble concentrates. Molecular weight = 144.49; specific gravity (H 2 O:1) = 1.2; 1.65; boiling point = (decomposes) 265°C; freezing/melting point = 73−74°C; vapor pressure = 1.1×10^{-7} mmHg @ 20°C; <0.01 mmHg @ 20°C. High solubility in water; solubility = <1 kg/L. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Ethephon is an organophosphonate plant growth regulator used to promote fruit ripening, abscission, flower induction, and other responses. It is registered for use on a number of food, animal feed and nonfood crops (rubber plants, flax), greenhouse nursery stock, and outdoor residential ornamental plants, but is used primarily on cotton. Ethephon is applied to plant foliage by either ground or aerial equipment. It also may be applied by hand sprayer to certain home garden vegetables and ornamentals. Use practice limitations include prohibitions against applying ethephon through any type of irrigation system; feeding or grazing livestock in treated areas; and treating within 2 to 60 days of harvest, depending on the crop.

Incompatibilities: Hygroscopic. Aqueous solutions are highly acidic. May cause corrosion if metals, especially when moisture is present. Contact with flammable material may cause fire and explosions. Contact with combustible or oxidizable materials may form heat-, shock-, and friction-sensitive explosive mixtures. Static electricity may also cause explosions. Keep away from all acids, especially dibasic organic acids, ammonium compounds, antimony sulfide, arsenic trioxide, metal sulfides, powdered metals, calcium aluminum hydride, cyanides, manganese dioxide, phosphorus, selenium, sulfur, thiocyanates, and zinc.

Determination in Water: Octanol-water coefficient: Log $K_{\mathrm{ow}} = -0.22$[83,161]. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low−26627.94738 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Harmful Effects and Symptoms

Ethephon is an organophosphonate or salt of a phosphonic acid. Unlike organophosphates, it may not inhibit activity of the enzyme acetylcholinesterase that is essential for transmission of nerve signals in animals and insects. Nevertheless, the metal ions may act as a neurotoxin.

Short-Term Exposure: Highly corrosive. Because this material has a low vapor pressure and volatility, significant inhalation of vapors is unlikely at ordinary temperatures. Delayed pulmonary edema may occur after inhalation. LD_{50} (oral, rat) = >3 g/kg; LD_{50} (dermal, rabbit) = >5 g/kg.

Long-Term Exposure: A cholinesterase inhibitor. A neurotoxin. May cause heart problems. Human toxicity (long term)[101]: Very low−126.0 ppb, Health advisory

Points of Attack: CNS, cardiovascular system, skin, and eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Routine biological monitoring of pesticide applicators and field workers includes testing of plasma and red blood cell acetylcholinesterase levels (for enzyme poisoned by this chemical). These tests are normally accurate only if done within about 2 hours of exposure. If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate pesticides is recommended until enzyme levels recover. Do not drink any alcoholic beverages before or during use as it promotes absorption of organophosphates.

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: (1) Color code-Blue: Health Hazard/Toxics/ Poisons: Store in a secure poison location. (2) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. (3) Color code-Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Store in tightly closed containers in a cool, well-ventilated area. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong acids; strong bases and other incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2928 Toxic solids, corrosive, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Stay upwind; keep out of low areas. Ventilate area of spill or leak. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* Dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Fire Extinguishing: Decomposes starts above 250°C releasing oxides of nitrogen, sulfur, phosphorus, and carbon. May be fatal if inhaled, ingested or absorbed through skin. Inhalation or contact with some of these materials will irritate or burn skin and eyes. Vapors may cause dizziness or suffocation. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire:* Dry chemical, carbon dioxide or water spray. *Large fire:* Dry chemical, carbon dioxide, alcohol-resistant foam or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/trailer loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destruction by alkali hydrolysis or incineration. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

CAS Registry Number: 57-63-6

HSDB Number: 3587

RTECS Number: RC8925000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 200-342-2

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Limited Evidence (Equigyne), *carcinogenic to humans*, Group 1, 1998; NTP 13th Report on Carcinogens[10]

California Proposition 65 Chemical[102]: Cancer 1/1/1988; Developmental/Reproductive toxin 1/1/1990.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard, Drug.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R45; R23/24/25; R34; R60; R62; R63; safety phrases: S41; S45; S53 (see Appendix 4).

Description: Ethinylestradiol is a white to creamy-white powder. Odorless. Molecular weight = 296.44; freezing/melting point = 142°C−146°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0.

Potential Exposure: A synthetic steroid. Used in medicine, in combination with progestogen, as an estrogenic hormone and as an oral contraceptive.

Incompatibilities: May react exothermically with reducing agents to generate flammable gaseous hydrogen. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices. *Note:* An industrial guideline of 0.05 μg airborne estrogen dust)/m^3 TWA (8 h work-day) was adopted at one manufacturing company.

Harmful Effects and Symptoms

Short-Term Exposure: Nausea, vomiting, abdominal cramps; bloating, cholasma, cholestatic jaundice; skin eruptions; loss of scalp hair; hirsutism, changes in menstrual flow; headache, migraine, dizziness, mental depression, increase or decrease in weight, edema, changes in libido, and breast enlargement.

Long-Term Exposure: A confirmed carcinogen. May have teratogenic effects and reproductive effects. Human mutation data reported.

First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsion, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere and protect from exposure to light.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-

up is complete. Remove all ignition sources and dampen spilled material with 60%−70% ethanol. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

EC Number: 209-242-3 [*Annex I Index No.:* 015-047-00-2]

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Negative: Histidine reversion-Ames test Negative: In vitro UDS-human fibroblast; TRP reversion Negative: *S. cerevisiae-homozygosis* Inconclusive: *B. subtilis* rec assay; *E. coli polA* without S9.

Hazard Alert: Poison inhalation hazard, Possible cumulative neurotoxin, Combustible, Suspected of causing genetic defects, Environmental hazard.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant

United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041. Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R21; R25; R33; R50/53; R62; safety phrases: S1/2; S25; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Ethion is a colorless to amber-colored, odorless liquid. The technical product has a very disagreeable odor; freezing/melting point = −13°C − 12°C. Molecular weight = 384.49; boiling point = 164°C; vapor pressure = 0.0000015 mmHg @ 20°C; flash point = 176°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.0001%.

Potential Exposure: An organothiophosphate. A potential danger to those involved in the manufacture, formulation and application of this insecticide and acaricide. Ethion is a preharvest topical insecticide used primarily on citrus fruits, deciduous fruits, nuts, and cotton. It is also used as a cattle dip for ticks and as a treatment for buffalo flies.

Incompatibilities: Incompatible with alkaline formulations and strong acids. Decomposes violently when heated above 150°C. Mixtures with magnesium may be explosive. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides; may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.4 milligram per cubic meter [skin]

ACGIH TLV [1]: 0.05 milligram per cubic meter TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEIA issued as Acetylcholinesterase inhibiting pesticides.

PAC Ver. 29[138]

PAC-1: 1.2 milligram per cubic meter

PAC-2: 13 milligram per cubic meter

PAC-3: 38 milligram per cubic meter

Australia: TWA 0.4 milligram per cubic meter, [skin], 1993; Belgium: TWA 0.4 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.4 milligram per cubic meter, [skin], 1999; France: VME 0.4 milligram per cubic meter, [skin], 1999; Switzerland: MAK-W 0.4 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.4 milligram per cubic meter, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for Ethion in ambient air[60] ranging from 4.0 μ/m^3 (North Dakota) to 6.0 μ/m^3 (Connecticut) to 9.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH (IV), Method #5600, Organophosphorus Pesticide.

Permissible Concentration in Water: California[61] has set a guideline for Ethion in drinking water of 35 μg/L.

Determination in Water: No tests listed. Octanol-water coefficient: Log $K_{ow} = 5.1$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Harmful Effects and Symptoms

Symptoms may include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; headache, giddiness, weakness, muscle twitching; difficult breathing; blurring or dimness of vision; and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles; intense bronchoconstriction, or all three. This material is very toxic; the probable oral lethal dose for humans is 50–500 mg/kg, which is between one teaspoonful and one ounce for a 150 lb person.

Short-Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and GI tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Exposure may cause unconsciousness and death. The effects may be delayed and medical observation is recommended.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Ethion may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. 4 hours: Teflon gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid or wear dust-proof goggles when working with powders or dusts, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 0.4 milligram per cubic meter, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from alkaline material, strong acids and other incompatible materials listed above. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not empty into drains or sewage system. Small amounts can be burned with alkali[22]. For larger amounts, the suggested method is incineration with added solvent in furnace equipped with afterburner and alkali scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Formula: $C_{13}H_{18}O_5S$

Synonyms: Batamix progress; 5-Benzofuranol, 2-ethoxy-2,3-dihydro-3,3-dimethyl-, methanesulfonate (+)-; Betanal; Ethosat 500; 2-Ethoxy-2,3-dihydro-3,3-dimethyl-5-benzofuranyl methanesulfonate,(+)-; 2-Ethoxy-2,3-dihydro-3,3-dimethylbenzofuran-5-yl methanesulfonate; Kemiron; Nortron; NC-8438; Powertwin; Prograss; Progress; Tandem; Torero

CAS Number: 26225-79-6

HSDB Number: 7451

RTECS Number: DF7716500

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 247-525-3 [*Annex I Index No.:* 607-314-00-2]

Potential Exposure: Benzofuran herbicide used to control weeds in sugar beet crops.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group D, Not classifiable as a human carcinogen

Hazard Alert: Combustible, Environmental hazard.

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R51/53; safety phrases: S2; S29; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Colorless to white crystalline solid. Commercial formulations include flowable concentrate, emulsifiable concentrate, and granular products. Mild aromatic odor. Molecular weight = 286.33; freezing/melting point = 71°C; boiling point = (decomposes); specific gravity (H_2O:1) = 1.25 @ 20°C; vapor pressure = 4.9×10^{-6} mmHg @ 20°C; 8.6×10^{-7} mmHg @ 25°C; flash point = 80°C; 100°C[lit.]. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water; solubility = 110 ppm @ 25°C. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air: No standards or PAC available.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Determination in Water: Octanol-water coefficient: Log $K_{ow} = \sim 2.7$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Intermediate—58.73095 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Inhalation, ingestion, and dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May irritate eyes, skin, and respiratory tract. May be harmful if inhaled. May be harmful if swallowed. LD_{50} (oral, rat) = < 1200 mg/kg; LD_{50} (dermal, rat) = > 1200 mg/kg.

Long-Term Exposure: Possible eye problems. Human toxicity (long term)[101]: Very low—2800.00 ppb, Health advisory

Points of Attack: Liver, kidney, and cornea.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of sulfur and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* Use dry chemical, CO_2, water spray or regular *foam. On a large fire:* Use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical, as organic phosphate, Substance ID: EDF-041

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xi; risk phrases: R45; R23/24/25; R26/27; R29/35; R33; R43; R50/53; safety phrases: S1/2; S27/28; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethoprophos is a pale yellow liquid. Molecular weight = 242.36; boiling point = 88°C @ 0.2 mmHg; vapor pressure = 0.0004 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this nematocide and soil insecticide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.14 milligram per cubic meter

PAC-2: 1.6 milligram per cubic meter

PAC-3: 9.3 milligram per cubic meter

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Fish Tox = 0.47783000 ppb (EXTRA HIGH)

Determination in Soil: Soil Adsorption Index (Koc) = 70

Routes of Entry: Inhalation, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms are similar to parathion and may include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; headache, giddiness, weakness, muscle twitching; difficult breathing; blurring or dimness of vision; and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. Human Tox = 12.45550 ppb (INTERMEDIATE). It is a cholinesterase inhibitor which affects the nervous system.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and

storage. Store in tightly closed containers in a cool, well ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m)	100/30
Then: Protect persons downwind (mi/km)	
Day	0.3/0.4
Night	0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m)	600/200
Then: Protect persons downwind (mi/km)	
Day	1.4/2.3
Night	2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. *For small fires*, use dry chemical, carbon dioxide; water spray; or foam. *For large fires*, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: 2-Ethoxyethanol is a colorless, viscous liquid with a sweetish odor. Molecular weight = 90.12; specific gravity (H 2O:1) = 0.93 @ 20°C; boiling point = 135°C; freezing/melting point = −70°C; vapor pressure = 4 mmHg @ 20°C; 7.5 mmHg @ 30°C; flash point = 43.3°C; autoignition temperature = 235°C. Explosive limits: LEL: 1.7% @ 93°C; UEL: 15.6% @ 93°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: This material is used as a solvent for nitrocellulose and alkyd resins in lacquers; as a solvent for printing inks; in dyeing leathers and textiles; in the formulation of cleaners and varnish removers; as an anti-icing additive in brake fluids and auto and aviation fuels.

Incompatibilities: May form explosive mixture with air. Strong oxidizers may cause fire and explosions. Attacks some plastics, rubber and coatings. Able to form peroxides. Incompatible with strong acids; aluminum and its alloys.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

Odor threshold = 2.7 ppm.

OSHA PEL: 200 ppm/740 milligram per cubic meter TWA [skin]

NIOSH REL: 0.5 ppm/1.8 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 5 ppm/ 18 milligram per cubic meter TWA [skin]; BEI: 100 mg[2-ethoxyacetic acid]/g creatinine in urine at end of work-week

PAC Ver. 29[138]

PAC-1: 15 ppm

PAC-2: 1000 ppm

PAC-3: 6000 ppm

DFG MAK: 5 ppm/19 milligram per cubic meter TWA; Peak Limitation Category II(8) [skin]; BAT: 50 mg [Ethoxyacetic acid]/g creatinine in urine at end-of-shift; after several shifts (long term); Pregnancy Risk Group B

Australia: TWA 5 ppm (19 milligram per cubic meter), [skin], 1993; Austria: MAK 20 ppm (75 milligram per cubic meter), [skin], 1999; Belgium: TWA 5 ppm (18 milligram per cubic meter), [skin], 1993; Denmark: TWA 5 ppm (18.5 milligram per cubic meter), [skin], 1999; Finland: TWA 50 ppm (185 milligram per cubic meter); STEL 100 ppm (370 milligram per cubic meter), [skin], 1999; France: VME 5 ppm (19 milligram per cubic meter), [skin], 1999; Hungary: TWA 70 milligram per cubic meter; STEL 140 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 19 milligram per cubic meter, [skin], 2003; Norway: TWA 5 ppm (18 milligram per cubic meter), 1999; the Philippines: TWA 200 ppm (740 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 20 milligram per cubic meter, MAC (STEL) 80 milligram per cubic meter, 1999; Russia: TWA 5 ppm; STEL 5 milligram per cubic meter, 1993; Sweden: NGV 5 ppm (19 milligram per cubic meter), KTV 10 ppm (40 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 5 ppm (19 milligram per cubic meter), KZG-W 10 ppm (38 milligram per cubic meter), [skin], 1999; Turkey: TWA 200 ppm (740 milligram per cubic meter), 1993; United Kingdom: TWA 10 ppm (37 milligram per cubic meter), [skin], 2000; New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 5 ppm [skin]. Finally, Russia[43] set a MAC in ambient air in residential areas of 0.7 milligram per cubic meter on a once daily basis[35]. Several states have set guidelines or standards for ethoxyethanol in ambient air[60] ranging from 120−190 μ/m^3 (North Carolina) to 180 μ/m^3 (Florida and New York) to 190 μ/m^3 (North Dakota) to 320 μ/m^3 (Virginia) to 380 μ/m^3 (Connecticut) to 452 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1403, alcohols IV or OSHA Analytical Methods 53 or 79.

Permissible Concentration in Water: Russia set a MAC in surface water of 1.0 mg/L.

Determination in Water: No tests listed. Octanol-water coefficient: Log $K_{ow} = -0.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: 2-Ethoxyethanol can affect you when breathed in and by passing through your skin. Irritates the eyes, skin and respiratory tract. High levels may cause headache, drowsiness, dizziness, lightheadedness and even passing out. Exposure may cause CNS depression, liver, and kidney damage. LD_{50} = (oral-rat) 2125 mg/kg (slightly toxic). Medical observation is recommended.

Long-Term Exposure: 2-Ethoxyethanol should be handled as a teratogen-with extreme caution. It may damage the testes, resulting in decreased fertility. Exposure may affect blood cells, causing a low blood count (anemia) and lesions of blood cells. Prolonged or repeated contact defats the skin. May cause liver and kidney damage.

Points of Attack: Eyes, respiratory system, blood, kidneys, liver, reproductive system, and hematopoietic system

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: complete blood count. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Liver function tests. NIOSH lists the following test: urine (chemical/metabolite) End-of-shift at end-of-work-week.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim under medical observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. 8 hours: Saranex coated suits; Responder suits; 4 hours: 4 H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: Up to 5 ppm: Sa (APF = 10) (any supplied-air respirator). Up to 12.5 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). Up to 25 ppm: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Up to 500 ppm: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Ethoxyethanol must be stored to avoid contact with strong oxidizers, such as nitrates, permanganates, chlorine, bromine, or chlorine dioxide, since violent reaction occur. Store in tightly closed containers in a dark, cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where 2-ethoxyethanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Keep in dark because of possible formation of explosive peroxides.

Shipping: UN1171 Ethylene glycol monoethyl ether, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Several states have set guidelines or standards for ethoxyethyl acetate in ambient air[60] ranging from 270 μ/m^3 (North Dakota) to 450 μ/m^3 (Virginia) to 540 μ/m^3 (Connecticut and South Dakota) to 643 μ/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS2, analysis by gas chromatography /flame ionization. Use NIOSH Analytical Method #1450 or OSHA Analytical Methods 53 and 79.

Determination in Water: No tests listed. Octanol-water coefficient: Log $K_{ow} = < 0.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, and eyes and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: 2-Ethoxyethylacetate can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose and throat. High levels could cause you to become dizzy, lightheaded, and to pass out. Very high exposures could cause kidney damage and even death. May affect the blood and CNS.

Long-Term Exposure: 2-Ethoxyehylacetate may damage the developing fetus. It may damage the testes (male reproductive glands), resulting in decreased fertility. It may affect the blood, liver, and kidneys. Many similar petroleum-based solvents have been shown to cause brain and nerve damage.

Points of Attack: Inhalation, skin absorption, ingestion, and skin and/or eye contact

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Complete blood count. Evaluate for brain effects and consider evaluation of the nervous systems.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. 8 hours: Barricade coated suits; Responder suits; 4 hours: polyvinyl alcohol gloves; 4 H and Silver Shield gloves. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: 5 ppm: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; Sa (APF = 10) (any supplied-air respirator). 12.5 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. 25 ppm: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 500 ppm: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Ethoxyethylacetate must be stored to avoid contact with strong oxidizers, such as nitrates, permanganates, bromine, chlorine, and chlorine dioxide; strong alkalis, such as sodium hydroxide and potassium hydroxide; and strong acids, such as nitric, hydrochloric, and sulfuric acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where 2-ethoxyethylacetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1172 Ethylene glycol monoethyl ether acetate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

HSDB Number: 400

RTECS Number: VB8225000

UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 202-075-7 [*Annex I Index No.:*613-014-00-2]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Suspected reprotoxic hazard

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R19; R22; R61; safety phrases: S2; S24 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Transparent yellow or brown viscous liquid. Molecular weight = 217.32; specific gravity (H_2O:1) = 1.032 @ 25°C; boiling point = 124°C; 150°C @ 2 mmHg (decomposes); freezing/melting point = −20°C; specific gravity (H_2O:1) = 1.029 @ 25°C; vapor pressure = 2.56×10^{-4} mmHg @ 25°C Flash point = 143°C(oc). Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = < 1 mg/L @25°C.

Potential Exposure: Quinoline insecticide, fungicide and plant growth regulator. Also and ingredient in other products. Used for preharvest or postharvest preservation of color in apples and pears. It is used as an anti-oxidant to preserve color in paprika and ground and powdered chili. Ethoxyquin also is a chemical preservative used in animal feed to prevent ingredients from reacting with oxygen and becoming rancid. It has been known to cause birth defects in pet birds and dogs.

Incompatibilities: Polymerization can occur on contact with strong light and/or water. Decomposes in temperatures above 150°C. Keep away from oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); strong acids.

Determination in Air: No occupational or safety limits found.

Determination in Water: Octanol-water coefficient: Log K_{ow} = > 3.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, and eye and/or dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical can irritate skin, eyes and respiratory tract. Harmful if swallowed. May cause reversible liver problems. Overexposure may cause irritation of the GI tract. May affect CNS and behavior causing respiratory problems, convulsions, coma, loss of voluntary muscle control; lack of balance and coordination; drowsiness. LD_{50} (oral, rat) = 800− > 1725 mg/kg.

Long-Term Exposure: May cause dermatitis. Possible blood, bladder, liver and kidney toxin. May be a skin sensitizer; causing allergic skin reaction. May affect metabolism, blood resulting in a change in clotting factor. May be mutagenic.

Points of Attack: Skin, lungs, liver, and kidney

Medical Surveillance: With ethoxyquin, if symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests; routine blood analysis. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure, locked poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* Use dry chemical, CO_2, water spray or regular *foam. On a large fire:* Use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl acetate is a colorless liquid. Pleasant, fruity odor. Molecular weight = 88.11; specific gravity (H_2O:1) = 0.90; boiling point = 77°C; freezing point = −82.8; vapor pressure = 75 mmHg @ 20.4°C; flash point = −4.4°C; autoignition temperature = 426°C. Explosive limits: LEL: 2.0%; UEL: 11.5%. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 0.9%.

Potential Exposure: This material is used as a solvent for nitrocellulose and lacquer. It is also used in making dyes, flavoring and perfumery, and in smokeless powder manufacture.

Incompatibilities: May form explosive mixture with air. Heating may cause violent combustion or explosion. Incompatible with strong acids; strong alkalies; nitrates, strong oxidizers; chlorosulfonic acid; lithium aluminum hydride; oleum will hydrolyze on standing forming acetic acid and ethyl alcohol. This reaction is greatly accelerated by alkalies. Decomposes under influence of UV light, bases, and acids. Attacks aluminum and plastics.

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 ppm [LEL]

Conversion factor: 1 ppm = 3.60 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 3.9 ppm in air

OSHA PEL: 400 ppm/1400 milligram per cubic meter TWA

NIOSH REL: 400 ppm/1400 milligram per cubic meter TWA

ACGIH TLV[1]: 400 ppm/1440 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 1200 ppm

PAC-2: 1700 ppm

PAC-3: 10,000 ppm

DFG MAK: 400 ppm/1500 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group C

Australia: TWA 400 ppm (1400 milligram per cubic meter), 1993; Austria: MAK 400 ppm (1400 milligram per cubic meter), 1999; Belgium: TWA 400 ppm (1440 milligram per cubic meter), 1993; Denmark: TWA 150 ppm (540 milligram per cubic meter), 1999; Finland: TWA 300 ppm (1100 milligram per cubic meter); STEL 500 ppm (1800 milligram per cubic meter), 1993; France: VME 400 ppm (1400 milligram per cubic meter), 1999; Hungary: TWA 400 milligram per cubic meter; STEL 1200 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 550 milligram per cubic meter, 2003; Norway: TWA 150 ppm (550 milligram per cubic meter), 1999; the Philippines: TWA 400 ppm (1400 milligram per cubic meter), 1993; Poland: MAC (TWA) 200 ppm, MAC (STEL) 600 milligram per cubic meter, 1999; Russia: TWA 400 ppm; STEL 200 milligram per cubic meter, 1993; Sweden: NGV 150 ppm (500 milligram per cubic meter), KTV 300 ppm (1100 milligram per cubic meter), 1999; Switzerland: MAK-W 400 ppm (1400 milligram per cubic meter), KZG-W 800 ppm (2800 milligram per cubic meter), 1999; Turkey: TWA 400 ppm (1400 milligram per cubic meter), 1993; United Kingdom: TWA 400 ppm (1460 milligram per cubic meter), 2000; New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 400 ppm. the Czech Republic:[35] 400 milligram per cubic meter, Russia[35,43] set a MAC value in the ambient air of residential areas of 0.1 milligram per cubic meter on either a momentary or a daily average basis. Several States have set guidelines or standards for ethyl acetate in ambient air[60] ranging from 2.0 milligram per cubic meter (Massachusetts) to 14.0 milligram per cubic meter (North

Dakota) to 23.0 milligram per cubic meter (Virginia) to 28.0 milligram per cubic meter (Connecticut, Florida, New York and South Dakota) to 33.333 milligram per cubic meter (Nevada) to 140.0 milligram per cubic meter (North Carolina).

Determination in Air: Use NIOSH Analytical Method #1450 or OSHA Analytical Method 7.

Permissible Concentration in Water: Russia set a MAC in surface water of 0.2 mg/L.

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl acetate can affect you when breathed in and by passing through your skin. Exposure to high levels can cause you to feel dizzy and lightheaded. Very high levels could cause you to pass out. Repeated contact can cause drying and cracking of the skin. The vapor can irritate the eyes and respiratory tract. Ethyl acetate is a flammable liquid and a fire hazard. May affect the CNS. Very high exposure may result in death.

Long-Term Exposure: May decrease the fertility in males. Repeated contact can cause drying and cracking of the skin. Many similar petroleum-based chemicals can cause brain and nerve damage.

Points of Attack: Eyes, skin, and respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Evaluate for brain and nervous system damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: 4 H and Silver Shield gloves; Barricade coated suits; CPF3 suits; Responder suits, Trellchem HPS suits; Trychem 1000 suits, 4 hours: polyvinyl alcohol gloves; Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 2000 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:*

SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl acetate must be stored to avoid contact with nitrates; strong oxidizers; such as chlorine, bromine, chlorine dioxide, nitrates, and permanganates; strong alkalis, such as sodium hydroxide and potassium hydroxide; or strong acids, such as sulfuric acid, hydrochloric acid, and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where ethyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of ethyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl acetate. Store in containers that are properly labeled with health hazard information and safe handling procedures. Wherever ethyl acetate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1173 Ethyl acetate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive

limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Ethyl acetylene E:0310

Formula: C_4H_6; $C_2H_5C{\equiv}CH$

Synonyms: 1-Butine; 1-Butino (Spanish); 1-Butyne; Ethylacetylene; Ethyl ethyne

CAS Registry Number: 107-00-6

RTECS Number: ER9553000

UN/NA & ERG Number: UN2452 (stabilized)/116 (P)

EC Number: 203-451-3

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Extremely flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Polymerization hazard.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: F + , risk phrases: R5; R12; R18; R19; R21; safety phrases: S1; S9; S16; S23; S33; S38; S45.

Description: Ethyl acetylene is a colorless, compressed gas or liquid. Molecular weight = 54.0; boiling point = 8.1°C; freezing/melting point = −130°C; flash point ≤ −7°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 2. Practically insoluble in water.

Potential Exposure: A simple asphyxiant. Ethyl acetylene is used as a fuel and as a chemical intermediate.

Incompatibilities: Extremely flammable; forms explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, copper and its alloys, and various plastics including Teflon. May undergo violent polymerization when subjected to heat, direct sunlight, or contamination.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl acetylene can affect you when breathed in. Exposure can cause you to feel dizzy, lightheaded and to pass out. Exposure to very high levels can cause suffocation and death due to lack of oxygen.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce

vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Wear gas-proof goggles and face shield, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to ethyl acetylene is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ethyl acetylene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine and fluorine), since violent reactions occur. Protect cylinders from physical damage and store away from potential heat sources. Sources of ignition, such as smoking and open flames, are prohibited where ethyl acetylene is handled, used, or stored. Wherever ethyl acetylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2452 Ethylacetylene, stabilized, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Water spray may be used to reduce vapors. Keep ethyl acetylene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations.

Fire Extinguishing: This chemical is an unstable, flammable gas. Thermal decomposition products may include oxides of carbon and flammable hydrogen gas. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier.

EC Number: 205-438-8 [*Annex I Index No.:* 607-032-00-X]

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Carcinogenesis Studies (gavage); clear evidence: mouse, rat; IARC: Animal Sufficient Evidence; Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1999; NIOSH: Potential occupational carcinogen.

California Proposition 65 Chemical[102]: Cancer 7/1/1989.

Hazard Alert: Highly flammable liquid, Polymerization hazard (nonstabilized), Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Sensitization hazard (skin), Primary irritant (w/o allergic reaction), Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U113 RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xn, Xi; risk phrases: R45; R11; R19; R20/21/22; R36/37/38; R43; R62; R63; safety phrases: S2; S9; S16; S21; S29/35; S33; S36/37; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ethyl acrylate is a colorless liquid. Sharp, acrid odor. The Odor Threshold is 0.00024−0.0009 ppm. Molecular weight = 100.12; boiling point = 99.4°C; freezing/melting point = −71°C; vapor pressure = 29 mmHg @ 20°C; vapor pressure = 75 mmHg @ 38.5°C; flash point = 10°C (oc); autoignition temperature = 372°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2. Explosive limits: LEL: 1.4%; UEL: 14%. Slightly soluble in water.

Potential Exposure: This material is used in emulsion polymers for paints, textiles, adhesives, coatings and binders; as a monomer in the manufacture of homopolymer and copolymer resins for the production of paints and plastic films.

Incompatibilities: May form explosive mixture with air. Atmospheric moisture and strong alkalies may cause fire and explosions unless properly inhibited (*Note:* Inert gas blanket not recommended). Heat, light or peroxides can cause polymerization. Incompatible with oxidizers (may be violent), peroxides, polymerizers, strong alkalis; moisture, chlorosulfonic acid, strong acids; amines. May accumulate static electrical charges, and may cause ignition of its vapors. Polymerizes readily unless an inhibitor, such as hydroquinone is added. Uninhibited vapors may plug vents by the formation of polymers.

Permissible Exposure Limits in Air

NIOSH IDLH = 300 ppm, Potential occupational carcinogen

OSHA PEL: 25 ppm/100 milligram per cubic meter TWA [skin]

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 5 ppm/20 milligram per cubic meter TWA; 15 ppm/61 milligram per cubic meter STEL; [skin], not classifiable as a human carcinogen

PAC* Ver. 29[138]

PAC-1: **8.3**$_{\mathbf{A}}$ ppm

PAC-2: **36**$_{\mathbf{A}}$ ppm

PAC-3: **240**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 5 ppm/21 milligram per cubic meter; [skin] danger of skin sensitization; Pregnancy Risk Group C

Australia: TWA 5 ppm (20 milligram per cubic meter), 1993; Austria: MAK 5 ppm (20 milligram per cubic meter), 1999; Belgium: TWA 5 ppm (20 milligram per cubic meter); STEL 25 ppm (100 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (20 milligram per cubic meter), [skin] 1999; Finland: TWA 5 ppm (20 milligram per cubic meter); STEL 10 ppm (40 milligram per cubic meter), [skin] 1993; France: VME 5 ppm (20 milligram per cubic meter), [skin] 1999; Hungary: STEL 10 milligram per cubic meter, [skin] carcinogen, 1993; the Netherlands: MAC-TGG 20 milligram per cubic meter, [skin] 2003; Norway: TWA 5 ppm (20 milligram per cubic meter), 1999; the Philippines: TWA 25 ppm (100 milligram per cubic meter), [skin] 1993; Poland: TWA 20 milligram per cubic meter; STEL 80 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter, 1993; Sweden: NGV 5 ppm (20 milligram per cubic meter), KTV 10 ppm (40 milligram per cubic meter), [skin] 1999; Switzerland: MAK-W 5 ppm (20 milligram per cubic meter), KZG-W 10 ppm (40 milligram per cubic meter), 1999; Turkey: TWA 25 ppm (100 milligram per cubic meter), [skin] 1993; United Kingdom: TWA 5 ppm (21 milligram per cubic meter); STEL 15 ppm (62 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 15 ppm. The Czech Republic[35] and Russia[43] have set MAC values in ambient air of residential areas at 0.05 milligram per cubic meter (50 μ/m^3). Several states have set guidelines or standards for ethyl acrylate in ambient air[60] ranging from 0.28 μ/m^3 (Massachusetts) to 350.0 μ/m^3 (Virginia) to 400 μ/m^3 (Connecticut) to 200−1000 μ/m^3 (North Dakota) to 476.0 μ/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1450 or OSHA Analytical Method 92.

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.005 mg/L (5 μg/L).

Determination in Water: No tests listed. Octanol-water coefficient: Log $K_{ow} = 1.3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl acrylate can affect you when breathed in and by passing through your skin. Ethyl acrylate is corrosive and can severely irritate and burn the eyes and skin. Inhalation can cause severe irritation and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Breathing very high levels of ethyl acrylate can cause dizziness, difficulty breathing and even death. Contact may cause a skin allergy.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis and skin allergy. May affect the liver and kidneys. This chemical may be a human carcinogen; it has been shown to cause stomach cancer in animals. May damage the developing fetus. Highly irritating substances may cause lung damage.

Points of Attack: Eyes, skin, and respiratory system. Cancer site in animals: tumors of the fore-stomach.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Liver function tests. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: polyvinyl alcohol gloves; Teflon gloves, suits, boots; Responder suits; Trychem 1000 suits, 4 hours: 4 H and Silver Shield gloves. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Ethyl acrylate must be stored to avoid contact with oxidizers (such as peroxides, perchlorates, chlorates, nitrates and permanganates); strong alkalis (such as sodium hydroxide and potassium hydroxide) and moisture, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Heat can cause ethyl acrylate to react by itself. If this takes place in a closed container, an explosion could occur. Ethyl acrylate usually contains as inhibitor, such as hydroquinone or its methyl ether to prevent a self-reaction. If it does not contain an inhibitor, the reaction may occur without the application of heat. Sources of ignition, such as smoking and open flames, are prohibited where ethyl acrylate is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethyl acrylate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of ethyl acrylate. Wherever ethyl acrylate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1917 Ethyl acrylate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. May polymerize and cause container to explode. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration[22] or by absorption and landfill disposal[22].

Regulatory Authority and Advisory Information

Carcinogenicity: Alcoholic Beverage Consumption, NTP 13th Report on Carcinogens, Known to be a Human Carcinogen. United States Environmental Protection Agency Gene-Tox Program, Positive: Rodent dominant lethal; Negative: Aspergillus-forward mutation; SHE-clonal assay; Negative: Cell transformation-RLV F344 rat embryo; Negative: In vitro cytogenetics-nonhuman; Mammalian micronucleus; Negative: *N. crassa-aneuploidy*; Histidine reversion-Ames test; Negative: In vitro SCE-human lymphocytes; In vitro SCE-human; Negative: In vitro SCE-nonhuman; Sperm morphology-mouse; Negative/limited: Carcinogenicity-mouse/rat

California Proposition 65 Chemical[102]: Cancer (alcoholic beverages, when associated with alcohol abuse).

Hazard Alert: Highly flammable, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

FDA-over the counter and proprietary drug

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1 (carcinogen); Class B2, D2A, D2B.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; risk phrases: R11; R36/37/38; R62; R63; safety phrases: S2; S7; S16; S21; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl alcohol is a colorless, volatile, flammable liquid with a sweet, fruity odor. The Odor Threshold is 0.135−5 ppm. Molecular weight = 46.07; specific gravity (H_2O:1) = 0.79 @ 20°C; boiling point = 78.3°C; freezing/melting point = −113.9°C; vapor pressure = 75 mmHg @ 29.2°C; flash point = 12.8°C (96%). Explosive limits: LEL: 3.3%; UEL: 19.0%; autoignition temperature = 363°C. Hazard identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Ethyl alcohol is used, topical anti-infective agent; solvent to make beverages; in the chemical synthesis of a wide variety of compounds, such as acetaldehyde, ethyl ether, ethyl chloride, and butadiene. It is a solvent or processing agent in the manufacture of pharmaceuticals; plastics, lacquers, polishes, plasticizers, perfumes, cosmetics, rubber accelerators; explosives, synthetic resins; nitrocellulose, adhesives, inks, and preservatives. It is also used as an antifreeze and as a fuel. It is an intermediate in the manufacture of many drugs and pesticides.

Incompatibilities: May form explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Reactions may be violent with oleum, sulfuric acid; nitric acid, bases, aliphatic amines;

isocyanates, strong oxidizers. Also incompatible with potassium dioxide, bromine pentafluoride; acetyl bromide; acetyl chloride; platinum, sodium.

Permissible Exposure Limits in Air

NIOSH IDLH = 3300 ppm [LEL]

OSHA PEL: 1000 ppm/1900 milligram per cubic meter TWA

NIOSH REL: 1000 ppm/1900 milligram per cubic meter TWA

ACGIH TLV[1]: 1000 ppm/1880 milligram per cubic meter STEL; not classifiable as a human carcinogen

PAC* Ver. 29[138]

PAC-1: **1800** $_{\mathbf{A}}$ ppm

PAC-2: **3300** $_{\mathbf{A}}$ ppm

PAC-3: 15,000 ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 500 ppm/960 milligram per cubic meter TWA; Peak Limitation Category II(2); Carcinogen Category 5; Pregnancy Risk Group C

Australia: TWA 1000 ppm (1900 milligram per cubic meter), 1993; Austria: MAK 1000 ppm (1900 milligram per cubic meter), 1999; Belgium: TWA 1000 ppm (1880 milligram per cubic meter), 1993; Denmark: TWA 1000 ppm (1900 milligram per cubic meter), 1999; Finland: TWA 1000 ppm (1900 milligram per cubic meter); STEL 1250 ppm (2400 milligram per cubic meter), 1999; France: VME 1000 ppm (1900 milligram per cubic meter), VLE 5000 ppm, 1999; Hungary: TWA 1000 milligram per cubic meter; STEL 3000 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 1000 milligram per cubic meter, 2003; Norway: TWA 500 ppm (950 milligram per cubic meter), 1999; the Philippines: TWA 1000 ppm (1900 milligram per cubic meter), 1993; Poland: MAC (TWA) 1000 milligram per cubic meter, MAC (STEL) 3000 milligram per cubic meter, 1999; Russia: STEL 1000 milligram per cubic meter, 1993; Sweden: NGV 500 ppm (1000 milligram per cubic meter), KTV 1000 ppm (1900 milligram per cubic meter), 1999; Switzerland: MAK-W 1000 ppm (1900 milligram per cubic meter), 1999; Thailand: TWA 1000 ppm (1900 milligram per cubic meter), 1993; Turkey: TWA 1000 ppm (1900 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (1950 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[43] set a MAC in ambient air of residential areas of 5.0 milligram per cubic meter on either a momentary or a daily average basis. Several states have set guidelines or standards for ethanol in ambient air[60] ranging from 0.26 milligram per cubic meter (Massachusetts) to 16.0 milligram per cubic meter (Virginia) to 19.0 milligram per cubic meter (North Dakota) to 38.0 milligram per cubic meter (Connecticut and South Dakota) to 45.238 milligram per cubic meter (Nevada).

Determination in Air: Collection by charcoal tube, 2-butanol/CS2; analysis by gas chromatography/flame ionization detection; NIOSH Analytical Method (IV) #1400, alcohols I

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 26,000 μg/L based on health effects.

Determination in Water: Octanol-water coefficient: Log $K_{\mathrm{ow}} = -0.32$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Levels of 5000−10,000 ppm may result in irritation of mouth, nose, throat and coughing, leading to sleep and stupor. *Skin:* Pure ethyl alcohol may cause drying, redness and irritation. May be absorbed through damaged skin. *Eyes:* Irritation and tearing may result @ 5000 ppm of vapor. Contact with liquid may cause severe irritation. *Ingestion:* One ounce of pure ethyl alcohol may cause reddening of face and neck and an exaggerated feeling of well-being. Three ounces of pure ethyl alcohol may cause an initial burst of excitement and activity followed by increasing loss of coordination; slurred speech; nausea and drowsiness. This may proceed to stupor, coma and death. Lethal dose of ethyl alcohol ranges from two to five ounces, depending on age and size of the individual. *Note:* Many denatured alcohols contain additives which are extremely poisonous and cannot be removed by normal methods. Ingestion of denatured alcohol will produce much more serious poisoning.

Long-Term Exposure: Prolonged inhalation of concentrations above 5000 ppm may produce symptoms listed under inhalation and the additional symptoms of headache, dizziness, tremor, and fatigue. Additives in denatured alcohol may result in other more severe symptoms. Alcohol has been linked to birth defects in humans. Ethyl alcohol may cause mutations. Repeated exposure (including alcoholic beverages) may cause spontaneous abortions; as well as birth defects and other developmental problems; including "fetal alcohol syndrome." Chronic use of ethanol may cause cirrhosis of the liver. *Alcoholic Beverage Consumption* is on the NTP 13th Report on Carcinogens, Known to be a Human Carcinogen

Points of Attack: Eyes, skin, respiratory system, CNS, liver, blood, and reproductive system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: Liver function tests. Ethyl alcohol can be measured in the blood, urine, and exhaled breath. NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite) End-of-shift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: Viton gloves, suits; 4 H and Silver Shield gloves; 4 hours: Neoprene rubber gloves, suits, boots; Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 3300 ppm: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl alcohol must be stored to avoid contact with oxidizers, such as perchlorates, peroxides, chlorates, nitrates, and permanganates, because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame. Sources of ignition, such as smoking and open flames are prohibited where ethyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of ethyl alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl alcohol.

Shipping: UN1170 Ethyl alcohol or Ethanol or Ethanol solutions or Ethyl alcohol solutions, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Ethylamine E:0340

Formula: C_2H_7N; $C_2H_5NH_2$

Synonyms: Aethylamine (German); 1-Aminoethane; Aminoethane; EA; Etanamina (Spanish); Ethanamine; Etilamina (Spanish); MEA; Monoethylamine

CAS Registry Number: 75-04-7
HSDB Number: 803
RTECS Number: KH2100000
UN/NA & ERG Number: UN1036/118; UN2270 [aqueous solution with not <50% but not > 70% ethylamine]/132
EC Number: 200-834-7 [*Annex I Index No.:* 612-002-00-4]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

List 1, DEA chemical code 8678 (Title 21 CFR1310.02), as Ethylamine and its salts.

Hazard Alert: Extremely flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Primary irritant (w/o allergic reaction).

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 7500 lb

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xi; risk phrases: R5; R12; R21; R36/3738; safety phrases: S1; S2; S9; S16; S26; S33; S38; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethylamine is a colorless gas or water-white liquid (below 17°C). Strong, ammonia-like odor. Shipped as a liquefied compressed gas. Molecular weight = 45.10; specific gravity (H_2O:1) = 0.66 @ 20°C (liquid); boiling point = 16.7°C; freezing/melting point = −81°C; vapor pressure = 400 mmHg @ 20°C; Flash point ≤ −18°C; autoignition temperature = 385°C. Explosive limits: LEL: 3.5%; UEL: 14.0%. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water.

Potential Exposure: Monoethylamine (MEA) is used as an intermediate in the manufacture of the following chemicals: triazine herbicides, 1,3-diethylthiourea (a corrosion inhibitor); ethylamino-ethanol; 4-ethylmorpholine (urethane foam catalyst); ethyl isocyanate; and dimethylolethyltriazone (agent used in wash-and-wear fabrics). The cuprous chloride salts of MEA are used in the refining of petroleum and vegetable oil.

Incompatibilities: The aqueous solution is a strong base. May form explosive mixture with air. Reacts violently with strong acids; strong oxidizers; cellulose nitrate; and organic compounds; causing fire and explosion hazard. Also incompatible with organic anhydrides; isocyanates, vinyl acetate; acrylates, substituted allyls; alkylene oxides; epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks nonferrous metals: aluminum, copper, lead, tin, zinc, and alloys; some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 600 ppm

Conversion factor: 1 ppm = 1.85 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/18 milligram per cubic meter TWA

NIOSH REL: 10 ppm/18 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/9.2 milligram per cubic meter TWA; 15 ppm/27.6 milligram per cubic meter STEL [skin]

PAC* Ver. 29[138]

PAC-1: **7.5** $_{\mathbf{A}}$ ppm

PAC-2: **49** $_{\mathbf{A}}$ ppm

PAC-3: **270** $_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 5 ppm/9.4 milligram per cubic meter TWA; Peak Limitation Category I(2) a momentary value of 10 ml/m^3/19 milligram per cubic meter should not be exceeded; Pregnancy Risk Group D

Australia: TWA 10 ppm (18 milligram per cubic meter), 1993; Austria: MAK 10 ppm (18 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (18 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (18 milligram per cubic meter), [skin], 1999; Finland: TWA 10 ppm (18 milligram per cubic meter); STEL 20 ppm (37 milligram per cubic meter), [skin], 1999; France: VME 10 ppm (18 milligram per cubic meter), VLE 15 ppm (27 milligram per cubic meter), 1999; Japan: 10 ppm (18 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 9 milligram per cubic meter, 2003; Norway: TWA 10 ppm (18 milligram per cubic meter), 1999; the Philippines: TWA 10 ppm (18 milligram per cubic meter), 1993; Poland: MAC (TWA) 5 milligram per cubic meter, MAC (STEL) 15 milligram per cubic meter, 1999; Russia: TWA 10 ppm, 1993; Sweden: NGV 10 ppm (18 milligram per cubic meter), KTV 15 ppm (30 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 10 ppm (18 milligram per cubic meter), KZG-W 20 ppm (36 milligram per cubic meter), 1999; Turkey: TWA 10 ppm (18 milligram per cubic meter), 1993; United Kingdom: TWA 2 ppm (3.8 milligram per cubic meter; STEL 6 ppm (11 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 15 ppm [skin]. Russia set a MAC in ambient air in residential areas of 0.01 milligram per cubic meter on both a momentary and a daily average basis. Several states have set guidelines or standards for monoethylamine in ambient air[60] ranging from 180 μ/m^3 (North Dakota) to 300 μ/m^3 (Virginia) to 360 μ/m^3 (Connecticut) to 429 μ/m^3 (Nevada).

Determination in Air: Use NIOSH [II(3)] Method #S144 or OSHA Analytical Method 36.

Permissible Concentration in Water: EPA[32] has suggested an ambient environmental goal of 248 μg/L on a health basis. Russia[35] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Determination in Water: Octanol-water coefficient: Log K_{ow} = −0.27/−0.08 (calculated) Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption (liquid), ingestion (liquid), and skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: Ethylamine can affect you when breathed in and by passing through your skin. Contact can severely burn the eyes and skin. Inhalation can severely irritate the eyes, nose, throat and lungs; causing cough, wheezing, and/or shortness of breath. Repeated exposure may damage the lungs, kidneys and heart.

Long-Term Exposure: Repeated exposure can cause damage to the kidneys, liver and heart. Can affect the eyes; causing blurred vision and/or cause the victim to see halos around lights; and result in permanent damage. Repeated exposure can affect the lungs, causing bronchitis; and tissue lesions.

Points of Attack: Eyes, skin, respiratory system, liver, and kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Exam of the eyes and vision. If symptoms develop or overexposure is suspected, the following may be useful: exam of the heart. Kidney function tests. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: butyl rubber gloves, suits, boots; 4 hours: Teflon gloves, suits, boots; Responder suits. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 250 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. 500 ppm: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern] organic vapor and acid gas cartridge(s); or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 600 ppm: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Check oxygen content prior to entering storage area. Flammable gas.(1) Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (2) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Ethylamine must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric and nitric); or strong oxidizers (such as chlorine and bromine) because violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where ethylamine is handled, used, or stored. Metal containers used in the transfer of five gallons or more of ethylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of ethylamine. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1036, Ethylamine, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Ethylamine, aqueous solution with not

<50% but not >70% ethylamine, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Gas:* This chemical is flammable. Thermal decomposition products may include oxides of nitrogen and carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Solution: This chemical is flammable. Thermal decomposition products may include oxides of nitrogen and carbon. Shut off supply. If not possible, and at no risk to surroundings, let the fire burn itself out; in other cases use dry chemical or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Controlled incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions[22].

2-Ethylaniline E:0360

Formula: $C_8H_{11}N$

Synonyms: 2-Aethylanilin (German); *o*-Aminoethylbenzene; Aniline, *o*-ethyl-; Benzenamine, 2-ethyl-; 2-Ethyl aniline; 2-Ethylbenzenamine; 2-Ethylbenzenamino; 2-Etilanilina (Spanish)

CAS Registry Number: 578-54-1

HSDB Number: 5698

RTECS Number: BX9800000

UN/NA & ERG Number: UN2273/153

EC Number: 209-424-2

Regulatory Authority and Advisory Information

Carcinogenicity: No tests or studies found.

Hazard Alert: Poison, Flammable liquid.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R10; R23/24/25; R36/37/38; R51; safety phrases: S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: 2-Ethylaniline is a yellow liquid that turns brown on standing in air. Molecular weight = 121.20; boiling point = 215°C; 210°C @ 760 mmHg; freezing/melting point = 44°C; vapor pressure = 0.11 mmHg @ 20°C; flash point = 85°C (oc). Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: This material is used in making drugs, dyes, and pesticides.

Incompatibilities: Combustible; vapor may form explosive mixture with air above 80°C. Decomposes on contact with light or air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, anhydrides, and chloroformates. Contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, passing through the unbroken skin, and absorption of fumes through the mouth.

Harmful Effects and Symptoms

Short-Term Exposure: *n*-Ethylaniline can affect you when breathed in and by passing through your skin. High exposure can reduce the blood's ability to supply oxygen to the body (methemoglobinemia) and can cause the skin and lips to turn a blue color. Headache, weakness and passing out may occur. Death could result from high exposures to skin or breathing. Contact can irritate or burn skin and eyes.

Long-Term Exposure: Exposure can cause skin allergy to develop, with rash and itching. Once allergy is present, even low exposures may trigger symptoms. May affect the nervous system causing headache, drowsiness, irritability, and confusion. May cause liver and bladder damage.

Points of Attack: Skin, blood, bladder, and nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for methemoglobin (the blood change caused by ethylaniline). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and bladder function tests.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention if any symptoms are present. *Skin Contact:* Quickly remove contaminated clothing. Immediately wash area with large amounts of soap; promptly seek medical attention. *Breathing:* Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to ethylaniline use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. 2-Ethylaniline must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric and nitric); strong oxidizers; acid anhydrides (such as maleic anhydride) and chloroformates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where 2-ethylaniline is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2273 2-Ethylaniline, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep 2-ethylaniline out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include aniline and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the

containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R20; R62; R63; safety phrases: S2; S16; S21; S24/25; S29; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethylbenzene is a colorless liquid. Pungent aromatic odor. The Odor Threshold is 0.092−0.60 ppm. Molecular weight = 106.18; specific gravity (H_2O:1) = 0.87 @ 20°C; boiling point = 136°C; freezing/melting point = −95°C; vapor pressure = 10 mmHg @ 26°C; flash point = 12.8°C; explosive limits: LEL: 20.000 ppm; UEL: unknown. Autoignition temperature = 432°C. Explosive limits: LEL: 0.8%; UEL: 6.7%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Practically insoluble in water; solubility = 0.7%.

Potential Exposure: Ethyl benzene is used in styrene manufacture and in synthesis of *p*-nitroacetophenone; in the manufacture of cellulose acetate, and synthetic rubber. It is also used as a solvent or diluent; and as a component of automotive and aviation gasoline. Significant quantities of EB are present in mixed xylenes. These are used as dilatants in the paint industry, in agricultural sprays for insecticides and in gasoline blends (which may contain as much as 20% EB). In light of the large quantities of EB produced and the diversity of products in which it is found, there may exist environmental sources for ethylbenzene, e.g., vaporization during solvent use; pyrolysis of gasoline and emitted vapors at filling stations. Groups of individuals who are exposed to EB to the greatest extent and could represent potential pools for the expression of EB toxicity include: (1) individuals in commercial situations where petroleum products or by-products are manufactured e.g., rubber or plastics industry); (2) individuals residing in areas with high atmospheric smog generated by motor vehicle emissions.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Attacks plastics and rubber. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 800 ppm [LEL]

Conversion factor: 1 ppm = 4.34 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 100 ppm/435 milligram per cubic meter TWA

NIOSH REL: 100 ppm/435 milligram per cubic meter TWA; 125 ppm/545 milligram per cubic meter STEL

ACGIH TLV[1]: 100 ppm/434 milligram per cubic meter TWA; 125 ppm/543 milligram per cubic meter STEL; BEI: 1.5 g [Mandelic acid]/g creatinine in urine at end-of-shift at end of work-week; 2 ppm [ethyl benzene]in end-exhaled air prior to next shift

PAC* Ver. 29[138]

PAC-1: **33** $_{\mathbf{A}}$ ppm

PAC-2: **1100** $_{\mathbf{A}}$ ppm

PAC-3: **1800** $_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin] Germ Cell Mutagen Category 3 A (2006)

Australia: TWA 100 ppm (435 milligram per cubic meter); STEL 125 ppm, 1993; Austria: MAK 100 ppm (440 milligram per cubic meter), 1999; Belgium: TWA 100 ppm (434 milligram per cubic meter); STEL 125 ppm (543 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (217 milligram per cubic meter), 1999; Finland: TWA 100 ppm (435 milligram per cubic meter); STEL 150 ppm (655 milligram per cubic meter), 1999; France: VME 100 ppm (435 milligram per cubic meter), 1999; Hungary: TWA 100 milligram per cubic meter; STEL 200 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 215 milligram per cubic meter, [skin], 2003; Norway: TWA 50 ppm (220 milligram per cubic meter), 1999; the Philippines: TWA 100 ppm (435 milligram per cubic meter), 1993; Poland: MAC (TWA) 100 milligram per cubic meter, MAC (STEL) 350 milligram per cubic meter, 1999; Russia: TWA 100 ppm; STEL 50 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (200 milligram per cubic meter), KTV 100 ppm (450 milligram per cubic meter), 1999; Switzerland: MAK-W 100 ppm (435 milligram per cubic meter), KZG-W 500 ppm (2175 milligram per cubic meter), [skin], 1999; Turkey: TWA 100 ppm (435 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (441 milligram per cubic meter); STEL 125 ppm (552 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: STEL 125 ppm. The Czech Republic: TWA 200 milligram per cubic meter. Russia[35,43] set a MAC in the ambient air in residential areas of 0.02 milligram per cubic meter on either a momentary or a daily average basis. Several states have set guidelines or standards for ethylbenzene in ambient air[60] ranging from 0.12 milligram per cubic meter (Massachusetts) to 1.45 milligram per cubic meter (New York) to 4.35 milligram per cubic meter (Florida, South Carolina) to 4.35−5.45 milligram per cubic meter (North Dakota) to 7.25 milligram per cubic meter (Virginia) to 8.7 milligram per cubic meter (Connecticut) to 10.357 milligram per cubic meter (Nevada).

Determination in Air: Charcoal adsorption, workup with CS2, analysis by gas chromatography/flame ionization. NIOSH Analytical Method #1501 for aromatic hydrocarbons.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.7 mg/L; MCLG, 0.7 mg/L. Federal Drinking Water Standards: EPA 700 μg/L; Federal Drinking Water Guidelines: EPA 750 μg/L; State Drinking Water Standards: California 300 μg/L; Massachusetts 5 μg/L; State Drinking Water Guidelines: Arizona 680 μg/L; Florida 30 μg/L; Maine 70 μg/L; Minnesota 700 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography and photoionization detection (EPA Method 602) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl benzene irritates the eyes, skin, and respiratory tract. Exposure to high concentrations can cause dizziness, lightheadedness and unconsciousness. Very high exposures (above the OEL) can cause difficult breathing; narcosis, coma, and even death. Swallowing the liquid may cause aspiration into the lungs, resulting in chemical pneumonitis. May affect the CNS. Concentration of 200 ppm can cause irritation.

Long-Term Exposure: May cause liver and kidney problems. Repeated or prolonged exposure to the skin may cause drying, scaling and blistering.

Points of Attack: Eyes, skin, respiratory system, and CNS.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests. Kidney function tests. Evaluate for brain and nervous system effects. NIOSH lists the following tests: whole blood (chemical/metabolite); during exposure, expired air, expired air: prior to next shift; urine (chemical/metabolite); urine (chemical/metabolite) End-of-shift; urine (chemical/metabolite) End-of-shift, end of work-week; urine (chemical/metabolite) Last 2 hours of 8 hour exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: Viton gloves, suits, Barricade coated suits; Responder suits; Trychem 1000 suits, 4 hours: Teflon gloves, suits, boots All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 800 ppm: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Outside or detached storage is preferable. Inside storage should be in a standard flammable liquids storage room or cabinet. Isolate from acute fire hazards and oxidizing agents. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN1175 Ethylbenzene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources.

Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep EB out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity: *Theft hazard:* CUM 100 g.

Carcinogenicity: According to NIOSH, HN-1 is a known carcinogen, developmental toxin, and reproductive toxin[77].

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Blister agent (HN-1), Combustible, Primary irritant (w/o allergic reaction), Drug

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xi; risk phrases: R27/28; R35/36/337; R50/53; safety phrases: S1; S13; S28; S36/37/39; S41; S45 (see Appendix 4)

Description: Nitrogen mustard is a pale yellow, oily, mobile liquid. HN-1 is a mustard blister agent (vesicant) that has a faint musty or fishy odor. *Nitrogen mustards* are colorless when pure but are typically a yellow to brown oily substance. Odors are variably described as; sweet, agreeable, slightly garlic-or mustard-like. It evaporates slowly. Molecular weight = 170.11; 170.08[77]; specific gravity 1.09 g/cm^3 @ 25°C; boiling point = (decomposes) 194°C; freezing/melting point = − 3.4°C; volatility = 2.29 mg/L @ 25°C; vapor density (air = 1) = 5.9; vapor pressure = 0.25 mmHg @ 25°C. Hazard identification (based on NFPA- 704 M Rating System): Health 4, Flammability 2, Reactivity 0. Slightly soluble in water. 160 mg/L @ 25°C. Dissolved in water, nitrogen mustard forms a strong base. Toxic intermediate products are produced during hydrolysis of HN-1.

Potential Exposure: Sulfur mustards were formerly used as a gas warfare agent. Nitrogen mustards have not previously been used in warfare[77]. HN-1 can be used as a delayed-action military casualty agent. Exposure to nitrogen mustard damages the eyes, skin, and respiratory tract and suppresses the immune system. Although the nitrogen mustards cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Exposure to large amounts can be fatal[77].

Persistence of Chemical Agent: HN: Summer: 3 days to 1 week; Winter: May last for weeks.

Incompatibilities: Avoid contamination with oxidizing agents, e.g., nitrates, oxidizing acids; chlorine bleaches;

swimming pool chlorine; hypochlorites which form compounds that may result in ignition or explosions. Toxic intermediate products are produced during hydrolysis of HN-1[77]. Unstable in the presence of light and heat and forms dimers at temperatures above 122°F/50°C. HN-1: When dissolved in water this chemical forms a strong base; keep away from acids and oxidizers. Corrosive to ferrous alloys beginning at 149°F/65°C. Solution attacks copper, copper alloys, and copper compounds. Contact with metals may evolve flammable hydrogen gas. Polymerizes slowly; munitions would be effective and dangerous for several years.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

HN-1

PAC-1: 0.002 milligram per cubic meter

PAC-2: **0.022** $_{\mathbf{A}}$ milligram per cubic meter

PAC-3: **0.37** $_{\mathbf{A}}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Water: HN-1 is a water contaminant. Octanol-water coefficient: Log K_{ow} = (estimated) ~2. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Nitrogen mustard is a blister agent (vesicant) that causes delayed severe damage to the respiratory tract. It is an alkylating agent that damages the cells within the bone marrow that are necessary for making blood cells. Clinical effects do not appear until hours after exposure. Nitrogen mustards penetrate and bind quickly to cells of the body; their health effects develop slowly. The full extent of cellular injury may not be known for days. The sooner after exposure that health effects occur, the more likely it is that the patient/victim was exposed to a high concentration of HN-2. Similarly, the sooner that health effects occur, the more likely it is that they will progress and become severe. *Eye exposure*: The eyes are the organs that are most sensitive to mustard vapor; eye injury may occur within 1 to 2 hours after severe exposure, or 3 to 12 hours after a mild to moderate exposure. Inhalation exposure: Airway injury may occur within 2 to 6 hours after severe exposure and within 12 to 24 hours after mild exposure. Skin exposure: The symptom-free (latent) period is 6 to 12 hours in temperate conditions; hot, humid weather strikingly increases the action of nitrogen mustards. Some skin injury may appear as late as 48 hours after exposure[77]. This compound is a nitrogen mustard. It is highly irritating to skin, eyes, and mucous membranes. Nitrogen mustards have preferential toxicity for rapidly dividing cells. Workers exposed briefly to estimated concentrations of 10−100 ppm by inhalation became severely ill. The median lethal dosage is 1500 mg-minute/m^3 [88, 136].

Short-Term Exposure: Poisonous by all routes. HN-1is a nitrogen mustard. It is highly irritating to skin, eyes, and mucous membranes. Nitrogen mustards have preferential toxicity for rapidly dividing cells. Workers exposed briefly to estimated concentrations of 10−100 ppm by inhalation became severely ill. The median lethal dosage is 1500 mg-minute/m^3. Irritate the eyes in quantities which do not significantly damage the skin or respiratory tract, insofar as single exposures are concerned. After mild vapor exposure, there may be no skin lesions. After severe vapor exposures, or after exposure to the liquid, erythema may appear. Irritation and itching may occur. Later, blisters may appear in the erythematous areas. Effects on the respiratory tract include irritation of the nose and throat, hoarseness progressing to loss of voice, and a persistent cough. Fever, labored respiration, and moist riles develop. Bronchial pneumonia may appear after the first 24 hours. Following ingestion or systemic absorption, material causes inhibition of cell mitosis, resulting in depression of the blood-forming mechanism and injury to other tissues. Severe diarrhea, which may be hemorrhagic, occurs. Lesions are most marked in the small intestine and consist of degenerative changes and narcosis in the mucous membranes. Ingestion of 2−6 milligrams causes nausea and vomiting.

Long-Term Exposure: Following significant whole-body (systemic) absorption of nitrogen mustard, injury to the bone marrow, lymph nodes, and spleen may cause a drop in white blood cell counts (beginning on days 3 to 5), which can result in an increased risk for developing (life-threatening) infections. Counts of red blood cells and platelets may also fall due to bone marrow damage.

First Aid: There is no antidote for nitrogen mustard toxicity. Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage[77]. Because health effects due to nitrogen mustard may not occur until several hours after exposure, patients/victims should be observed in a hospital setting for at least 24 hours. Gastric lavage is contraindicated following ingestion of this agent due to the risk of perforation of the esophagus or upper airway. Stop exposure and treat symptomatically. Move victim to fresh air; call emergency medical care. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 minutes. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Decontamination: Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage[77]. Remove clothes and place contaminated clothes and personal belongings in a sealed double bag. Decontamination of mustard-exposed victims by either vapor or liquid should be performed within the first 2 minutes following the exposure to prevent tissue damage. If not accomplished within the first several minutes, decontamination should still be performed to ensure any residual liquid mustard is removed from the skin or clothes, or to ensure any trapped mustard vapor is removed with the clothing. Removing trapped mustard vapor will prevent vapor off-gassing or subsequent cross-contamination of other emergency responders/healthcare providers or the healthcare facility. Physical removal of the mustard agent, rather than detoxification or neutralization, is the most important principle in patient decontamination. Mustard is not detoxified by water alone and will remain in decontamination effluent (in dilute concentrations) if hydrolysis has not taken place.

(1) Patients exposed to vapor should be decontaminated by removing all clothing in a clean air environment and shampooing or rinsing the hair to prevent vapor off-gassing. (2) Patients exposed to liquid should be decontaminated by

(a) Washing in warm or hot water at least three times. Use liquid soap (dispose of container after use and replace), large volumes of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged, because skin damage may occur which may enhance absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. The rapid physical removal of a chemical agent is essential. If warm or hot water is not available, but cold water is, use cold water. Do not delay decontamination to obtain warm water. (b) Rinse the eyes, mucous membranes; or open wounds with sterile saline or water.

(3) The healthcare provider should (a) Check the victim after the three washes to verify adequate decontamination before allowing entry to the medical treatment facility. If the washes were inadequate, repeat the entire process. (b) Be prepared to stabilize conventional injuries during the decontamination process. Careful decontamination can be a time consuming process. The healthcare provider may have to enter the contaminated area to treat the casualty during this process. Medical personnel should wear the proper PPE and evaluate the exposed workers.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, and nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APRs) or Powered Air Purifying Respirators (PAPRs) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: When used as a weapon, use SCBA Respirator Certified by NIOSH for CBRN Environments. Where a potential exposure to the chemical exists, use a NIOSH-certified CBRN full facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA (SCBA) with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

HN-1, when used as a weapon

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.3/0.5

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/180
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 1.1/1.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid inhalation and skin contact. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: When heated to decomposition, it emits hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Principles and methods for destruction of chemical weapons: "Destruction of chemical weapons" means a process by which chemicals are converted in an essentially irreversible way to a form unsuitable for production of chemical weapons, and which in an irreversible manner renders munitions and other devices unusable as such. Each nation shall determine how it shall destroy chemical weapons, except that the following processes may not be used: dumping in any body of water, land burial or open-pit burning. It shall destroy chemical weapons only at specifically designated and appropriately designed and equipped facilities. Each nation shall ensure that its chemical weapons destruction facilities are constructed and operated in a manner to ensure the destruction of the chemical weapons; and that the destruction process can be verified under the provisions of this Convention (Organization for the Prohibition of Chemical Weapons; Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and Their Destruction).

California Proposition 65 Chemical[102]: Cancer 12/22/2000.

Hazard Alert: Poison, Highly flammable, Possible risk of forming tumors, Suspected reprotoxic hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R20/21/22; R40; R61; safety phrases: S2; S21; S36/37; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl bromide is a colorless liquid (turns yellow on contact with air) with an ethereal odor and a burning taste. A gas above the boiling point. Molecular weight = 108.98; specific gravity (H_2O:1) = 1.46 @ 20°C; boiling point = 38.4°C; freezing/melting point = − 118.9; vapor pressure = 400 mmHg @ 21°C; flash point = < − 15.6°C; autoignition temperature = 511°C. Explosive limits: LEL: 6.8%; UEL: 8.0%. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 0.9%.

Potential Exposure: This chemical is used as an industrial chemical, pharmaceutical, and veterinary drug; as an ethylating agent in organic synthesis and gasoline; as a refrigerant; and as an extraction solvent. It has limited use as a local anesthetic.

Incompatibilities: May form explosive mixture with air. Hydrolyzes in water, forming hydrogen bromide (HBr). Oxidizers may cause fire or explosions. Fire and explosions may be caused by contact with chemically active metals: aluminum, magnesium or zinc powders; lithium, potassium, sodium. Attacks some plastic, rubber and coatings. *Note:* Chlorinating agents destroy nitrogen mustards. Dry chlorinated lime and chloramines with a high content of active chlorine, vigorously chlorinate nitrogen mustards to the carbon chain, giving low toxicity products. In the presence of water this interaction proceeds less actively. They are rapidly oxidized by peracids in aqueous solution at weakly alkaline pH. In acid solution the oxidation is much slower.

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 ppm

Conversion factor: 1 ppm = 4.46 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 3.1 ppm.

OSHA PEL: 200 ppm/890 milligram per cubic meter TWA

NIOSH REL: None

ACGIH TLV[1]: 5 ppm/22 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 15 ppm

PAC-2: 370 ppm

PAC-3: 3500 ppm

DFG MAK: [skin] Carcinogen Category 2

Australia: TWA 200 ppm (890 milligram per cubic meter); STEL 250 ppm, 1993; Austria: carcinogen, 1999; Belgium: TWA 200 ppm (891 milligram per cubic meter); STEL 250 ppm (1100 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (22 milligram per cubic meter), [skin], 1999; Finland: TWA 200 ppm (890 milligram per cubic meter); STEL 250 ppm (1115 milligram per cubic meter), 1999; France: VME 288 ppm (890 milligram per cubic meter), 1999; Hungary: TWA 50 milligram per cubic meter; STEL 100 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 22 milligram per cubic meter, [skin], 2003; Norway: TWA 5 ppm (22 milligram per cubic meter), 1999; the Philippines: TWA 300 ppm (890 milligram per cubic meter), 1993; Poland: MAC (TWA) 50 milligram per cubic meter, MAC (STEL) 400 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter, 1993; Switzerland: MAK-W 5 ppm (22 milligram per cubic meter), [skin], carcinogen, 1999; Turkey: TWA 200 ppm (890 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (906 milligram per cubic meter); STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines for ethyl bromide in ambient air[60] ranging from 8.9−11.1 milligram per cubic meter (North Dakota) to 14.8 milligram per cubic meter (Virginia) to 17.8 milligram per cubic meter (Connecticut) to 21.19 milligram per cubic meter (Nevada).

Determination in Air: Charcoal adsorption, workup with isopropanol, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1011.

Routes of Entry: Inhalation, ingestion, and skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Nitrogen Mustard is a blister agent (vesicant) that causes delayed severe damage to the respiratory tract. It is an alkylating agent that damages the cells within the bone marrow that are necessary for making blood cells.

Short-Term Exposure: Irritates the skin, eyes, and respiratory tract. Inhalation can cause lung irritation with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause CNS depression, headache, nausea, dizziness, loss of balance; slurred speech; numbness, unconsciousness and death. Exposure to high concentrations can cause cardiac arrhythmia. This can be fatal.

Points of Attack: Skin, liver, kidneys, respiratory system, lungs, cardiovascular system, and CNS.

Medical Surveillance: Liver and kidney function tests. EKG. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: Up to 2000 ppm: Sa (APF = 10) (any supplied-air respirator); or SCBA (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1891 Ethyl bromide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl bromide out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon and hydrogen bromide. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration with adequate scrubbing and ash disposal facilities.

EC Number: 203-290-9 [*Annex I Index No.:* 607-069-00-1]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable liquid, Poison, Possible risk of forming tumors.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F; risk phrases: R10; R26/27/28; safety phrases: S1/2; S7/9; S26; S41; S45 (see Appendix 4).

Description: Ethyl bromoacetate is a clear, colorless to light-yellow liquid. Molecular weight = 167.02; specific gravity (H_2O:1) = 1.5 @ 20°C; boiling point = 159°C. freezing point ≤ -20°C; vapor pressure = 2.6 mmHg @ 25°C; flash point = 48°C. Explosive limits: LEL: 14,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Insoluble in water.

Potential Exposure: Used for making pharmaceuticals; as a warning gas in poisonous, odorless gasses; as a tear gas.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and reducing agents. Esters are generally incompatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.18 ppm

PAC-2: 1.9 ppm

PAC-3: 12 ppm

Routes of Entry: Inhalation and absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation can irritate the respiratory tract and cause headache, nausea, and vomiting. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Can irritate the skin causing rash or a burning sensation on contact. Can cause severe eye burns leading to permanent damage.

Long-Term Exposure: May cause skin allergy and irritate the lungs, causing bronchitis to develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs and skin.

Medical Surveillance. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Outside or detached storage is preferable. Inside storage should be in a standard flammable liquids storage room or cabinet. Isolate from acute fire hazards and oxidizing agents. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN1603 Ethyl bromoacetate, Hazard class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen bromide and oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R10; R21/22; safety phrases: S2; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethylbutanol is a colorless liquid with a mild, alcoholic odor. Molecular weight = 102.20; boiling point = 149°C. freezing/melting point = −114°C; vapor pressure = 0.89 mmHg @ 20°C; flash point = 58°C (oc). Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as a solvent; for making dyes, perfumes, flavorings, and drugs.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers, strong acids; caustics, isocyanates, amines, isocyanates.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, eyes, and through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause skin irritation. Eye contact can cause severe irritation and burns; possible permanent damage. Inhalation can cause irritation of the respiratory tract causing coughing and wheezing. Exposure can cause headache, dizziness, nausea, and vomiting.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2275 Ethylbutanol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of

carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration by spraying or in paper packaging. Flammable solvent may be added.

Ethyl butyl ether E:0440

Formula: $C_6H_{14}O$

Synonyms: Butane, 1-ethoxy-; Butyl ethyl ether; Ether ethylbutylique (French); Ethyl-*n*-butyl ether

CAS Registry Number: 628-81-9

RTECS Number: KN4725000

UN/NA & ERG Number: UN1179/127 (P)

EC Number: 211-055-7

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Possible polymerization hazard (nonstabilized),

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R19; R22; R33; safety phrases: S16; S21; S23; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl butyl ether is a colorless liquid. Molecular weight = 102.21; boiling point = 92°C; freezing/melting point = −124°C; flash point = 4°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Slightly soluble in water.

Potential Exposure: Used as a solvent for extraction and in making other chemicals

Incompatibilities: May form explosive mixture with air. Heat or prolonged storage may cause the formation of unstable peroxides. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Attacks some plastics, rubber and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion, eyes, and through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract with coughing and wheezing. High levels can cause dizziness and loss of consciousness.

Long-Term Exposure: Repeated or high exposures may affect the nervous system. Repeated exposure may remove the oils from the skin causing dryness, rash or cracking.

Points of Attack: Skin and nervous system.

Medical Surveillance: Test the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1179 Ethyl butyl ether, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R10; R20; R36; safety phrases: S2; S24; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl butyl ketone is a colorless liquid with a powerful, fruity odor. Molecular weight = 114.21; specific gravity (H 2 O:1) = 0.82 @ 20°C; boiling point = 147.8°C; freezing/melting point = −36.7°C; vapor pressure = 4 mmHg @ 20°C; flash point = 46°C (oc). Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water; solubility = 1%.

Potential Exposure: Ethyl butyl ketone is used as a solvent and as an intermediate in organic synthesis. It is a solvent for vinyl and nitrocellulose resins. It is used in food flavoring.

Incompatibilities: May form explosive mixture with air. Violent reaction with strong oxidizers, acetaldehyde, perchloric acid. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm

OSHA PEL: 50 ppm/230 milligram per cubic meter TWA

NIOSH REL: 50 ppm/230 milligram per cubic meter TWA

ACGIH TLV[1]: 50 ppm/234 milligram per cubic meter TWA; 75 ppm/350 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 75 ppm

PAC-2: 500 ppm

PAC-3: 3000 ppm

DFG MAK: 10 ppm/47 milligram per cubic meter TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group D
Australia: TWA 50 ppm (230 milligram per cubic meter), 1993; Austria: MAK 50 ppm (230 milligram per cubic meter), 1999; Belgium: TWA 50 ppm (234 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (230 milligram per cubic meter), 1999; Finland: TWA 50 ppm (230 milligram per cubic meter); STEL 75 ppm (345 milligram per cubic meter), 1999; France: VME 50 ppm (230 milligram per cubic meter), 1999; Norway: TWA 25 ppm (115 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 163 milligram per cubic meter, 2003; Sweden: TWA 25 ppm (120 milligram per cubic meter); STEL 50 ppm (250 milligram per cubic meter), 1999; Switzerland: MAK-W 50 ppm (230 milligram per cubic meter), 1999; United Kingdom: TWA 50 ppm (237 milligram per cubic meter); STEL 100 ppm [skin] 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 75 ppm. Several states have set guidelines or standards for ethyl butyl ketone in ambient air[60] ranging from 2.3−3.45 milligram per cubic meter (North Dakota) to 3.8 milligram per cubic meter (Virginia) to 4.6 milligram per cubic meter (Connecticut) to 5.476 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1301, #2553, or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl butyl ketone irritates the eyes, skin, and respiratory tract. Exposure to high concentrations can affect the CNS; cause dizziness, lightheadedness, and to lose consciousness.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dryness and cracking.

Points of Attack: Eyes, skin, respiratory system, and CNS.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Repeated or prolonged skin contact. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: 500 ppm: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)]; or Sa (APF = 10) (any supplied-air respirator). 1000 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ethyl butyl ketone must be stored to avoid contact with oxidizers, such as peroxides, chlorates, perchlorates, permanganates, and nitrates, because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where ethyl butyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1224 Ketones, liquid, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources.

Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl butyl ketone out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Ethyl butyraldehyde E:0460

Formula: $C_6H_{12}O$; $(C_2H_5)_2CHCHO$

Synonyms: Aldehyde-2-ethylbutyrique (French); Butyraldehyde, 2-ethyl-; Diethyl acetaldehyde; 2-Ethylbutanal; α-Ethylbutyraldehyde; 2-Ethylbutyraldehyde; Ethylbutyraldehyde; 2-Ethylbutyric aldehyde

CAS Registry Number: 97-96-1

RTECS Number: ES2625000

UN/NA & ERG Number: UN1178/130 (P)

EC Number: 202-623-5

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Polymerization hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R5; R11; R19; R36/38; safety phrases: S2; S16; S21; S26; S36 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl butyraldehyde is a colorless liquid. Molecular weight = 100.18; boiling point = 116.8°C; freezing/melting point = −89°C; flash point = 21°C (oc). Explosive limits: LEL: 1.2%; UEL: 7.7%. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Used in organic synthesis of pharmaceuticals and rubber chemicals.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and reducing agents. Aldehydes are frequently involved in self-condensation or polymerization reactions. These reactions are exothermic; they are often catalyzed by acid. Aldehydes are readily oxidized to give carboxylic acids. Flammable and/or toxic gases are generated by the combination of aldehydes with azo, diazo compounds, dithiocarbamates, nitrides, and strong reducing agents. Aldehydes can react with air to give first peroxo acids, and ultimately carboxylic acids. These autoxidation reactions are activated by light, catalyzed by salts of transition metals, and are autocatalytic (catalyzed by the products of the reaction). The addition of stabilizers (antioxidants) to shipments of aldehydes retards autoxidation[101].

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation and skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin and eyes on contact. Inhalation may irritate the respiratory tract causing coughing and wheezing.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1178 2-Ethyl butyraldehyde, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, polyurethane foams, or a similar material and deposit in sealed containers. Keep ethyl butyraldehyde out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Formula: $C_6H_{12}O_2$: $C_3H_7COOC_2H_5$

Synonyms: Butonic acid, ethyl ester; Butyric acid, ethyl ester; Butyric ether; Ethyl butanoate; Ethyl *n*-butyrate

CAS Registry Number: 105-54-4

HSDB Number: 406

RTECS Number: ET1660000

UN/NA & ERG Number: UN1180/130 (P); UN1178/130 (P)

EC Number: 203-306-4

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Polymerization hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R19; R36/37/38; safety phrases: S16; S21; S26; S36; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl butyrate is a colorless liquid. Pineapple odor. The Odor Threshold is 0.015 ppm[41]. Molecular weight = 116.16; boiling point = 120°C; flash point = 24°C; autoignition temperature = 463°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Ethyl butyrate, and aldehyde, is used in flavorings, extracts, perfumery, and as a solvent.

Incompatibilities: Vapor explosive mixture with air. Ethers can act as bases. They form salts with strong acids and addition complexes with Lewis acids. The complex between diethyl ether and boron trifluoride is an example. Ethers may react violently with strong oxidizing agents. In other reactions, which typically involve the breaking of the carbon-oxygen bond, ethers are relatively inert[101]. Incompatible with alkaline materials, strong acids, oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from strong bases and heat.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation and passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl butyrate can affect you when breathed in and by passing through your skin. Contact can irritate the skin and eyes. The vapor irritates the eyes, nose, throat and lungs. Symptoms may include nosebleeds, sore throat; cough with phlegm; and/or difficulty breathing. Overexposure may cause headaches and make you feel dizzy and lightheaded. Higher levels can make you pass out.

Long-Term Exposure: Unknown at this time.

Points of Attack: Lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: consider lung function tests, especially with irritation symptoms. Consider liver function tests after suspected overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethyl butyrate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ethyl butyrate is incompatible with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); strong acids (such as hydrochloric, sulfuric and nitric); bases, and heat. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where ethyl butyrate is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethyl butyrate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of ethyl butyrate.

Shipping: UN1180; UN1178 Ethyl butyrate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill. Cover spill with activated carbon adsorbent, take up and deposit in sealed containers. Keep ethyl butyrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include carbon monoxide. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F + , N, Xn; risk phrases: R45; R5; R12; R19; R20/21/22; R23/24/25; R26/28; R36/37/38; R39/23/24/25; R51/53; R61; R62; R63; R66; R67; safety phrases: S1; S7; S9; S16; S26; S28; S29; S33; S36/37/39/; S38; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ethyl chloride is a colorless gas or liquid (below 12°C) with a pungent, ethereal odor and a burning taste. Shipped as a liquefied compressed gas. Molecular weight = 64.51; specific gravity (H_2O:1) = 0.92 (liquid @ 0°C); boiling point = 12.3°C; freezing/melting point = −138.4; vapor pressure = 1000 mmHg @ 20°C; 750 mmHg @ 12°C; flash point = −50°C (liquid); autoignition temperature = 519°C. Explosive limits: LEL: 3.8%, 8000 ppm[138]; UEL: 15.4%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 0. Slightly soluble in water; solubility = 0.6%.

Potential Exposure: Ethyl chloride is used as an ethylating agent in the manufacture of tetraethyl lead, dyes, drugs, and ethyl cellulose; as a pharmaceutical, solvent; alkylating agent; as a refrigerant and as a local anesthetic (freezing).

Incompatibilities: Flammable gas. Slow reaction with water; forms hydrogen chloride gas. Contact with moisture (water, steam) forms hydrochloric acid and/or fumes of hydrogen chloride. May accumulate static electrical charges, and may cause ignition of its vapors. May form explosive mixture with air. Contact with chemically active metals: aluminum, lithium, magnesium, sodium, potassium, zinc may cause fire and explosions. Attacks some plastics and rubber.

Permissible Exposure Limits in Air

NIOSH IDLH = 3800 [LEL]

Conversion factor: 1 ppm = 2.64 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1000 ppm/2600 milligram per cubic meter TWA

NIOSH REL: Handle with caution in the work-place. NIOSH considers chloroethanes to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV[1]: 100 ppm [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 300 ppm

PAC-2: 5100 ppm

PAC-3: 20,000 ppm (LEL, lower explosive limit)

DFG MAK: [skin] Carcinogen Category 3B

Australia: TWA 1000 ppm (2600 milligram per cubic meter), 1993; Austria Suspected: carcinogen, 1999; Belgium: TWA 1000 ppm (2640 milligram per cubic meter), 1993; Denmark: TWA 1000 ppm (2600 milligram per cubic meter), 1999; Finland: TWA 500 ppm (1300 milligram per cubic meter); STEL 625 ppm (1625 milligram per cubic meter), 1999; France: VME 1000 ppm (2600 milligram per cubic meter), 1999; Hungary: TWA 100 milligram per cubic meter; STEL 300 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 2600 milligram per cubic meter, 2003; Norway: TWA 500 ppm (1300 milligram per cubic meter), 1999; the Philippines: TWA 1000 ppm (2600 milligram per cubic meter), 1993; Poland: MAC (TWA) 200 milligram per cubic meter, MAC (STEL) 1600 milligram per cubic meter, 1999; Russia: TWA 1000 ppm; STEL 50 milligram per cubic meter, 1993; Sweden: NGV 500 ppm (1300 milligram per cubic meter), KTV 700 ppm (1900 milligram per cubic meter), 1999; Switzerland: MAK-W 1000 ppm (2600 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (2600 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (2700 milligram per cubic meter); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia[35,43] set a MAC in work-place air of 50 milligram per cubic meter. Limits on ambient air in residential areas have been set by Russia[35] at 0.2 milligram per cubic meter on a daily average basis and by the Czech Republic at 0.1 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for ethyl chloride in ambient air[60] ranging from zero (Virginia) to 0.36 milligram per cubic meter (Massachusetts) to 26.0 milligram per cubic meter (North Dakota) to 52.0 milligram per cubic meter (Connecticut, Florida, New York) to 61.88 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method 2519[18].

Permissible Concentration in Water: No criteria set due to volatility and low specific gravity.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.53$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of gas, slight percutaneous absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl chloride irritates eyes, skin, and respiratory tract. Inhalation of vapor may have a narcotic effect. Skin contact with the liquid may cause frostbite. Ethyl chloride exposure may produce headache, dizziness, lack of coordination; stomach cramps; and eventual loss of consciousness. In high concentrations, it is a respiratory tract irritant, and death due to cardiac arrest has been recorded. Renal damage has been reported in animals.

Long-Term Exposure: There is limited evidence that ethyl chloride causes skin or uterine cancer in animals. May affect the nervous system; liver, and kidneys.

Points of Attack: Liver, kidneys, respiratory system, and cardiovascular system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24 hours EKG (Holter monitor) to look for irregular heartbeat. Tests of liver and kidney function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 4 hours: Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles

and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: Up to 3800 ppm: Sa (APF = 10) (any supplied-air respirator); * or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl chloride must be stored to avoid contact with oxidizers (such as peroxides, chlorates, perchlorates, nitrates, and permanganates) or chemically active metals (such as sodium, potassium, calcium, powdered aluminum, zinc, and magnesium) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where ethyl chloride is handled, used, or stored. Metal containers used in the transfer of five gallons or more of ethyl chloride should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of ethyl chloride. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1037 Ethyl chloride, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *If ethyl chloride gas is leaked*, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep ethyl chloride out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid or gas. Thermal decomposition products may include hydrogen chloride and oxides of carbon. *Liquid:* Establish forced ventilation to keep levels below explosive limit. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. *Gas:* Establish forced ventilation to keep levels below explosive limit. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22].

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Highly flammable, Possible risk of forming tumors, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, N; risk phrases: R11; R23/24/25; R50; safety phrases: S1/2; S7/9; S21; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ethyl chloroacetate is a water-white liquid with a pungent, fruity odor. Molecular weight = 122.56; specific gravity (H_2O:1) = 1.2 @ 20°C; boiling point = 144°C; freezing point = −27°C; vapor pressure = 10 mmHg @ 37.5°C; flash point = 64°C. Hazard identification (based on NFPA-704 M Rating System): Health: 3, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Used to make rodenticides, dyes, and other chemicals. Also used as a military poison.

Incompatibilities: May form explosive mixture with air. Incompatible with strong bases; strong acids; reducing agents. Moisture, water, and steam contact forms toxic and corrosive fumes. Violent reaction with oxidizers, alkaline earth metals (barium, calcium, magnesium, strontium, etc.), alkaline metals, sodium cyanide. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.11 ppm

PAC-2: 1.2 ppm

PAC-3: 7.1 ppm

Routes of Entry: Inhalation, eyes, and through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can severely irritate and burn eyes and skin. Inhalation can irritate the respiratory tract with coughing and wheezing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause headache, nausea, and vomiting.

Long-Term Exposure: Very irritating substances may cause lung damage.

Points of Attack: Lungs.

Medical Surveillance. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong acids; strong bases; reducing agents; heat and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1181 Ethylchloroacetate, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and carbon monoxide. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: Ethyl Chloroacetate*, Trenton, NJ (March 1999)

Ethyl chloroformate E:0495

Formula: $C_3H_5ClO_2$

Synonyms: Carbonochloridic acid, ethyl ester; Cathyl chloride; Chlorocarbonate d'ethyle (French) * Chloroformic acid ethyl ester; Chlorameisensaeureaethylester; ECF; Ethyl chlorocarbonate; Ethyle, chloroformiat d' (French);

Etil clorocarbonato (Spanish); Etil cloroformiato (Spanish); Formic acid, chloro-, ethyl ester; TL 423

CAS Registry Number: 541-41-3

HSDB Number: 409

RTECS Number: LQ6125000

UN/NA & ERG Number: (PIH) UN1182/155

EC Number: 208-778-5

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Air reactive (with moisture), Extremely flammable liquid, Sensitization hazard, Corrosive, Lacrimator, Electrostatic hazard, Dangerously water reactive (exothermic).

EPCRA Section 313 Form R de minimus concentration reporting level: 1.0%.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F; risk phrases: R11; R14; R22; R26; R34; R36/37/38; R43; R45; R22; R24; R26; safety phrases: S9; S16; S21; S26; S28; S33; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: A colorless to light yellow liquid. Sharp, pungent odor, similar to HCl. Molecular weight = 108.53; specific gravity (H_2O:1) = 1.135 @ 20°C; boiling point = 94°C; freezing/melting point = −81°C; vapor pressure = 23 mmHg @ 25°C; Flash point = 16−18°C; autoignition temperature = ~500°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 1 ₩. Water reactive, releasing hydrogen chloride, carbon dioxide and ethanol.

Potential Exposure: Heavily used in industry for various processes; in ore processing, photography, making other chemicals including amines, carbamates, isocyanates; polymers, diethyl carbonate; nitriles, etc.[193].

Incompatibilities: Highly flammable; Vapors may form explosive mixture with air. Emits fumes containing HCl on contact with moist air. Decomposes exothermically but slowly in water. Ethyl chloroformate decomposes slowly in water forming ethanol, hydrogen chloride and carbon dioxide. May react vigorously, possibly explosively, if mixed with di-isopropyl ether or other ethers in the presence of trace amounts of metal salts. Reacts with acids, alkalies, amines, alcohols, oxidizers and water. Corrosive to metals especially in the presence of moisture.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 0.15 ppm

PAC-2:1.6 ppm

PAC-3:4.8 ppm

Routes of Entry: Inhalation, ingestion, and dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Poison inhalation hazard. Vapor causes severe lachrymation; liquid causes acid-type burns of eyes and skin, like those of hydrochloric acid. Inhalation causes irritation of the mucous membrane with severe irritation, coughing, and sneezing. Ingestion causes severe burns of mouth and stomach. Very toxic by inhalation; capable of producing delayed pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Vapors are heavier than air. Corrosive to tissue: eyes, skin and respiratory system. LD_{50} = (oral-rat) <50 mg/kg[136].; LD_{50} = (oral-rat) <300 mg/kg.

Long-Term Exposure: Prolonged exposure to low concentrations or short exposure to high concentrations may have adverse health effects from inhalation. Skin sensitization may occur. If skin or lung sensitization is suspected, consider evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

Points of Attack: Lungs, skin, and eyes

Medical Surveillance: Special attention should be given to the eyes and respiratory tract in medical exam[193] [Pattty's].

First Aid: *Inhalation:* remove to fresh air; use artificial respiration if breathing has stopped; call a doctor; keep victim quiet and administer oxygen if needed. *Eyes*: flush with water for at least 15 min.; see a doctor. *Skin*: wash liberally with water for at least 15 min., then apply dilute solution of sodium bicarbonate or commercially prepared neutralizer. *Ingestion*: do NOT induce vomiting; give large amount of water; get medical attention.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Poison inhalation hazard, Where there is potential exists for exposure to this compound, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA (SCBA) with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation hazard (PIH) chemical; check oxygen content prior to entering storage area.(1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (3) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Store refrigerated (preferred) or in a cool, dry, well-ventilated atmosphere and location. Normally refrigerated[193]. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong acids; strong bases; reducing agents; heat and sources of ignition.

Shipping: UN1182 Ethyl chloroformate, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, 8-Corrosive material Inhalation Hazard Zone B

Spill Handling:

Ethyl chloroformate

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/03
Night 0.4/0.6

Releases may require immediate isolation or evacuation. Eliminate all ignition sources (no smoking, flares, sparks or flames in immediate area). All equipment used when handling the product must be grounded. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. A vapor suppressing foam may be used to reduce vapors.

Fire Extinguishing: Thermal decomposition products may include phosgene, hydrogen chloride and oxides of carbon. *Note:* Most foams will react with the material and release corrosive/toxic gases. *Note:* Most foams will react with the material and release corrosive/toxic gases. *Small fire*: CO_2, dry chemical, dry sand, alcohol-resistant foam. *Large fire:* Water spray, fog or alcohol-resistant foam. For chlorosilanes, do not use water; use AFFF alcohol-resistant medium-expansion foam. Move containers from fire area if you can do it without risk. Use water spray or fog; do not use straight streams. *Fire involving tanks or car/trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire[31].

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: Ethyl Chloroformate*, Trenton, NJ, (March 2000)

Ethyl 2-chloropropionate E:0500

Formula: $C_5H_9ClO_2$: $CH_3CHClCOOC_2H_5$

Synonyms: 2-Chloropropionic acid, ethyl ester; Propanoic acid, 2-chloro-, ethyl ester

CAS Registry Number: 535-13-7

RTECS Number: UE8870000

UN/NA & ERG Number: UN2935/129

EC Number: 208-610-0

Regulatory Authority and Advisory Information

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R36/37/38; R52; safety phrases: S16; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl-2-chloropropionate is a liquid with a pleasant odor. Molecular weight = 136.8; boiling point = 147°C; freezing/melting point = < -20°C; flash point = 41.8°C; ignition temperature = ~400°C. Practically insoluble in water.

Potential Exposure: This material is used in organic synthesis.

Incompatibilities: Flammable liquid; forms explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and reducing agents. Esters are generally incompatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition. Esters react with acids releasing heat in addition to alcohols and acids. Contact with caustic solutions generate heat. Contact with esters with alkali metals and hydrides releases flammable hydrogen.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation and dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl-2-chloropropionate can affect you when breathed in. Eye or skin contact may irritate the nose, throat and bronchial tubes. High exposures might cause a dangerous fluid build-up in the lungs (pulmonary edema); a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Some related chemicals may cause skin allergy. Very irritating substances may cause lung problems.

Points of Attack: Respiratory tract.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: consider lung function tests, especially if lung symptoms are present. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to ethyl-2-chloropropionate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, bases, oxidizing and reducing agents. Sources of ignition, such as smoking and open flames, are prohibited where ethyl-2-chloropropionate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2935 Ethyl 2-chloropropionate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include chlorides, are released in fire including hydrogen chloride and oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 220-928-1

Regulatory Authority and Advisory Information

Hazard Alert: Poison Inhalation hazard, Neurotoxin, Corrosive, Flammable liquid, Water reactive, Environmental hazard.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazard symbols, risk, & safety statements: Hazard symbol: C, T+, F, N; risk phrases: R10; R22;, R26; R20/21/22; R34; R36/37; R50/53; safety phrases: S16; S24/25; S26; S27; S28; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethyl chlorothioformate is a flammable clear yellow or amber-colored liquid. Pungent, penetrating odor. Molecular weight = 124.59[136]; 132.56[138]; specific gravity (H_2O:1) = 1.195 @ 20°C; boiling point = 132.2°C; freezing/melting point = −55°C; flash point = 51.7°C. Practically insoluble in water; solubility = < 1 mg/L @ 19°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 0 ₩. Reacts with water, releasing corrosive hydrogen chloride gas. Sinks in water and vapors are heavier than air.

Potential Exposure: Used for making other chemicals. A pharmaceutical intermediate.

Incompatibilities: Corrosive to metals. Flammable vapors may form explosive mixture with air. Contact with moisture releases highly corrosive and toxic hydrogen chloride gas. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 0.024 ppm

PAC-2: **0.26** $_{\mathbf{A}}$ ppm

PAC-3: **0.79** $_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation and ingestion. May pass through unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Very toxic by inhalation; and a nervous system toxin. Corrosive to all body tissues. Eye, skin, and respiratory tract irritant. GI tract-acute effects; Nervous system toxin-acute effects. Exposure may cause a dangerous fluid build-up in the lungs (pulmonary edema); a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause respiratory and nervous system effects.

Points of Attack: Nervous system and respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: consider lung function tests, especially if lung symptoms are present. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Full impervious protective clothing, including boots and gloves. Where splashing is possible wear full face shield or chemical safety goggles. Use approved respirator to protect against vapors.

Respirator Selection: Where there is potential exists for exposure to Maneb, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area.(1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition.

Shipping: UN2826 Ethyl chlorothioformate, Hazard Class: 8; Labels: 8-Corrosive material, 6.1-Poison Inhalation Hazard, 3-Flammable liquid; Inhalation Hazard Zone B

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.4/0.6

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. Stop discharge; Collection Systems: Dredge; Do not burn. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Highly flammable liquid. Thermal decomposition products may include vapors and toxic gases, including hydrogen chloride and oxides of sulfur and carbon. Vapors can flow along surfaces to distant ignition source and flash back. *Note:* Most foams will react with the material and release corrosive/toxic gases. *Small fire*: CO_2, dry chemical, dry sand, alcohol-resistant foam. *Large fire:* Water spray, fog or alcohol-resistant foam. For chlorosilanes, do not use water; use AFFF alcohol-resistant medium-expansion foam. Move containers from fire area if you can do it without risk. Use water spray or fog; do not use straight streams. *Fire involving tanks or car/trailer loads*: fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire[31].

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

Ethyl cyanoacetate E:0510

Formula: $C_5H_7NO_2$

Synonyms: Acetic acid, cyano-, ethyl ester; Cyanacetate ethyle (German); Cyanoacetic acid ethyl ester; Cyanoacetic ester; Estere cianoacetico; Ethyl cyanoacetate; Ethyl cyanoethanoate; Malonic acid, ethyl ester nitrile

CAS Registry Number: 105-56-6

HSDB Number: 2769

RTECS Number: AG4110000

UN/NA & ERG Number: UN3276/151

EC Number: 203-309-0

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Possible polymerization hazard (nitriles), Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl cyanoacetate is a colorless to straw colored liquid with a mild pleasant odor. Molecular weight = 113.14; boiling point = 207°C; freezing/melting point = −23°C; vapor pressure = 1 mmHg @ 68°C; flash point = 110°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: A nitrile used to manufacture dyes, pharmaceuticals, and other chemicals.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and reducing agents. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101]. Reacts with moisture, water, and steam, forming toxic fumes.

Permissible Exposure Limits in Air

NIOSH REL: (*nitriles*) 2 ppm, Ceiling Concentration, not to be exceeded in any 15 minute work period. PAC not available.

Determination in Air: See NIOSH Criteria Document 78-212, NITRILES.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg [CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; short-term consumption; raw water constituents (maximum) 20 mg[CN]/L.

Routes of Entry: Inhalation. May be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: An organic cyanide compound. Irritates the eyes, skin, and respiratory tract. Exposure can cause headache, nausea, and vomiting. Poisonous if ingested.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode. NIOSH (*as cyanides)*: 25 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong bases; strong acids; reducing agents; moisture and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3276 Nitriles, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required, Potential Inhalation Hazard (Special Provision 5).

Spill Handling:

Nitriles spill

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition include cyanide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard (organic arsenical), Nervous system toxin, Delayed-action blister/vesicants, Environmental hazard, Organometallic, Strong reducing agent, Water reactive, Air reactive, Agricultural chemical (organoarsenic).

CLEAN AIR ACT: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds

Clean Water Act: Toxic pollutant designated pursuant to section 307(a)(1) of the Federal Water Pollution Control Act and is subject to effluent limitations: 40 CFR 401.15 (7/1/2001).

RCRA Section 261 Hazardous Constituents, waste number D004

EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg)

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: (inorganics) 0.1%; organics 1.0%

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n. o. s; arsenates, solid, n. o. s; arsenical pesticides liquid, toxic, flammable, n. o. s.

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as arsenic compounds Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as arsenic compounds. The "Director's List" (CAL/OSHA) as arsenic compounds

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements:: Hazard symbol: T, Xi, N; risk phrases: R20/22; R36/37/38; safety phrases: S1; S29/35; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: A colorless mobile liquid. Acrid, biting, irritating, fruit-like odor. Molecular weight = 174.89; specific gravity (H_2O:1) = 1.742 @ 14°C; freezing/melting point = −65°C; vapor pressure = 2.29 mmHg @ 21.5°C. Insoluble in water. ₩ Water reactive, quick hydrolysis, forming hydrochloric acid and ethylarsine chloride.

Potential Exposure: Organoarsenic compound, Organometallic.

Incompatibilities: Reacts with water or moist air releasing hydrochloric acid and/or corrosive fumes of hydrogen chloride (HCl). A strong reducing agent; incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Attacks some metals; brass, but not ferrous metals.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 0.0026 milligram per cubic meter

PAC-2: **0.029** $_{\mathbf{A}}$ milligram per cubic meter

PAC-3: **0.086** $_{\mathbf{A}}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Air: Filter; Reagent: Ion chromatography/hydride atomic absorption: NIOSH IV [#5022, Arsenic, organo-][18].

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons. Federal Drinking Water Guidelines: EPA 10 μg/L; State Drinking Water Guidelines: Arizona 10 μg/L; Connecticut 10 μg/L. Toxic pollutant designated pursuant to section 307 (a) (1) of the Clean Water Act and is subject to effluent limitations (arsenic and inorganic and organic arsenic) [40 CFR 401.15 (7/1/1987)]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: See OSHA Analytical Method ID-105 for arsenic. The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry.

Routes of Entry: Inhalation, ingestion, and skin absorption

Harmful Effects and Symptoms

Short-Term Exposure: Liquid and vapors are extremely toxic by inhalation, ingestion, skin absorption. Severe eye irritant. The vapor is a powerful lacrimatory irritant of the eyes, skin and respiratory tract. It is corrosive to eye tissue and may cause permanent corneal opacity and conjunctival scarring. Severe exposure may result in overwhelming pulmonary edema. Respiratory toxin: acute effects other than severe or moderate irritation; Nervous system toxin: acute effects; GI tract-acute effects; Skin irritant-severe; Respiratory irritant-acute, severe, or moderate but not mild irritant effects; Eye-acute effects other than irritation[138]. Strong irritant: LCLo (inhalation-man) 14ppm/30 M.

Points of Attack: Respiratory system, eyes, and CNS

Medical Surveillance: Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to Physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (NOT penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you don't have the equipment and training, don't enter the hot or the warm zone to rescue and decontaminate victims. If the victim can't move, decontaminate without touching and without entering the hot or the warm zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Use caution to avoid hypothermia in children and the elderly. Wash—strip—wash—evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. There are differing guidelines for decontamination and more research is needed to identify the optimal decontamination method. The effect of lewisite and mustard-lewisite can be prevented by rapid topical application of 2,3-dimercaptopropanol, known as British anti-lewisite (BAL) which reacts with Lewisite to form a stable nontoxic cyclic product. Decontaminate with diluted household bleach (0.5%, or one part bleach to 200 parts water), but don't let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Be sure you've decontaminated the victims as much as you can before they leave the area so that they don't spread the Lewisite. Use the antidote "Anti-Lewisite." Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 ounces per five gallons of water) to decontaminate scissors used in clothing removal, clothes and other items. *Note:* Decontamination wash water (effluent) will contain toxic arsenic.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APRs or PAPRs are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full facepiece respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Personal Protective Methods: A severe eye irritant; danger of blindness. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: PIH; check oxygen content prior to entering storage area. Color code-Blue: Health Hazard/Poison: Store in a secure, locked, poison location. Prior to working with arsenic compounds all handlers should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1892 Ethyldichloroarsine Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard; Inhalation Hazard Zone B. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line)

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 1.0/1.5
Night 1.5/2.4

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1500/500
Then: Protect persons downwind (mi/km)
Day 3.3/5.3
Night 6.1/9.7

ED when used as a weapon 500/150

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 1.2/1.9
Night 1.8/2.8

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 3000/1000
Then: Protect persons downwind (mi/km)
Day 6.5/10.5
Night 7.0 + /11.0 + *

*+ means distance can be larger in certain atmospheric conditions.

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing:

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

CAS Registry Number: 1789-58-8
HSDB Number: 4048
RTECS Number: VV3230000
UN/NA & ERG Number: UN1183/139
EC Number: 217-255-0
Regulatory Authority and Advisory Information
Check
Hazard Alert: Highly flammable, Pyrophoric hazard, Violently reactive with water.
Hazard symbols, risk, & safety statements: Hazard symbol: T, F+, C; risk phrases: R11; R14/15; R17; R29; R34; R37; safety phrases: S7; S16; S21; S26; S36/37/39; S43; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Ethyl dichlorosilane is a colorless liquid. Sharp, irritating odor. Molecular weight = 129.07; boiling point = 75.5°C; flash point = −1°C. Explosive Limits: LEL: 2.9%; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2 ₩. Dangerously reactive with water, rapidly releasing hydrogen chloride gas.
Potential Exposure: This material is used in silicone polymer manufacture.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture.
Permissible Exposure Limits in Air
No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short-Term Exposure: Ethyl dichlorosilane is corrosive. It can affect you when breathed in. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema), a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Ethyl dichlorosilane is a corrosive chemical and contact can cause severe skin and eye burns leading to permanent eye damage.
Long-Term Exposure: This chemical can irritate the lungs. Repeated exposure may cause bronchitis with cough, phlegm, and/or shortness of breath.
Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposure to ethyl dichlorosilane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.
Storage: (1) Color code-Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other

flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Do not store in a basement. (2) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl dichlorosilane must be stored to avoid contact with moisture and oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam and moisture, because toxic and corrosive chloride gases, including hydrogen chloride can be produced. Sources of ignition, such as smoking and open flames, are prohibited where ethyl dichlorosilane is handled, used or stored. Metal containers involving the transfer of five gallons or more of ethyl dichlorosilane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl dichlorosilane.

Shipping: UN1183 Ethyldichlorosilane, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material; 8-Corrosive material.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

When Spilled in Water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.4/2.3

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include phosgene and hydrogen chloride. Use dry chemical. *Do not use water* (forms hydrogen chloride gas). Fire may restart after it has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: IARC: Human Inadequate Evidence; Animal No Adequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1994.

Hazard Alert: Extremely flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Polymerization hazard, Possible risk of forming tumors.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R3; R5; R12; R19; R21; R67; safety phrases: S1; S2; S9; S16; S33; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Ethylene, an alkene is a colorless gas (at room temperature). Sweet odor. Minimum detectable odor = 260 ppm. Molecular weight = 28.06; boiling point = −104°C; freezing/melting point = −169°C; autoignition temperature = 450°C−490°C. Explosive limits: LEL = 2.7%; UEL: 36.0%[17]. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 2. Insoluble in water.

Potential Exposure: Ethylene is used in production of fabricated plastics, antifreeze; making fibers; to manufacture ethylene oxide, polyethylene for plastics, alcohol, mustard gas and other organics. It is used to accelerate ripening of fruit; as an anesthetic; and for oxyethylene welding and cutting of metals.

Incompatibilities: A highly flammable gas at room temperature. Contact with oxidizers may cause explosive polymerization and fire. May be spontaneously explosive in sunlight or ultraviolet light when mixed with chlorine. Reacts violently with mixtures of carbon tetrachloride and benzoyl peroxide; bromotrichloromethane; aluminum chloride and ozone. Incompatible with acids, halogens, nitrogen oxides; hydrogen bromide; aluminum chloride; chlorine dioxide; nitrogen dioxide. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Minimum detectable odor = 260 ppm.

OSHA PEL (*construction & shipyards only*): Simple asphyxiants-inert gas and vapor

NIOSH REL: None

ACGIH TLV[1]: 200 ppm/230 milligram per cubic meter TLV; not classifiable as a human carcinogen (2001); *Excursion Limit Recommendation:* Excursions in worker exposure levels may exceed three times the TLV-TWA for no more than a total of 30 minutes during a work day, and under no circumstances should they exceed five times the TLV-TWA, provided that the TLV-TWA is not exceeded.

PAC Ver. 29[138]

PAC-1: 600 ppm

PAC-2: 6600 ppm (> = 10% LEL; <50% LEL)*

PAC-3: 40,000 ppm (> = 100% LEL; LEL = 27,000 ppm)

DFG MAK: Carcinogen Category 3B

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Russia: STEL 100 milligram per cubic meter, 1993; Switzerland: MAK-W 10000 ppm (11500 milligram per cubic meter), 1999; United Kingdom: asphyxiant, 2000; the Netherlands: MAC-TGG 330 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia cites a MAC for ambient air of residential areas of 3 milligram per cubic meter on either a momentary or a daily average basis. Virginia[60] has set a guideline for ethylene in ambient air of 3.0 μ/m^3.

Permissible Concentration in Water: Russia[43] gives a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Increasingly severe exposures may cause faintness, a lack of coordination; excitement, stupor, unconsciousness, convulsions, stopped breathing, paralysis, and heart, liver, and kidney damage. 20%−25% (200,000−250,000 ppm) gas has caused loss of sense of pain. 80%−90% (800,000−900,000 ppm) has caused anesthesia. *Skin:* Contact with liquid can cause a "freezing burn." *Eyes:* Same as skin. *Ingestion:* No information available.

Long-Term Exposure: Inhalation may cause loss of appetite and weight, irritability, insomnia, increase in red blood cell count, and inflammation of the kidneys.

Points of Attack: Kidneys

Medical Surveillance: Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming

frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to ethylene gas is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from chlorine compounds, oxidizing agents, and combustible materials. Sources of ignition, such as smoking and open flames are prohibited where ethylene is handled, used, or stored, Use only nonsparking tools and equipment, especially when opening and closing containers of ethylene. Wherever ethylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1962 Ethylene, Hazard Class: 2.1; Labels: 2.1-Flammable gas; UN1038 Ethylene, refrigerated liquid (cryogenic liquid), Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible gas or liquid. Thermal decomposition products may include oxides of carbon. *Liquid:* Use dry chemical, carbon dioxide; or water spray in large amounts. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Gas: Ventilate area of leak to disperse gas. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for

firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethylene chlorohydrin is a colorless liquid with a faint, ethereal odor. Molecular weight = 80.52; specific gravity (H_2O:1) = 1.20; boiling point = 127.8°C; freezing/melting point = −67.8°C; vapor pressure = 5 mmHg @ 20°C; Flash point = 60°C (cc); autoignition temperature = 425°C. Explosive limits: LEL = 4.9%; UEL: 15.9%. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Ethylene chlorohydrin is used as a solvent and emulsifier; in the synthesis of ethylene glycol, ethylene oxide, amines, carbitols, indigo, malonic acid, novocaine, and in other reactions where the hydroxyethyl group is introduced into organic compounds; for the separation of butadiene from hydrocarbon mixtures; in dewaxing and removing cycloalkanes from mineral oil; in the refining of rosin; in the manufacture of certain pesticides and in the extraction of pine lignin. In the lacquer industry, it is used as a solvent for cellulose acetate, cellulose esters, resins and waxes; and in the dyeing and cleaning industry, it is used to remove tar spots; as a cleaning agent for machines; and as a solvent in fabric dyeing. It has also found use in agriculture in speeding up sprouting of potatoes and in treating seeds to inhibit biological activity. Making chemical warfare agents.

Incompatibilities: May form explosive mixture with air. Strong oxidizers may cause fire and explosions. Incompatible with strong caustics (formation of ethylene gas), strong acids; alkaline metals; aliphatic amines; isocyanates. Violent reaction with ethylene diamine, chlorosulfonic acid. Attacks some plastics, rubber and coatings. Reacts with water or steam producing toxic and corrosive fumes.

Permissible Exposure Limits in Air

NIOSH IDLH = 7 ppm

Conversion factor: 1 ppm = 3.29 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/16 milligram per cubic meter TWA [skin]

NIOSH REL: 1 ppm/3 milligram per cubic meter Ceiling Concentration [skin]

ACGIH TLV[1]: 1 ppm/3.3 milligram per cubic meter Ceiling Concentration [skin]; not classifiable as a human carcinogen

PAC* Ver. 29[138]

PAC-1: 0.11 ppm

PAC-2: **1.2** $_A$ ppm

PAC-3: **3.5** $_A$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 1 ppm/3.3 milligram per cubic meter Peak Limitation Category II(1) [skin]; Pregnancy Risk Group C

Australia: TWA 1 ppm (3 milligram per cubic meter), [skin], 1993; Austria: MAK 1 ppm (3 milligram per cubic meter), [skin], 1993; Belgium: STEL 1 ppm (3.3 milligram per cubic meter), [skin], 1993; Denmark: TWA 1 ppm (3 milligram per cubic meter), [skin], 1999; Finland: STEL 1 ppm (3 milligram per cubic meter), [skin], 1999; France: VLE 1 ppm (3 milligram per cubic meter), [skin], 1999; the

Netherlands: MAC 3 milligram per cubic meter, [skin], 2003; the Philippines: TWA 5 ppm (16 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1999; Russia: STEL 0.5 milligram per cubic meter, [skin], 1993; Sweden: TGV 1 ppm (3.5 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 1 ppm (3 milligram per cubic meter), KZG-W 5 ppm (15 milligram per cubic meter), [skin], 1999; Turkey: TWA 5 ppm (16 milligram per cubic meter), 1993; United Kingdom: STEL 1 ppm (3.4 milligram per cubic meter), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: Ceiling Concentration 1 ppm [skin]. Several states have set guidelines or standards for 2-chloroethanol in ambient air[60] ranging from 30 μ/m^3 (North Dakota) to 71 μ/m^3 (Nevada) to 320 μ/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #2513 or OSHA Analytical Method 7[18].

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.7 mg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -0.06$.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Inhalation can cause severe irritation, with cough and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure to 18 ppm has resulted in vomiting and shock. Additional symptoms may include irritation of the nose, throat and lungs. Poor coordination, numbness, visual disturbance; headache, difficult breathing and unconsciousness, may also occur. Death has resulted from inhalation of 300 ppm for 2½ hours. Signs and symptoms of acute exposure to this chemical may include weakness, dizziness, confusion, visual disturbances; shock, seizures, and coma. Weak pulse, Hypotension (low blood pressure), and cyanosis (blue tint to the skin and mucous membranes) may be observed. Nausea, vomiting, and hematuria (bloody urine) may be seen after exposure. Chloroethanol affect the CNS; cardiovascular system; liver and kidneys. This chemical readily absorbed through the skin even though no irritation occurs and may cause symptoms listed above. Death has occurred from skin absorption of one teaspoon of liquid. Ingestion can cause irritation to the throat. May cause symptoms listed under inhalation. About 1/5 ounce may be lethal to a 150 pound adult.

Long-Term Exposure: Can cause damage to the kidneys, liver, cardiovascular system, and nervous system. May cause reproductive damage. Can irritate the lungs. Repeated exposure may cause bronchitis. High or repeated exposure can cause disturbed sleep; with loss of coordination in arms and legs.

Points of Attack: Respiratory system, liver, kidneys, CNS, cardiovascular system, and eyes.

Medical Surveillance: Preplacement examination, including a complete history and physical should be performed. Examination of the respiratory system, liver, kidneys, and CNS should be stressed. The skin should be examined. A chest X-ray should be taken and pulmonary function tests performed (FVC-FEV). The above procedures should be repeated on an annual basis, except that the X-ray is needed only when indicated by pulmonary function testing. NIOSH lists the following tests: Expired Air; liver function tests; urinalysis (routine)

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. *Beware:* the liquid penetrates rubber. 8 hours: Viton gloves, suits, polyvinyl alcohol gloves; Barricade coated suits; 4 hours: 4 H and Silver Shield gloves. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear eye protection to prevent any possibility of eye contact. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 7 ppm: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: PIH; check oxygen content prior to entering storage area. Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Keep in a cool, well-ventilated area, protected from physical damage, ignition sources; and separated from strong oxidizers or caustics. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of five gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN1135 Ethylene chlorohydrin, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Inhalation Hazard Zone B

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.3/0.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phosgene and hydrogen chloride. Use dry chemical, carbon dioxide; alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

Hazard Alert: Flammable liquid, Corrosive, Suspected reprotoxic hazard, Suspected of causing genetic defects, Sensitization hazard (skin), Primary irritant (w/o allergic reaction).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 20,000 lb (9080 kg)

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10,000 lb (4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C, Xi; risk phrases: R10; R21/22; R34; r36/37/38; R42; R61; R62; safety phrases: S1/2; S23-S26-S36/37/39-S45.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ethylenediamine, a polyamine, is a strongly alkaline, colorless, clear, thick liquid. Ammonia odor. A solid below 8.5°C. The Odor Threshold is 1.0 ppm. Molecular weight = 60.12; specific gravity (H_2O:1) = 0.9 @ 20°C; boiling point = 117°C; freezing/melting point = 8.5°C; vapor pressure = 11 mmHg @ 20°C; flash point = 33.9°C; autoignition temperature = 385°C. Explosive limits: LEL = 2.5% @ 100°C; UEL: 12% @ 100°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water. Hygroscopic; reacts releasing fumes.

Potential Exposure: Ethylenediamine is used as an intermediate; as a urine acidifier; as a solvent; an emulsifier for casein and shellac solutions; a stabilizer in rubber late. A chemical intermediate in the manufacture of dyes; corrosion inhibitors; synthetic waxes; fungicides, resins, insecticides, asphalt wetting agents; and pharmaceuticals. Ethylenediamine is a degradation product of the agricultural fungicide Maneb.

Incompatibilities: Vapor may form explosive mixture with air. Ethylenediamine is a medium strong base. Violent reaction with strong acids; strong oxidizers; chlorinated organic compounds; acetic acid; acetic anhydride; acrolein, acrylic acid; acrylonitrile, allyl chloride; carbon disulfide; chlorosulfonic acid; epichlorohydrin, ethylene chlorohydrin, oleum, methyl oxide; vinyl acetate. Also incompatible with silver perchlorate, 3-propiolactone, mesityl oxide; ethylene dichloride; organic anhydrides; isocyanates, acrylates, substituted allyls; alkylene oxides; ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks aluminum, copper, lead, tin, zinc, and alloys; some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm

Conversion factor: 1 ppm = 2.46 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/25 milligram per cubic meter TWA

NIOSH REL: 10 ppm/25 milligram per cubic meter TWA

ACGIH TLV[1]: 10 ppm/25 milligram per cubic meter TWA [skin]; not classifiable as a human carcinogen

PAC* Ver. 29[138]
PAC-1: 0.88 ppm
PAC-2: **9.7** $_{\mathbf{A}}$ ppm
PAC-3: **20** $_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: previous MAK suspended 2004; [skin] Danger of sensitization of the airways and skin.

Australia: TWA 10 ppm (25 milligram per cubic meter), 1993; Austria: MAK 10 ppm (25 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (25 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (25 milligram per cubic meter), 1999; Finland: TWA 10 ppm (25 milligram per cubic meter); STEL 20 ppm (50 milligram per cubic meter), 1999; France: VME 10 ppm (25 milligram per cubic meter), VLE 15 ppm (35 milligram per cubic meter), 1999; Japan; 10 ppm (25 milligram per cubic meter) [skin] 1999; the Netherlands: MAC-TGG 18 milligram per cubic meter, 2003; Norway: TWA 10 ppm (25 milligram per cubic meter), 1999; the Philippines: TWA 10 ppm (25 milligram per cubic meter), 1993; Poland: MAC (TWA) 2 milligram per cubic meter, MAC (STEL) 6 milligram per cubic meter, 1999; Russia: TWA 10 ppm; STEL 2 milligram per cubic meter, 1993; Sweden: NGV 10 ppm (25 milligram per cubic meter), KTV 15 ppm (35 milligram per cubic meter), 1999; Switzerland: MAK-W 1000 ppm (6400 milligram per cubic meter), 1999; Turkey: TWA 10 ppm (25 milligram per cubic meter), 1993; United Kingdom: TWA 10 ppm (25 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for ethylenediamine in ambient air[60] ranging from 250 μ/m^3 (North Dakota) to 300−2500 μ/m^3 (North Carolina) to 400 μ/m^3 (Virginia) to 500 μ/m^3 (Connecticut) to 595 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2540 or OSHA Analytical Method 60.

Permissible Concentration in Water: Russia[43] set a MAC of 0.7 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -1.2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ethylenediamine is corrosive to the eyes, skin, and respiratory tract. Skin contact can cause blistering. Eye contact can cause pain, serious injury and permanent damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Acute exposure to ethylenediamine may result in cough, difficulty in breathing; irritation of the lungs, and pneumonia. Nausea, vomiting, and diarrhea are often seen. Contact with ethylenediamine may result in redness, pain, irritation, and burns. Vapor inhalation at a concentration of 200 ppm for 5−10 minutes will lead to nasal irritation and produce a tingling sensation. Inhalation at concentrations of 400 ppm or greater leads to severe nasal irritation. Respiratory irritation may result. Many individuals are hypersensitive to ethylenediamine exposure; therefore, safe threshold limits are difficult to set.

Long-Term Exposure: Repeated or prolonged contact with skin may cause skin allergy. Repeated or prolonged exposure can cause an asthma-like allergy. Repeated high exposure may cause liver, kidney, and lung damage.

Points of Attack: Respiratory system, liver, kidneys, and skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: Saranex coated suits; Responder suits; 4 hours: Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash if liquids containing >5% contaminants are involved.

Respirator Selection: 250 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. 500 ppm: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern] organic vapor and acid gas cartridge(s); or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 1000 ppm: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition.

(3) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethylenediamine must be stored to avoid contact with acetic acid, acetic anhydride; acrolein, acrylic acid; acrylonitrile, allyl chloride; carbon disulfide; chlorosulfonic acid; epichlorhydrin, ethylene chlorohydrin; oleum, methyl oxide; vinyl acetate; hydrogen chloride and sulfuric; acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from

oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates). Detached outdoor storage is preferred. Sources of ignition, such as smoking and open flames, are prohibited where ethylenediamine is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethylenediamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethylenediamine.

Shipping: UN1604 Ethylenediamine, Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Stay upwind and keep out of low areas. Isolate area for 1/2 mi in all directions if tank car or truck is involved in fire. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use water spray, dry chemical, alcohol foam, or carbon dioxide. Wear full protective clothing including gloves and boots. If necessary to enter closed area, wear full-faced gas masks with SCBA. *Do not use water* in case of drum or tank fires. If a leak or spill has not ignited, use water spray to reduce the vapors and dilute spills to nonflammable mixtures. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R20/21/22: R36; R51; R61; R62; safety phrases: S2; S26; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: EDTA is a white, odorless, crystalline material or white powder. Molecular weight = 292.24; boiling point = 150°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: EDTA is a general purpose chelating agent; as a drug; food additive; in cosmetics; household and textile articles; in pharmaceutical products; and in biochemicals. It is also used as a laboratory chemical in research; in photographic processing.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, copper, copper alloys, and nickel.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 4.1 milligram per cubic meter

PAC-2: 45 milligram per cubic meter

PAC-3: 200 milligram per cubic meter

Determination in Air: None available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: EDTA irritates the eyes, skin, and respiratory tract. Skin contact may cause a burning sensation and rash. May affect the kidneys.

Long-Term Exposure: May cause kidney damage. May damage the developing fetus.

Points of Attack: Kidneys.

Medical Surveillance: Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. It does not easily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Ethylene dibromide is a colorless nonflammable liquid or solid (below 10°C). Sweet, chloroform-like odor. The minimum concentration detectable by odor is 10 ppm. Molecular weight = 187.88;specific gravity (H_2O:1) = 2.17; boiling point = 131°C; freezing/melting point = 10°C; relative vapor density (air = 1) = 6.5; vapor pressure = 12 mmHg. Soluble in water.
Potential Exposure: Ethylene dibromide is used as a chemical intermediate; as a fumigant for ground pest control; as a constituent of ethyl gasoline (anti-knock agent). It is also used in fire extinguishers, gauge fluids, and waterproofing preparations; and it is used as a solvent for celluloid, fats, oils, and waxes. Pesticide not in use; TRI and/or IUR indicates importers or manufacturers are unlikely[88].
Incompatibilities: Reacts vigorously with chemically active metals; liquid ammonia, strong bases; strong oxidizers; causing fire and explosion hazard. Light, heat, and moisture can cause slow decomposition, forming hydrogen bromide. Attacks fats, rubber, some plastics and coatings.
Permissible Exposure Limits in Air
Minimum odor concentration detectable = 10 ppm.
NIOSH IDLH = 100 ppm, potential occupational carcinogen
Conversion factor: 1 ppm = 7.69 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: 20 ppm TWA; 30 ppm Ceiling Concentration; 50 ppm [5 minute maximum peak] [skin]. For Construction, Shipyards, and Federal Contractors: 25 ppm/190 milligram per cubic meter Ceiling Concentration [skin]
NIOSH REL: 0.045 ppm TWA; 0.13 ppm [15 minute] Ceiling Concentration; Potential occupational carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A
ACGIH TLV[1]: [skin] confirmed animal carcinogen with unknown relevance to humans. PAC* Ver. 29[138]

PAC-1: $\mathbf{17_A}$ ppm
PAC-2: $\mathbf{24_A}$ ppm
PAC-3: $\mathbf{46_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin] Carcinogen Category 2

Arab Republic of Egypt: TWA 0.13 ppm (1 milligram per cubic meter), 1999; Australia: [skin], carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: [skin], carcinogen, 1993; Finland: TWA 20 ppm (145 milligram per cubic meter); STEL 30 ppm, [skin], carcinogen, 1999; France: carcinogen, 1993; Hungary: STEL 0.8 milligram per cubic meter, [skin], carcinogen, 1993; the Netherlands: MAC-TGG 0.002 milligram per cubic meter, 2003; the Philippines: TWA 25 ppm (190 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter, 1999; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.1 ppm (0.8 milligram per cubic meter), [skin], carcinogen, 1999; Thailand: TWA 20 ppm; STEL 30 ppm, 1993; Turkey: TWA 25 ppm (190 milligram per cubic meter), [skin], 1993; United Kingdom: TWA 0.5 ppm (3.9 milligram per cubic meter), [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic[35] has set a TWA of 10 milligram per cubic meter with a ceiling value of 20 milligram per cubic meter. Several states have set guidelines or standards for ethylene dibromide in ambient air[60] ranging from zero (North Dakota and New York) to 0.045 μ/m^3 (North Carolina) to 2.47 μ/m^3 (Pennsylvania) to 720 μ/m^3 (Indiana) to 770 μ/m^3 (South Carolina) to 1500 μ/m^3 (Virginia) to 1550 μ/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #1008 or OSHA Analytical Method 2.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.00005 mg/L; MCGL, zero. Several states have set guidelines or standards for ethylene dibromide in drinking water[61] ranging from 0.005 μg/L (Kansas) to 0.008 μg/L (Minnesota) to 0.01 μg/L (Arizona) to 0.02 μg/L (California and Washington) to 0.04 μg/L (Massachusetts) to 0.10 μg/L (Connecticut and New Mexico) to 0.50 μg/L (Wisconsin) to 1.0 μg/L (Maine).

Determination in Water: Octanol-water coefficient: Log K_{ow} = 1.9. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of the vapor, absorption through the skin, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause severe skin and eye burns, with permanent eye damage. Exposure to the vapor may also damage the eyes. Inhalation may irritate and damage the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High exposure can cause dizziness, drowsiness, vomiting, unconsciousness, and death. High exposure can damage the liver or kidneys enough to cause death. *Inhalation:* Levels of 75 ppm may cause irritation of the nose, throat and lungs. 100−200 ppm for 1 hour may cause diarrhea, abdominal pain and vomiting. Other symptoms may include headache, loss of appetite; swollen glands; pale skin coloring; insomnia, dizziness and depression. Accidental high exposure has caused symptoms as listed above; internal bleeding and death. *Skin:* Contact with as little as 1 gram (1/28 ounce) may cause itching, swelling, redness, burning and blistering. May be absorbed through the skin and cause symptoms as listed under inhalation. *Eyes:* May cause irritation of eyes and eyelids.

Ingestion: May cause vomiting, diarrhea, abdominal pain; nausea and damage to the liver and kidneys. As little as 4.5 ml (about one teaspoon) has caused death.

Long-Term Exposure: may cause problems of the liver, stomach, reproductive system, or kidneys; increased risk of cancer. May cause irritation of the throat, headaches, loss of appetite; swollen glands; paleness, insomnia, vomiting, diarrhea, abdominal pain and damage to the liver and kidneys. Ethylene dibromide is a probable carcinogen in humans. It causes birth defects and changes in the genetic material of laboratory animals. It may damage the reproductive system, causing abnormal sperm in males and decreased fertility in females. Handle with extreme caution.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, and reproductive system. Cancer site in animals: skin and lung tumors.

Medical Surveillance: Pre-employment and periodic examinations should evaluate the skin and eyes, respiratory tract, and liver and kidney functions.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: polyvinyl alcohol gloves; Teflon gloves, suits, boots; Viton gloves, suits; 4 H and Silver Shield gloves; Barricade coated suits; Trychem 1000 suits. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: PIH; check oxygen content prior to entering storage area. Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place that is well-ventilated. Keep in tightly sealed containers and away from light, heat, active metals and liquid ammonia. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1605/154 Ethylene dibromide, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, Inhalation Hazard Zone B

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: EDB is a noncombustible liquid. Use an extinguishing agent suited to a surrounding fire. Thermal decomposition products may include bromine and hydrogen bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration with adequate scrubbing and ash disposal facilities[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: 1,2-Dichloroethane is a colorless, flammable liquid which has a pleasant, chloroform-like odor, and a sweetish taste. Decomposes slowly: turns dark and acidic on contact with air, moisture, and light. The Odor Threshold is 100 ppm. Molecular weight = 98.96; specific gravity (H_2O:1) = 1.24; boiling point = 83.3°C; freezing/melting point = −35.6°C; vapor pressure = 64 mmHg @ 20°C; flash point = 13°C (cc); autoignition temperature = 413°C. Explosive limits: LEL = 6.2%; UEL: 16.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.
Potential Exposure: In recent years, 1,2-dichloroethane is used in the production of vinyl chloride and as a lead-scavenging agent in petrol; it has found wide use in the manufacture of ethylene glycol, diaminoethylene, polyvinyl chloride; nylon, viscose rayon; styrenebutadiene rubber, and various plastics. It is a solvent for resins, asphalt, bitumen, rubber, cellulose acetate; cellulose ester; and paint; a degreaser in the engineering, textile, and petroleum industries; and an extracting agent for soybean oil and caffeine. It is also used as an antiknock agent in gasoline; a pickling agent; a fumigant; and a dry-cleaning agent. It has found use in photography, xerography, and water softening; and also in the production of adhesives, cosmetics, pharmaceuticals, and varnishes.
Incompatibilities: May form explosive mixture with air. Reacts violently with strong oxidizers and caustics; chemically active metals, such as magnesium or aluminum powder, sodium and potassium; alkali metals; alkali amides; liquid ammonia. Decomposes to vinyl chloride and HCl above 600°C. Attacks plastics, rubber, coatings. Attacks many metals in presence of water.
Permissible Exposure Limits in Air
NIOSH IDLH = 50 ppm
Conversion factor: 1 ppm = 4.05 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: 50 ppm TWA; 100 ppm Ceiling Concentration; 200 ppm [5 min maximum peak in any 3 hours]. For Construction and Shipyards: 50 ppm/200 milligram per cubic meter TWA

NIOSH REL: 1 ppm/4 milligram per cubic meter TWA; 2 ppm/8 milligram per cubic meter STEL, a potential occupational carcinogen. Limit exposure to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 10 ppm, not classifiable as a human carcinogen as chloroethanes PAC* Ver. 29[138]

PAC-1: **50**$_{\mathbf{A}}$ ppm

PAC-2: **200**$_{\mathbf{A}}$ ppm

PAC-3: **300**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin] Carcinogen Category 2

Arab Republic of Egypt: TWA 5 ppm (2 milligram per cubic meter), 1993; Australia: TWA 10 ppm (40 milligram per cubic meter), 1993; Austria: carcinogen, 1999; Belgium: TWA 10 ppm (40 milligram per cubic meter), 1993; Finland: TWA 10 ppm (40 milligram per cubic meter); STEL 20 ppm (80 milligram per cubic meter), carcinogen, 1999; France: VME 10 ppm (40 milligram per cubic meter), continuous carcinogen, 1999; Hungary: STEL 4 milligram per cubic meter, carcinogen, 1993; the Netherlands: MAC-TGG 7 milligram per cubic meter, 2003; Norway: TWA 1 ppm (4 milligram per cubic meter), 1999; the Philippines: TWA 50 ppm (200 milligram per cubic meter), 1993; Poland: TWA 50 milligram per cubic meter; STEL 60 milligram per cubic meter, 1999; Russia: TWA 10 ppm, 1993; Sweden: NGV 1 ppm (4 milligram per cubic meter), KTV 5 ppm (20 milligram per cubic meter), [skin], carcinogen, 1999; Switzerland: MAK-W 5 ppm (20 milligram per cubic meter), carcinogen, 1999; Turkey: TWA 50 ppm (200 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (21 milligram per cubic meter), [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[43] has set MAC values in ambient air in residential areas of 3 milligram per cubic meter on a momentary basis and 1 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for ethylene dichloride in ambient air[60] ranging from 0−400 μ/m^3 (North Dakota) to 0.038 μ/m^3 (North Carolina) to 0.04 μ/m^3 (Rhode Island) to 0.2 μ/m^3 (New York) to 0.39 μ/m^3 (Massachusetts) to 20.0 μ/m^3 (Connecticut) to 148.0 μ/m^3 (Pennsylvania) to 200.0 μ/m^3 (South Carolina) to 650.0 μ/m^3 (Nevada) to 1000.0 μ/m^3 (Indiana).

Determination in Air: Use NIOSH Analytical Method (IV) #1003 for halogenated hydrocarbons or OSHA Analytical Method 3[18]

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.005 mg/L; MCLG, zero. Federal Drinking Water Standards: EPA 5 μg/L; State Drinking Water Standards: California 0.5 μg/L; Florida 3 μg/L; New Jersey 2 μg/L; State Drinking Water Guidelines: Arizona 0.38 μg/L; Connecticut 1 μg/L; Maine 4 μg/L; Minnesota 4 μg/L.

Determination in Water: Inert gas purge followed by chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol-water coefficient: Log $K_{ow} = 1.48$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor, skin absorption of liquid, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause nausea, vomiting, headaches, drowsiness, and loss of consciousness. Overexposure to ethylene dichloride may damage the CNS; kidneys, liver. *Inhalation:* Levels of 10−30 ppm may cause dizziness, nausea, and vomiting. Levels up to 50 ppm may cause weakness, trembling, headaches, abdominal cramps; liver and kidney damage; and fluid buildup in lungs. May cause coma and death at high levels. *Skin:* Contact may cause irritation and skin rash, and irritates the eyes. *Eyes:* May cause redness, pain, and blurred vision. Vapor can damage the cornea. *Ingestion:* Ingestion of two ounces has resulted in nausea, vomiting, faintness, drowsiness, troubled breathing; pale skin, internal bleeding; kidney damage; and death due to respiratory failure. Other possible symptoms may include abdominal spasms, severe headache; lethargy, lowered blood pressure; diarrhea, shock, physical collapse, and coma.

Long-Term Exposure: Repeated or prolonged contact can chronically irritate the skin causing dryness, redness and a rash. Prolonged or repeated exposure may cause eye, nose and throat irritation; nerve damage; liver and kidney damage. This substance has been determined to cause cancer of the lung, stomach, breast and other sites in laboratory animals; and may be a human carcinogen. Can irritate the lungs and bronchitis may develop. Repeated or prolonged exposure can cause loss of appetite; nausea and vomiting; trembling and low blood sugar.

Points of Attack: Eyes, skin, kidneys, liver, CNS, and cardiovascular system. Cancer site in animals: fore-stomach, mammary gland, and circulatory system cancer.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. Liver and kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. NIOSH lists the following tests: expired air; liver function tests; pulmonary function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: Teflon gloves, suits, boots; Viton gloves, suits; 4 H and Silver Shield gloves; Barricade coated suits; CPF3 suits; Responder suits; Trychem 1000 suits; 4 hours: polyvinyl alcohol gloves. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); strong acids (such as hydrochloric, sulfuric and nitric); chemically active metals (such as potassium, sodium, magnesium and zinc), strong caustics (such as sodium hydroxide) and dimethylaminopropylamine, since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1184 Ethylene dichloride, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials. *Note:* United States DOT 49CFR172.101, Inhalation Hazardous Chemical as 1,2-Dichloroethane

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethylene dichloride out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include phosgene and hydrogen chloride. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22].

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F; risk phrases: R11; R20; R23; R26/27/28; R36/37/38; R50; safety phrases: S16; S21; S23; S36/37/39; S45; 68/20 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Ethylene fluorohydrin is a colorless liquid. Molecular weight = 64.07; boiling point = 103.5°C; freezing/melting point = −26°C; flash point = 34°C; vapor pressure = 16 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Ethylene fluorohydrin is used as a rodenticide, insecticide, and acaricide. It is not registered as a pesticide in the U.S.

Incompatibilities: Ethylene fluorohydrin vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.0025 ppm

PAC-2: 0.027 ppm

PAC-3: 0.35 ppm

Routes of Entry: Inhalation, dermal contact, and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Toxicity rating is the same as for fluoroacetate: super toxic. Symptoms include tremors, severe muscular weakness; nausea, headache, and slight swelling of the liver. Delayed convulsant. The probable oral lethal dose in humans is a taste (less than seven drops) for a 70 kg (150 lb) person. The chemical is highly toxic when inhaled or absorbed through the skin. Toxicity depends on its oxidation to fluoroacetate by tissue alcohol dehydrogenase. LD_{50} = (oral-rat) <10 mg/kg.

Long-Term Exposure: May cause liver and CNS problems.

Medical Surveillance: Liver function tests. Nervous system tests.

First Aid: Acute poisoning should be treated like poisoning by fluoroacetate. Ethylene fluorohydrin (2-fluoroethanol) is listed among the organic fluorine derivatives of fluoroacetic acid. The emergency procedures for fluoroacetic acid are: move victim to fresh air; call emergency medical care. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 minutes. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Employees should wash immediately with soap when

skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: PIH; check oxygen content prior to entering storage area.(1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3383 Poisonous Toxic by inhalation liquid, flammable, n.o.s. with an $LC_{50} \leq 200$ ml/m^3 and saturated vapor concentration ≥ 500 LC_{50}, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid, Technical Name Required, Inhalation Hazard Zone A.

Spill Handling:

Initial Isolation and Protective Action Distances: UN3383

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

When Spilled in Water

First: Isolate in all directions (ft/m) 200/60

Then: Protect persons downwind (mi/km)

Day 0.5/0.8

Night 1.1/1.8

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300

Then: Protect persons downwind (mi/km)

Day 2.5/4.1

Night 4.1/6.6

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen fluoride and oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R62; R63;?; safety phrases: S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Ethylene glycol is a colorless, viscous, hydroscopic liquid with a sweetish taste. Often colored fluorescent yellow-green when used in automotive antifreeze. Ethylene glycol is odorless and does not provide any warning of inhalation exposure to hazardous concentrations. The Odor Threshold in air is 25 ppm. Molecular weight = 62.08; specific gravity (H_2O:1) = 1.1 @ 20°C; relative vapor density (air = 1) = 2.12; boiling point = 197°C; freezing/melting point = −12.7°C; vapor pressure = 0.06 mmHg @ 20°C; flash point = 111°C; autoignition temperature = 398°C. Explosive limit: LEL = 3.2%; UEL: 15.3%. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water.
Potential Exposure: Ethylene glycol is used in antifreeze (especially as car radiator antifreeze) and in production of polyethylene terephthalate fibers and films; in hydraulic fluids; electrolytic condensers; and heat exchangers. It is also used as a solvent and as a chemical intermediate for ethylene glycol dinitrate, glycol esters; resins, and for pharmaceuticals.
Incompatibilities: Reacts with sulfuric acid, oleum, chlorosulfonic acid; strong oxidizing agents; strong bases; chromium trioxide; potassium permanganate; sodium peroxide. Hygroscopic (i.e., absorbs moisture from the air).
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: After reviewing available published literature, NIOSH provided comments to OSHA on August 1, 1988, regarding the "*Proposed Rule on Air Contaminants*" (29 CFR 1910, Docket No. H-020). In these comments, NIOSH questioned whether the PELs proposed (Ceiling 50 ppm) were adequate to protect workers from recognized health hazards.
ACGIH TLV[1]: 100 milligram per cubic meter (hour) Ceiling Concentration; (aerosol only). Not classifiable as a human carcinogen. Proposed change: to aerosol, 10 milligram per cubic meter (hour) Ceiling Concentration; vapors, 25 ppm TWA; 50ppm STEL.
PAC Ver. 29[138]
PAC-1: 30 ppm
PAC-2: 150 ppm
PAC-3: 900 ppm
DFG MAK: 10 ppm/26 milligram per cubic meter TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group C
Australia: TWA 60 milligram per cubic meter; STEL 120 milligram per cubic meter, 1993; Austria: MAK 10 ppm (26 milligram per cubic meter), [skin], 1999; Belgium: STEL 50 ppm (127 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (130 milligram per cubic meter), 1999; Finland: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 1993; France: VLE 50 ppm (125 milligram per cubic meter), 1999; Hungary: STEL 50 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 52 milligram per cubic meter (fume), 2003; MAC-TGG 10 milligram per cubic meter (drops), 2003; Norway: TWA 25 ppm (63 milligram per cubic meter), 1999; Poland: MAC (TWA) 15 milligram per cubic meter, MAC (STEL) 50 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter, 1993; Sweden: NGV 10 ppm (25 milligram per cubic meter), KTV 20 ppm (50 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 50 ppm (125 milligram per cubic meter), 1999; United Kingdom: TWA 10 milligram per cubic meter, particulate; TWA 60 milligram per cubic meter; STEL 125 milligram per cubic meter, vapor, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam; ACGIH TLV: 100 milligram per cubic meter (hour) Ceiling Concentration. Several

states have set guidelines or standards for ethylene glycol in ambient air[60] ranging from 0.17 milligram per cubic meter (Massachusetts) to 1.0 milligram per cubic meter (Virginia) to 1.25 milligram per cubic meter (North Dakota) to 2.976 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5523.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 140 μg/L based on health effects and also a lifetime Health advisory: of 7000 μg/L[48]. Several states have set guidelines for ethylene glycol in drinking water[61] ranging from 100 μg/L (Connecticut) to 290 μg/L (New Jersey)[59] to 5500 μg/L (Arizona, Massachusetts and Maine).

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -1.9$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion and inhalation. Poor skin absorption, but may contribute to intoxication.

Harmful Effects and Symptoms

In the body, ethylene glycol is chemically broken down into toxic compounds. It and its toxic byproducts first affect the CNS, then the heart, and finally the kidneys. Ingestion of sufficient amounts can be fatal[77].

Short-Term Exposure: Ethylene glycol irritates the eyes, skin, and respiratory tract. *Inhalation:* Mild throat irritation resulted from exposure of 28 milligram per cubic meter. Levels above 140 milligram per cubic meter resulted in more marked irritation, with levels of more than 250 milligram per cubic meter being unbreathable. These levels are only reached at elevated temperature. *Skin:* May cause mild irritation if not promptly removed. *Eyes:* Accidental eye contact with concentrated ethylene glycol resulted in extreme swelling of the eyes, cloudy vision and slow response to light. These symptoms lasted a month. *Ingestion:* May cause symptoms in the nervous system; heart, lungs and kidneys. Earliest effects are usually felt in the nervous system between 1/2−12 hours after ingestion. Symptoms from one liquid ounce may include nausea, vomiting, dizziness, loss of coordination and abdominal pain. Large amounts may cause stupor, coma, convulsions and death. Survival of this stage may lead to development of rapid heartbeat; enlarged heart and fluid in the lungs which, too, can lead to death usually after 1−3 days. Some individuals who drank 3−4 fluid ounces who survived both the above stages because of prompt medical treatment, later (3−17 days) died of kidney failure.

Long-Term Exposure: Occupational exposure to heated ethylene glycol has caused involuntary eye movement that may indicate nerve damage. Some individuals also reported attacks of unconsciousness lasting 5−10 minutes which went away when they stopped working with ethylene glycol. Ethylene glycol may affect the CNS and eyes. Has been shown to be a teratogen in animals. Ethylene glycol may damage the developing fetus. May cause kidney and brain damage.

Points of Attack: Eyes, skin, respiratory system, CNS, and heart, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function test. Urine oxalate level. Exam of the nervous system. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APRs or PAPRs are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: Natural, Neoprene rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyethylene gloves, polyvinyl chloride gloves, suits, boots; Teflon gloves, suits, boots; Viton gloves, suits, Saranex coated suits; 4 H and Silver Shield gloves, Trellchem HPS suits; 4 hours: Responder suits. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 50 ppm; Use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethylene glycol must be stored to avoid contact with sulfuric acid; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents (such as perchlorates, peroxides, permanganates, chlorates, and nitrates).

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethylene glycol out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Alternatively, ethylene glycol can be recovered from polyester plant wastes.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Possible polymerization hazard (glycol ethers), Reproductive toxins, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: F, T; risk phrases: R61; R11; R19; R36; R51; R62; safety phrases: S21; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

As Glycol Ethers:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono-and di-ethers of ethylene glycol, diethyl glycol, and triethylene glycol R-(OCH2CH2)n-OR' where n = 1, 2, or 3; R = alkyl or aryl groups; R' = R, H, or groups which, when removed, yield glycol ethers with the structure: R-(OCH_2CH)n-OH. Polymers are excluded from the glycol category.

EPCRA Section 313: Certain glycol ethers are covered. R-(OCH_2CH_2) n-OR'; Where n = 1, 2, or 3; R = alkyl C 7 or less; or R = phenyl or alkyl substituted phenyl; R' + H, or alkyl C7 or less; or consisting of carboxylic ester, sulfate, phosphate, nitrate or sulfonate.

Form R *de minimis* concentration reporting level: 1.0%.

Description: Ethylene glycol diethyl ether is a colorless liquid. Molecular weight = 118.20; boiling point = 122°C; freezing/melting point = −74°C; flash point = 35°C; autoignition temperature = 406°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Ethylene glycol diethyl ether is used as an aprotic solvent; in chemical manufacturing; as a solvent for detergents and in other cleaning products.

Incompatibilities: Forms explosive mixture with air when heated. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Attacks some plastics, rubber and coatings. May slowly form unstable reactive peroxides during prolonged storage or on exposure to air and light. Also incompatible with strong acids; aluminum and its alloys.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Harmful Effects and Symptoms

Short-Term Exposure: Ethylene glycol diethyl ether can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose and throat. Contact can irritate the skin and eyes. High levels can cause you to feel drowsy and dizzy. Very high levels could cause you to pass out. Repeated high or single very high exposures may damage the kidneys.

Long-Term Exposure: Repeated or high exposures may damage the kidneys. There is limited evidence that ethylene glycol diethyl ether may damage the developing fetus.

Points of Attack: Kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: CBC. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Glove manufacturers have recommended gloves of Neoprene or nitrile butyl rubber construction for protection against liquid ethylene glycol diethyl ether. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to ethylene glycol diethyl ether, use a NIOSH/

MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ethylene glycol diethyl ether must be stored to avoid contact with strong oxidizers (such as chlorine, bromine and fluorine) and strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where ethylene glycol diethyl ether is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethylene glycol diethyl ether should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Use only nonsparking tools and equipment, especially when opening and closing containers of ethylene glycol diethyl ether. Wherever ethylene glycol diethyl ether is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1153 Ethylene glycol diethyl ether, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep ethylene glycol diethyl ether out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: Ethylene Glycol Diethyl Ether*, Trenton, NJ (June 2005)

Ethylene glycol dinitrate E:0630

Formula: $C_2H_4N_2O_6$; $O_2NOCH_2CH_2ONO_2$

Synonyms: EGDN; 1,2-Ethanediol dinitrate; Ethanediol dinitrate; Ethylene dinitrate; Ethylene nitrate; Glycol (dinitrate de) (French); Glycol dinitrate; Glykoldinitrat (German)

CAS Registry Number: 628-96-6

HSDB Number: 537

RTECS Number: KW5600000

UN/NA & ERG Number: UN0473 (Explosive)/112

EC Number: 211-063-0 [*Annex I Index No.:* 603-032-00-9]

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: MCLG = 10 mg[N]/L; MCL = 10 mg/L as nitrates Explosive Substance (World Bank)[15]

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: E, T+; R3; R26/27/28; R33; safety phrases: S1/2; S27/28; S33; S35; S36/37; S41; S45 (see Appendix 4).

Description: Ethylene glycol dinitrate is a colorless to yellow, oily, odorless liquid. An explosive ingredient (60%−80%) in dynamite along with nitroglycerine (40%−20%). It may be detonated by mechanical shock, heat, or spontaneous chemical reaction. Molecular weight = 152.08; specific gravity (H_2O:1) = 1.49; boiling point = 197.2°C (explodes); freezing/melting point = −22.2°C; vapor pressure = 0.05 mmHg @ 20°C; flash point = 215°C. Very slightly water soluble; solubility = 0.48%.

Potential Exposure: An explosive ingredient (60%−80%) in dynamite along with nitroglycerine (40%−20%). Although ethylene glycol dinitrate is an explosive in itself, it is primarily used to lower the freezing/melting point of nitroglycerin; together these compounds are the major constituents of commercial dynamite, cordite, and blastine gelatin. Occupational exposure generally involves a mixture of the two compounds. Ethylene glycol dinitrate is 160 times more volatile than nitroglycerin.

Incompatibilities: Unstable; highly explosive. Heating may cause violent combustion or explosion producing toxic fumes (nitrogen oxides). May explosively detonate violently from heat above 200°C, mechanical shock, friction, impact or concussion. Not compatible with strong acids and alkalies.

Permissible Exposure Limits in Air

NIOSH IDLH = 75 milligram per cubic meter

Conversion factor: 1 ppm = 6.22 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.2 ppm/1 milligram per cubic meter Ceiling Concentration [skin]

NIOSH REL: 0.1 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.05 ppm/0.31 milligram per cubic meter TWA [skin]

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: 0.05 ppm/0.32 milligram per cubic meter TWA; Peak Limitation Category II(1);[skin]; BAT: 0.3 μg/L in blood; end of exposure; end-of-shift

PAC* Ver. 29[138]

PAC-1: 0.016 ppm

PAC-2: 0.2 ppm

PAC-3: 80 ppm

Australia: TWA 0.05 ppm (0.3 milligram per cubic meter), [skin], 1993; Austria: MAK 0.05 ppm (0.3 milligram per cubic meter), [skin], 1999; Belgium: TWA 0.05 ppm (0.31 milligram per cubic meter), [skin], 1993; Denmark: TWA 0.02 ppm (0.12 milligram per cubic meter), [skin], 1999; Finland: TWA 0.1 ppm (0.6 milligram per cubic meter); STEL 0.3 ppm (2 milligram per cubic meter), [skin], 1999; France: VME 0.17 ppm (1 milligram per cubic meter), [skin], 1999; Japan: STEL 0.05 ppm (0.31 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 0.3 milligram per cubic meter, [skin], 2003; Norway: TWA 0.03 ppm (0.18 milligram per cubic meter), 1999; the Philippines: TWA 0.2 ppm (1.2 milligram per cubic meter), [skin], 1993; Poland: TWA 0.3 milligram per cubic meter; STEL 0.4 milligram per cubic meter, 1999; Russia: TWA 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.03 ppm (0.2 milligram per cubic meter), KTV 0.1 ppm (0.6 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 0.05 ppm (0.3 milligram per cubic meter), KZG-W 0.1 ppm, [skin], 1999; Thailand: TWA 0.2 ppm (1 milligram per cubic meter), 1993; Turkey: TWA 0.2 ppm (1 milligram per cubic meter), [skin], 1993; United Kingdom: TWA 0.2 ppm (1.3 milligram per cubic meter); STEL 0.2 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.05 ppm [skin]. Several states have set guidelines or standards for EGDN in ambient air[60] ranging from 3.0 μ/m^3 (North Dakota) to 6.0 μ/m^3 (Connecticut) to 7.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2507 or OSHA Analytical Method 43.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = <1.2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of dust or vapor, ingestion of dust, percutaneous absorption, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: EGDN can cause headache, dizziness, nausea, vomiting, and abdominal pain; and may affect the cardiovascular system, causing a fall in blood pressure. High levels can interfere with the blood's ability to carry oxygen (methemoglobinemia). Exposure may result in death. The effects may be delayed. Skin contact can cause a rash or burning feeling on contact. Exposure to small amounts of ethylene glycol dinitrate and/or nitroglycerin by skin exposure, inhalation, or swallowing may cause severe throbbing headaches. With large exposure, nausea, vomiting, cyanosis, palpitations of the heart; coma, cessation of breathing; and death may occur. A temporary tolerance to the headache may develop, but this is lost after a few days without exposure. On some occasions a worker may have anginal pains a few days after discontinuing repeated daily exposure.

Long-Term Exposure: EGDN can damage the heart causing pain in the chest and/or increased heart rate or cause arrhythmia (irregular heartbeat). This can be fatal. High exposure may affect the nervous system. May damage the red blood cells leading to anemia.

Points of Attack: Skin, cardiovascular system, blood, liver, and kidneys.

Medical Surveillance: Placement and periodic examinations should be concerned with CNS; blood, glaucoma; and especially history of alcoholism. Urinary and blood ethylene glycol dinitrate may be determined by gas chromatography. NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), during exposure; complete blood count; electrocardiogram, expired air, during exposure; urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Both EGDN and nitroglycerin are readily absorbed through the skin, lungs, and mucous membranes. It is, therefore, essential that adequate skin protection by providing for each worker: impervious clothing where liquids are likely to contaminate and full body clothing where dust creates the problem. All clothing should be discarded at the end of the shift and prior to changing to street clothing. In case of spill or splash that contaminates work clothing, the clothes should be changed at once and the skin area washed thoroughly. Masks of the dust type or organic vapor canister type may be necessary in areas of concentration of dust or vapors. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: Up to 1 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator).* up to 2.5 milligram per cubic meter*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* up to 5 milligram per cubic meter: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode);* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Up to 75 milligram per cubic meter*:* SAF: PD/PP (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in unknown concentration or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Explosive and Strong Oxidizer. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN0473 Substances, explosive, n.o.s., Hazard Class: 1.1 A; Labels:1.1A-Explosive (with a mass explosion, hazard); A-Substances which are expected to mass detonate very soon after fire reaches them, Technical Name Required.

Spill Handling: Spread sodium bisulfate over the spill area and sprinkle with water. Then flush to sewer with water[22]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep EGDN out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Evacuate area of fire. Heat may cause violent combustion (explodes @ 114°C) or explosion. Fight fires only from a secure, explosion-resistant position. This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information
California Proposition 65 Chemical[102]: Cancer; Developmental/Reproductive toxin 1/1/1989.
Hazard Alert: Flammable liquid, Possible polymerization hazard (glycol ethers), Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction). Listed for Tier 1 screening as an endocrine disruptor[88].
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%, 2-Methoxyethanol
Hazard symbols, risk, & safety statements: Hazard symbol: F, T; risk phrases: R10; R19; R60; R61; R10; R20/21/22; R61; R62; R63; safety phrases: S53; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
As Glycol Ethers:
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono-and diethers of ethylene glycol, diethyl glycol; and triethylene glycol R-(OCH_2CH_2)n-OR' where n = 1, 2, or 3; R = alkyl or aryl groups; R' = R, H, or groups which, when removed, yield glycol ethers with the structure: R-(OCH_2CH)n-OH. Polymers are excluded from the glycol category
EPCRA Section 313: Certain glycol ethers are covered. R-(OCH_2CH_2)n-OR'; Where n = 1, 2, or 3; R = alkyl C7 or less; or R = phenyl or alkyl substituted phenyl; R' + H, or alkyl C7 or less; or' consisting of carboxylic ester, sulfate, phosphate, nitrate or sulfonate. Form R *de minimis* concentration reporting level: 1.0%.
Description: Ethylene glycol monomethyl ether is a colorless liquid with a slight ethereal odor. The Odor Threshold is 0.9–2.3 ppm. Molecular weight = 76.11; specific gravity (H_2O:1) = 0.97; boiling point = 124.5°C; freezing/melting point = −86.5°C; vapor pressure = 6.2 mmHg @20°C; flash point = 39°C; autoignition temperature = 285°C. Explosive limits: LEL = 1.8%; UEL: 14%, both @ STP. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.
Potential Exposure: Ethylene glycol monomethyl ether is used as a jet fuel additive; solvent for protective coating; and in chemical synthesis. Ethylene glycol ethers are used as solvents for resins used in the electronics industry, lacquers, paints, varnishes, gum, perfume; dyes and inks; and as a constituent of painting pastes, cleaning compounds; liquid soaps; cosmetics, nitrocellulose, and hydraulic fluids.
Incompatibilities: Vapors may form explosive mixture with air. Heat or oxidizers may cause the formation of unstable peroxides. Attacks many metals. Strong oxidizers may cause fire and explosions. Strong bases cause decomposition and the formation of toxic gas. Attacks some plastics, rubber and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.
Permissible Exposure Limits in Air
NIOSH IDLH = 200 ppm

Australia: TWA 5 ppm (16 milligram per cubic meter), [skin], 1993; Austria: MAK 5 ppm (15 milligram per cubic meter), [skin], 1999; Belgium: TWA 5 ppm (16 milligram per cubic meter), [skin], 1993; Denmark: TWA 5 ppm (16 milligram per cubic meter), [skin], 1999; Finland: TWA 25 ppm (80 milligram per cubic meter); STEL 40 ppm (120 milligram per cubic meter), [skin], 1999; France: VME 5 ppm (16 milligram per cubic meter), [skin], 1999; Hungary: TWA 15 milligram per cubic meter; STEL 30 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 1 milligram per cubic meter, [skin], 2003; Norway: TWA 5 ppm (16 milligram per cubic meter), 1999; the Philippines: TWA 25 ppm (80 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 15 milligram per cubic meter, MAC (STEL) 60 milligram per cubic meter, 1999; Russia: TWA 5 ppm, 1993; Sweden: NGV 5 ppm (16 milligram per cubic meter), KTV 10 ppm (30 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 5 ppm (15 milligram per cubic meter), KZG-W 10 ppm (30 milligram per cubic meter), [skin], 1999; Turkey: TWA 25 ppm (80 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (16 milligram per cubic meter), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 5 ppm [skin]. The former USSR-UNEP/

IRPTC[35] set a MAC for ambient air in residential areas of 0.3 milligram per cubic meter (on a once daily basis). Several states have set guidelines or standards for 2-methoxyethanol in ambient air[60] ranging from 21.0 μ/m^3 (Massachusetts) to 53.3 μ/m^3 (New York) to 100 μ/m^3 (Rhode Island) to 160.0 μ/m^3 (Florida and North Dakota) to 270.0 μ/m^3 (Virginia) to 320.0 μ/m^3 (Connecticut) to 381.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1403, alcohols I or OSHA Analytical Method 53 and 79.

Determination in Water: Octanol-water coefficient: Log $K_{\mathrm{ow}} = -0.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor, ingestion, and eye and/or skin contact, plus cutaneous absorption of liquid.

Harmful Effects and Symptoms

Short-Term Exposure: EGME irritates the eyes and the respiratory tract. More severe exposures may cause damage to brain, nervous system; liver and kidneys; and death. *Inhalation:* Exposure to levels above 25 ppm may cause headache, drowsiness, lethargy, weakness and tremors. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* Readily absorbed through the skin. May cause stinging and reddening upon contact; and cause or contribute to symptoms in the lungs. *Eyes:* Contact with liquid or high vapor concentrations may cause burning irritation and clouded vision. *Ingestion:* Three liquid ounces (100 ml) has been reported to cause confusion, nausea, weakness and rapid breathing. Symptoms were delayed 8−18 hours.

Long-Term Exposure: Prolonged exposure can cause anemia and lesions of blood cells. May cause symptoms listed under inhalation. Repeated exposure can cause headaches, weakness, drowsiness, personality changes; loss of weight; upset stomach and tremors. May cause kidney damage. Extended exposures of 25−75 ppm has caused anemia and nervous system effects, such as fatigue, weakness, loss of muscle control and mental changes. Ethylene glycol monomethyl ether has been shown to cause reproductive problems, damage to the testes, and cause birth defects in animal studies.

Points of Attack: Eyes, respiratory system, CNS, blood, kidneys, reproductive system, and hematopoietic system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Complete blood count. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Exam of the nervous system. NIOSH lists the following tests: complete blood count; urine (chemical/metabolite), end-of-shift

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: 8 hours: butyl rubber gloves, suits, boots; Tychem 1000 suits. 4 hours: 4 H and Silver Shield gloves Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: Up to 1 ppm: Sa (APF = 10) (any supplied-air respirator).* up to 2.5 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* up to 5 ppm: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Up to 100 ppm: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode).* up to 200 ppm: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Methoxyethanol must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong caustics, since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where 2-methoxyethanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever 2-methoxyethanol is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1188 Ethylene glycol monomethyl ether, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep EGME out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides: discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides: perforation of a container of the waste from a safe distance followed by open burning[24].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethyleneimine is a colorless volatile liquid with an ammoniacal odor. Molecular weight = 43.07; specific gravity (H 2 O:1) = 0.83; boiling point = 56.1°C; freezing/melting point = −78°C; vapor pressure = 160 mmHg @ 20°C; 75 mmHg @ 41°C; flash point = −11°C (cc); autoignition temperature = 322°C. Explosive limits: LEL = 3.3%; UEL: 54.8%. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3. Highly soluble in water.

Potential Exposure: Ethyleneimine is used in production of binding agents; formation of plastics; and improving paper strength; in many organic syntheses; as an intermediate and monomer for fuel oil and lubricating refining. The polymerization products, polyethyleneimines, are used as auxiliaries in the paper industry and as flocculation aids in the clarification of effluents. It is also used in the textile industry for increasing wet strength, flame-, water-, shrinkproofing, and stiffening.

Incompatibilities: May form explosive mixture with air. Ethyleneimine is a medium strong base. Contact with acids, aqueous acid conditions, oxidizers, aluminum, or carbon dioxide may cause explosive polymerization. Explosive silver derivatives may be formed with silver alloys e.g., silver solder). Self-reactive with heat or atmospheric carbon dioxide. May accumulate static electrical charges, and may cause ignition of its vapors. Attacks rubber, coatings, plastics, and chemically active metals. Ethyleneimine vapors are not inhibited and may form polymers in vents or flame arresters, resulting in stopping of the vents.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm. Potential occupational carcinogen.

Conversion factor: 1 ppm = 1.76 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.5 ppm/ 0.09 milligram per cubic meter TWA; 0.1 ppm/ 0.18 milligram per cubic meter [skin] confirmed animal carcinogen with unknown relevance to humans.

PAC* Ver. 29[138]

PAC-1: 0.1 ppm

PAC-2: **4.6**$_{\mathbf{A}}$ ppm

PAC-3: **9.9**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutation Category 2

Australia: TWA 0.5 ppm (1 milligram per cubic meter), [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Denmark: TWA 0.5 ppm (1 milligram per cubic meter), [skin], 1999; Finland: STEL 0.5 ppm (1 milligram per cubic meter), [skin], carcinogen, 1999; Japan: 0.5 ppm (0.88 milligram per cubic meter), [skin], 1999; Norway: TWA 0.5 ppm (1 milligram per cubic meter), 1999; Russia: TWA 0.5 ppm; STEL 0.02 milligram per cubic meter, [skin], 1993; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.5 ppm (0.9 milligram per cubic meter), [skin], carcinogen, 1999; Turkey: TWA 0.5 ppm (1 milligram per cubic meter), [skin], 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia[43] have set a MAC in ambient air of residential areas of 0.001 milligram per cubic meter on either a momentary or a daily average basis. Several states have set guidelines or standards for ethyleneimine in ambient air[60] ranging from zero (North Carolina) to 3.3 μ/m^3 (New York) to 5.0 μ/m^3 (South

Carolina) to 10.0 μ/m^3 (Florida and North Dakota) to 20.0 μ/m^3 (Connecticut) to 24.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3514.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 14 μg/L based on health effects.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -0.4$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation and percutaneous absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyleneimine is corrosive to the eyes, skin, and respiratory tract. Eye contact can cause severe illness or death. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Symptoms include tearing and burning of the eyes; sore throat; nausea, vomiting, coughing (may persist for weeks or months); and a slow healing dermatitis due to severe blistering. Ethyleneimine is classified as extremely toxic with a probable oral lethal dose of 5–50 mg/kg which is approximately seven drops to one teaspoonful for a 75 kg (150 lb) person. Ethyleneimine gives inadequate warning when over-exposure is by inhalation or skin absorption. It is a severe blistering agent, causing third degree chemical burns of the skin. Also, it has a corrosive effect on mucous membranes and may cause scarring of the esophagus. It is corrosive to eye tissue and may cause permanent corneal opacity and conjunctival scarring. Severe exposure may result in overwhelming pulmonary edema. Renal damage has been described. Hemorrhagic congestion of all internal organs has been observed. May affect the CNS; kidneys and liver.

Long-Term Exposure: May be a carcinogen in humans. May damage the developing fetus. May damage the testes. Repeated or prolonged contact with skin may skin allergy. May damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, liver, and kidneys. Cancer site in animals: lung and liver tumors.

Medical Surveillance: OSHA Mandated Tests: *Increased Risks* check for Reduced Immunologic Competence; steroid treatment; pregnancy; cigarette smoking. NIOSH lists the following tests: electrocardiogram, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 45 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately since eye splashes can cause severe illness or death. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: Tychem 1000 suits; 4 hours: Teflon gloves, suits, boots; Responder suits. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: Employees engaged in handling operations involving this carcinogen must be provided with, and required to wear and use, a half-mask filter-type respirator for dusts, mists, and fumes. A respirator affording higher levels of protection than this respirator may be substituted. NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: PIH; check oxygen content prior to entering storage area.(1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyleneimine must be inhibited and stored to avoid contact with strong acids (such as hydrochloric, sulfuric and nitric) and oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where ethyleneimine is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethyleneimine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyleneimine. Wherever ethyleneimine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1185 Ethyleneimine, stabilized, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Inhalation Hazard Zone A. PGI.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.3/0.5

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.6/0.9
Night 1.3/2.0

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Avoid breathing vapors. Stay upwind, keep out of low areas. Avoid bodily contact with the material. *Do not* handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Dry chemical, alcohol foam, or carbon dioxide are useful for small fires. For large fires: water spray, fog or foam. Do not extinguish fire unless flow can be stopped; use water in flooding quantities as a fog. Solid streams of water may be ineffective. Apply water from as far a distance as possible. If tank car or truck is involved in fire, isolate the surrounding area as shown above. May polymerize in fires with evolution of heat and container rupture. Runoff to sewer may create fire or explosion hazard. Ethyleneimine vapors are not inhibited and may form polymers in vents or flame arresters, resulting in stopping of the vents. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ethylene oxide is a colorless, compressed, liquefied gas or liquid (below 11°C). Sweet odor; the odor threshold is 50 ppm. Molecular weight = 44.06; specific gravity (H_2O:1) = 0.82 (liquid @ 10°C); boiling point = 11°C; freezing/melting point = -112°C; vapor pressure = 1.46 atm; relative vapor density (air = 1) = 1.49; relative vapor density (air = 1) = 1.49; flash point = flammable gas (-20°C, liquid); autoignition temperature = 429°C. Explosive limits: LEL = 3.0%; UEL: 100%. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 3. Easily dissolved in water.

Potential Exposure: Ethylene oxide is a man-made chemical used in the production of glycols (ethylene glycol, polyglycols, glycol ethers, esters), nontonic surface-active agent; ethanolamines, acrylonitrile, plastics. It is also used as a fumigant for foodstuffs and textiles; an agricultural fungicide; and for sterilization, especially for surgical instruments. It is used in drug synthesis and as a pesticide intermediate.

Incompatibilities: May form explosive mixture with air. Chemically unstable. Dangerously reactive; may rearrange chemically and/or polymerize violently with evolution of heat; when in contact with highly active catalytic surfaces, such as anhydrous chlorides of iron, tin and aluminum; pure oxides of iron and aluminum; and alkali metal hydroxides. Even small amounts of strong acids; alkalis, or oxidizers can cause a reaction. Avoid contact with copper. Protect container from physical damage, sun and heat. Attacks some plastics, rubber or coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 800 ppm

Conversion factor: 1 ppm = 1.80 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 ppm/5 ppm [15 min excursion] TWA, cancer hazard, see 29CFR1910.1047(c).

NIOSH REL: <0.1 ppm/ <0.18 milligram per cubic meter TWA; 5 ppm/9 milligram per cubic meter [10 min/day] Ceiling Concentration; Potential carcinogen. Limit exposure to lowest feasible level, See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 1 ppm/1.8 milligram per cubic meter TWA, Suspected Human Carcinogen

PAC Ver. 29[138]

PAC-1: 5 ppm

PAC-2: $\mathbf{45_A}$ ppm (60 min.)

PAC-3: $\mathbf{200_A}$ ppm (60 min.)

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin]; Carcinogen Category 2; Germ Cell Mutagen Category 2; TRK: 1 ppm/1.83 milligram per cubic meter; Sampling time: not fixed; 90 μg[hydroxyethylvaline]/L blood.

Arab Republic of Egypt: TWA 10 ppm (20 milligram per cubic meter), 1993; Australia: TWA 1 ppm (2 milligram per cubic meter), carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 1 ppm (1.8 milligram per cubic meter), carcinogen, 1993; Denmark: TWA 1 ppm (1.8 milligram per cubic meter), 1999; Finland: TWA 1 ppm (2.8 milligram per cubic meter), carcinogen, 1999; Hungary: STEL 1 milligram per cubic meter, carcinogen, 1993; the Netherlands: MAC-TGG 0.84 milligram per cubic meter, 2003; Norway: TWA 1 ppm, 1999; Poland: MAC (TWA) 1 milligram per cubic meter, MAC (STEL) 3 milligram per cubic meter, 1999; Russia: TWA 50 ppm; STEL 1 milligram per cubic meter, 1993; Sweden: NGV 1 ppm (2 milligram per cubic meter), KTV 5 ppm (9 milligram per cubic meter), [skin], carcinogen, 1999; Switzerland: MAK-W 1 ppm (2 milligram per cubic meter), [skin], carcinogen, 1999; Turkey: TWA 50 ppm (90 milligram per cubic meter), 1993; United Kingdom:; TWA 5 ppm (9.2 milligram per cubic meter), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: Suspected Human Carcinogen. The Czech Republic: 1 milligram per cubic meter; Russia[35,43] set a MAC for ambient air in residential areas of 0.3 milligram per cubic meter on a momentary basis and 0.03 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for ethylene oxide in ambient air[60] ranging from zero (North Dakota) to 0.01 milligram per cubic meter (Rhode Island) to 0.1 μ/m^3 (North Carolina) to 4.87 μ/m^3 (Pennsylvania) to 6.67 μ/m^3 (New York) to 10.0 μ/m^3 (South Carolina) to 20.0 μ/m^3 (Connecticut, South Dakota and Virginia) to 48.0 μ/m^3 (Nevada) to 450.0 μ/m^3 (Indiana).

Determination in Air: Use NIOSH Analytical Method (IV) s #1614, Ethylene oxide; by portable GC #3800; passive monitor; OSHA Method 1010, Ver. 2 (Revised March 2014).

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -0.29$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of gas, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Signs and symptoms of acute exposure to ethylene oxide may be severe and include dyspnea (shortness of breath), cough, pulmonary edema, pneumonia, and respiratory failure. Lethargy, headache, dizziness, twitching, convulsions, paralysis, and coma may be observed. Cardiac arrhythmias and cardiovascular collapse may also occur. GI effects of acute exposure may include nausea, vomiting, and abdominal pain. Ethylene oxide irritates the eyes, skin, and respiratory tract. Very high exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. *Inhalation:* Exposure to 500−700 ppm for 2−3 minutes, resulted in nausea, vomiting, headache, disorientation; fluid in the lungs, followed by seizures. Human volunteers breathing a concentration of about 2500 ppm experienced slight irritation of the respiratory tract; breathing in 12,500 ppm showed definite respiratory tract irritation within 10 seconds. Symptoms may not occur for hours after exposure. Other symptoms reported at unknown concentrations include headache, nausea, coughing, vomiting, difficult breathing; respiratory tract irritation; weakness, a lack of coordination; seizures and fluid in the lungs. *Skin:* The pure liquid may cause frostbite. A 1% water solution can cause irritation and redness. A 40%−80% water solution may cause extensive blister formation. Ethylene oxide may severely irritate or burn mucous membranes and moist skin. *Eyes:* May cause irritation and severe burns. May affect the eyes, causing delayed development of cataract. Eye contact may result in conjunctivitis (red, inflamed eyes) and erosion of the cornea. *Ingestion:* May cause gastric irritation and liver injury.

Long-Term Exposure: Repeated or prolonged contact with skin may cause skin allergy. ETO may affect the nervous system; kidneys, adrenal glands; skeletal muscles and cause reproductive effects. It may be carcinogenic to humans. Exposure to low concentrations of gaseous ETO may cause irritation to the respiratory tract and eyes; loss of sense of smell; and nausea and vomiting. Repeated skin exposure can cause scaling, cracking and redness. Exposure to 5−10 ppm for 11 years or to 1 ppm for 15 years has caused blood changes. ETO has caused cancer in several species of laboratory animals. It has also caused changes in genetic material and reproductive problems in laboratory animals. May damage the developing fetus. It may cause inheritable genetic damage in humans. There is an increased incidence of gynecological disorders and spontaneous abortions among workers in ethylene oxide production. Its role in this increase is unclear at this time. Increased incidence of leukemia and stomach cancer have been reported; however the evidence is not considered conclusive. Leukemia, brain tumors, lung tumors, and other cancers have been observed in laboratory animals (DHHS).

Points of Attack: Eyes, skin, respiratory system, liver, CNS, blood, kidneys, and reproductive system. *Cancer site:* peritoneal cancer and leukemia.

Medical Surveillance: OSHA Mandated Tests: complete blood count/white blood cells/differential, red blood cells/count, hematocrit, hemoglobin. NIOSH lists the following tests: blood gas analysis; whole blood (chemical/metabolite); complete blood count; expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); red blood cells/count; sputum cytology; white blood cell count/differential. For those with frequent or potentially high exposure (half the tlv or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If ethylene oxide gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: Barricade coated suits; Responder, Trellchem HPS suits; Trychem 1000 suits; 4 hours: Teflon gloves, suits, boots; 4 H and Silver Shield gloves. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas and splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Ethylene oxide (1910.1047): $<$ or = 50 ppm (parts per million) Full-facepiece respirator with ethylene oxide approved canister, front-or back-mounted. $<$ or = 2000 ppm (1) Positive-pressure supplied-air respirator equipped with full facepiece, hood, or helmet; or (2) Continuous-flow supplied-air respirator (positive-pressure) equipped with hood, helmet, or suit. $>$2000 ppm or unknown concentrations: (1) Positive-pressure SCBA equipped with full facepiece; or (2) Positive-pressure full-facepiece supplied-air respirator equipped with an auxiliary positive-pressure SCBA. *Firefighting*: Positive-pressure SCBA equipped with full facepiece. *Escape:* Any respirator described above.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned t

o other hazard categories and radiant heat sources on non-wooden floors. If indoors, store in a well-

ventilated areas in temperatures not to exceed 50°C. (2) Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. It must be stored to avoid contact with even small amounts of acids (such as nitric or sulfuric acids); alkalis (such as sodium hydroxide or potassium hydroxide); catalytic anhydrous chlorides of iron, aluminum or tin; iron or aluminum oxide; or metallic potassium, since it may react by itself, liberating much heat and causing a

possible explosion. Ethylene oxide should not contact oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since an explosion could occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or sunlight. Sources of ignition, such as smoking and open flames are prohibited where ethylene oxide is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethylene oxide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethylene oxide. Wherever ethylene oxide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1040 Ethylene oxide or Ethylene oxide with nitrogen up to a total pressure of 1 MPa (10 bar) at 50°C, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Inhalation Hazard Zone D. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

Ethylene oxide & Ethylene oxide or Ethylene oxide with nitrogen up to a total pressure of 1 MPa (10 bar) at 50°C

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.5/0.8
Night 1.3/2.0

***Attention:** If dealing with a large spill from the following containers: (1) Rail tank car, (2) Highway tank truck or trailer, (3) Multiple ton cylinders or (4) Multiple small cylinders or single ton cylinder see the following: "ERG Table 3: Initial Isolation and Protective Action Distances for Different Quantities of Six Common Toxic-by-Inhalation Gases." This chart shows isolation protective distances for the transport containers listed above (numbers 1 through 4) and various wind conditions: Low wind (<6 mph); Moderate wind (6 to 12 mph); High wind (>12 mph).

Gas: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations.

Liquid: For *small spills* flush area with flooding amounts of water. For *large spills* dike spill for later disposal. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Highly flammable. This gas is under pressure; containers may rupture and explode when heated. Thermal decomposition includes oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Liquid: Highly flammable. Acrid and Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Although soluble in water, solutions will continue to burn until diluted to approximately 22 volumes of water to one volume of ethylene oxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Concentrated waste containing no peroxides-discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides-perforation of a container of the waste from a safe distance followed by open burning[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethylene thiourea is a white to light green, needle-like crystalline solid with a faint amine odor. Molecular weight = 102.17; boiling point = 230−312.8°C; freezing/melting point = 200°C; vapor pressure = 16 mmHg @ 20°C; flash point = 252.2°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in cold water; solubility = 2%

@ 30°C; highly soluble in hot water. Commercial ethylene thiourea is available as a solid powder, as a dispersion in oil (which retards the formation of fine dust dispersions in workplace air), and "encapsulated" in a matrix of compatible elastomers. In this latter form, ethylene thiourea may be least likely to escape into the work-place air.

Potential Exposure: Ethylene thiourea is used extensively as an accelerator in the curing of polychloroprene (Neoprene) and other elastomers; as a vulcanizing accelerator in rubber processing; in electroplating baths. In addition, exposure to ethylene thiourea also results from the very widely used ethylene bisdithiocarbamate fungicides. Ethylene thiourea may be present as a contaminant in the ethylene bisdithiocarbamate fungicides and can also be formed when food containing the fungicides is cooked.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid anhydrides, and acrolein.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration Use encapsulated form.

PAC Ver. 29[138]

PAC-1: 0.085 milligram per cubic meter

PAC-2: 0.94 milligram per cubic meter

PAC-3: 110 milligram per cubic meter

DFG MAK: Carcinogen Category 3B

Finland: TWA 0.2 milligram per cubic meter; STEL 0.6 milligram per cubic meter, carcinogen, 1993; France: carcinogen, 1993; Sweden: carcinogen, 1999; the Netherlands: MAC-TGG 0.024 milligram per cubic meter, 2003. States which have set guidelines or standards for ethylene thiourea in ambient air[60] include North Dakota (zero level) and Pennsylvania (0.7 μ/m^3).

Determination in Air: Use NIOSH Analytical Method (IV) #5011 or OSHA Analytical Method 95.

Permissible Concentration in Water: Maine[61] has set a guideline for drinking water of 4.4 μg/L. The United States Environmental Protection Agency in a Health advisory: (see "References" below), has developed a no-observed-adverse-effect level (NOAEL) of 1.25 (31); (109); (102); mg/kg/day based on absence of thyroid effects in male rats exposed to(100). ETU in the diet for up to 12 months. This results(2) in a longer term. Health advisory: for an adult of 0.44 mg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -0.7$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation can cause irritation of the respiratory tract with soreness, hoarseness, cough and phlegm. High exposure can cause sweating, thirst, nausea; an increase in the heart rate and blood pressure that can last for hours or days. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Contact can cause irritation of the skin and eyes, and may cause eye burns. A related chemical, ziram, can cause brain swelling and hemorrhage with muscle weakness and liver, kidney effects.

Long-Term Exposure: Ethylene thiourea has been shown to be carcinogenic and teratogenic (causing malformation in offspring) in laboratory animals. May cause malformations in human babies. Ethylene thiourea may cause thyroid and liver damage. In addition, ethylene thiourea can cause myxedema (the drying and thickening of skin, together with a slowing down of physical and mental activity), goiter, and other effects related to decreased output of thyroid hormone. Maneb, a related fungicide, can cause nerve damage.

Points of Attack: Eyes, skin, thyroid, and reproductive system. Cancer site in animals: liver, thyroid, and lymphatic system tumors.

Medical Surveillance: Initial and routine employee exposure surveys should be made by competent industrial hygiene and engineering personnel. These surveys are necessary to determine the extent of employee exposure and to ensure that controls are effective. The *NIOSH Occupational Exposure Sampling Strategy Manual*, NIOSH Publication #77-173, may be helpful in developing efficient programs to monitor employee exposures to ethylene thiourea. The manual discusses determination of the need for exposure measurements, selection of appropriate employees for exposure evaluation, and selection of sampling times. Employee exposure measurements should consist of 8 hour TWA exposure estimates calculated from personal or breathing zone samples (air that would most nearly represent that inhaled by the employees). Area and source measurements may be useful to determine problem areas, processes, and operations. Thyroid function tests. Examination of the nervous system. Consider chest X-ray following acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: There are four basic methods of limiting employee exposure to ethylene thiourea. None of these is a simple industrial hygiene or management decision and careful planning and thought should be used prior to implementation of any of these.

Product Substitution: The substitution of an alternative material with a lower potential health and safety risk in one method. However, extreme care must be used when selecting possible substitutes. Alternatives to ethylene thiourea should be fully evaluated with regard to possible human effects. Unless the toxic effects of the alternative have been thoroughly evaluated, a seemingly safe replacement, possibly only after years of use, may be found to induce serious health effects.

Contaminant Control: The most effective control of ethylene thiourea, where feasible, is at the source of contamination by enclosure of the operation and/or local exhaust ventilation. If feasible, the process or operation should be enclosed with a slight vacuum so that any leakage will result in the flow of air into the enclosure. The next most effective means of control would be a well-designed local exhaust ventilation system that physically encloses the process as much as possible, with sufficient capture velocity to keep the contaminant from entering the work atmosphere. To ensure that ventilation equipment is working properly, effectiveness e.g., air velocity, static pressure, or air volume) should be checked at least every 3 months. System effectiveness should be checked soon after any change in production, process or control, which might result in significant increases in airborne exposures to ethylene thiourea.

Employee Isolation: A third alternative is the isolation of employees. It frequently involves the use of automated equipment operated by personnel observing from a closed control booth or room. The control room is maintained at a greater air pressure than that surrounding the process equipment so that air flow is out of, rather than into, the room. This type of control will not protect those employees that must do process checks, adjustments, maintenance, and related operations.

Personal Protective Equipment: The least preferred method is the use of personal protective equipment. This equipment, which may include respirators, goggles, gloves, and related items, should not be used as the only means to prevent or minimize exposure during routine operations. Exposure to ethylene thiourea should not be controlled with the use of respirators except: During the time necessary to install or implement engineering or work practice controls; or, in work situation in which engineering and work practice controls are technically not feasible; or, for maintenance; or, for operations which require entry into tanks or closed vessels; or, in emergencies.

Respirator Selection: *At Any Detectable Concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from strong oxidizers, acids, acid anhydrides; acrolein. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep ethylene glycol diethyl ether out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen, sulfur and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a furnace equipped with afterburner and scrubber[22].

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xn; risk phrases: R12; R19; R22; R62; R66; R67; safety phrases: S1; S2; S9; S16; S33 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl ether is a colorless, mobile, highly flammable, volatile liquid. Characteristic pungent odor. The Odor Threshold is 0.63 ppm[41]. Molecular weight = 74.12; specific gravity (H 2 O:1) = 0.71; boiling point = 34.5°C; freezing/melting point = −116°C; relative vapor density (air = 1) = 2.62; vapor pressure = 750 mmHg @ 34.1°C; 440 mmHg @ 20°C; flash point = −45°C; autoignition temperature = 180°C. Explosive limits: LEL = 1.9%; UEL: 36.0%[17]. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water; solubility = 7%.

Potential Exposure: Ethyl ether is used as a solvent for waxes, fats, oils, perfumes, alkaloids, dyes, gums, resins, nitrocellulose, hydrocarbons, raw rubber, and smokeless powder. It is also used as an inhalation anesthetic; a refrigerant; in diesel fuels; in dry cleaning; as an extractant; and as a chemical reagent for various organic reactions.

Incompatibilities: May form explosive mixture with air. Incompatible with strong acids; strong oxidizers halogens, sulfur, sulfur compounds, causing fire and explosion hazard. Can form peroxides from air, heat, sunlight; may explode when container is unstoppered or otherwise opened. Attacks some plastics, rubber and coatings. Being a nonconductor, chemical may accumulate static electric charges that may result in ignition of vapor.

Permissible Exposure Limits in Air

NIOSH IDLH = 1900 ppm [LEL]

OSHA PEL: 400 ppm/1200 milligram per cubic meter TWA

NIOSH REL: None. See Appendix D (NIOSH Pocket Guide)

ACGIH TLV[1]: 400 ppm/1210 milligram per cubic meter TWA; 500 ppm/1560 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 500 ppm

PAC-2: 3200 ppm

PAC-3: 19,000 ppm

DFG MAK: 400 ppm/1200 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group D

Australia: TWA 400 ppm (1200 milligram per cubic meter); STEL 500 ppm, 1993; Austria: MAK 400 ppm (1200 milligram per cubic meter), 1999; Belgium: TWA 400 ppm (1210 milligram per cubic meter); STEL 500 ppm, 1993; Denmark: TWA 400 ppm (1200 milligram per cubic meter), 1999; Finland: TWA 400 ppm (1200 milligram per cubic meter); STEL 500 ppm (1500 milligram per cubic meter), 1999; France: VME 400 ppm (1200 milligram per cubic meter), VLE 500 ppm (1500 milligram per cubic meter), 1999; Hungary: TWA 300 milligram per cubic meter; STEL 600 milligram per cubic meter [skin] 1993; the Netherlands: MAC-TGG 308 milligram per cubic meter, 2003; Norway: TWA 200 ppm (600 milligram per cubic meter), 1999; the Philippines: TWA 400 ppm (1200 milligram per cubic meter), 1993; Poland: MAC

(TWA) 300 milligram per cubic meter, MAC (STEL) 1500 milligram per cubic meter, 1999; Russia: TWA 400 ppm; STEL 300 milligram per cubic meter, 1993; Switzerland: MAK-W 400 ppm (1200 milligram per cubic meter), KZG-W 800 ppm (2400 milligram per cubic meter), 1999; Turkey: TWA 400 ppm (1200 milligram per cubic meter), 1993; United Kingdom: TWA 400 ppm (1230 milligram per cubic meter); STEL 500 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 500 ppm.

The Czech Republic:[35] TWA 500 milligram per cubic meter; STEL 1500 milligram per cubic meter. Russia[35] set a MAC in the ambient air of residential areas of 1.0 milligram per cubic meter on a once-α-day basis and 0.6 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for ethyl ether in ambient air[60] ranging from 0.16 milligram per cubic meter (Massachusetts) to 12.0−15.0 milligram per cubic meter (North Dakota) to 20.0 milligram per cubic meter (Virginia) to 24.0 milligram per cubic meter (Connecticut, Florida, New York) to 28.571 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #1610 or OSHA Analytical Method 7[18].

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.3 mg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Local: Ethyl ether vapor is mildly irritating to the eyes, nose, and throat. Contact with liquid may produce a dry, scaly, fissured dermatitis. *Systemic:* Ethyl ether has predominantly narcotic properties. Overexposed individuals may experience drowsiness, vomiting, and unconsciousness. Death may result from severe overexposure. Chronic exposure results in some persons in anorexia, exhaustion, headache, drowsiness, dizziness, excitation, and psychic disturbances. Albuminuria has been reported. Chronic exposure may cause an increased susceptibility to alcohol. There is an association between exposure to anesthetic vapors and increased miscarriages and birth defects. Diethyl ether's role in these increased risks in unclear.

Short-Term Exposure: Ethyl ether irritates the eyes and respiratory tract. Inhalation can cause drowsiness, excitement, dizziness, vomiting, irregular breathing and increased saliva. Swallowing the liquid may cause chemical pneumonitis. High exposure can affect the CNS; causing unconsciousness and even death.

Long-Term Exposure: Repeated or prolonged contact can cause skin cracking, scaling and extreme drying. Repeated exposure may cause an addiction.

Points of Attack: CNS; skin, respiratory system, and eyes.

Medical Surveillance: Preplacement or periodic examinations should evaluate the skin and respiratory tract; liver, and kidney function. Persons with a past history of alcoholism may be at some increased risk due to possibility of ethyl ether addiction (known as "ether habit"). Tests for exposure may include expired breath for unmetabolized ethyl ether and blood for ethyl ether content by oxidation with chromate solution or by GC methods. NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of salt water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 8 hours: polyvinyl alcohol gloves; 4 H and Silver Shield gloves; Barricade coated suits; 4 hours: Teflon gloves, suits, boots; Responder suits, Trellchem HPS suits. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: 1900 ppm: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:*

SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister];

or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl ether must be stored to avoid contact with strong oxidizers (such as bromine, chlorine, chlorine dioxide, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and sunlight. Unstable peroxides may form if diethyl ether is exposed for a long time to air or sunlight, causing explosions. Sources of ignition, such as smoking and open flames are prohibited where ethyl ether is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethyl ether should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl ether. Wherever ethyl ether is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1155 Diethyl ether or Ethyl ether, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep diethyl ether out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an extremely flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides-discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides-perforation of a container of the waste from a safe distance followed by open burning[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Possible risk of forming tumors, Primary irritant (w/o allergic reaction). Banned or Severely Restricted (in agriculture) (UN)[13]

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R20/22; R36/37/38; safety phrases: S2; S9; S16; S21, S24; R26; S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl formate is a colorless liquid with a fruity odor. Molecular weight = 74.09; specific gravity (H_2O:1) = 0.92; boiling point = 54.4°C; freezing/melting point = −80.6; vapor pressure = 200 mmHg @ 20°C; flash point = −20°C; autoignition temperature = 440°C. Explosive limits:

LEL = 2.8%; UEL: 16.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Solubility in water = 9% @ 18°C.

Potential Exposure: This material is used as an emulsifier; food and feed additive; flavor, packaging material; as a solvent for cellulose nitrate and acetate; it is used as a fumigant and in the production of synthetic flavors. It is also a raw material in pharmaceutical manufacture.

Incompatibilities: May form explosive mixture with air. Reacts violently with nitrates, strong oxidizers, strong alkalis, and strong acids. Decomposes slowly in water, forming ethyl alcohol and formic acid. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 1500 ppm

OSHA PEL: 100 ppm/300 milligram per cubic meter TWA

NIOSH REL: 100 ppm/300 milligram per cubic meter TWA

ACGIH TLV[1]: 100 ppm/303 milligram per cubic meter TWA

Several states have set guidelines or standards for ethyl formate in ambient air[60] ranging from 3.0−4.5 milligram per cubic meter (North Dakota) to 5.0 milligram per cubic meter (Virginia) to 6.0 milligram per cubic meter (Connecticut) to 7.143 milligram per cubic meter (Nevada).

Determination in Air: Charcoal (tube) adsorption, workup with CS2; analysis by gas chromatography/flame ionization detection; NIOSH Analytical Method (IV) #1452.

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Either contact or the vapor can cause skin and eye irritation. Inhalation irritates the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Ethyl formate may affect the CNS. Exposure can cause headache, nausea, and vomiting.

Long-Term Exposure: Prolonged or repeated contact can cause skin dryness and cracking. May affect the nervous system.

Points of Attack: Eyes, respiratory system, and CNS.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Consider chest X-ray following acute overexposure. Nervous system tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene, Nitrile and styrene-butadiene rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Up to 1500 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrOv (APF = 10) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a

full facepiece); SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:*
SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong bases; moisture and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1190 Ethyl formate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray into a furnace in admixture with a flammable solvent[24].

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, Xi; risk phrases: R10; R36/37/38; R43; R63; safety phrases: S26; S36/37 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl hexaldehyde is a colorless liquid with a mild, pleasant odor. Molecular weight = 128.24; boiling point = 163°C; flash point = 44.4°C; autoignition temperature = 190°C. Explosive limits: LEL = 0.85% @ 93°C; UEL: 7.2% @ 135°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Slightly soluble in water.

Potential Exposure: It is used as a solvent extraction chemical; in organic synthesis; perfume formulation, disinfectant.

Incompatibilities: May form explosive mixture with air. Violent reaction with oxidizers. Incompatible with strong acids; caustics, ammonia, amines. May ignite spontaneously when spilled on clothing or other absorbent materials. May form unstable peroxides on contact with air; under certain conditions ignites spontaneously with air.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Skin absorption, inhalation, and ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Skin or eye contact can cause severe irritation or burns. The vapors can irritate the eyes, throat and bronchial tubes, with coughing and difficulty breathing. Headaches and nausea may occur. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated exposure may cause bronchitis with cough, phlegm and shortness of breath.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to ethyl hexaldehyde exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with ethyl hexaldehyde all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong bases and combustible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1191 Octyl aldehydes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl hexaldehyde out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Limited Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1994.

Hazard Alert: Combustible, Polymerization hazard (nonstabilized), Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R10; R19; R37/38; R43; R61; R62; safety phrases: S7; S16; S29/35; sensitization hazard, S36/37; S45; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 2-Ethylhexyl acrylate is a combustible, colorless liquid with a pleasant odor. Molecular weight = 184.31; specific gravity (H_2O:1) = 0.89 @ 20°C; boiling point = 214°C; freezing/melting point = −90°C; vapor pressure = 1 mmHg @ 50°C; flash point = 82°C; autoignition temperature = 252°C. Explosive limits: LEL = 0.8%; UEL: 6.4%. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 2. Insoluble in water.

Potential Exposure: A potential danger to those involved in the use of this monomer as a feedstock for chemical syntheses; in the manufacture of plastics; protective coatings, including water-based paints; in paper treatment; the production of emulsion polymers.

Incompatibilities: Unless inhibited, sunlight, heat, contaminants, or peroxides can cause dangerous polymerization. Vapors are uninhibited and may polymerize, blocking vents. Violent reaction with strong oxidizers, with risk of fire and explosions. May form explosive mixture with air. Incompatible with strong acids; aliphatic amines; alkanolamines.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 15 ppm

PAC-2: 120 ppm

PAC-3: 150 ppm

DFG MAK: 5 ppm/38 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group D; [skin] danger of skin sensitization

Poland: TWA 35 milligram per cubic meter; STEL 100 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter, 1993.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3.6$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Severely irritates the eyes and skin. Irritates the respiratory tract. High exposure may cause respiratory difficulty and collapse. CNS stimulation following ingestion.

Long-Term Exposure: Repeated or prolonged contact may cause skin allergy.

Points of Attack: Skin.
Medical Surveillance: Evaluation by a qualified allergist.
First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for a least 20−30 minutes. Seek medical attention. *Inhalation:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.
Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.
Shipping: *Note:* Unless inhibited, this material is a polymerization hazard. May be classified as a NA1993 Combustible liquid, n.o.s. This class of compounds requires no particular shipping label. It falls in Hazard Class 3. Each reference to a Class 3 material is modified to read "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter, or has a flash point above 60.5°C/141°F but below 93°C/200°F.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical or carbon dioxide. Water or foam may cause frothing[41]. Vapors are uninhibited and may polymerize, blocking vents. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Spray into incinerator with added flammable solvent.

Sax, N. I., Ed., "*Dangerous Properties of Industrial Materials Report*," 1, No. 7, 57−59 (1981) and 3, No. 2, 83−85 (1983)

Ethylidene norbornene E:0720

Formula: C_9H_{12}
Synonyms: ENB; 5-Ethylidenebicyclo(2,21)hept-2-ene; 5-Ethylidene-2-norbornene (stabilized)
CAS Registry Number: 16219-75-3
HSDB Number: 1160
RTECS Number: RB9450000
UN/NA & ERG Number: UN1993 (flammable liquids, n.o.s.)/128
EC Number: 240-347-7

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid, Sensitization hazard, Suspected of causing genetic defects, Environmental hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xi, N; risk phrases: R2; R11; R62; safety phrases: S16; S29/35; S33; S41; S45(see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: 5-Ethylidene- 2-norbornene is a colorless liquid with a turpentine-like odor. The Odor Threshold is 0.007 ppm[41]. Molecular weight = 120.19; boiling point = 148°C; freezing/melting point = −80°C; vapor pressure = 4 mmHg; flash point = 38.3°C. Explosive limits: LEL = 8000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: 5-Ethylidene-2-norbornene is used as the third monomer in terpolymer elastomers. Those engaged in the synthesis of pharmaceuticals; pesticides, or in the preparation of specialty resins.

Incompatibilities: May form explosive mixture with air. Reacts violently with strong oxidants. Violent reaction with oxygen and strong oxidizers. May accumulate static electrical charges, and may cause ignition of its vapors. The substance may polymerize. Inhibit peroxide formation with *tert*-butyl catechol. ENB should be stored in a nitrogen atmosphere since it reacts with oxygen.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.92 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 5 ppm/25 milligram per cubic meter Ceiling Concentration
ACGIH TLV[11]: 5 ppm/25 milligram per cubic meter Ceiling Concentration
PAC* Ver. 29[138]8
PAC-1: $\mathbf{0.2}_{\mathbf{A}}$ ppm
PAC-2: $\mathbf{100}_{\mathbf{A}}$ ppm
PAC-3: $\mathbf{500}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Australia: TWA 5 ppm (25 milligram per cubic meter), 1993; Belgium: STEL 5 ppm (25 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (25 milligram per cubic meter), 1999; Finland: TWA 5 ppm (25 milligram per cubic meter); STEL 10 ppm (50 milligram per cubic meter), 1999; France: VLE 5 ppm (25 milligram per cubic meter), 1999; Norway: TWA 5 ppm (25 milligram per cubic meter), 1999; Switzerland: MAK-W 5 ppm (25 milligram per cubic meter), 1999; the Netherlands: MAC 25 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: Ceiling Concentration 5 ppm. Several states have set guidelines on standards for ethylidene norbornene in ambient air[60] ranging from 200.0 μ/m^3 (Virginia) to 250.0 μ/m^3 (North Dakota) to 595.0 μ/m^3 (Nevada).

Determination in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the eyes, nose, and respiratory tract. Contact can irritate and may burn the skin and eyes. Exposure can cause headache, confusion, nausea and vomiting. Ingestion of the liquid may cause chemical pneumonitis. Exposure to high concentrations may cause unconsciousness and cause death.

Long-Term Exposure: Repeated or high exposure may damage the liver, lungs and kidneys. Ethylidene norbornene may damage the testes (male reproductive glands).

Points of Attack: Eyes, skin, respiratory system, CNS, liver, kidneys, urogenital system, and bone marrow

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Reproductive history and possibly semen analysis with sperm count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 5 ppm; Use an NIOSH/MSHA or European Standard EN 149-approved full facepiece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full facepiece powered APRs. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ethylidene norbornene should be stored in a nitrogen atmosphere. Do not allow it to come in contact with oxygen because violent reactions can occur.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Highly flammable liquid, Water reactive, Sensitization hazard, Suspected of causing genetic defects.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xi; risk phrases: R11, R20/21; R22; R25; R29; R36/37/38; R42/43; R50/53; R62; safety phrases: S16; S21, S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethyl Isocyanate is a clear, colorless liquid with a pungent odor. Molecular weight = 71.08; specific gravity (H_2O:1) = 0.91 @ 20°C; boiling point = 60°C; vapor pressure = 100 mmHg @ 25°C; flash point = −10°C;

≤ 23°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2 ₩. Hydrolyzes in water, releasing carbon dioxide.

Potential Exposure: Ethyl isocyanate is used to make pharmaceuticals and pesticides.

Incompatibilities: Vapor may form explosive mixture with air. May form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, and ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acyl-chlorides may cause explosive polymerization. Contact Attacks some plastics, rubber and coatings. Contact with metals may evolve flammable hydrogen gas. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: 0.0031 ppm

PAC-2: $\mathbf{0.034_A}$ ppm

PAC-3: $\mathbf{0.10_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values. *Face*.

Routes of Entry: Inhalation and passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Ethyl isocyanate can irritate the eyes, skin and respiratory tract. Skin contact can cause a rash. Exposure can irritate the nose and throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Similar chemicals cause lung and skin allergies. It is not known if ethyl isocyanate does this.

Points of Attack: Skin and lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to ethyl isocyanate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: PIH; check oxygen content prior to entering storage area.(1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where ethyl isocyanate is used, handled, or stored in a manner that could create a potential fire or exposition hazard. Use only non-sparking tools and equipment, especially when opening and closing containers of ethyl isocyanate. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association

Shipping: UN2481 Ethyl isocyanate, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 1.2/1.9
Night 3.7/5.6

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 3000/1000
Then: Protect persons downwind (mi/km)
Day 7.0 + /11.0 +*
Night 7.0 + /11.0+ *

*+ means distance can be larger in certain atmospheric conditions.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Ethyl mercaptan E:0740

Formula: C_2H_6S; C_2H_5SH

Synonyms: Ethanethiol; Ethyl hydrosulfide; Ethyl sulfhydrate; Ethyl thioalcohol; LPG ethyl mercaptan 1010; Mercaptoethane; Thioethanol; Thioethyl alcohol

CAS Registry Number: 75-08-1

HSDB Number: 814

RTECS Number: KI9625000

UN/NA & ERG Number: UN2363/129 (P0

EC Number: 200-837-3 [*Annex I Index No.:* 016-022-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Extremely flammable liquid, Polymerization hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xn, N; risk phrases: R12; R19; R20; R50/53; safety phrases: S2; S16; S25; S29; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethyl mercaptan is a yellowish liquid (or a colorless gas above the BP). Strong, sharp odor of garlic or skunk-like odor. Molecular weight = 62.13; specific gravity (H 2 O:1) = 0.83 @ 20°C; boiling point = 35°C; freezing/melting point = -148°C; relative vapor density (air = 1) = 2.14; vapor pressure = 442 mmHg @ 20°C; 750 mmHg @ 34.7°C; flash point ≤ -18°C; autoignition temperature = 299.5°C. Explosive limits: LEL = 2.8%; UEL: 18.0%. Hazard identification (based on NFPA-704M Rating System): Health 2, Flammability 4, Reactivity 1. Practically insoluble in water; solubility = 0.7%.

Potential Exposure: This material is used as a warning odorant for liquefied petroleum gases. It is used as an intermediate in the manufacture of many pesticides and other organic chemicals.

Incompatibilities: May form explosive mixture with air. Slowly forms peroxides. This material is a weak acid. Reacts with oxidizers, causing fire and explosion hazard. Reacts with strong acids evolving toxic and flammable hydrogen sulfide. May accumulate static electrical charges, and may cause ignition of its vapors. Attacks some forms of plastics, coatings and rubber. Aldehydes are frequently involved in self-condensation or polymerization reactions. These reactions are exothermic; they are often catalyzed by acid. Aldehydes are readily oxidized to give carboxylic acids. Flammable and/or toxic gases are generated by the combination of aldehydes with azo, diazo compounds, dithiocarbamates, nitrides, and strong reducing agents. Aldehydes can react with air to give first peroxo acids, and ultimately carboxylic acids. These autoxidation reactions are activated by light, catalyzed by salts of transition metals, and are autocatalytic (catalyzed by the products of the reaction). The addition of stabilizers (antioxidants) to shipments of aldehydes retards autoxidation[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

Conversion factor: 1 ppm = 2.54 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/25 milligram per cubic meter Ceiling Concentration (General Industry); 0.5 ppm/1.3 milligram per cubic meter TWA (Construction and Shipyards)

NIOSH REL: 0.5 ppm/1.3 milligram per cubic meter/15 min, Ceiling Concentration [15-min.]

ACGIH TLV[1]: 0.5 ppm/1.3 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: $\mathbf{1.0_A}$ ppm

PAC-2: $\mathbf{120_A}$ ppm

PAC-3: $\mathbf{360_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.5 ppm/1.3 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group D, *as ethanethiol.*

Australia: TWA 0.5 ppm (1 milligram per cubic meter), 1993; Austria: MAK 0.5 ppm (1 milligram per cubic meter), 1999; Belgium: TWA 0.5 ppm (1.3 milligram per cubic meter), 1993; Finland: STEL 0.5 ppm (1.3 milligram per cubic meter), 1999; France: VME 0.5 ppm (1 milligram per cubic meter), 1999; Hungary: STEL 1 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; the Philippines: TWA 10 ppm (25 milligram per cubic meter), 1993; Poland: MAC (TWA) 1 milligram per cubic meter, MAC (STEL) 3 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter [skin] 1993; Switzerland: MAK-W 0.5 ppm (1.3 milligram per cubic meter), KZG-W 1 ppm (2.6 milligram per cubic meter), 1999; Thailand: TWA 10 ppm (25 milligram per cubic meter), 1993; Turkey: TWA 10 ppm (25 milligram per cubic meter), 1993; United Kingdom: TWA 0.5 ppm (1.3 milligram per cubic meter); STEL 2 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 0.5 ppm. Several states have set guidelines or standards for ethyl mercaptan in ambient air[60] ranging from 3.3 μ/m^3 (New York) to 10.0 μ/m^3 (Florida, North Dakota, South Carolina) to 16.0 μ/m^3 (Virginia) to 20.0 μ/m^3 (Connecticut) to 24.0 μ/m^3 (Nevada) to 100.0 μ/m^3 (North Carolina).

Determination in Air: Collection filter (special); workup with hydrochloric acid/1,2-dichloroethane; analysis with gas chromatography/flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #2542.

Permissible Concentration in Water: No criteria set but EPA[32] has suggested a permissible ambient goal or 13.8 μg/L based on health effects.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause skin and eye irritation. Inhalation can irritate the respiratory tract and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause headaches, nausea, vomiting, diarrhea, muscle weakness, and tiredness. May affect the CNS; causing convulsions and respiratory failure. High levels may cause dizziness, lightheadedness, coma and death.

Long-Term Exposure: Repeated exposure can cause lung irritation and bronchitis. May cause liver and kidney damage. Repeated or long-term exposure may damage the red blood cells, causing anemia.

Points of Attack: Eyes, respiratory system, liver, kidneys, and blood.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Complete blood cell count (CBC). Liver and kidney function tests. Consider chest X-ray following acute overexposure. NIOSH lists the following tests: Blood Gas Analysis, electrocardiogram, expired air, pulmonary function tests; sputum cytology; white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of salt water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. 4 hours: Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 5 ppm: CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). 12.5 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. 25 ppm: CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 500 ppm: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2363 Ethyl mercaptan, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Use SCBA during cleanup[57]. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas or liquid. Thermal decomposition products may include oxides of sulfur and carbon. *Liquid:* Use dry chemical, carbon dioxide; halon, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. *Gas:* Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (1093°C) followed by scrubbing with a caustic solution[22].

Ethyl mercuric chloride E:0750

Formula: C_2H_5ClHg; C_2H_5HgCl

Synonyms: Ceresan; Chloroethyl mercury; EMC; Ethylmercuric chloride; Ethylmercury chloride; Granosan; Granozan

CAS Registry Number: 107-27-7

HSDB Number: 6424

RTECS Number: OV9800000

UN/NA & ERG Number: UN2025 (mercury compounds, solid, n.o.s.)/151; UN2777 (Mercury based pesticides, solid, toxic)/151

EC Number: 203-478-0 [*Annex I Index No.:* 080-00-2-6]

Regulatory Authority and Advisory Information

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/1990.

Hazard Alert: Poison, Organometallic, Strong reducing agent, Suspected reprotoxic hazard.

United States National Primary Drinking Water Regulations: MCLG = 0.002 mg[Hg]/L; MCL = 0.002 mg[Hg]/L as mercury.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R6; R26; R48/23; R50/53; R61; R63; safety phrases: S53; S45; S60; S61.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Ethyl mercuric chloride, an alkyl-organo mercury compound, is silvery white, forming leaf-like crystals. Molecular weight = 265; freezing/melting point = 192°C. Explosive limits: LEL = 17,000 ppm; UEL: unknown. Insoluble in water.

Potential Exposure: Ethyl mercuric chloride is used as an organic fungicide for seed treatment.

Incompatibilities: A strong reducing agent, Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Sensitive to light.

Permissible Exposure Limits in Air

NIOSH IDLH = 2 mg[Hg]/m^3

OSHA PEL: 0.01 mg[Hg]/m^3 TWA; 0.04 milligram per cubic meter Ceiling Concentration

NIOSH REL: 0.01 mg[organomercury]/m^3 TWA; 0.03 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 milligram per cubic meter STEL [skin]

PAC Ver. 29[138]

PAC-1: 0.04 milligram per cubic meter

PAC-2: 0.53 milligram per cubic meter

PAC-3: 2.6 milligram per cubic meter

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3

Russia[43] set a MAC in work-place air of 0.005 milligram per cubic meter and a MAC for ambient air in residential areas of 0.0009 milligram per cubic meter on a momentary basis and 0.0001 milligram per cubic meter on an average daily basis.

Determination in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: A severe marring pollutant. Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Symptoms of exposure to this compound may include headache, paresthesia of the tongue, lips, fingers and toes, other nonspecific dysfunction, metallic taste, slight GI disturbances, excessive flatulence and diarrhea. Acute poisoning may cause irritation of the GI tract and renal failure. Nervous symptoms usually appear first. They include fine tremors of extended hands, loss of side vision and slight loss of coordination. Other symptoms include incoordination in speech, writing and gait. Incoordination progresses to inability to stand or carry out voluntary movements. Muscle atrophy, flexure contractions, generalized myoclinic movements, difficulty understanding speech, irritability and bad temper progressing to mania, stupor coma and mental retardation may occur. Symptoms of exposure to this type of compound include CNS effects, ataxia, chorea, athetosis and convulsions. Ingestion of this type of compound may cause urticaria, stomatitis, salivation, anemia, leukopenia and liver damage. Inhalation of this type of compound can cause salivation, stomatitis, loosening of the teeth, blue lines on gums, pain and numbness in the extremities, nephritis, anxiety, weight loss, anorexia, mental depression, insomnia, irritability, instability, hallucinations and evidences of mental deterioration. This class of compound is a primary skin irritant which may cause dermatitis, skin burns and sensitization[101].

Short-Term Exposure: Ethyl mercuric chloride is an extremely toxic chemical that can cause permanent brain damage weeks after exposure with little or no warning during exposure. LD_{50} = (oral-rat) 40 mg/kg. Severe poisoning can cause death. It enters the body through the lungs, skin and contaminated hands. Poisoning causes a "pins and needles" feeling, becoming clumsy and weak; hearing loss; abnormal walking; tremors, personality changes and other brain damage. Eye contact may cause severe irritation.

Long-Term Exposure: Ethyl mercuric chloride should be handled as a teratogen-with extreme caution. It may cause mutations. Handle with extreme caution. Mercury accumulates in the body. May cause kidney damage. It can take months or years for the body to get rid of excess mercury.

Points of Attack: Eyes, skin, CNS, peripheral nervous system, and kidneys.

Medical Surveillance: NIOSH lists the following tests: body hair/nail; whole blood (chemical/metabolite); neurologic Examination/Electromyography. Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended, with: exam of the nervous system including handwriting. Visual exam, including "visual field" exam. Hearing tests. Test for mercury in hair and blood. After suspected illness or overexposure, repeat these tests promptly, again in 4−6 weeks and then as recommended by your doctor. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: For severe poisoning BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate [CAS: 134-72-5].

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Up to 0.1 milligram per cubic meter: Sa (APF = 10) (any supplied-air respirator). Up to 0.25 milligram per cubic meter*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). Up to 0.5 milligram per cubic meter: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Up to 2 milligram per cubic meter*:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates).

Shipping: UN2025 Mercury compounds, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2777 Mercury based pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressant or special vacuums. Kits specific for clean-up of mercury spills should be available. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemicals appropriate for extinguishing metal fires. *Do not use water*. Thermal decomposition products may include corrosive hydrogen chloride and very toxic oxides of mercury (HgOx) and carbon and fumes of chloride ion and mercury. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl methacrylate is a colorless liquid. Molecular weight = 114.16; specific gravity (H_2O:1) = 0.9 @ 20°C; boiling point = 119°C; freezing/melting point ≤ -75°C; vapor pressure = 20.6 mmHg @ 20°C; flash point = 20°C; autoignition temperature = 393°C. Explosive limits: LEL = 1.8%; 28,000 ppm[138]; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Slightly soluble in water.

Potential Exposure: This chemical is used in manufacture of coatings, resins, and lacquers. Widely known as "Plexiglass" (in the polymer form), ethyl methacrylate is used to make polymers, which in turn are used for building, automotive, aerospace, and furniture industries. It is also used by dentists as dental plates, artificial teeth, and orthopedic cement.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Corrodes some metals. Unless inhibited, violent polymerization can occur from heat, sunlight, and contact with strong oxidizers.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.04 ppm

PAC-2: 0.53 ppm

PAC-3: 2.6 ppm

DFG MAK: [skin] danger of skin sensitization.

Denmark: TWA 50 ppm (235 milligram per cubic meter), 1999; Norway: TWA 50 ppm (250 milligram per cubic meter), 1999; Russia: STEL 50 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (250 milligram per cubic meter), KTV 75 ppm (350 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 48 milligram per cubic meter, 2003.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: A lacrimator. Exposure can irritate the eyes, skin, and respiratory tract. Very high vapor levels could cause you to feel dizzy, lightheaded and even to pass out. Contact can irritate the eyes and skin.

Long-Term Exposure: Repeated or prolonged contact with skin may cause allergy with rash and itching. May damage the nervous system. There is limited evidence that ethyl methacrylate may damage the developing fetus.

Points of Attack: Skin and CNS.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. There is evidence that fluorinated ethylene propylene materials offer protection from ethyl methacrylate for up to 3 hours. Polyvinyl alcohol is also among the recommended protective materials. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to ethyl methacrylate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, (such as perchlorates, peroxides, permanganates, chlorates and nitrates). Sources of ignition, such as smoking and open flames, are prohibited where ethyl methacrylate is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethyl methacrylate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl methacrylate.

Shipping: UN2277 Ethyl methacrylate, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl methacrylate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethyl methane sulfonate is a clear liquid. Molecular weight = 124.17; specific gravity (H_2O:1) = 1.15 @ 20°C; boiling point = 213°C; vapor pressure = 0.33 mmHg @25°C; flash point = 100°C. Explosive limits: LEL = 20,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Soluble in water; solubility = 50 g/L @ 27°C.

Potential Exposure: Used as a research tool for mutagenesis and carcinogenesis studies. Was considered as a possible human male contraceptive. Also considered as a reversible male hemosterilant for insects and mammalian pests.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Contact with moisture may cause hydrolysis or other forms of decomposition.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.1 milligram per cubic meter

PAC-2: 23 milligram per cubic meter

PAC-3: 140 milligram per cubic meter

Determination in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: Octanol-water coefficient: Log $K_{ow} = < 0.1$. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Short-Term Exposure: Harmful if swallowed. Irritation of skin, eyes and mucous membranes; sores and burns. LD_{50} = 470 mg/kg.

Long-Term Exposure: A carcinogen in animals. A possible mutagen, genetic effects; Suspected of causing genetic defects.

First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place or a refrigerator away from acids and acid fumes. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Land spill:* Build dikes to contain the flow of spilled compound and fire-fighting water, if any. Absorb the compound on bentonite, sawdust, clay or carbon. Alternatively, add a 5% solution of sodium hydroxide. Collect the waste in barrels for later disposal or treatment. *Spill on water body:* If the spill occurs on a large flowing water body, add a 5% solution of sodium hydroxide. Collect the waste in barrels for later disposal or treatment. In case of spill on nonflowing small water body, add 5% caustic followed by carbon adsorption or biological treatment depending on the end uses of the water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of sulfur and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of lab chemicals, expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. Nonaqueous wastes may be treated in an incinerator, boiler, or cement kiln where temp and residence time are in excess of 1000°C and 25 seconds, respectively. Alternatively, the nonaqueous wastes may be disposed of in an RCRA-approved landfill. The detoxified aqueous waste may be treated using biological wastewater methods or disposed of through deep-well injection. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

N-Ethylmorpholine E:0780

Formula: $C_6H_{13}NO$

Synonyms: Ethylmorpholine; 4-Ethylmorpholine; NEM

CAS Registry Number: 100-74-3

HSDB Number: 1644

RTECS Number: QE4025000

UN/NA & ERG Number: UN1993 (flammable liquids, n.o.s.)/128; UN2920 (corrosive liquid, flammable, n.o.s.)/132

EC Number: 202-885-0

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Corrosive, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, T, C, Xi; risk phrases: R11; R21; R22; R34; R63; safety phrases: S16; S21, S26; S36/37/39; S45; S63; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 4-Ethylmorpholine is a colorless liquid with an ammonia-like odor. Molecular weight = 115.20; specific gravity (H_2O:1) = 0.90; boiling point = 138.3°C; freezing/melting point = −62.8°C; vapor pressure = 6.2 mmHg @ 20°C; flash point = 28.3°C (oc); autoignition temp = 275°C. Explosive limits: LEL = 0.9%; UEL: 4.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Soluble in water; aqueous solution is alkaline.

Potential Exposure: Primary irritant (without allergic reaction). This material is used as a catalyst in polyurethane foam production. It is a solvent for dyes and resins. It is used as an intermediate in surfactant, dye, pharmaceutical, and rubber chemical manufacture.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 4.71 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 20 ppm/94 milligram per cubic meter TWA [skin]

NIOSH REL: 5 ppm/23 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 5 ppm/24 milligram per cubic meter TWA [skin]

No PAC available

Australia: TWA 5 ppm (23 milligram per cubic meter), [skin], 1993; Belgium: TWA 5 ppm (24 milligram per cubic meter), [skin], 1993; Denmark: TWA 5 ppm (23.5 milligram per cubic meter), [skin], 1999; Finland: TWA 5 ppm (47 milligram per cubic meter); STEL 10 ppm (50 milligram per cubic meter), [skin], 1999; France: VME 5 ppm (23 milligram per cubic meter), [skin], 1999; Norway: TWA 5 ppm (23 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 23 milligram per cubic meter, [skin], 2003; Russia: STEL 5 milligram per cubic meter, [skin], 1993; Sweden: NGV 5 ppm (25 milligram per cubic meter), KTV 10 ppm (50 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 20 ppm (70 milligram per cubic meter), KZG-W 40 ppm (140 milligram per cubic meter), [skin], 1999; United Kingdom: TWA 5 ppm (24 milligram per cubic meter); STEL 20 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea: ACGIH TLV: TWA 5 ppm [skin]. Several states have set guidelines or standards for *n*-ethylmorpholine in ambient air[60] ranging from 230 μ/m^3 (North Dakota) to 400 μ/m^3 (Virginia) to 460 μ/m^3 (Connecticut) to 548 μ/m^3 (Nevada).

Determination in Air: Adsorption on Si gel, workup with H_2SO_4 using ultrasonics; analysis by gas chromatography/flame ionization. See NIOSH (II-3) Method #S-146.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can irritate and burn the skin and eyes. Exposure to high concentration of the vapor can cause drowsiness, foggy vision; visual disturbance; corneal edema; blue-gray vision; seeing colored halos around light.

Long-Term Exposure: Unknown at this time.

Points of Attack: Respiratory system, eyes, and skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: Up to 50 ppm: CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)];or Sa (APF = 10) (any supplied-air respirator).* up to 100 ppm: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2920 Corrosive liquids, flammable, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid. UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition include oxides of nitrogen and carbon. Water may be ineffective. Alcohol foam is recommended[17]. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

Ethyl phenyl dichlorosilane E:0790

Formula: $C_8H_{10}C_{12}Si$; $C_2H_5(C_6H_5)SiC_{12}$

Synonyms: Dichloroethyl phenylsilane; Ethylphenyldichlorosilane

CAS Registry Number: 1125-27-5

HSDB Number: 443

RTECS Number: VV3270000

UN/NA & ERG Number: UN2435/156

EC Number: 214-407-8

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Corrosive, Strong reducing agent, Violently reactive with water.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R29; R34; R36/37/38; safety phrases: S23; S24/25; S26; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl phenyl dichlorosilane is a colorless liquid. Fumes in humid air. Molecular weight = 205.17; boiling point = 149°C; flash point104°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2 ₩. Reacts with water, rapidly releasing corrosive hydrogen chloride gas and heat.

Potential Exposure: Used in the manufacture of silicone polymers.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks human tissue and metals in the presence of moisture.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the eyes, nose and throat. It is a corrosive chemical and contact can cause severe skin and eye burns leading to permanent eye damage. High levels can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Very irritating substances may affect the lungs.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethyl phenyl dichlorosilane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe) -approved SCBA with a full facepiece operate in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Ethyl phenyl dichlorosilane must be stored to avoid contact with water, steam, oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), and combustible materials (such as wood, paper and oil), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam and moisture because toxic and corrosive chloride gases, including hydrogen chloride, can be produced. Sources of ignition, such as smoking and open flames are prohibited where ethyl phenyl dichlorosilane is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2435 Ethylphenyldichlorosilane, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Initial Isolation and Protective Action Distances as Chlorosilanes, Corrosive, n.o.s.

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

When Spilled in Water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phosphine gas, hydrogen chloride and oxides of metal and carbon. *For chlorosilanes do not use water. Use AFFF alcohol-resistant, medium expansion foam. Small fire*: Use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: Use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, and tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely.

Do not get water on spilled substance or inside containers. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: Ethyl Phenyl Dichlorosilane*, Trenton, NJ (November 2000)

2-Ethyl-3-propyl acrolein E:0810

Formula: $C_8H_{14}O$
Synonyms: 2-Ethyl-2-hexenal; 2-Ethylhexenal; α-Ethyl-β-*n*-propylacrolein; 2-Ethyl-3-propyl acrolein
CAS Registry Number: 645-62-5
HSDB Number: 1120
RTECS Number: MP6300000
UN/NA & ERG Number: UN1988/131
EC Number: 211-448-3
Regulatory Authority and Advisory Information.
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 2-Ethyl-3-propyl acrolein is a colorless or yellowish liquid with a sharp, powerful, irritating odor. Molecular weight = 126.22; boiling point = 175°C; freezing/melting point = 100°C; flash point = 68°C (oc). Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Slightly soluble in water.

Potential Exposure: Those workers involved in organic synthesis operations and use of this flammable and toxic aldehyde warning agent.

Incompatibilities: Aldehydes are frequently involved in self-condensation or polymerization reactions. These reactions are exothermic; they are often catalyzed by acid. Aldehydes are readily oxidized to give carboxylic acids. Flammable and/or toxic gases are generated by the combination of aldehydes with azo, diazo compounds, dithiocarbamates, nitrides, and strong reducing agents. Aldehydes can react with air to give first peroxo acids, and ultimately carboxylic acids. These autoxidation reactions are activated by light, catalyzed by salts of transition metals, and are autocatalytic (catalyzed by the products of the reaction). The addition of stabilizers (antioxidants) to shipments of aldehydes retards autoxidation[101]. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, caustics, ammonia, and amines.

Permissible Exposure Limits in Air
Russia[43] set a MAC in work-place air of 3 milligram per cubic meter.

Harmful Effects and Symptoms
Short-Term Exposure: This chemical is an irritant, a moderate inhalative and ingestive toxin; and is slightly toxic (LD_{50} = (oral-rat) 3000 mg/kg). It irritates eyes, skin and mucous membranes. Causes smarting of the skin and first degree burns on short exposure. May cause second degree burns on long exposure.

Long-Term Exposure: Very irritating substances may cause lung irritation and bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consider chest X-ray following acute overexposure.

First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in cool, dry place and protect from air.

Shipping: UN1988 Aldehydes, flammable, toxic, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam (recommended) extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, or dissolve in flammable solvent and spray into incinerator containing afterburner.

Ethyl silicate E:0820

Formula: $C_8H_{20}O_4Si$; $(C_2H_5O)_4Si$

Synonyms: Ethyl orthosilicate; Ethyl silicate, condensed; Ethyl silicate 40; Extrema; Silibone; Silicate d'ethyle (French); Silicic acid tetraethyl ester; TEOS; Tetraethoxysilane; Tetraethyl orthosilicate; Tetraethyl silicate

CAS Registry Number: 78-10-4

HSDB Number: 534

RTECS Number: VV9450000

UN/NA & ERG Number: UN1292/129

EC Number: 201-083-8 [*Annex I Index No.:* 014-005-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R10; R20; R36/37; safety phrases: S2; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ethyl silicate is a colorless, flammable liquid with a sharp odor detectable @ 85 ppm. Molecular weight = 208.37; boiling point = 168.9°C; specific gravity (H_2O:1) = 0.93 @ 25°C; freezing/melting point = −82.8°C; vapor pressure = 1 mmHg @ 20°C; flash point = 54°C (cc). Explosive limits: LEL = 1.3%; UEL: 23%. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slowly hydrolyzes in water.

Potential Exposure: Ethyl silicate is used as a binder in production of cases and molds for investment casting of metals. The next largest application is in corrosion-resistant coatings; primarily as a binder for zinc dust paints. Miscellaneous uses include the protection of white-light bulbs; the preparation of soluble silicas; catalyst preparation and regeneration; and as a crosslinker and intermediate in the production of silicones.

Incompatibilities: May form explosive mixture with air. Strong oxidizers; strong acids; water.

Permissible Exposure Limits in Air

NIOSH IDLH = 700 ppm

OSHA PEL: 100 ppm/850 milligram per cubic meter TWA

NIOSH REL: 10 ppm/85 milligram per cubic meter TWA

ACGIH TLV[1]: 10 ppm/85 milligram per cubic meter TWA

DFG MAK: 10 ppm/86 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group D

Australia: TWA 10 ppm (85 milligram per cubic meter), 1993; Austria: MAK 20 ppm (170 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (85 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (85 milligram per cubic meter), 1999; Finland: TWA 10 ppm (85 milligram per cubic meter); STEL 20 ppm (170 milligram per cubic meter), 1999; France: VME 10 ppm (85 milligram per cubic meter), 1999; Japan: 10 ppm (85 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 85 milligram per cubic meter, 2003; Norway: TWA 10 ppm (85 milligram per cubic meter), 1999; the Philippines: TWA 100 ppm (850 milligram per cubic meter), 1993; Poland: MAC (TWA) 80 milligram per cubic meter, MAC (STEL) 250 milligram per cubic meter, 1999; Russia: STEL 20 milligram per cubic meter, 1993; Switzerland: MAK-W 10 ppm (85 milligram per cubic meter), 1999; Turkey: TWA 100 ppm (850 milligram per cubic meter), 1993; United Kingdom: TWA 10 ppm (87 milligram per cubic meter); STEL 30 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 10 ppm.

Determination in Air: XAD-2 (tube); adsorption on resin, workup with CS2, analysis by gas chromatography/flame ionization. NIOSH II,[3] Method S-264.

Routes of Entry: Inhalation of vapor, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Skin or eye contact can cause severe irritation or burns. The vapor can irritate the nose, eyes, throat, and bronchial tubes causing cough and difficulty breathing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated skin contact can cause drying and cracking. Exposure can affect the nervous system causing tremors, weakness, dizziness, and unconsciousness. High or repeated exposure may damage the liver, kidneys, lungs, and red blood cells.

Points of Attack: Eyes, respiratory system, liver, kidneys, blood, and skin

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Kidney and liver function test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests and CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Remove clothing immediately if wet or contaminated to avoid flammability hazard. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 100 ppm: Sa (APF = 10) (any supplied-air respirator). 250 ppm: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 500 ppm: SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 700 ppm: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Ethyl silicate (a silane) must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from water. Sources of ignition, such as smoking and open flames, are prohibited where ethyl silicate is handled, used, or stored. Metal containers involving the transfer of five gallons or more of ethyl silicate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl silicate.

Shipping: UN1292 Tetraethyl acetate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl silicate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition includes oxides silicon and carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with a more flammable solvent.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R20/21/22; R36/37/38; R50/53; safety phrases: S16; S21, S24/25; S26; S36/37; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ethyl thiocyanate is a liquid. Onion odor. Molecular weight = 87.15; boiling point = 146°C; freezing/melting point = −86°C; flash point 42°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: This thiocyanate material is used as an agricultural insecticide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Esters are generally incompatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition. Caution should be exercised in treating a thiocyanate with an oxidizing agent such as a peroxide or chlorate as such mixtures have been known to explode[101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 20 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 170 milligram per cubic meter

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine. 140 μg[CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg [CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; short-term consumption; raw water constituents (maximum) 20 mg[CN]/L.

Routes of Entry: Inhalation and dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: The ingestion of a concentrated solution may lead to vomiting. The principal systemic reaction is probably one of central nervous depression, interrupted by periods of restlessness; abnormally fast and deep respiratory movements and convulsions. Death is usually due to respiratory arrest from paralysis of the medullary centers. In nonfatal cases injures to the liver and kidneys may appear. LD_{50} = (oral-rat) 200 mg/kg.

Long-Term Exposure: Prolonged absorption may produce various skin eruptions, runny nose; and occasionally dizziness, cramps, nausea, vomiting and mild or severe disturbances of the nervous system.

Points of Attack: Nervous system, liver, and kidneys.

Medical Surveillance: Liver function tests. Kidney function tests. Examination of the nervous system.

First Aid: Treatment is as for aliphatic thiocyanates. Because cyanide is probably largely responsible for poisonings; antidotal measures against cyanide should be instituted promptly, for including moving the victim to fresh air. Call emergency medical care. If not breathing, give artificial respiration. IF breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 minutes. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear butyl rubber gloves; protective clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, chlorates, nitrates, nitric acid. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2929 Toxic liquids, flammable, organic, n.o.s., Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. For *large spills*, dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include nitrogen, sulfur and carbon. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.
